Generates new lines by subtracting the regions common to both *NL* lines and *NA* areas (the intersection) from the *NL* lines. The intersection can be a line(s) or keypoint(s). If the intersection is a keypoint and *SEPO* is blank, the *NL* line is divided at the keypoint and the resulting lines will be connected, sharing a common keypoint where they touch. If *SEPO* is set to SEPO, *NL* is divided into two unconnected lines with separate keypoints where they touch. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>With Options>Line by Area

---

***LSBAC**,*EngineName*,*RhsVector*,*SolVector*,*TransKey*

Performs the solve (forward/backward substitution) of a factorized linear system.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

EngineName

Name used to identify this engine. Must have been previously created using ***LSENGINE (p. 1077)** and factorized using ***LSFACTOR (p. 1078)**.

RhsVector

Name of vector containing the right-hand side (load) vectors as input. Must have been previously defined as a ***VEC (p. 2085)** vector or a ***DMAT (p. 551)** matrix.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SolVector

Name of vector that will contain the solution vectors upon completion. Must be predefined as a ***VEC (p. 2085)** vector or ***DMAT (p. 551)** matrix.

TransKey

Transpose key. Set *TransKey* = TRANS to solve the transposed linear system. If blank, transpose will not be used.

Notes

This command performs forward and back substitution to obtain the solution to the linear matrix equation Ax = b (or $A^T x = b$ if *TransKey* = TRANS). The matrix engine must have been previously defined using ***LSENGINE (p. 1077)**, and the matrix factored using ***LSFACTOR (p. 1078)**.

You can use the ***DMAT (p. 551)**,,,COPY (or ***VEC (p. 2085)**,,,COPY) command to copy the load vector to the solution vector in order to predefine it with the appropriate size.

Menu Paths

This command cannot be accessed from a menu.

LSBL, *NL1*, *NL2*, *SEP0*, *KEEP1*, *KEEP2*

Subtracts lines from lines.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Line (or lines, if picking is used) to be subtracted from. If ALL, use all selected lines. Lines specified in this argument are not available for use in the *NL2* argument. If P, graphical picking is enabled (valid only in the GUI) and all remaining fields are ignored. A component name may also be substituted for *NL1*.

NL2

Line (or lines, if picking is used) to subtract. If ALL, use all selected lines (except those included in the *NL1* argument). A component name may also be substituted for *NL2*.

SEP0

Behavior if the intersection of the *NL1* lines and the *NL2* lines is a keypoint or keypoints:

(blank)

The resulting lines will share keypoint(s) where they touch.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SEPO

The resulting lines will have separate, but coincident keypoint(s) where they touch.

KEEP1

Specifies whether *NL1* lines are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NL1* lines after **LSBL (p. 1067)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NL1* lines after **LSBL (p. 1067)** operation (override **BOPTN (p. 269)** command settings).

KEEP2

Specifies whether *NL2* lines are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NL2* lines after **LSBL (p. 1067)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NL2* lines after **LSBL (p. 1067)** operation (override **BOPTN (p. 269)** command settings).

Notes

Generates new lines by subtracting the regions common to both *NL1* and *NL2* lines (the intersection) from the *NL1* lines. The intersection can be a line(s) or point(s). If the intersection is a point and *SEPO* is blank, the *NL1* line is divided at the point and the resulting lines will be connected, sharing a common keypoint where they touch. If *SEPO* is set to SEPO, *NL1* is divided into two unconnected lines with separate keypoints where they touch. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated. **LSBL (p. 1067)**,ALL,ALL will have no effect since all the lines (in *NL1*) will be unavailable as *NL2* lines.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>Line by Line

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>With Options>Line by Line

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Main Menu>Preprocessor>Modeling>Operate>Booleans>Subtract>Lines

Main Menu>Preprocessor>Modeling>Operate>Booleans>Subtract>With Options>Lines

LSBV, *NL*, *NV*, *SEPO*, *KEEPL*, *KEEPV*

Subtracts volumes from lines.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL

Line (or lines, if picking is used) to be subtracted from. If ALL, use all selected lines. If *NL* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL*.

NV

Volume (or volumes, if picking is used) to be subtracted. If ALL, use all selected volumes. A component name may also be substituted for *NV*.

SEPO

Behavior if the intersection of the *NL* lines and the *NV* volumes is a keypoint or keypoints:

(blank)

The resulting lines will share keypoint(s) where they touch.

SEPO

The resulting lines will have separate, but coincident keypoint(s) where they touch.

KEEPL

Specifies whether *NL* lines are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NL* lines after **LSBV (p. 1069)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NL* lines after **LSBV (p. 1069)** operation (override **BOPTN (p. 269)** command settings).

KEEPV

Specifies whether *NV* volumes are to be deleted:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NV* volumes after **LSBV (p. 1069)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NV* volumes after **LSBV (p. 1069)** operation (override **BOPTN (p. 269)** command settings).

Notes

Generates new lines by subtracting the regions common to both *NL* lines and *NV* volumes (the intersection) from the *NL* lines. The intersection can be a line(s) or point(s). If the intersection is a point and *SEPO* is blank, the *NL1* line is divided at the point and the resulting lines will be connected, sharing a common keypoint where they touch. If *SEPO* is set to SEPO, *NL1* is divided into two unconnected lines with separate keypoints where they touch. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated. **LSBL (p. 1067)**,ALL,ALL will have no effect since all the lines (in *NL1*) will be unavailable as *NL2* lines.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>Line by Volume

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>With Options>Line by Volume

Main Menu>Preprocessor>Modeling>Operate>Divide>Line by Volu

LSBW, *NL*, *SEPO*, *KEEP*

Subtracts the intersection of the working plane from lines (divides lines).

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL

Line (or lines, if picking is used) to be subtracted from. If *NL* = ALL, use all selected lines. If *NL* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be input for *NL*.

SEPO

Behavior of the created boundary.

(blank)

The resulting lines will share keypoint(s) where they touch.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SEPO

The resulting lines will have separate, but coincident keypoint(s).

KEEP

Specifies whether *NL* lines are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NL* lines after **LSBW (p. 1070)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NL* lines after **LSBW (p. 1070)** operation (override **BOPTN (p. 269)** command settings).

Notes

Generates new lines by subtracting the intersection of the working plane from the *NL* lines. The intersection will be a keypoint(s). The working plane must not be in the same plane as the *NL* line(s). If *SEPO* is blank, the *NL* line is divided and the resulting lines will be connected, sharing a common keypoint where they touch. If *SEPO* is set to SEPO, *NL* is divided into two unconnected lines with separate keypoints. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated. Areas that completely contain the input lines will be updated if the lines are divided by this operation.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>Line by WrkPlane

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>With Options>Line by WrkPlane

Main Menu>Preprocessor>Modeling>Operate>Divide>Line by WrkPlane

---

LSCLEAR, *Lab*

Clears loads and load step options from the database.

SOLUTION (p. 38): Load Step Operations (p. 46)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Label identifying the data to be cleared:

SOLID

Delete only solid model loads.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FE

Delete only finite element loads.

INER

Delete only inertia loads (**ACEL (p. 92)**, etc.).

LFACT

Initialize only load factors (on **DCUM (p. 502)**, **FCUM (p. 739)**, **SFCUM (p. 1758)**, etc.).

LSOPT

Initialize only load step options.

ALL

Delete all loads and initialize all load step options and load factors.

Notes

Loads are deleted, and load step options are initialized to their default values.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Delete>All Load Data>All F.E. Loads
Main Menu>Preprocessor>Loads>Define Loads>Delete>All Load Data>All Inertia Lds

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LSDELE, *LSMIN*, *LSMAX*, *LSINC*

Deletes load step files.

SOLUTION (p. 38): Load Step Operations (p. 46)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LSMIN*, *LSMAX*, *LSINC

Range of load step files to be deleted, from *LSMIN* to *LSMAX* in steps of *LSINC*. *LSMAX* defaults to *LSMIN*, and *LSINC* defaults to 1. If *LSMIN* = ALL, all load step files are deleted (and *LSMAX* and *LSINC* are ignored). The load step files are assumed to be named `Jobname.S`*n*, where *n* is a number assigned by the **LSWRITE (p. 1087)** command (01--09,10,11, etc.). On systems with a 3-character limit on the extension, the "S" is dropped for numbers > 99.

Notes

Deletes load step files in the current directory (written by the **LSWRITE (p. 1087)** command).

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Operate>Delete LS Files

Main Menu>Solution>Define Loads>Operate>Delete LS Files

***LSDUMP**, *EngineName*, *FileName*

Dumps a linear solver engine to a binary File.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

EngineName

Name used to identify this engine. Must have been previously created using ***LSENGINE (p. 1077)** and factorized using ***LSFACTOR (p. 1078)**.

FileName

Name of the file to create.

Notes

Dumps a previously factorized linear solver system to a binary file. Only LAPACK and BCS linear solvers can be used with this feature. The Linear Solver can later be restored with the ***LSRESTORE (p. 1083)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A BCS Sparse Solver can be dumped only if uses the *INCORE* memory option (see **BCSOPTION (p. 218)**).

Menu Paths

This command cannot be accessed from a menu.

LSEL, *Type*, *Item*, *Comp*, *VMIN*, *VMAX*, *VINC*, *KSWP*

Selects a subset of lines.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

ALL

Restore the full set.

NONE

Unselect the full set.

INVE

Invert the current set (selected becomes unselected and vice versa).

STAT

Display the current select status.

The following fields are used only with *Type* = S, R, A, or U:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item

Label identifying data. Valid item labels are shown in the table below. Some items also require a component label. If *Item* = PICK (or simply "P"), graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). Defaults to LINE.

Comp

Component of the item (if required). Valid component labels are shown in the table below.

VMIN

Minimum value of item range. Ranges are line numbers, coordinate values, attribute numbers, etc., as appropriate for the item. If *VMIN* = 0.0, a tolerance of ±1.0E-6 is used, or ±0.005 x *VMIN* if *VMIN* = *VMAX*. A component name (as specified on the **CM (p. 356)** command) may also be substituted for *VMIN* (*VMAX* and *VINC* are ignored). If *Item* = MAT, TYPE, REAL, ESYS, or NDIV and if *VMIN* is positive, the absolute value of *Item* is compared against the range for selection; if *VMIN* is negative, the signed value of *Item* is compared. See the **LLIST (p. 1056)** command for a discussion of signed attributes.

VMAX

Maximum value of item range. *VMAX* defaults to *VMIN*.

VINC

Value increment within range. Used only with integer ranges (such as for line numbers). Defaults to 1. *VINC* cannot be negative.

KSWP

Specifies whether only lines are to be selected:

0

Select lines only.

1

Select lines, as well as keypoints, nodes, and elements associated with selected lines. Valid only with *Type* = S.

Command Default

All lines are selected.

Notes

Selects lines based on values of a labeled item and component. For example, to select a new set of lines based on line numbers 1 through 7, use **LSEL (p. 1074)**,S,LINE,,1,7. The subset is used when the ALL label is entered (or implied) on other commands, such as **LLIST (p. 1056)**,ALL. Only data identified by line number are selected. Data are flagged as selected and unselected; no data are actually deleted from the database.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If *Item* = LCCA, the command selects only those lines that were created by concatenation. The *KSWP* field is processed, but the *Comp*, *VMIN*, *VMAX*, and *VINC* fields are ignored.

If *Item* = HPT, the command selects only those lines that contain hard points.

Item = RADIUS is only valid for lines that are circular arcs.

LSEL (p. 1074) is valid in any processor.

For selections based on non-integer numbers (coordinates, results, etc.), items that are within the range *VMIN* -*Toler* and *VMAX* +*Toler* are selected. The default tolerance *Toler* is based on the relative values of *VMIN* and *VMAX* as follows:

- If *VMIN* = *VMAX*, *Toler* = 0.005 x *VMIN*.
- If *VMIN* = *VMAX* = 0.0, *Toler* = 1.0E-6.
- If *VMAX* ≠ *VMIN*, *Toler* = 1.0E-8 x (*VMAX* - *VMIN*).

Use the **SELTOL (p. 1710)** (p. 1710) command to override this default and specify *Toler* explicitly.

Table 193: LSEL - Valid Item and Component Labels

Valid Item and Component Labels LSEL (p. 1074), *Type, Item, Comp, VMIN, VMAX, VINC, KSWP*

Item	Comp	Description
LINE		Line number.
EXT		Line numbers on exterior of selected area (ignore remaining fields).
LOC	X,Y,Z	X, Y, or Z center location in the active coordinate system.
TAN1	X,Y,Z	Unit vector component of outward tangent at beginning of line.
TAN2	X,Y,Z	Unit vector component of outward tangent at end of line.
NDIV		Number of divisions within the line.
SPACE		Spacing ratio of line divisions.
MAT		Material number associated with the line.
TYPE		Element type number associated with the line.
REAL		Real constant set number associated with the line.
ESYS		Element coordinate system associated with the line.
SEC		Cross section ID number. (**SECNUM (p. 1685)**)
LENGTH		Length of the line.
RADIUS		Radius of the line.
HPT		Line number (selects only lines with associated hard points).
LCCA		Concatenated lines (selects only lines that were created by concatenation (**LCCAT (p. 1020)**)).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>Select>Entities

---

*LSENGINE, *Type*,*EngineName*,*Matrix*,*Option*

Creates a linear solver engine.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Type

Specifies the algorithm to be used:

DSS --

MKL sparse linear solver.

LAPACK --

LAPACK dense matrix linear solver (default if applied to dense matrices).

DSP --

Distributed sparse solver (default for sparse matrices).

EngineName

Name used to identify this engine. Must be specified.

Matrix

Name of the matrix to solve.

Option

Option to control the memory mode of the DSS solver (used only if *Type* = DSS):

INCORE --

In-core memory mode.

OUTOFCORE --

Out-of-core memory mode.

Notes

This command creates a linear solver engine.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The DSS and DSP solvers can only be used with sparse matrices. For dense matrices, use the LAPACK solver.

Menu Paths

This command cannot be accessed from a menu.

---

*LSFACTOR, *EngineName*, *Option*

Performs the numerical factorization of a linear solver system.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

EngineName

Name used to identify this engine. Must have been previously created using ***LSENGINE (p. 1077)**.

Option

Option to invert the matrix, used only with an LAPACK engine (***LSENGINE (p. 1077)**,LAPACK):

INVERT --

Invert the matrix.

Notes

Performs the computationally intensive, memory intensive factorization of a matrix specified by ***LSENGINE (p. 1077)**, using the solver engine also specified by ***LSENGINE (p. 1077)**.

Menu Paths

This command cannot be accessed from a menu.

LSLA, *Type*

Selects those lines contained in the selected areas.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of line select:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

LSLK, *Type*, *LSKEY*

Selects those lines containing the selected keypoints.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of line select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LSKEY

Specifies whether all contained line keypoints must be selected (**KSEL (p. 995)**):

0

Select line if any of its keypoints are in the selected keypoint set.

1

Select line only if all of its keypoints are in the selected keypoint set.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

LSOPER

Specifies "Load step operations" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Load Step Operations

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/LSPEC, *LCOLOR*, *LINSTL*, *XLNWID*

Specifies annotation line attributes (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LINSTL

Line style:

0

Solid line.

1

Dashed line.

XLNWID

Line width multiplier (1.0 to 20.0). Defaults to 1.0.

Notes

This command specifies annotation line attributes to control certain characteristics of the lines created via the **/LINE (p. 1051)**, **/LARC (p. 1011)**, **/LSYMBOL (p. 1088)**, **/POLYGON (p. 1460)**, **/PMORE (p. 1454)**, **/PCIRCLE (p. 1370)**, and **/PWEDGE (p. 1557)** commands.

The command is generated by the Graphical User Interface (GUI) and appears in the log file (`Jobname.log`) if annotation is used. It is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with the **/INPUT (p. 948)** command).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LSREAD, *LSNUM*

Reads load and load step option data into the database.

SOLUTION (p. 38): Load Step Operations (p. 46)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LSNUM

Identification number of the load step file to be read. Defaults to 1 + highest number read in the current session. Issue **LSREAD (p. 1083)**,STAT to list the current value of *LSNUM*. Issue **LSREAD (p. 1083)**,INIT to reset *LSNUM* to 1. The load step files are assumed to be named Jobname.S*n*, where *n* is a number assigned by the **LSWRITE (p. 1087)** command (01--09,10,11, etc.). On systems with a 3-character limit on the extension, the "S" is dropped for *LSNUM* > 99.

Notes

Reads load and load step option data from the load step file into the database. **LSREAD (p. 1083)** *will not* clear the database of *all* current loads. However, if a load is respecified with **LSREAD (p. 1083)**, then it will overwrite the existing load. See the **LSWRITE (p. 1087)** command to write load step files, and the **LSDELE (p. 1073)** command to delete load step files. **LSREAD (p. 1083)** removes any existing **SFGRAD (p. 1772)** specification.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Read LS File

Main Menu>Solution>Load Step Opts>Read LS File

***LSRESTORE**, *EngineName*, *FileName*

Restores a linear solver engine from a binary file.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

EngineName

Name used to identify this engine.

FileName

Name of the file to read from.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Restores a previously dumped Linear Solver (see the ***LSDUMP (p. 1073)** command). This Linear Solver can be used to solve a linear system using the ***LSBAC (p. 1066)** command.

Menu Paths

This command cannot be accessed from a menu.

LSSCALE, *NL1*, *NL2*, *NINC*, *RX*, *RY*, *RZ*, *KINC*, *NOELEM*, *IMOVE*

Generates a scaled set of lines from a pattern of lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1*, *NL2*, *NINC

Set of lines (*NL1* to *NL2* in steps of *NINC*) that defines the pattern to be scaled. *NL2* defaults to *NL1*, *NINC* defaults to 1. If *NL1* = ALL, *NL2* and *NINC* are ignored and the pattern is defined by all selected lines. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* and *NINC* are ignored).

RX*, *RY*, *RZ

Scale factors to be applied to the X, Y, Z keypoint coordinates in active coordinate system (*RR*, *R*θ, *RZ* for cylindrical; *RR*, *R*θ, *R*Φ for spherical). Note that the *R*θ and *R*Φ scale factors are interpreted as angular *offsets*. For example, for **CSYS (p. 441)**,1, *RR*, *R*θ, *RZ* input of (1.5,10,3) would scale the specified keypoints 1.5 times in the radial and 3 times in the Z direction, while adding an offset of 10 degrees to the keypoints. Zero, blank, or negative scale factor values are assumed to be 1.0. Zero or blank angular offsets have no effect.

KINC

Increment to be applied to keypoint numbers for generated set. If zero, the lowest available keypoint numbers will be assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies whether nodes and elements are also to be generated:

0

Nodes and line elements associated with the original lines will be generated (scaled) if they exist.

1

Nodes and line elements will *not* be generated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IMOVE

Specifies whether lines will be moved or newly defined:

0

Additional lines will be generated.

1

Original lines will be *moved* to new position (*KINC* and *NOELEM* are ignored). Use only if the old lines are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

This command generates a scaled set of lines (and their corresponding keypoints and mesh) from a pattern of lines.

The MAT, TYPE, REAL, and ESYS attributes are based on the lines in the pattern and not the current settings.

Scaling occurs in the active coordinate system. Lines in the pattern could have been generated in any coordinate system.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Scale>Lines

LSSOLVE, *LSMIN*, *LSMAX*, *LSINC*

Reads and solves multiple load steps.

SOLUTION (p. 38): Load Step Operations (p. 46)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | PrepPost | **Solver** | AS add-on

LSMIN*, *LSMAX*, *LSINC

Range of load step files to be read and solved, from *LSMIN* to *LSMAX* in steps of *LSINC*. *LSMAX* defaults to *LSMIN*, and *LSINC* defaults to 1. If *LSMIN* is blank, a brief command description is displayed. The load step files are assumed to be named `Jobname.S`*n*, where *n* is a number assigned by the **LSWRITE (p. 1087)** command (01--09,10,11, etc.). On systems with a 3-character limit on the extension, the "S" is dropped for numbers > 99.

Notes

This command invokes a Mechanical APDL macro (LSSOLVE.MAC) to read and solve multiple load steps.

The macro loops through a series of load step files written by the **LSWRITE (p. 1087)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command cannot be used with the birth-death option, does not support cyclic symmetry analysis, and does not support restarts.

Menu Paths

Main Menu>Solution>Solve>From LS Files

LSTR, *P1*, *P2*

Defines a straight line irrespective of the active coordinate system.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

P1

Keypoint at the beginning of line. If *P1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI)

P2

Keypoint at the end of line.

Notes

Defines a straight line from *P1* to *P2* using the global Cartesian coordinate system. The active coordinate system will be ignored. The line shape is invariant with the coordinate system after it is generated. Lines may be redefined only if not yet attached to an area.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Lines>Lines>Straight Line

---

LSUM

Calculates and prints geometry statistics of the selected lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Calculates and prints geometry statistics (length, centroid, moments of inertia, etc.) associated with the selected lines. Geometry items are reported in the global Cartesian coordinate system. A unit density is assumed, irrespective of any material associations (**LATT (p. 1014)**, **MAT (p. 1111)**). Items calculated by **LSUM (p. 1086)** and later retrieved by a ***GET (p. 797)** or ***VGET (p. 2118)** command are valid only if the model is not modified after the **LSUM (p. 1086)** command is issued.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Calc Geom Items>Of Lines

---

LSWRITE, *LSNUM*

Writes load and load step option data to a file.

SOLUTION (p. 38): Load Step Operations (p. 46)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LSNUM

Number to be assigned to the load step file name for identification purposes. Defaults to 1 + highest *LSNUM* used in the current session. Issue **LSWRITE (p. 1087)**,STAT to list the current value of *LSNUM*. Issue **LSWRITE (p. 1087)**,INIT to reset to 1. The load step file will be named `Jobname.S`*n*, where *n* is the specified *LSNUM* value (preceded by "0" for values 1-9). On systems with a 3-character limit on the file name extension, the "S" is dropped for *LSNUM* > 99.

Notes

Writes all load and load step option data for the selected model to a load step file for later use. **LSWRITE (p. 1087)** does *not* capture changes made to real constants (**R (p. 1565)**), material properties (**MP (p. 1160)**), couplings (**CP (p. 421)**), or constraint equations (**CE (p. 297)**).

Solid model loads will not be saved if the model is not meshed. Solid model loads, if any, are transferred to the finite element model. Issue **LSCLEAR (p. 1071)**,FE to delete finite element loads.

One file is written for each load step. Use the **LSREAD (p. 1083)** command to read a single load step file, and the **LSDELE (p. 1073)** command to delete load step files. Use the **LSSOLVE (p. 1085)** command to read and solve the load steps sequentially.

Solution control commands are typically not written to the file unless you specifically change a default solution setting.

LSWRITE (p. 1087) does not support the following commands: **DJ (p. 537)**, **FJ (p. 759)**, **GSBDATA (p. 876)**, **GSGDATA (p. 877)**, **ESTIF (p. 681)**, **EKILL (p. 616)**, **EALIVE (p. 592)**, **MPCHG (p. 1167)**, and **OUTRES (p. 1336)**. These commands will not be written to the load step file.

LSWRITE (p. 1087) cannot be used with the birth-death option.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Write LS File

Main Menu>Solution>Load Step Opts>Write LS File

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/LSYMBOL, *X*, *Y*, *SYMANG*, *SYMTYP*, *SYMSIZ*, *KEYBMP*

Creates annotation symbols (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

X

X location for symbol (-1.0 < X < 2.0).

Y

Y location for symbol (-1.0 < Y < 1.0).

SYMANG

Symbol orientation angle.

SYMTYP

Symbol type:

1

Arrow.

2

Tee.

3

Circle.

4

Triangle.

5

Star.

SYMSIZ

Symbol size multiplier (0.1 to 20.0). Defaults to 1.0.

KEYBMP

If *KEYBMP* = 1, the annotation is a bitmap. *SYMTYP* will then be a number from 1-99, indicating the bitmap type (see notes), and *X* and *Y* will define the lower left corner of the bitmap. The *SYMANG*, *SYMSIZ*arguments are ignored. If *KEYBMP* = 0, or blank, then the argument definitions above apply.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Defines annotation symbols to be written directly onto the display at a specified location. This is a command generated by the GUI and will appear in the log file (`Jobname.log`) if annotation is used. This command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with the **/INPUT (p. 948)** command).

All symbols are shown on subsequent displays unless the annotation is turned off or deleted. Use the **/LSPEC (p. 1081)** command to set the attributes of the symbol.

The *KEYBMP* argument reads the symtype argument to determine which bitmap to insert. This bitmap is defined by an integer between 1 and 99. Numbers 1 through 40 correspond to the standard texture values found in the **/TXTRE (p. 2029)** command, while numbers 51 through 99 correspond to user supplied bitmaps, as defined using the Filename option of the **/TXTRE (p. 2029)** command. Numbers 51 through 57 are predefined (the logos, clamps and arrows available from the GUI) but can be overridden. Numbers 41 through 50 are reserved.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

LSYMM, *Ncomp*, *NL1*, *NL2*, *NINC*, *KINC*, *NOELEM*, *IMOVE*

Generates lines from a line pattern by symmetry reflection.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ncomp

Symmetry key:

X

X symmetry (default).

Y

Y symmetry.

Z

Z symmetry.

NL1*, *NL2*, *NINC

Reflect lines from pattern beginning with *NL1* to *NL2* (defaults to *NL1*) in steps of *NINC* (defaults to 1). If *NL1* = ALL, *NL2* and *NINC* are ignored and pattern is all selected lines (**LSEL (p. 1074)**). If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* and *NINC* are ignored).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KINC

Keypoint increment between sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies whether nodes and elements are also to be generated:

0

Generate nodes and elements associated with the original lines, if they exist.

1

Do not generate nodes and elements.

IMOVE

Specifies whether areas will be moved or newly defined:

0

Generate additional lines.

1

Move original lines to new position retaining the same keypoint numbers (*KINC* and *NOELEM* are ignored). Valid only if the old lines are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Generates a reflected set of lines (and their corresponding keypoints and mesh) from a given line pattern by a symmetry reflection (see analogous node symmetry command, **NSYM (p. 1289)**). The MAT, TYPE, REAL, and ESYS attributes are based upon the lines in the pattern and not upon the current settings. Reflection is done in the active coordinate system by changing a particular coordinate sign. The active coordinate system must be Cartesian. Lines in the pattern may have been generated in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended. Lines are generated as described in the **LGEN (p. 1046)** command.

See the **ESYM (p. 684)** command for additional information about symmetry elements.

Menu Paths

Main Menu>Preprocessor>Modeling>Reflect>Lines

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LTAN, *NL1*, *P3*, *XV3*, *YV3*, *ZV3*

Generates a line at the end of, and tangent to, an existing line.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Number of the line the generated line is tangent to. If negative, assume *P1* (see below), instead of *P2*, is the second keypoint of line *NL1*. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

P3

Keypoint at which generated line must end.

The following fields are used only if a specified slope on the end of the new line is desired, otherwise a zero curvature end slope will be automatically calculated. To specify the end slope, use the following fields to define a "slope vector" that has its tail at the origin and its head at the point *XV*, *YV*, *ZV* in the active coordinate system (**CSYS (p. 441)**). The corresponding end slope of the line will then be parallel to this "slope vector."

XV3, YV3, ZV3

Location (in the active coordinate system) of the head of the "slope vector" corresponding to the slope at the *P3* end of the line. The tail of the vector is at the coordinate system origin.

Notes

Generates a line (*P2-P3*) tangent at end point (*P2*) of line *NL1* (*P1-P2*).

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Lines>Lines>Tangent to Line

LTRAN, *KCNTO*, *NL1*, *NL2*, *NINC*, *KINC*, *NOELEM*, *IMOVE*

Transfers a pattern of lines to another coordinate system.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCNTO

Reference number of coordinate system where the pattern is to be transferred. Transfer occurs from the active coordinate system. The coordinate system type and parameters of *KCNTO* must be the same as the active system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NL1, NL2, NINC

Transfer lines from pattern beginning with *NL1* to *NL2* (defaults to *NL1*) in steps of *NINC* (defaults to 1). If *NL1* = ALL, *NL2* and *NINC* are ignored and pattern is all selected lines (**LSEL (p. 1074)**). If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* and *NINC* are ignored).

KINC

Keypoint increment between sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies whether nodes and elements are also to be generated:

0

Generate nodes and elements associated with the original lines, if they exist.

1

Do not generate nodes and elements.

IMOVE

Specifies whether lines will be moved or newly defined:

0

Generate additional lines.

1

Move original lines to new position retaining the same keypoint numbers (*KINC* and *NOELM* are ignored). Valid only if the old lines are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Transfers a pattern of lines (and their corresponding keypoints and mesh) from one coordinate system to another (see analogous node transfer command, **TRANSFER (p. 2011)**). The MAT, TYPE, REAL, and ESYS attributes are based upon the lines in the pattern and not upon the current settings. Coordinate systems may be translated and rotated relative to each other. Initial pattern may be generated in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended. Coordinate and slope values are interpreted in the active coordinate system and are transferred directly. Lines are generated as described in the **LGEN (p. 1046)** command.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Transfer Coord>Lines

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LUMPM, *Key*, - -, *KeyElt*

Specifies a lumped mass matrix formulation.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Formulation key:

OFF

Use the element-dependent default mass matrix formulation (default).

ON

Use a lumped mass approximation.

- -

Unused field.

KeyElt

Formulation key for elements with rotational degrees of freedom; applicable only when the lumped mass formulation key is turned on (*Key* = ON):

0 (blank)

Use direct diagonalization of the element mass matrix (default).

1

Use translational mass only.

2

Use the frame invariant formulation.

Command Default

Use the default element mass matrix.

Notes

In a modal analysis, the lumped mass matrix option (**LUMPM (p. 1093)**,ON) is not allowed when using the Supernode mode-extraction method (**MODOPT (p. 1140)**,SNODE). The eigensolver will automatically be switched to Block Lanczos (LANB) in this case.

In the use pass of a substructuring analysis, the lumped mass matrix formulation (**LUMPM (p. 1093)**,ON) modifies the superelement mass matrix and may give unexpected results.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The translational mass only option (**LUMPM (p. 1093)**,ON,,1) applies to the following elements: SHELL181, BEAM188, BEAM189, SHELL208, SHELL209, SHELL281, PIPE288, PIPE289, and ELBOW290. The frame invariant formulation (**LUMPM (p. 1093)**,ON,,2) applies only to BEAM188, BEAM189, PIPE288, and PIPE289 elements.

For more information, see Lumped Matrices in the *Theory Reference*.

This command is also valid in PREP7. If used in SOLUTION, this command is valid only within the first load step.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Preprocessor>Loads>Analysis Type>New Analysis

Main Menu>Solution>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>New Analysis

LVSCALE, *FACT*, *LDSTEP*

Scales the load vector for mode-superposition analyses.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FACT

Scale factor applied to both the real and imaginary (if they exist) components of the load vector. Defaults to 0.0.

LDSTEP

Specifies the load step number from the modal analysis (**MODCONT (p. 1132)**,ON). It corresponds to the load vector number. Defaults to 1. The maximum admissible value is the number of vectors written in the `Jobname.mode` file.

Command Default

No load vector is applied.

Notes

Specifies the scale factor for the load vector that was created in a modal (**ANTYPE (p. 162)**,MODAL) analysis. Applies only to the mode-superposition transient analysis (**ANTYPE (p. 162)**,TRANS), mode-superposition harmonic analysis (**ANTYPE (p. 162)**,HARMIC), random vibration analysis (**ANTYPE (p. 162)**,SPECTR with **SPOPT (p. 1837)**,PSD), and multiple point response spectrum analysis (**ANTYPE (p. 162)**,SPECTR with **SPOPT (p. 1837)**,MPRS). For PSD and MPRS analyses, **LVSCALE (p. 1094)** is only applicable for pressure loading.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **LVSCALE (p. 1094)** command supports tabular boundary conditions (%TABNAME_X%) for *FACT* input values only as a function of time in the mode-superposition transient (**ANTYPE (p. 162)**,TRANS) or as a function of frequency in mode-superposition harmonic (**ANTYPE (p. 162)**,HARMIC).

MPC contact generates constraint equations that can include constant terms (included on the right-hand side of the system equation). The **LVSCALE (p. 1094)** command scales the constant terms.

In mode-superposition transient and harmonic analyses, all of the load vectors need to be scaled in the first load step. Use a zero scale factor if they are not actually used in this first load step. Similarly, in random vibration and multipoint response spectrum analyses, all of the load vectors need to be scaled in the first participation factor calculation (**PFACT (p. 1385)**). Use a zero scale factor if they are not actually used for the first input table.

This command is also valid in PREP7.

LWPLAN, *WN*, *NL1*, *RATIO*

Defines the working plane normal to a location on a line.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number whose viewing direction will be modified to be normal to the working plane (defaults to 1). If *WN* is a negative value, the viewing direction will not be modified.

NL1

Number of line to be used. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

RATIO

Location on *NL1*, specified as a ratio of the line length. Must be between 0.0 and 1.0. If *RATIO* = P, use graphical picking to specify location on the line.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Working plane is parallel to the Global X-Y plane at Z = 0.0.

Notes

Defines a working plane (to assist in picking operations) normal to a location on a line. See **WPSTYL (p. 2182)** command to set the style of working plane display.

This command is valid in any processor.

Menu Paths

Utility Menu>WorkPlane>Align WP with>Plane Normal to Line

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

M Commands

M, *NODE*, *Lab1*, *NEND*, *NINC*, *Lab2*, *Lab3*, *Lab4*, *Lab5*, *Lab6*, *SUPPORT*

Defines master degrees of freedom (MDOFs) for superelement generation analyses.

SOLUTION (p. 38): Master DOF (p. 46)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Node number at which an MDOF is defined. If ALL, define MDOFs at all selected nodes (**NSEL (p. 1266)**). If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE*.

Lab1

Valid degree-of-freedom label. If ALL, use all appropriate labels. *Structural labels*: UX, UY, or UZ (displacements); ROTX, ROTY, or ROTZ (rotations). *Thermal labels*: TEMP, TBOT, TE2, TE3, . . ., TTOP (temperature). *Electric labels*: VOLT (voltage).

NEND, NINC

Define all nodes from *NODE* to *NEND* (defaults to *NODE*) in steps of *NINC* (defaults to 1) as MDOFs in the specified direction.

Lab2, Lab3, Lab4, . . . , Lab6

Additional MDOF labels. The nodes defined are associated with each label specified.

SUPPORT

Pseudo-constraints key for the free-interface (**CMSOPT (p. 378)**,FREE) and residual-flexible free-interface (**CMSOPT (p. 378)**, RFFB) CMS method analyses:

OFF – Defined MDOFs remain free during the mode-extraction analysis (default).

ON – Defined MDOFs are constrained during the mode-extraction analysis.

Notes

Defines master degrees of freedom (MDOFs) for superelement generation. If defined for other analyses, MDOFs are ignored. If used in the SOLUTION processor, this command is valid only within the first load step.

Reissue **M (p. 1097)** for additional MDOFs. The number of master nodes allowed is limited only by the maximum system memory available.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The substructure (**ANTYPE (p. 162)**,SUBSTR) analysis uses the matrix condensation technique to reduce the structure matrices to those characterized by a set of MDOFs.

MDOFs are identified by a list of nodes and their nodal directions. The actual degree-of-freedom directions available for a given node depends upon the degrees of freedom associated with element types (**ET (p. 686)**) at that node.

There must be some mass (or stress stiffening in the case of a buckling analysis) associated with each MDOF (except for the VOLT label). The mass may be due either to the distributed mass of the element or due to discrete lumped masses at the node.

If an MDOF is specified at a constrained point, it is ignored.

If an MDOF is specified at a coupled node, it should be specified at the prime node of the coupled set.

For cyclic symmetry superelements, if MDOFs are defined at both low- and high-edge nodes, the cyclic constraint equations between those nodes are ignored.

Substructure analysis connection points must be defined as MDOFs.

The *SUPP0RT* argument is ignored for the fixed-interface CMS method analysis (**CMSOPT (p. 378)**,FIX).

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Master DOFs>Define

Main Menu>Preprocessor>Modeling>CMS>CMS Interface>Define

Main Menu>Solution>Master DOFs>Define

MACOPT,*Option*,*Value1*,*Value2*,*Value3*

Specifies modal assurance criterion (MAC) or frequency response function (FRF) correlation criteria calculation options for RSTMAC (p. 1627).

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Matching / Mapping options:		
Option Label	**Description**	***Value1*, *Value2*, *Value3***
(blank)	Matching method based on the node location (default).	NA
NUMMATCH	Key to activate the node matching method based on the node number.	*Value1*: 0 (OFF or NO) – Node number matching is off, and nodes are matched based on node location. Tolerance for node matching may also be applied.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

		1 (ON or YES) – Nodes are matched based on node number and solutions are compared at matched nodes only.
NODMAP	Key to activate node mapping.	*Value1*: 0 (OFF or NO) – Node mapping is off, and nodes are matched based on node location. Tolerance for node matching may also be applied. 1 (ON or YES) – Nodes are mapped and solution is interpolated.
Options for matching by location (not applicable to NUMMATCH and NODMAP methods):		
ABSTOLN	Absolute tolerance for node matching. Relative tolerance setting (RELTOLN) is ignored. This is the default option.	*Value1*: Absolute tolerance value. Defaults to 0.01.
RELTOLN	Relative tolerance for node matching. Absolute tolerance setting (ABSTOLN) is ignored. Relative tolerance is based on a fraction of the minimum element dimension.	*Value1*: Relative tolerance value. It must be greater than 0 and less than or equal to 1. Defaults to 0.5 (50%).
KEYALGONOD	Key to specify the algorithm for node matching based on location.	*Value1*: 0 (OFF or NO) – The first node with distance below tolerance is considered a match (default). 1 (ON or YES) – The nearest node with distance below tolerance is considered a match.
MAC calculation options :		
DOF	Key to specify the degrees of freedom used. Defaults to all structural degrees of freedom. DOF selection is not supported with node mapping.	*Value1*: Supported labels are: UX, UY, UZ, ROTX, ROTY, ROTZ, U (all translations), ROT (all rotations), STRU (all structural DOFs) PRES, VOLT, CONC, MAG, TEMP, AZ *Value2*: (blank) – Select DOF DELE – Reset to default (all structural DOFs)
KEYMASS	Key to include the mass matrix diagonal in the MAC calculations.	*Value1*:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

		0 (OFF or NO) – Do not include the mass. 1 (ON or YES) – Include the mass if available (default).
NMAC	Key to activate the computation of MAC per node pair	*Value1*: 0 (OFF or NO) – Do not activate the node pair MAC calculation (default). 1 (ON or YES) – Activate the node pair MAC calculation.
UNV file options :		
FRF (p. 1102)	Key to activate the frequency response function (FRF) correlation method and specify required inputs. Only applies when File2 on **RSTMAC (p. 1627)** is a universal format file (.unv) and contains Dataset 58.	*Value1*: Key to activate/deactivate FRF correlation methods and specify the needed criteria: YES (or blank) – Activates the cross signature assurance criterion (default). ALL – Activates the computation of both the cross signature assurance criterion and the cross signature scale factor. NO – Deactivates the FRF correlation and activates the default MAC calculations. *Value2* and *Value3* are ignored. *Value2*: Key to specify the considered response degree of freedom in the .rst file. The following options are available: 1– +X Translation 4– +X Rotation 2– +Y Translation 5– +Y Rotation 3– +Z Translation 6– +Z Rotation *Value3*: Key to specify the considered response degree of freedom in the .unv file. The following options are available: 1 – +X Translation 4– +X Rotation -1 – -X Translation -4– -X Rotation 2 – +Y Translation 5– +Y Rotation -2 – -Y Translation -5– -Y Rotation

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

		3 – +Z Translation 6– +Z Rotation -3 – -Z Translation -6– -Z Rotation
UNVSCALE	Scaling of the nodal coordinates when *File2* on **RSTMAC (p. 1627)** is a universal format file (.unv).	*Value1*: Blank or 0 – No scaling (default). Non-zero value – Scaling factor applied to nodal coordinates.
UNVTRAN	Key to control the transformation of the solution vector from the local to the global coordinate system. Only applies when *File2* on **RSTMAC (p. 1627)** is a universal format file (.unv) and contains Dataset Number 2420.	*Value1*: 0 (OFF or NO) – No transformation is performed (default). 1 (ON or YES) – Transformation of the solution vector is performed.
UNVDEBUG	Key to control the printout of the universal format file records. All information is listed on file *File2_unv.txt*. Only applies when *File2* on **RSTMAC (p. 1627)** is a universal format file (.unv).	*Value1*: 0 (OFF or NO) – No printout (default). 1 (ON or YES) – Print file records.

Command Default

If **MACOPT (p. 1098)** is not issued prior to **RSTMAC (p. 1627)**, node matching based on location is used by default in MAC calculations performed by **RSTMAC (p. 1627)**. Unless otherwise specified, an absolute tolerance (ABSTOLN) value of 0.01 is used for the node matching.

Notes

The **RSTMAC (p. 1627)** command calculates the MAC or FRF criteria values based on the options specified via **MACOPT (p. 1098)**. The **MACOPT (p. 1098)** command must be issued before the **RSTMAC (p. 1627)** command. These commands enable you to compare nodal solutions from two results files (.rst or .rstp) or from one results file and one Universal Format file (.unv). Multiple **MACOPT (p. 1098)** commands can be issued to specify which results are compared and how.

As listed in the table above, model solutions can be compared using three different mehtods: matching nodes based on location, matching nodes based on node number, or by node mapping and solution interpolation.

When node mapping and solution interpolation is performed (*Option* = NODMAP), the following applies:

- *File1* on **RSTMAC (p. 1627)** must correspond to a model meshed in solid and/or shell elements. Other types of elements can be present, but the node mapping is not performed for these elements.
- You should only compare solutions of models having the same dimension (both models are 2D or both models are 3D). Comparing models with different dimensions may lead to incorrect results if the solution at mapped/matched nodes is not representative of the global solution.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Interpolation is performed on UX, UY, and UZ degrees of freedom.

Node pair MAC computation (*Option* = NMAC) is only supported when a matching procedure is used and a specific substep number is requested for each solution (*Sbstep1*, *Sbstep2* on **RSTMAC (p. 1627)** command).

Non-structural degrees of freedom in coupled-field analyses are supported for the matching methods (*Option* = ABSTOLN or NUMMATCH). Multiple **MACOPT (p. 1098)**, DOF commands can be issued consecutively to combine different degrees of freedom.

The FRF option is not compatible with any MAC calculation options (DOF, NMAC and KEYMASS) and can only be used with node matching procedures.

Example Usage

For a detailed discussion on using **MACOPT (p. 1098)** with examples, see Comparing Nodal Solutions From Two Models or From One Model and Experimental Data (RSTMAC) in the *Basic Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

MAGOPT, *Value*

Specifies options for a 3D magnetostatic field analysis.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Value

Option key:

0

Calculate a complete H field solution in the entire domain using a single (reduced) potential.

> **Caution:**
>
> When used in problems with both current sources and iron regions, errors may result due to numerical cancellation.

1

Calculate and store a preliminary H field in "iron" regions ($\mu_r \neq 1$). Requires flux-parallel boundary conditions to be specified on exterior iron boundaries. Used in conjunction with subsequent solutions with *VALUE* = 2 followed by *VALUE* = 3. Applicable to multiply-connected iron domain problems.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2

Calculate and store a preliminary H field in "air" regions (μ_r = 1). The air-iron interface is appropriately treated internally by the program. Used in conjunction with a subsequent solution with *VALUE* = 3. Applicable to singly-connected iron domain problems (with subsequent solution with *VALUE* = 3) or to multiply-connected iron domain problems (when preceded by a solution with *VALUE* = 1 and followed by a solution with *VALUE* = 3).

3

Use the previously stored H field solution(s) and calculate the complete H field.

Notes

Specifies the solution sequence options for a 3D magnetostatic field analysis using a scalar potential (MAG). The solution sequence is determined by the nature of the problem.

You cannot use constraint equations with *Value* = 1.

This command is also valid in PREP7.

Distributed-Memory Parallel (DMP) Restriction

MAGOPT (p. 1102),3 is not supported in a DMP solution when the following contact elements are present in the model: CONTA174, CONTA175, or CONTA177.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Magnetics>Options Only>DSP Method

Main Menu>Preprocessor>Loads>Load Step Opts>Magnetics>Options Only>GSP Method

Main Menu>Solution>Load Step Opts>Magnetics>Options Only>RSP Method

---

MAGSOLV, *OPT*, *NRAMP*, *CNVCSG*, *CNVFLUX*, *NEQIT*, *BIOT*, *CNVTOL*

Specifies magnetic solution options and initiates the solution.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

OPT

Static magnetic solution option:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Vector potential (MVP) or edge formulation (default).

1

Combined vector potential and reduced scalar potential (MVP-RSP).

2

Reduced scalar potential (RSP).

3

Difference scalar potential (DSP).

4

General scalar potential (GSP).

NRAMP

Number of ramped substeps for the first load step of a nonlinear MVP or MVP-RSP solution. Defaults to 3. If *NRAMP* = -1, ignore the ramped load step entirely.*NRAMP* is ignored for linear magnetostatics.

CNVCSG

Tolerance value on the program-calculated reference value for the magnetic current-segment convergence. Used for the MVP, the MVP-RSP, and the edge formulation solution options (*OPT* = 0 and 1). Defaults to 0.001.

CNVFLUX

Tolerance value on the program-calculated reference value for the magnetic flux convergence. Used for all scalar potential solution options (*OPT* = 2, 3, 4). Defaults to 0.001.

NEQIT

Maximum number of equilibrium iterations per load step. Defaults to 25.

BIOT

Option to force execution of a Biot-Savart integral solution (**BIOT (p. 265)**,NEW) for the scalar potential options. Required if multiple load steps are being performed with different current source primitives (SOURC36 elements).

0

Do not force execution of Biot-Savart calculation (default); Biot-Savart is automatically calculated only for the first solution.

1

Force execution of Biot-Savart calculation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CNVTOL

Sets the convergence tolerance for AMPS reaction. Defaults to 1e-3.

Notes

MAGSOLV (p. 1103) invokes a Mechanical APDL macro which specifies magnetic solution options and initiates the solution. The macro is applicable to any Mechanical APDL magnetostatic analysis using the magnetic vector potential (MVP), reduced scalar potential (RSP), difference scalar potential (DSP), general scalar potential (GSP), or combined MVP-RSP formulation options. Results are only stored for the final converged solution. (In POST1, issue ***SET (p. 1720)**,LIST to identify the load step of solution results.) The macro internally determines if a nonlinear analysis is required based on magnetic material properties.

If you use the *BIOT* option and issue **SAVE (p. 1645)** after solution or postprocessing, the Biot-Savart calculations are saved to the database, but will be overwritten upon normal exit from the program. To save this data after issuing **SAVE (p. 1645)**, use the **/EXIT (p. 708)**,NOSAVE command. You can also issue the **/EXIT (p. 708)**,SOLU command to exit Mechanical APDL and save all solution data, including the Biot-Savart calculations, in the database. Otherwise, when you issue **RESUME (p. 1601)**, the Biot-Savart calculation will be lost (resulting in a zero solution).

The MVP, MVP-RSP, and edge formulation options perform a two-load-step solution sequence. The first load step ramps the applied loads over a prescribed number of substeps (*NRAMP*), and the second load step calculates the converged solution. For linear problems, only a single load step solution is performed. The ramped load step can be bypassed by setting *NRAMP* to -1.

The RSP option solves in a single load step using the adaptive descent procedure. The DSP option uses two load steps, and the GSP solution uses three load steps.

The following analysis options and nonlinear options are controlled by this macro: **KBC (p. 970)**, **NEQIT (p. 1214)**, **NSUBST (p. 1287)**, **CNVTOL (p. 396)**, **NROPT (p. 1261)**, **MAGOPT (p. 1102)**, and **OUTRES (p. 1336)**.

You cannot use constraint equations with *OPT* = 4.

When the *BIOT* option is on (*BIOT* = 1), Distributed-Memory Parallel (DMP) restrictions may apply. For more information, see the **BIOT (p. 265)** command.

Menu Paths

Main Menu>Solution>Solve>Electromagnet>Static Analysis>Opt&Solv

---

MAP, - - , *kDIM*, - - , *kOUT*, *LIMIT*

Maps pressures from source points to target surface elements.

/MAP (p. 63): Pressure Mapping (p. 63)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

- -

Unused field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

kDIM

Interpolation key:

0 or 2

Interpolation is done on a surface (default).

3

Interpolation is done within a volume. This option is useful if the supplied source data is volumetric field data rather than surface data.

--

Unused field.

kOUT

Key to control how pressure is applied when a target node is outside of the source region:

0

Use the pressure(s) of the nearest source point for target nodes outside of the region (default).

1

Set pressures outside of the region to zero.

LIMIT

Number of nearby points considered for interpolation. The minimum is 5; the default is 20. Lower values reduce processing time. However, some distorted or irregular meshes will require a higher *LIMIT* value to find the points encompassing the target node in order to define the region for interpolation.

Notes

Maps pressures from source points to target surface elements.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/MAP

Enters the mapping processor.

/MAP (p. 63): Pressure Mapping (p. 63)
SESSION (p. 11): Processor Entry (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Enters the mapping processor. This processor is used to read in source data from an external file and map it to the existing geometry.

The current database is saved (to `BeforeMapping.db`) upon entering the processor, and it is resumed upon exiting (**FINISH (p. 758)** command). Any nodes or elements not on the target surface are deleted for easier viewing of the mapping quantities. A database of this mapping geometry (`Mapping.db`) is also saved at the **FINISH (p. 758)** command.

This command is valid only at the Begin Level.

Menu Paths

This command cannot be accessed from a menu.

MAP2DTO3D,*Action*,*VALUE1*,*VALUE2*

Initiates a 2D to 3D analysis and maps variables.

SOLUTION (p. 38): 2D to 3D Analysis (p. 47)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

The 2D to 3D analysis action to perform:

START

Start the analysis process by rebuilding the 2D analysis database (`.db`) based on the specified load step and substep information, and update nodes to their deformed positions in the 2D mesh.

VALUE1

The load step number at which 2D to 3D analysis should occur. The default value is the highest load step number found in the `Jobname.R`*nnn* files (for the current jobname and in the current directory).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VALUE2

The substep number of the specified load step (*VALUE1*) at which the 2D to 3D analysis should occur. The default value is the highest substep number found in the specified load step in the `Jobname.Rnnn` files (for the current jobname and in the current directory).

FINISH

Maps boundary conditions and loads from the 2D mesh to the extruded 3D mesh. (*VALUE1* and *VALUE2* are not used.)

SOLVE

Map nodal and element solutions from 2D to 3D and rebalance the results.

VALUE1

The maximum number of substeps allowed during rebalancing. Default = 500.

Notes

The **MAP2DTO3D (p. 1107)** command initiates the 2D to 3D analysis process, sets analysis options, rebuilds the database, and maps the solution variables from the 2D mesh to the 3D mesh.

Before issuing this command, clear the database (**/CLEAR (p. 350)**).

For more information, see 2D-to-3D Analysis in the *Advanced Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

MAPSOLVE, *MAXSBSTEP*

Maps solved node and element solutions from an original mesh to a new mesh.

SOLUTION (p. 38): Rezoning (p. 46)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAXSBSTEP

The maximum number of substeps for rebalancing the residuals. The default value is 5.

Notes

Used during the rezoning process, the **MAPSOLVE (p. 1108)** command maps solved node and element solutions from the original mesh to the new mesh and achieves equilibrium based on the new mesh.

Additional substeps are necessary to reduce the residuals to zero.

During the rebalancing stage, the external loads and time remain unchanged.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **MAPSOLVE (p. 1108)** command is valid only for rezoning (**REZONE (p. 1606)**).

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

Menu Paths

Main Menu>Solution>Manual Rezoning>Map Results

MAPVAR,*Option*,*MatId*,*IstrtStress*,*nTenStress*,*IstrtStrain*,*nTen-Strain*,,*IstrtVect*,*nVect*

Defines tensors and vectors in user-defined state variables for rezoning and in 2D to 3D analyses.

SOLUTION (p. 38): Rezoning (p. 46)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

DEFINE

Define variables for the specified *MatId* material ID (default).

LIST

List the defined variables for the specified *MatId* material ID.

MatId

The material ID for the state variables which you are defining (*Option* = DEFINE) or listing (*Option* = LIST).

When *Option* = LIST, the default value for this argument is ALL (which lists *all* defined variables). When *Option* = DEFINE, you must explicitly specify a material ID.

IstrtStress

The start position of stress-like tensors in the state variables. This value must be either a positive integer or 0 (meaning no stress-like tensors).

nTenStress

The number of stress-like tensors in the state variables. This value must be either a positive integer (or 0), and all stress-like tensors must be contiguous.

IstrtStrain

The start position of strain-like tensors in the state variables. This value must be either a positive integer or 0 (meaning no strain-like tensors).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

nTenStrain

The number of strain-like tensors in the state variables. This value must be either a positive integer (or 0), and all strain-like tensors must be contiguous.

IstrtVect

The start position of vectors in the state variables. This value must be either a positive integer or 0 (meaning no vectors).

nVect

The number of vectors in the state variables. This value must be either a positive integer (or 0), and all vectors must be contiguous.

Notes

The **MAPVAR (p. 1109)** command identifies the tensors and vectors in user-defined state variables (**TB (p. 1899)**,STATE) for user-defined materials (**TB (p. 1899)**,USER and `UserMat` or `UserMatTh`) or user-defined creep laws (**TB (p. 1899)**,CREEP,,,,100 and `UserCreep`).

To handle large-rotation effects and to correctly differentiate between tensor- and vector-mapping, specify the start position of specific state variables. For stress-like tensors, the shear components saved as state variables are the tensor component. For strain-like tensors, the shear components saved as state variables are twice the tensor components. Therefore, issue the **MAPVAR (p. 1109)** command to define the stress-like and strain-like tensors individually. The command ensures that user-defined state variables are mapped correctly during rezoning and in 2D to 3D analyses.

In a rezoning operation, **MAPVAR (p. 1109)** must be issued *after* remeshing (**REMESH (p. 1581)**,FINISH) but *before* mapping (**MAPSOLVE (p. 1108)**).

Menu Paths

This command cannot be accessed from a menu.

MASCALE,*massFact*

Activates scaling of the entire system matrix.

`SOLUTION` (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

massFact

Scaling factor (> 0) for the mass matrix. Default = 1.0.

Command Default

No scaling is applied.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command is supported in the first load step of the analysis only.

The following features are not affected by the scaling:

- Ocean loading (Applying Ocean Loading from a Hydrodynamic Analysis)
- Steady-state rolling (**SSTATE (p. 1855)**)

The mass-related information (mass, center of mass, and mass moments of inertia) printed in the mass summary is based on unscaled mass properties.

Menu Paths

This command cannot be accessed from a menu.

MASTER

Specifies "Master DOF" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Master DOF

MAT, *MAT*

Sets the element material attribute pointer.

PREP7 (p. 22): Meshing (p. 29)
PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT

Assign this material number to subsequently defined elements (defaults to 1).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Identifies the material number to be assigned to subsequently defined elements. This number refers to the material number (*MAT*) defined with the material properties (**MP (p. 1160)**). Material numbers may be displayed (**/PNUM (p. 1457)**).

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh Attributes>Default Attribs

Main Menu>Preprocessor>Modeling>Create>Elements>Elem Attributes

---

MATER

Specifies "Material properties" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Materials

MAXCYCMODE, *LSTEP1*, *SBSTEP1*, *Cmp1x1*, *LSTEP2*, *SBSTEP2*, *Cmp1x2*, *Comp*, *Numsect*

Computes the maximum results value of cyclic mode pairs at the same frequency or the amplitude of a single complex mode.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LSTEP1

Load step for the first mode in the pair. (Set *LSTEP1* and *LSTEP2* to the same integer value if you are using **MAXCYCMODE (p. 1112)** to calculate the amplitude of a single complex mode.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SBSTEP1

Substep for the first mode in the pair. (Set *SBSTEP1* and *SBSTEP2* to the same integer value if you are using **MAXCYCMODE (p. 1112)** to calculate the amplitude of a single complex mode.)

Cmp1x1

Complex value key for the first mode in the pair.

'Real'

Indicates the real part of the first mode (default).

'Imag'

Indicates the imaginary part of a complex mode. (Used only if you are using **MAXCYCMODE (p. 1112)** to calculate the amplitude of a single complex mode.)

LSTEP2

Load step for the second mode in the pair. (Set *LSTEP1* and *LSTEP2* to the same integer value if you are using MAXCYCMODE to calculate the amplitude of a single complex mode.)

SBSTEP2

Substep for the second mode in the pair. (Set *SBSTEP1* and *SBSTEP2* to the same integer value if you are using MAXCYCMODE to calculate the amplitude of a single complex mode.)

Cmp1x2

Complex value key for the second mode in the pair.

'Real'

Indicates the real part of the second mode (default).

'Imag'

Indicates the imaginary part of a complex mode. (Used only if you are using **MAXCYCMODE (p. 1112)** to calculate the amplitude of a single complex mode.)

Comp

Component for which a maximum value is to be obtained. Valid *Comp* labels and component descriptions are listed in the Notes (p. 1114) section.

Numsect

Number of sectors. This should only be used for cyclically symmetric modes computed using the **CYCLIC (p. 462)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

There is no command default (p. 7), and only *Cmp1x1* and *Cmp1x2* have argument defaults (p. 3). Values must be specified for all other command arguments except for *Numsect*, which is only required if the command is used for computing the maximum of cyclic modes calculated in a cyclic symmetry analysis using the **CYCLIC (p. 462)** command.

This command is valid only for mass normalized modes (**MODOPT (p. 1140)**,,,,,,OFF).

For a model generated with the **CYCLIC (p. 462)** command, results are only valid when the solution coordinate system is aligned with the cyclic coordinate system. Issuing **MAXCYCMODE (p. 1112)** while the cyclic sector is expanded (**/CYCEXPAND (p. 454)**,,ON) will result in resetting the cyclic expansion back to the sector (**/CYCEXPAND (p. 454)**,,OFF).

This command has two different functionalities:

- To compute the maximum results value of cyclic mode pairs at the same frequency (p. 1114) that are computed from a cyclically symmetric system.
- To compute the amplitude of a single complex mode (p. 1115) calculated in a modal analysis using the damped eigensolver (**MODOPT (p. 1140)**, DAMP).

To compute the maximum results value of cyclic mode pairs at the same frequency

This command can be used to compute the maximum results value of cyclic mode pairs at the same frequency that are computed from a cyclically symmetric system. Because two modes at the same frequency have indeterminate mode shapes, the combined mode pair must be considered to compare cyclic mode pairs from different solves or models. The maximum values computed are an estimate of the maximum value for each of the modes in the pair.

This command can be used on any mode pairs at the same frequency that are computed in a modal analysis (**ANTYPE (p. 162)**,MODAL) of a cyclically symmetry system modeled in any of the following ways:

- A cyclic symmetry model generated from the **CYCLIC (p. 462)** command
- A cyclic symmetry model generated under the multistage approach using the **MSOPT (p. 1195)** and **CECYCMS (p. 300)** commands
- A cyclic symmetry model generated using no symmetry boundary conditions (full 360° model).

Set the *Cmplx1* and *Cmplx2* values to Real to compute the maximum value of two cyclic modes at the same frequency.

Valid *Comp* labels are listed in the following table. The maximum values obtained are in the coordinate system defined by the **RSYS (p. 1639)** command.

Valid *Comp* Labels	
***Comp* Label**	**Description**
UX	Displacement in the X direction
UY	Displacement in the Y direction

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UZ	Displacement in the Z direction
UCOMP	Displacement in the X, Y, and Z directions
USUM	Displacement vector sum
SX	Stress in the X direction
SY	Stress in the Y direction
SZ	Stress in the Z direction
SCOMP	Stress in the X, Y, and Z directions

To compute the amplitude of a single complex mode

An alternative functionality of this command is to compute the amplitude of a single complex mode that was calculated in a modal analysis using the damped eigensolver (**MODOPT (p. 1140)**, DAMP). In this case, specify the real and imaginary parts of a single mode instead of only real parts of two separate modes. This is useful for cyclic symmetry or multistage cyclic symmetry analyses since **SET (p. 1724)**,,,,AMPL is not supported.

Example Usage

Example 3.4: MAXCYCMODE to Compute the Maximum Results Value of Cyclic Mode Pairs

Menu Paths

This command cannot be accessed from a menu.

MCHECK, *Lab*

Checks mesh connectivity.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Operation:

ESEL

Unselects the valid elements.

Notes

Wherever two area or volume elements share a common face, **MCHECK (p. 1115)** verifies that the way the elements are connected to the face is consistent with their relative normals or integrated volumes. (This may detect folds or otherwise overlapping elements.)

MCHECK (p. 1115) verifies that the element exterior faces form simply-connected closed surfaces. (This may detect unintended cracks in a mesh.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MCHECK (p. 1115) warns if the number of element facets in a 2D loop or 3D shell is not greater than a computed limit. This limit is the smaller of either three times the number of faces on one element, or one-tenth the total number of element faces in the model. (This may detect holes in the middle of a mesh.)

The **MCHECK (p. 1115)** command will perform a number of validity checks on the selected elements, including:

1. **Normal check:** Wherever two area elements share a common edge, **MCHECK (p. 1115)** verifies that the ordering of the nodes on each element is consistent with their relative normals.
2. **Volume check:** Wherever two volume elements share a common face, **MCHECK (p. 1115)** verifies that the sign of the integrated volume of each element is consistent.
3. **Closed surface check:** **MCHECK (p. 1115)** verifies that the element exterior faces form simply-connected closed surfaces (this may detect unintended cracks in a mesh).
4. **Check for holes in the mesh:** **MCHECK (p. 1115)** warns if the number of element faces surrounding an interior void in the mesh is small enough to suggest one or more accidentally omitted elements, rather than a deliberately formed hole. For this test, the number of faces around the void is compared to the smaller of a) three times the number of faces on one element, or b) one-tenth the total number of element faces in the model.

Menu Paths

Main Menu>Preprocessor>Meshing>Check Mesh>Connectivity>Ck Connectvty

Main Menu>Preprocessor>Meshing>Check Mesh>Connectivity>Sel Bad Connt

---

MCFOPT,*Format*,*Type*,*Norm*

Specifies options for the Modal Coordinates File (`Jobname.mcf`).

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Format

`Jobname.mcf` file format:

0

ASCII with wrap for more than 25 values (harmonic analysis) or 50 values (transient analysis) (default).

1

ASCII.

Type

Output form of the complex modal coordinates – Only supported for *Format* = 1:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Real and imaginary parts (default).

1

Amplitude and phase angle in degree.

Norm

Mode shape normalization for the calculation of the modal coordinates – Only supported for *Format* = 1:

0

The modes are mass normalized (default).

1

The modes are normalized to unity.

Notes

Options specified with **MCFOPT (p. 1116)** are processed when a request is made to write the *Jobname.mcf* file by issuing **TRNOPT (p. 2017)** or **HROPT (p. 912)** with *MCFwrite* = ON.

If you specify normalized to unity for the modal coordinates (*Norm* = 1), the generalized mass must be available (see Modal Mass and Kinetic Energy Output in the *Structural Analysis Guide*). Note that this option is independent from the normalization of the modes specified during the modal analysis (*NrmKey* on **MODOPT (p. 1140)** command).

Menu Paths

This command cannot be accessed from a menu.

MDAMP, *STLOC*, *V1*, *V2*, *V3*, *V4*, *V5*, *V6*

Defines the damping ratios as a function of mode.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

STLOC

Starting location in table for entering data. For example, if *STLOC* = 1, data input in the *V1* field applies to the first constant in the table. If *STLOC* = 7, data input in the *V1* field applies to the seventh constant in the table, etc. Defaults to the last location filled + 1.

V1, V2, V3, . . . , V6

Data assigned to six locations starting with *STLOC*. If a value is already in this location, it will be redefined. Blank values for *V2* to *V6* leave the corresponding previous value unchanged.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Defines the damping ratios as a function of mode. Table position corresponds to mode number. These ratios are added to the **DMPRAT (p. 562)** value, if defined. Use the **STAT (p. 1861)** command to list current values. This command applies to mode-superposition harmonic (**ANTYPE (p. 162)**,HARMIC), mode-superposition linear transient dynamic (**ANTYPE (p. 162)**,TRANS), and spectrum (**ANTYPE (p. 162)**,SPECTR) analyses. Repeat the **MDAMP (p. 1117)** command for additional constants (10000 maximum).

MDAMP (p. 1117) can also be defined in a substructure analysis that uses component mode synthesis. The damping ratios are added on the diagonal of the reduced damping matrix, as explained in Component Mode Synthesis (CMS).

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>Damping

Main Menu>Solution>Load Step Opts>Time/Frequenc>Damping

MDELE, *NODE*, *Lab1*, *NEND*, *NINC*, *Lab2*, *Lab3*, *Lab4*, *Lab5*, *Lab6*, *SUPPORT*

Deletes master degrees of freedom.

SOLUTION (p. 38): Master DOF (p. 46)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE*, *Lab1*, *NEND*, *NINC

Delete master degrees of freedom in the *Lab1* direction (**M (p. 1097)**) from *NODE* to *NEND* (defaults to *NODE*) in steps of *NINC* (defaults to 1). If *NODE* = ALL, *NEND* and *NINC* are ignored and masters for all selected nodes (**NSEL (p. 1266)**) are deleted. If *Lab1* = ALL, all label directions will be deleted. If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE*.

Lab2*, *Lab3*, *Lab4*, . . . , *Lab6

Delete masters in these additional directions.

SUPPORT

Pseudo-constraints key for the free-interface (**CMSOPT (p. 378)**,FREE) and residual-flexible free-interface (**CMSOPT (p. 378)**,RFFB) CMS method analyses:

OFF – delete selected master degrees of freedom and any pseudo-constraints applied on them with SUPPORT = ON in the **M (p. 1097)** command (default).

ON – only delete any pseudo-constraints applied on selected master degrees of freedom.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Deletes master degrees of freedom. If used in SOLUTION, this command is valid only within the first load step.

The *SUPPORT* argument is ignored for the fixed-interface CMS method analysis (**CMSOPT (p. 378)**,FIX).

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Master DOFs>Delete

Main Menu>Solution>Master DOFs>Delete

MDPLOT,*Function*,*Dmpname*,*Scale*

Plots frequency-dependent modal damping coefficients calculated by DMPEXT.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Function

Function to display.

d_coeff

Damping coefficient

s_coeff

Squeeze coefficient

d_ratio

Damping ratio

s_ratio

Squeeze stiffness ratio

Dmpname

Array parameter name where damping information is stored. Defaults to d_damp.

Scale

Indicates whether to perform a linear or a double logarithmic plot.

LIN

Perform a linear plot. Default

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LOG

Perform a double logarithmic plot.

Notes

See Thin Film Analysis for more information on thin film analyses.

Menu Paths

Main Menu>General Postproc>Plot Results>ThinFilm>Plot Dmp Parm

---

MEMM, *Lab*, *Keyword*

Allows the current session to keep allocated memory

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

When *Lab* = KEEP, the memory manager's ability to acquire and keep memory is controlled by *Keyword*

Keyword

Turns the memory "keep" mode on or off

ON

Keep any memory allocated during the analysis.

OFF

Use memory dynamically and free it up to other users after use (default).

Command Default

Keyword = OFF.

Notes

You can use the **MEMM (p. 1120)** command to ensure that memory intensive operations will always have the same memory available when the operations occur intermittently. Normally, if a large amount of memory is allocated for a specific operation, it will be returned to the system once the operation is finished. This option always maintains the highest level used during the analysis until the analysis is finished.

The **MEMM (p. 1120)** command does not affect the value you specify with the `-m` switch. When you allocate memory with the `-m` switch, that amount will always be available. However, if dynamic memory

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

allocation in excess of the -m value occurs, you can use the **MEMM (p. 1120)** command to ensure that amount is retained until the end of your analysis.

Menu Paths

This command cannot be accessed from a menu.

/MENU, *Key*

Activates the Graphical User Interface (GUI).

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Activation key:

ON

Activates the menu system (device dependent).

Command Default

GUI is enabled if entering Mechanical APDL program via the launcher. GUI is disabled if entering via the Mechanical APDL execution command.

Notes

Activates the Graphical User Interface (GUI).

Caution:

if you include the **/MENU (p. 1121)**,ON command in your `start.ans`, it should be the *last* command in the file. Any commands after **/MENU (p. 1121)**,ON may be ignored. (It is not necessary to include the **/SHOW (p. 1785)** and **/MENU (p. 1121)**,ON commands in `start.ans` if you will be using the launcher to enter the Mechanical APDL program.)

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*MERGE, *Name1*, *Name2*, *Val1*, *Val2*

Merges two dense matrices or vectors into one.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Name1

Name of the matrix or vector to extend.

Name2

Name of the matrix or vector to be merged into *Name1*.

Val1*, *Val2

Additional input. The meaning of *Val1* and *Val2* varies depending on the entity type (matrix or vector). See details below.

The following *Val1* and *Val2* fields are used if *Name1* refers to a dense matrix created by the *DMAT (p. 551) command:

Val1

Column or row number indicating where the new values are to be inserted into the *Name1* matrix.

Val2

Specifies how the *Name2* matrix or vector is copied into the *Name1* matrix.

COL

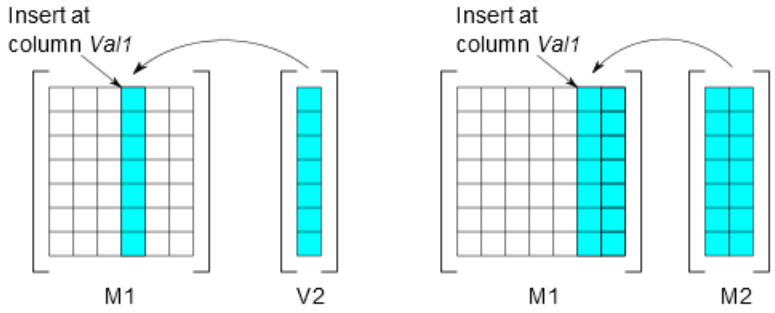
Insert the new values at the column location specified by *Val1* (default).

ROW

Insert the new values at the row location specified by *Val1*.

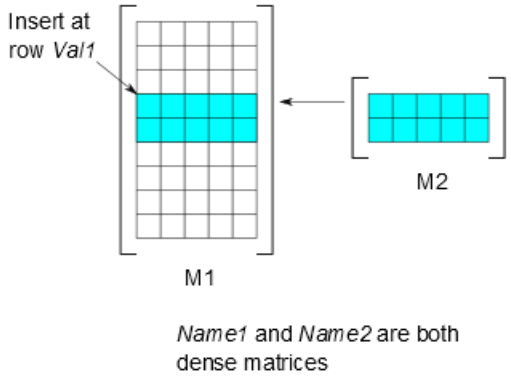
The following *Val1* field is used if *Name1* refers to a vector created by the *VEC (p. 2085) command:

Val1



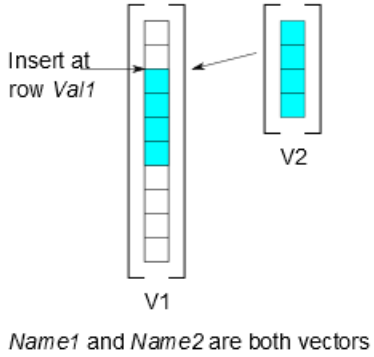
Row number indicating where the new values are to be inserted into the *Name1* vector.

Notes



*MERGE (p. 1122) can be used to add new columns or rows to a dense matrix that was created by the *DMAT (p. 551) command. In this case, *Name1* must be the name of the dense matrix and *Name2* must refer to a vector or another dense matrix.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The following two examples demonstrate merging columns into a dense matrix.

The following example demonstrates merging rows into a dense matrix.

***MERGE (p. 1122)** can also be used to add new rows to a vector that was created by the ***VEC (p. 2085)** command. In this case, *Name1* and *Name2* must both refer to vectors, as demonstrated in the example below.

In all cases, the values of the original matrix or vector are retained, and the matrix or vector is resized to accommodate the additional rows or columns.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information
of ANSYS, Inc. and its subsidiaries and affiliates.

MESHING

Specifies "Meshing" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Meshing

*MFOURI, *Oper*, *COEFF*, *MODE*, *ISYM*, *THETA*, *CURVE*

Calculates the coefficients for, or evaluates, a Fourier series.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Oper

Type of Fourier operation:

FIT --

Calculate Fourier coefficients *COEFF* from *MODE*, *ISYM*, *THETA*, and *CURVE*.

EVAL --

Evaluate the Fourier curve *CURVE* from *COEFF*, *MODE*, *ISYM* and *THETA*

COEFF

Name of the array parameter vector containing the Fourier coefficients (calculated if *Oper* = FIT, required as input if *Oper* = EVAL). See ***SET (p. 1720)** for name restrictions.

MODE

Name of the array parameter vector containing the mode numbers of the desired Fourier terms.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ISYM

Name of the array parameter vector containing the symmetry key for the corresponding Fourier terms. The vector should contain keys for each term as follows:

0 or 1 --

Symmetric (cosine) term

-1 --

Antisymmetric (sine) term.

THETA, CURVE

Names of the array parameter vectors containing the theta vs. curve description, respectively. Theta values should be input in degrees. If *Oper* = FIT, one curve value should be supplied with each theta value. If *Oper* = EVAL, one curve value will be calculated for each theta value.

Notes

Calculates the coefficients of a Fourier series for a given curve, or evaluates the Fourier curve from the given (or previously calculated) coefficients. The lengths of the *COEFF*, *MODE*, and *ISYM* vectors must be the same--typically two times the number of modes desired, since two terms (sine and cosine) are generally required for each mode. The lengths of the *CURVE* and *THETA* vectors should be the same or the smaller of the two will be used. There should be a sufficient number of points to adequately define the curve--at least two times the number of coefficients. A starting array element number (1) must be defined for each array parameter vector. The vector specifications ***VLEN (p. 2136)**, ***VCOL (p. 2077)**, ***VABS (p. 2072)**, ***VFACT (p. 2092)**, and ***VCUM (p. 2080)** do not apply to this command. Array elements should not be skipped with the ***VMASK (p. 2139)** and the *NINC* value of the ***VLEN (p. 2136)** specifications. The vector being calculated (*COEFF* if *Oper* is FIT, or *CURVE* if *Oper* is EVAL) must exist as a dimensioned array (***DIM (p. 530)**).

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Matrix Fourier

***MFUN**, *ParR*, *Func*, *Par1*

Copies or transposes an array parameter matrix.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the resulting array parameter matrix. See ***SET (p. 1720)** for name restrictions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Func

Copy or transpose function:

COPY --

Par1 is copied to *ParR*

TRAN --

Par1 is transposed to *ParR*. Rows (m) and columns (n) of *Par1* matrix are transposed to resulting *ParR* matrix of shape (n,m).

Par1

Array parameter matrix input to the operation.

Notes

Operates on one input array parameter matrix and produces one output array parameter matrix according to:

ParR = f(*Par1*)

where the function (f) is either a copy or transpose, as described above.

Functions are based on the standard FORTRAN definitions where possible. *ParR* may be the same as *Par1*. Starting array element numbers must be defined for each array parameter matrix if it does not start at the first location. For example, ***MFUN (p. 1125)**,A(1,5),COPY,B(2,3) copies matrix B (starting at element (2,3)) to matrix A (starting at element (1,5)). The diagonal corner elements for each submatrix must be defined: the upper left corner by the array starting element (on this command), the lower right corner by the current values from the ***VCOL (p. 2077)** and ***VLEN (p. 2136)** commands. The default values are the (1,1) element and the last element in the matrix. No operations progress across matrix planes (in the 3rd dimension). Absolute values and scale factors may be applied to all parameters (***VABS (p. 2072)**, ***VFACT (p. 2092)**). Results may be cumulative (***VCUM (p. 2080)**). Array elements should not be skipped with the ***VMASK (p. 2139)** and the *NINC* value of the ***VLEN (p. 2136)** specifications. The number of rows (***VLEN (p. 2136)**) applies to the *Par1* array. See the ***VOPER (p. 2142)** command for details.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Matrix Functions

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MGEN, *ITIME*, *INC*, *NODE1*, *NODE2*, *NINC*

Generates additional MDOF from a previously defined set.

SOLUTION (p. 38): Master DOF (p. 46)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITIME*, *INC

Do this generation operation a total of *ITIME*s, incrementing all nodes in the set by *INC* each time after the first. *ITIME* must be > 1 for generation to occur. All previously defined master degree of freedom directions are included in the set. A component name may also be substituted for *ITIME*.

NODE1*, *NODE2*, *NINC

Generate master degrees of freedom from set beginning with *NODE1* to *NODE2* (defaults to *NODE1*) in steps of *NINC* (defaults to 1). If *NODE1* = ALL, *NODE2* and *NINC* are ignored and set is all selected nodes (**NSEL (p. 1266)**). If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Notes

Generates additional master degrees of freedom from a previously defined set. If used in SOLUTION, this command is valid only within the first load step.

For the free-interface (**CMSOPT (p. 378)**, FREE) and residual-flexible free-interface (**CMSOPT (p. 378)**, RFFB) CMS method analyses, pseudo-constraints could have been applied on some master degrees of freedom of the previously defined set (SUPPORT = ON in the **M (p. 1097)** command). The master degrees of freedom generated from these with the **MGEN (p. 1127)** command are also defined with pseudo-constraints.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Master DOFs>Copy

Main Menu>Solution>Master DOFs>Copy

MIDTOL, *KEY*, *TOLERB*, *RESFQ*

Sets midstep residual criterion values for structural transient analyses.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Midstep residual criterion activation key.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON or 1

Activate midstep residual criterion in a structural transient analysis (default).

OFF or 0

Deactivate midstep residual criterion in a structural transient analysis.

STAT

List the current midstep residual criterion setting.

T0LERB

Midstep residual tolerance or reference value for *bisection*. Defaults to 100 times the *T0LER* setting of the **CNVTOL (p. 396)** command.

If *T0LERB* > 0, it is used as a tolerance about the typical force and/or moment to compare midstep residual force and/or moment for convergence.

If *T0LERB* < 0, it is used as a reference force value against which the midstep residual force is compared for convergence. The reference force value is used to compute a reference moment value for midstep residual moment comparison.

If midstep residual force and/or moment has not converged and **AUTOTS (p. 207)**,ON is used, then *T0LERB* is also used to predict time step size for bisection.

RESFQ

Key to use response frequency computation along with midstep residual criterion for automatic time stepping (**AUTOTS (p. 207)**,ON).

OFF or 0

Do not calculate response frequency and do not consider it in the automatic time stepping (default).

ON or 1

Calculate response frequency and consider it in the automatic time stepping.

Command Default

For transient structural analysis, the out-of-balance residual is not checked at the midstep.

Notes

When *T0LERB* is input as a tolerance value (*T0LERB* > 0), the typical force and/or moment from the regular time step is used in the midstep residual force and/or moment comparison.

In a structural transient analysis, the suggested tolerance range of *T0LERB* (*T0LERB* > 0) is as follows:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TOLERB = 1 to 10 times the *TOLER* setting of the **CNVTOL (p. 396)** command for high accuracy solution.

TOLERB = 10 to 100 times the *TOLER* setting of the **CNVTOL (p. 396)** command for medium accuracy solution.

TOLERB = more than 100 times the *TOLER* setting of the **CNVTOL (p. 396)** command for low accuracy solution.

If the structural transient analysis is elastic and linear, and the load is constant or changes slowly, use a smaller value of *TOLERB* to achieve an accurate solution. If the analysis involves large amounts of energy dissipation, such as elastic-plastic material, *TOLERB* can be larger. If the analysis includes contact or rapidly varying loads, a smaller value of *TOLERB* should be used if high frequency response is important; otherwise, a larger value of *TOLERB* may be used to enable faster convergence with larger time step sizes.

For more information on how the midstep criterion is used by the program, see Midstep Residual for Structural Dynamic Analysis in the *Mechanical APDL Theory Reference*.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Sol'n Controls>Transient

Main Menu>Solution>Analysis Type>Sol'n Controls>Transient

/MKDIR, *Dir*

Creates a directory.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Dir

The directory to create (248 characters maximum on Linux; 233 on Windows). If no path is provided, it will be created in the current working directory. Must be a valid name (and path) for the system you are working on.

Notes

Creates a directory on the computer Mechanical APDL is currently running on.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MLIST,*NODE1*,*NODE2*,*NINC*

Lists the MDOF of freedom.

SOLUTION (p. 38): Master DOF (p. 46)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE1*, *NODE2*, *NINC

List master degrees of freedom from *NODE1* to *NODE2* (defaults to*NODE1*) in steps of *NINC* (defaults to 1). If *NODE1* = ALL (default), *NODE2* and *NINC* are ignored and masters for all selected nodes (**NSEL (p. 1266)**) are listed. If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE1* (*NODE2* and *NINC* are ignored).

Notes

Lists the master degrees of freedom.

For the free-interface CMS method analysis (**CMSOPT (p. 378)**,FREE), any pseudo-constraints applied on master degrees of freedom with *SUPPORT* = ON in the **M (p. 1097)** command will be listed when **MLIST (p. 1130)** is issued after **CMSOPT (p. 378)** (see example printout below).

```
 NODE   LABEL      SUPPORT
  8529   UX
  8529   UY
  8529   UZ
  8545   UX          ON
  8545   UY          ON
  8545   UZ          ON
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MMASS,*Option*,*ZPA*

Specifies the missing mass response calculation.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Flag to activate or deactivate missing mass response calculation.

0 (OFF or NO)

Deactivate (default).

1 (ON or YES)

Activate.

ZPA

Zero Period Acceleration Value. If a scale factor *FACT* is defined on the **SVTYP (p. 1887)** command, it is applied to this value.

Notes

The missing mass calculation is valid only for single point excitation response spectrum analysis (**SPOPT (p. 1837)**, SPRS) and for multiple point response spectrum analysis (**SPOPT (p. 1837)**, MPRS) performed with base excitation using acceleration response spectrum loading. Missing mass is supported in a spectrum analysis only when the preceding modal analysis is performed with the Block Lanczos, PCG Lanczos, Supernode, or Subspace eigensolver (Method =LANB, LANPCG, SNODE, or SUBSP on the **MODOPT (p. 1140)** command).

The velocity solution is not available (*Label* = VELO on the combination command: **SRSS (p. 1845)**, **CQC (p. 433)**...) when the missing mass calculation is activated.

The missing mass calculation is not supported when the spectrum analysis is based on a linear perturbation modal analysis performed after a nonlinear base analysis.

The missing mass is not supported when superelements are present.

To take into account the contribution of the truncated modes, the residual vector (**RESVEC (p. 1603)**) can be used in place of the missing mass response. This is of particular interest if the velocity solution is requested or if a nonlinear prestress is included in the analysis (linear perturbation), or if a superelement is present, since the missing mass cannot be used in these cases.

In a multiple point response spectrum analysis (**SPOPT (p. 1837)**,MPRS), the **MMASS (p. 1131)** command must precede the participation factor calculation command (**PFACT (p. 1385)**).

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Additional Information

Performing a Single-Point Response Spectrum (SPRS) Analysis in the *Structural Analysis Guide*

Performing a Multi-Point Response Spectrum (MPRS) Analysis in the *Structural Analysis Guide*

Missing-Mass Response in the *Mechanical APDL Theory Reference*

RIGRESP (p. 1610) command

Menu Paths

This command cannot be accessed from a menu.

MMF

Calculates the magnetomotive force along a path.

POST1 (p. 51): Magnetics Calculations (p. 55)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

MMF (p. 1132) invokes a Mechanical APDL macro which calculates the magnetomotive force (mmf) along a predefined path (**PATH (p. 1354)**). It is valid for both 2D and 3D magnetic field analyses. The calculated mmf value is stored in the parameter MMF.

A closed path (**PATH (p. 1354)**), passing through the magnetic circuit for which mmf is to be calculated, must be defined before this command is issued. A counterclockwise ordering of points on the **PPATH (p. 1463)** command will yield the correct sign on the mmf. The mmf is based on Ampere's Law. The macro makes use of calculated values of field intensity (H), and uses path operations for the calculations. All path items are cleared upon completion. The **MMF (p. 1132)** macro sets the "ACCURATE" mapping method and "MAT" discontinuity option of the **PMAP (p. 1449)** command.

Menu Paths

Main Menu>General Postproc>Elec&Mag Calc>Path Based>MMF

MODCONT,*MLSkey*,*EnforcedKey*,--,*FastLV*

Specify additional modal analysis options.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MLSkey

Multiple load step key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

Perform the modal analysis (compute the eigenvalues and the load vector) for each load step. (default)

ON

Perform the modal analysis (compute the eigenvalues and the load vector) only for the first load step; form the load vector for each subsequent load step (without repeating the eigenvalue calculations) and write all load vectors to the `Jobname.mode` file for downstream mode-superposition analyses.

EnforcedKey

Enforced motion key:

OFF

Do not calculate enforced static modes. (default)

ON

Calculate enforced static modes and write them to the `Jobname.mode` file.

--

Unused field

FastLV

Fast load vector generation key; valid only when *MLSkey* = ON:

OFF

Do not activate fast load vector generation (default).

ON

Activate fast load vector generation. This option is only supported when each load vector is based on a unique element surface load (**SFE (p. 1761)**) applied on one element, and the element result superposition key is activated (*MSUPkey* = YES on **MXPAND (p. 1203)**).

Notes

Specifies additional modal analysis (**ANTYPE (p. 162)**,MODAL) options.

Use the **LVSCALE (p. 1094)** command to apply the desired load in a mode-superposition transient or harmonic analysis.

When *MSUPkey* = YES on the **MXPAND (p. 1203)** command, the maximum number of load vectors allowed in the `Jobname.mode` file defaults to 1000. To increase this limit, use the command **/CONFIG (p. 410)**,NUMLV. When *FastLV* = ON, the limit is automatically set to $1x10^6$ and cannot be changed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The maximum number of load vectors that can be used in the downstream mode-superposition transient or harmonic analysis is the number of load vectors written in the Jobname.mode file.

Generation of multiple loads (*MLSkey* = ON) is supported by the Block Lanczos, PCG Lanczos, Supernode, Subspace, Unsymmetric, and QRDAMP mode extraction methods.

The enforced motion calculation (*EnforcedKey* = ON) is supported by the Block Lanczos, Supernode, Subspace, and QRDAMP mode extraction methods.

Menu Paths

This command cannot be accessed from a menu.

MODDIR, *Key*, *Directory*, *Fname*

Enables remote read-only usage of modal analysis files or substructuring analysis files.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Key for enabling remote read-only usage of modal analysis files or substructuring analysis files:

1 (ON or YES)

The program performs the analysis using remote files. The files are read-only.

0 (OFF or NO)

The program performs the analysis using files located in the working directory (default).

LIST

List remote modal files status, directory path, and file name.

Directory

Directory path (248 characters maximum). The directory contains the modal analysis files or the substructuring generation pass files.

The directory path defaults to the current working directory.

Fname

File name (no extension or directory path) for the modal analysis files or the substructuring generation pass files.

The file name defaults to the current Jobname.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This commands is used when solving linked analyses in two different folders. It is mostly meant to be used to reduce solution time and disk space usage by specifying the path to required solution files rather than copying them in the Mechanical Application (see the file management sections of the following analyses: mode-superposition transient, mode-superposition harmonic, response spectrum,random vibration, and substructure generation in the *Mechanical User's Guide*).

This command applies to the following analysis types:

- Spectrum (**ANTYPE (p. 162)**,SPECTR)
- Modal restart (**ANTYPE (p. 162)**, MODAL, RESTART)
- Mode-superposition transient (**ANTYPE (p. 162)**,TRANS and **TRNOPT (p. 2017)**, MSUP)
- Mode-superposition harmonic (**ANTYPE (p. 162)**,HARM and **HROPT (p. 912)**, MSUP)
- Substructuring (**ANTYPE (p. 162)**,SUBSTR).

Using the default for both the directory path (*Directory*) and the file name (*Fname*) is not valid. At least one of these values must be specified.

In a spectrum analysis and in mode-superposition analyses, **MODDIR (p. 1134)** must be issued during the first solution and at the beginning of the solution phase (before **LVSCALE (p. 1094)** in particular). In a spectrum analysis, remote modal files usage is not supported when mode file reuse is activated (*modeReuseKey* = YES on **SPOPT (p. 1837)**).

After a PSD spectrum analysis, **MODDIR (p. 1134)** can be issued in POST26 prior to the **STORE (p. 1867)** command.

In a modal restart analysis, **MODDIR (p. 1134)** must be issued during the first solution. Remote modal files usage cannot be activated in a modal restart analysis if during the first modal analysis:

- Enforced static modes have been calculated (*EnforcedKey* = ON on **MODCONT (p. 1132)**).
- Element result superposition key (*MSUPkey* on **MXPAND (p. 1203)**) was set to NO, whereas it is set to YES in the modal restart.

When using distributed-memory parallel processing, if element results calculation based on element modal results is activated for the spectrum analysis (*Elcalc* = YES on **SPOPT (p. 1837)**), **MODDIR (p. 1134)** usage can significantly reduce computation time as it decreases the size of the distributed `.rst` files to be combined at the end of spectrum analysis solution.

In a substructuring or CMS analysis, **MODDIR (p. 1134)** can be issued during either of the following analysis phases:

- The first solution of the first restart of a generation pass. *ExpMth* on **SEOPT (p. 1715)** must be set to MODDIR during the first solve of the primary generation pass.
- The first solution of the expansion pass.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

MODE, *MODE*, *ISYM*

Specifies the harmonic loading term for this load step.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MODE

Number of harmonic waves around circumference for this harmonic loading term (defaults to 0).

ISYM

Symmetry condition for this harmonic loading term (not used when *MODE* = 0):

1

Symmetric (UX, UY, ROTZ, TEMP use cosine terms; UZ uses sine term) (default).

-1

Antisymmetric (UX, UY, ROTZ, TEMP use sine terms; UZ uses cosine term).

Command Default

MODE = 0, *ISYM* = 1.

Notes

Used with axisymmetric elements having nonaxisymmetric loading capability (for example, PLANE25, SHELL61, etc.). For analysis types **ANTYPE (p. 162)**,MODAL, HARMIC, TRANS, and SUBSTR, the term must be defined in the first load step and may not be changed in succeeding load steps.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>For Harmonic Ele

Main Menu>Solution>Load Step Opts>Other>For Harmonic Ele

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MODIFY,*SET*,*LSTEP*,*ITER*,*CUMIT*,*TIME*,*Ktitle*

Changes the listed values of the data in a set.

AUX3 (p. 61): Results Files (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SET

Set of data in results file to be modified.

LSTEP

The new load step number.

ITER

The new load substep number.

CUMIT

The new cumulative iteration.

TIME

The new time/frequency value.

Ktitle

Indicates if the set title should be modified.

0

Keep the original title.

1

Change the title to the title specified with the most current **/TITLE (p. 2007)** command.

Notes

Use this command to change the listed values in a data set in a results file. Using this command does not change any actual model data; it affects only the values listed in the results file.

The **MODIFY (p. 1137)** command is valid only in the results file editing processor (auxiliary processor AUX3), and, like the other AUX3 commands, it only affects the data steps index (DSI), time (TIM), loadstep, substep and cumulative step iteration (LSP) records in the results file.

Example Usage

If you start with the following results file:

```
SET   TIME/FREQ    LOAD STEP   SUBSTEP  CUMULATIVE
 1     1.0000          1          1         1
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
 first load set

 2     2.0000           2          1         2
 second load set

 3     3.0000           3          1         3
 third load set

 4     4.0000           4          1         4
 fourth load set
```

and you then issue the following commands:

```
/title, modified title for set number 3
modify,3,5,2,5,4.5,1
```

The modified results file would look like this:

```
SET   TIME/FREQ    LOAD STEP   SUBSTEP  CUMULATIVE
 1     1.0000          1          1         1
 first load set

 2     2.0000           2          1         2
 second load set

 3     4.5000           5          2         5
 modified title for set number 3

 4     4.0000           4          1         4
 fourth load set
```

Main Menu>Preprocessor>Loads>Other>For Harmonic Ele

Main Menu>Solution>Other>For Harmonic Ele

MODMSH, *Lab*

Controls the relationship of the solid model and the FE model.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Relationship key:

STAT

Gives status of command (default). This applies only to the CHECK option (no status is provided for the DETACH option).

NOCHECK

Deactivates the checking of the solid model and the finite element model. Allows elements and nodes generated with the mesh commands to be modified directly (**EMODIF (p. 626)**,

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NMODIF (p. 1247), **EDELE (p. 593)**, **NDELE (p. 1211)**, etc.). Also deactivates solid model hierarchical checking so that areas attached to volumes may be deleted etc.

CHECK

Reactivates future checking of the solid model.

DETACH

Releases all associativity between the current solid model and finite element model. Mechanical APDL deletes any element attributes that were assigned to the affected solid model entities through default attributes (that is, through the **TYPE (p. 2036)**, **REAL (p. 1579)**, **MAT (p. 1111)**, **SECNUM (p. 1685)**, and **ESYS (p. 685)** command settings and a subsequent meshing operation). However, attributes that were assigned directly to the solid model entities (via the **KATT (p. 969)**, **LATT (p. 1014)**, **AATT (p. 85)**, and **VATT (p. 2075)** commands) are not deleted.

Notes

Affects the relationship of the solid model (keypoints, lines, areas, volumes) and the finite element model (nodes, elements, and boundary conditions).

Specify *Lab* = NOCHECK carefully. By deactivating checking, the solid model database can be corrupted by subsequent operations.

After specifying *Lab* = DETACH, it is no longer possible to select or define finite element model items in terms of the detached solid model or to clear the mesh.

Menu Paths

Main Menu>Preprocessor>Checking Ctrls>Model Checking

MODSELOPTION, *dir1*, *dir2*, *dir3*, *dir4*, *dir5*, *dir6*

Specifies the criteria for selecting the modes to be expanded.

SOLUTION (p. 38): Dynamic Options (p. 40)
SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

dir1, dir2, …, dir6

Selection of the direction to be expanded.

For *ModeSelMethod* = EFFM on the **MXPAND (p. 1203)** command, the directions correspond to the global Cartesian directions, i.e. 1=X, 2=Y, 3=Z, 4=ROTX, 5=ROTY, and 6=ROTZ. If *dir1* = YES, then any mode in this direction is expanded if its modal effective mass divided by the total mass (modal effective mass ratio) is greater than *SIGNIF* on the **MXPAND (p. 1203)** command. If *dir1*=NO, then the specified direction is not considered as a criterion for expansion. If *dir1* is given a numerical decimal value, modes in that direction are selected (starting from the ones with the largest modal

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

effective mass ratios to the smallest) until the sum of their modal effective mass ratio equals this requested threshold.

For *ModeSelMethod* = MODC on the **MXPAND (p. 1203)** command, *dir1* corresponds to the first input spectrum, *dir2* to the second, etc. (i.e. for multiple spectrum inputs; the actual directions correspond to their respective SED directions). If *dir1*=YES, then any mode in this spectrum is expanded if its mode coefficient divided by the largest mode coefficient is greater than SIGNIF on the **MXPAND (p. 1203)** command. If *dir1*=NO, then the specified direction is not considered as a criterion for expansion.

Notes

This command is only applicable when a mode selection method is defined (*ModeSelMethod* on the **MXPAND (p. 1203)** command). See Using Mode Selection in the *Structural Analysis Guide* for more details.

If a numerical value is specified for a direction, the significance threshold (SIGNIF on the **MXPAND (p. 1203)** command) is ignored for the selection of the modes in this direction.

If a mode is determined to be expanded in **any** of the 6 directions, it will be expanded in the `.mode` file. Otherwise, the mode will not be expanded.

The default behavior is to consider all directions for expansion.

For *ModeSelMethod* = EFFM on the **MXPAND (p. 1203)** command, *dir4*, *dir5*, and *dir6* are not considered if mass related information have been calculated using the lumped approximation instead of the precise calculation (See Mass Related Information in the *Theory Reference*).

Menu Paths

This command cannot be accessed from a menu.

MODOPT,*Method*,*NMODE*,*FREQB*,*FREQE*,*Cpxmod*,*Nrmkey*,*ModType*,*BlockSize*,--,--,--,*FREQMOD*

Specifies modal analysis options.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 1144)

Method

Mode-extraction method to be used for the modal analysis.

LANB

Block Lanczos

LANPCG

PCG Lanczos

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SNODE

Supernode modal solver

SUBSP

Subspace algorithm

UNSYM

Unsymmetric matrix

DAMP

Damped system

QRDAMP

Damped system using QR algorithm

NMODE

The number of modes to extract. The value can depend on the value supplied for *Method*. *NMODE* has no default and must be specified. If *Method* = LANB, LANPCG, or SNODE, the number of modes that can be extracted can equal the DOFs in the model after the application of all boundary conditions.

For *Method* = LANB, SUBSP and UNSYM, you can specify *NMODE* = ALL to extract all eigenvalues in a given frequency range. To use this option, you must also define the frequency range (that is, a *FREQE* value must be set).

Recommendation:

When *Method* = LANPCG, *NMODE* should be less than 100 to be computationally efficient.

When *Method* = SNODE, *NMODE* should be greater than 100 for 2D plane or 3D shell/beam models and greater than 250 for 3D solid elements to be computationally efficient.

FREQB

The beginning, or lower end, of the frequency range (or eigenvalue range if *FREQMOD* is specified) of interest.

For *Method* = LANB, SUBSP, UNSYM, DAMP, and QRDAMP, *FREQB* also represents the first shift point for the eigenvalue iterations. For UNSYM and DAMP, the default = -1.0 For other methods, the default is calculated internally.

Eigenvalue extraction is most accurate near the shift point. Multiple shift points are used internally in the LANB, SUBSP, UNSYM, and QRDAMP methods. For the LANB, LANPCG, SUBSP, UNSYM, DAMP, and QRDAMP methods with a positive *FREQB* value, eigenvalues are output beginning at the shift point and increase in magnitude. For the UNSYM and DAMP methods with a negative *FREQB* value, eigenvalues are output beginning at zero magnitude and increase.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Choosing higher *FREQB* values with the LANPCG and SNODE methods may lead to inefficient solution times because these methods will find all eigenvalues between zero and *FREQB* before finding the requested modes between *FREQB* and *FREQE*.

FREQE

The ending, or upper end, of the frequency range (or eigenvalue range if *FREQMOD* is specified) of interest (in Hz). Default = 100 Hz when *Method* = SNODE. The default for all other methods is to calculate all modes, regardless of their maximum frequency.

To maintain solution efficiency, do not set the *FREQE* value too high; for example, not higher than 5000 Hz for an industrial problem. The higher the *FREQE* value used for the SNODE method, the more accurate the solution and the more eigenvalues produced; however, the solution time also increases. For example, if *FREQE* is set to 1e8, it causes the underlying supernodal structures to find all possible eigenvalues of each group of supernodes, requiring excessive solution time. The accuracy of the SNODE solution is controlled by *FREQE* and by the *RangeFact* value on the **SNOPTION (p. 1815)** command.

Cpxmod

Complex eigenmode key. (Valid only when *Method* = QRDAMP or *Method* = UNSYM).

AUTO

Determine automatically if the eigensolutions are real or complex and output them accordingly (default when *Method* = UNSYM). Not supported for *Method* = QRDAMP.

ON or CPLX

Calculate and output complex eigenmode shapes.

OFF or REAL

Do not calculate complex eigenmode shapes (default). This setting is required if a mode-superposition analysis is intended after the modal analysis for *Method* = QRDAMP.

Nrmkey

Mode shape normalization key:

OFF

Normalize the mode shapes to the mass matrix (default). This option is invalid for damped modal cyclic symmetry (*Method* = DAMP or QRDAMP with the **CYCLIC (p. 462)** command).

ON

Normalize the mode shapes to unity instead of to the mass matrix (default for damped modal cyclic symmetry [*Method* = DAMP or QRDAMP with the **CYCLIC (p. 462)** command]).

If a subsequent spectrum or mode-superposition analysis is planned, the mode shapes should be normalized to the mass matrix (*Nrmkey* = OFF).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ModType

Type of modes calculated by the eigensolver. Only applicable to the unsymmetric eigensolver.

Blank

Right eigenmodes (default).

BOTH

Right and left eigenmodes. The left eigenmodes are written to `Jobname.lmode`. This option must be activated if a mode-superposition analysis is intended.

BlockSize

The block vector size to be used with the Block Lanczos or Subspace eigensolver (used only when *Method* = LANB or SUBSP). *BlockSize* must be an integer value between 0 and 16. When BlockSize = zero or blank, the code decides the block size internally (normally, a value of 8 is used for LANB and a value of 6 is used for SUBSP). Typically, higher *BlockSize* values are more efficient under each of the following conditions:

- When running in out-of-core mode and there is not enough physical memory to buffer all of the files written by the Block Lanczos or Subspace eigensolver (and thus, the time spent doing I/O is considerable).
- Many modes are requested (>100).
- Higher-order solid elements dominate the model.

The memory usage only slightly increases as *BlockSize* is increased. It is recommended that you use a value divisible by 4 (4, 8, 12, or 16).

--

Unused field.

--

Unused field.

--

Unused field.

FREQMOD

The specified frequency when the solved eigenvalues are no longer frequencies (for example, the model has the Floquet periodic boundary condition). In a modal analysis, the Floquet periodic boundary condition (body load FPBC) is only valid for the acoustic elements FLUID30, FLUID220, and FLUID221.

Notes

Specifies modal analysis (**ANTYPE (p. 162)**,MODAL) options.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Additional options for specific eigensolvers are controlled by these commands:

- **SNOPTION (p. 1815)** specifies options for the Supernode (SNODE) eigensolver.
- **SUBOPT (p. 1869)** specifies options for the Subspace (SUBSP) eigensolver.
- **QRDOPT (p. 1560)** specifies options for the QRDAMP eigensolver.
- **DAMPOPT (p. 495)** specifies options for the damped (DAMP) eigensolver.
- **LANBOPTION (p. 1007)** specifies options for the Block Lanczos (LANB) eigensolver. For more difficult modal problems, you can specify an alternative version of the Block Lanczos eigensolver (**LANBOPTION (p. 1007)**,,, ALT1).

If *Method* = LANPCG, Mechanical APDL automatically switches to the PCG solver internally for this modal analysis. You can further control the efficiency of the PCG solver with the **PCGOPT (p. 1365)** and **EQSLV (p. 648)** commands.

For models that involve a non-symmetric element stiffness matrix, as in the case of a contact element with frictional contact, the QRDAMP eigensolver (**MODOPT (p. 1140)**, QRDAMP) extracts modes in the modal subspace formed by the eigenmodes from the symmetrized eigenproblem. The QRDAMP eigensolver symmetrizes the element stiffness matrix on the first pass of the eigensolution, and in the second pass, eigenmodes are extracted in the modal subspace of the first eigensolution pass. For such non-symmetric eigenproblems, you should verify the eigenvalue and eigenmode results using the non-symmetric matrix eigensolver (**MODOPT (p. 1140)**,UNSYM).

The DAMP and QRDAMP options cannot be followed by a subsequent spectrum analysis. The UNSYM method supports spectrum analysis when eigensolutions are real.

In a modal analysis, the Floquet periodic boundary condition (body load FPBC) is only valid for the acoustic elements FLUID30, FLUID220, and FLUID221.

For more details about mode shape normalization, see Description of Analysis for Symmetric Undamped Systems in the *Theory Reference*.

When rigid bodies are present in a modal analysis using the supernode modal eigensolver (**ANTYPE (p. 162)**,MODAL and **MODOPT (p. 1140)**,SNODE), mode shape displacements at the constrained nodes cannot be post-processed.

This command is also valid in PREP7.

Distributed-Memory Parallel (DMP) Restriction

All extraction methods are supported in a DMP solution. Block Lanczos, PCG Lanczos, SUBSP, UNSYM, DAMP, and QRDAMP are distributed eigensolvers that run a fully distributed solution. However, the Supernode eigensolver is not a distributed eigensolver; therefore, you will not see the full performance improvements with this method that you would with a fully distributed solution.

Main Menu>Solution>Analysis Type>Analysis Options

MONITOR, *VAR*, *Node*, *Lab*

Controls contents of variable fields in the nonlinear solution monitor file.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAR

One of four variable field numbers in the monitor file whose contents can be specified by the Lab field. Valid arguments are integers 1, 2, 3, or 4. See Notes section for default values.

Node

The node number for which information is monitored in the specified *VAR* field. In the GUI, if *Node* = P, graphical picking is enabled. If blank, the monitor file lists the maximum value of the specified quantity (Lab field) for the entire structure.

Lab

The solution quantity to be monitored in the specified *VAR* field. Valid labels for solution quantities are UX, UY, and UZ (displacements); ROTX, ROTY, and ROTZ (rotations); and TEMP (temperature). Valid labels for reaction force are FX, FY, and FZ (structural force) and MX, MY, and MZ (structural moment). Valid label for heat flow rate is HEAT. For defaults see the Notes section.

Notes

The monitor file always has an extension of **.mntr**, and takes its file name from the specified `Jobname`. If no `Jobname` is specified, the file name defaults to `file`.

You must issue this command once for each solution quantity you want to monitor at a specified node at each load step. You cannot monitor a reaction force during a linear analysis. The variable field contents can be redefined at each load step by reissuing the command. The monitored quantities are appended to the file for each load step.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reaction forces reported in the monitor file may be incorrect if the degree of freedom of the specified node is involved in externally defined coupling (**CP (p. 421)** command) or constraint equations (**CE (p. 297)** command), or if the program has applied constraint equations internally to the node.

The following example shows the format of a monitor file. Note that the file only records the solution substep history when a substep is convergent.

```

```

The following details the contents of the various fields in the monitor file:

LOAD STEP

The current load step number.

SUBSTEP

The current substep (time step) number.

NO. ATTEMPT

The number of attempts made in solving the current substep. This number is equal to the number of failed attempts (bisections) plus one (the successful attempt).

NO. ITER

The number of iterations used by the last successful attempt.

TOTL. ITER

Total cumulative number of iterations (including each iteration used by a bisection).

INCREMENT

TIME/LFACT

Time or load factor increments for the current substep.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TOTAL TIME/LFACT

Total time (or load factor) for the last successful attempt in the current substep.

VARIAB 1

Variable field 1. By default, this field lists the elapsed (or wall clock) times used up to (but not including) the current substep.

VARIAB 2

Variable field 2. In this example, the field is reporting the MZ value. By default, this field lists the maximum displacement in the entire structure.

VARIAB 3

Variable field 3. In this example, the field is reporting the FY value of a certain node. By default, this field reports the maximum equivalent plastic strain increment in the entire structure.

VARIAB 4

Variable field 4. By default, this field reports the maximum residual force in the entire structure.

---

*MOPER, *ParR*, *Par1*, *Oper*, *Val1*, *Val2*, *Val3*, *Val4*, *Val5*, *Val6*

Performs matrix operations on array parameter matrices.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the resulting array parameter matrix. See ***SET (p. 1720)** for name restrictions.

Par1

First array parameter matrix input to the operation.

Oper

Matrix operations. Usage of the *Val1* through *Val6* arguments varies for each operation, as described below:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

INVERT --

(***MOPER (p. 1147)**, *ParR*, *Par1*, INVERT)

Square matrix invert: Inverts the *n* x *n* matrix in *Par1* into *ParR*. The matrix must be well conditioned.

> **Warning:**
>
> Non-independent or ill-conditioned equations can cause erroneous results.

For large matrices, use the APDL Math operation ***LSFACTOR (p. 1078)** for efficiency (see APDL Math).

MULT --

(***MOPER (p. 1147)**, *ParR*, *Par1*, MULT, *Par2*)

Matrix multiply: Multiplies *Par1* by *Par2*. The number of rows of *Par2* must equal the number of columns of *Par1* for the operation. If *Par2* is input with a number of rows greater than the number of columns of *Par1*, matrices are still multiplied. However, the operation only uses a number of rows of *Par2* equal to the number of columns of *Par1*.

COVAR --

(***MOPER (p. 1147)**, *ParR*, *Par1*, COVAR, *Par2*)

Covariance: The measure of association between columns of the *Par1* input matrix. *Par1* of size *m* runs (rows) by *n* data (columns) is first processed to produce a row vector containing the mean of each column, which is transposed to the output column vector *Par2* of *n* array elements. The *Par1* and *Par2* operation then produces *ParR*, a resulting *n* x *n* matrix of covariances (with the variances as the diagonal terms).

CORR --

(***MOPER (p. 1147)**, *ParR*, *Par1*, CORR, *Par2*)

Correlation: The correlation coefficient between columns of the *Par1* input matrix. *Par1* of size *m* runs (rows) by *n* data (columns) is first processed to produce a row vector containing the mean of each column, which is then transposed to the output column vector *Par2* of *n* array elements. The *Par1* and *Par2* operation then produces *ParR*, a resulting *n* x *n* matrix of correlation coefficients (with a value of 1.0 for the diagonal terms).

SOLV --

(***MOPER (p. 1147)**, *ParR*, *Par1*, SOLV, *Par2*)

Solution of simultaneous equations: Solves the set of *n* equations of *n* terms of the form $a_{n1}x_1 + a_{n2}x_2 + \cdots + a_{nn}x_n = b_n$ where *Par1* contains the matrix of a-coefficients, *Par2*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

contains the vector(s) of b-values, and *ParR* contains the vector(s) of x-results. *Par1* must be a square matrix. The equations must be linear, independent, and well conditioned.

> **Warning:**
>
> Non-independent or ill-conditioned equations can cause erroneous results.

For large matrices, use the APDL Math operation ***LSFACTOR (p. 1078)** for efficiency (see APDL Math).

SORT --

(***MOPER (p. 1147)**, *ParR*, *Par1*, SORT, *Par2*, *n1*, *n2*, *n3*)

Matrix sort: Sorts the columns of matrix *Par1* according to sort vector *Par2* and places the result back into *Par1*. Rows of *Par1* are moved to the corresponding positions indicated by the values of *Par2*. *Par2* may be a column of *Par1* (in which case it will also be re-ordered). Alternatively, you may specify the column of *Par1* to sort using *n1* (leaving *Par2* blank). A secondary sort can be specified by column *n2*, and a third sort using column *n3*. *ParR* is the vector of initial row positions (the permutation vector). Sorting *Par1* according to *ParR* should reproduce the initial ordering.

NNEAR --

(***MOPER (p. 1147)**, *ParR*, *Par1*, NNEAR, *Toler*)

Nearest Node: Finds the nodes nearest to the given set of points in *Par1*, where *Par1* is an *n* x 3 array of coordinate locations. *ParR* is a vector of the nearest selected nodes, or 0 if no nodes are nearer than *Toler*. *Toler* defaults to 1 and is limited to the maximum model size.

ENEAR --

(***MOPER (p. 1147)**, *ParR*, *Par1*, ENEAR, *Toler*)

Nearest Element: Finds the elements nearest to the given set of points in *Par1*, where *Par1* is an *n* x 3 array of coordinate locations. *ParR* is a vector of the nearest selected elements, or 0 if no element centroids are nearer than *Toler*. *Toler* defaults to 1 and is limited to the maximum model size.

MAP --

(***MOPER (p. 1147)**, *ParR*, *Par1*, MAP, *Par2*, *Par3*, *kDim*, *--*, *kOut*, *LIMIT*)

Maps the results from one set of points to another. For example, you can map pressures from a CFD analysis onto your model for a structural analysis.

Par1 is the *Nout* x 3 array of points that will be mapped to. *Par2* is the *Nin* x *M* array that contains *M* values of data to be interpolated at each point and corresponds to the *Nin* x 3 points in *Par3*. The resulting *ParR* is the *Nout* x *M* array of mapped data points.

For each point in the destination mesh, all possible triangles in the source mesh are searched to find the best triangle containing each point. It then does a linear interpolation inside

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

this triangle. You should carefully specify your interpolation method and search criteria in order to provide faster and more accurate results (see *LIMIT*, below).

kDim is the interpolation criteria. If *kDim* = 2 or 0, two dimensional interpolation is applied (interpolate on a surface). If *kDim* = 3, three dimensional interpolation is applied (interpolate on a volume).

kOut specified how points outside of the domain are handled. If *kOut* = 0, use the value(s) of the nearest region point for points outside of the region. If *kOut* = 1, set results outside of the region to zero.

LIMIT specifies the number of nearby points considered for interpolation. The default is 20, and the minimum is 5. Lower values will reduce processing time; however, some distorted or irregular sets of points will require a higher *LIMIT* value to encounter three nodes for triangulation.

Output points are incorrect if they are not within the domain (area or volume) defined by the specified input points. Also, calculations for out-of-bound points require much more processing time than do points that are within bounds. Results mapping is available from the command line only.

INTP --

(***MOPER (p. 1147)**, *ParR*, *Par1*, INTP, *Par2*)

Finds the elements that contain each point in the array of *n* x 3 points in *Par1*. *Par2* will contain the set of element ID numbers and *ParR* will contain their *n* x 3 set of natural element coordinates (values between -1 and 1). *Par1* must be in global Cartesian coordinates.

SGET --

(***MOPER (p. 1147)**, *ParR*, *Par1*, SGET, *Par2*, *Label*, *Comp*)

Gets the nodal solution item corresponding to *Label* and *Comp* (see the **PLNSOL (p. 1425)** command) and interpolates it to the given element locations. *Par1* contains the *n* x 3 array of natural element coordinates (values between -1 and 1) of the *n* element ID numbers in *Par2*. *Par1* and *Par2* are usually the output of the ***MOPER (p. 1147)**,,,INTP operation. *ParR* contains the *n* interpolated results.

Val1*, *Val2*, . . . , *Val6

Additional input used in the operation. The meanings of *Val1* through *Val6* vary depending on the specified matrix operation. See the description of *Oper* for details.

Notes

Each starting array element number must be defined for each array parameter matrix if it does not start at the first location. For example, ***MOPER (p. 1147)**,A(2,3),B(1,4),MULT,C(1,5) multiplies submatrix B (starting at element (1,4)) by submatrix C (starting at element (1,5)) and puts the result in matrix A (starting at element (2,3)).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The diagonal corner elements for each submatrix must be defined: the upper left corner by the array starting element (on this command), the lower right corner by the current values from the ***VCOL (p. 2077)** and ***VLEN (p. 2136)** commands. The default values are the (1,1) element and the last element in the matrix. No operations progress across matrix planes (in the 3rd dimension). Absolute values and scale factors may be applied to all parameters (***VABS (p. 2072)**, ***VFACT (p. 2092)**). Results may be cumulative (***VCUM (p. 2080)**). Array elements should not be skipped with the ***VMASK (p. 2139)** and the *NINC* value of the ***VLEN (p. 2136)** specifications. See the ***VOPER (p. 2142)** command for details.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Matrix Operations

MOPT, *Lab*, *Value*

Specifies meshing options.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Meshing option to be specified (determines the meaning of *Value*):

AORDER

Mesh by ascending area size order. Set *Value* to ON to mesh smaller areas first. Using this results in finer meshes in critical areas for volume meshes; this can be used for cases where **SMRTSIZE (p. 1811)** does not mesh as needed. Default is OFF.

EXPND

Area mesh expansion (or contraction) option. (This option is the same as **SMRTSIZE (p. 1811)**,,,EXPND.) This option is used to size internal elements in an area based on the size of the elements on the area's boundaries.

Value is the expansion (or contraction) factor. For example, issuing **MOPT (p. 1151)**,EXPND,2 before meshing an area will allow a mesh with elements that are approximately twice as large in the interior of an area as they are on the boundary. If *Value* is less than 1, a mesh with smaller elements on the interior of the area will be allowed. *Value* for this option should be greater than 0.5 but less than 4.

Value defaults to 1, which does not allow expansion or contraction of internal element sizes (except when using **AESIZE (p. 104)** sizing). If *Value* = 0, the default value of 1 will be used. The actual size of the internal elements will also depend on the TRANS option (or upon **AESIZE (p. 104)** or **ESIZE (p. 668)** sizing, if used).

TETEXPND

Tet-mesh expansion (or contraction) option. This option is used to size internal elements in a volume based on the size of the elements on the volume's boundaries.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Value is the expansion (or contraction) factor. For example, issuing **MOPT (p. 1151)**,TET-EXPND,2 before meshing a volume will allow a mesh with elements that are approximately twice as large in the interior of the volume as they are on the boundary. If *Value* is less than 1, a mesh with smaller elements on the interior of the volume will be allowed. *Value* for this option should be greater than 0.1 but less than 3.

Value defaults to 1, which does not allow expansion or contraction of internal element sizes. If *Value* = 0, the default value of 1 will be used. If *Value* is greater than 2, mesher robustness may be affected.

The TETEXPND option is supported for both the **VMESH (p. 2140)** and **FVMESH (p. 784)** commands. Tet-mesh expansion is the only mesh control supported by **FVMESH (p. 784)**.

TRANS

Mesh-transition option. Controls how rapidly elements are permitted to change in size from the boundary to the interior of an area. (This option performs the same operation as **SMRTSIZE (p. 1811)**,,,,TRANS.)

Value is the transitioning factor. *Value* defaults to 2.0, which permits elements to approximately double in size as they approach the interior of the area. (If *Value* = 0, the default value of 2 will be used.) *Value* must be greater than 1 and, for best results, should be less than 4. The actual size of the internal elements will also depend on the EXPND option (or upon **AESIZE (p. 104)** or **ESIZE (p. 668)** sizing, if used).

For a quad mesh with any element size, this option has no effect, as the program strictly respects any face size to ensure the most uniform quad mesh possible. To obtain a graded mesh using this option, apply **LESIZE (p. 1041)** to the lines of the desired face.

AMESH

Triangle surface-meshing option. Valid inputs for *Value* are:

DEFAULT

Allows the program to choose which triangle mesher to use. In most cases, the program chooses the main triangle mesher, which is the Riemann space mesher. If the chosen mesher fails for any reason, the program invokes the alternate mesher and retries the meshing operation.

MAIN

The program uses the main triangle mesher (Riemann space mesher), and it does not invoke an alternate mesher if the main mesher fails. The Riemann space mesher is well suited for most surfaces.

ALTERNATE

The program uses the first alternate triangle mesher (3D tri-mesher), and it does not invoke another mesher if this mesher fails. This option is not recommended due to speed considerations. However, for surfaces with degeneracies in parametric space, this mesher often provides the best results.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALT2

The program uses the second alternate triangle mesher (2D parametric space mesher), and it does not invoke another mesher if this mesher fails. This option is not recommended for use on surfaces with degeneracies (spheres, cones, etc.) or poorly parameterized surfaces because poor meshes may result.

QMESH

Quadrilateral surface meshing option. (Quadrilateral surface meshes will differ based on which triangle surface mesher is selected. This is true because all free quadrilateral meshing algorithms use a triangle mesh as a starting point.) Valid inputs for *Value* are:

DEFAULT

Let the program choose which quadrilateral mesher to use. In most cases, the program will choose the main quadrilateral mesher, which is the Q-Morph (quad-morphing) mesher. For very coarse meshes, the program may choose the alternate quadrilateral mesher instead. In most cases, the Q-Morph mesher results in higher quality elements. If either mesher fails for any reason, the program invokes the other mesher and retries the meshing operation. (Default.)

MAIN

The program uses the main quadrilateral mesher (Q-Morph mesher), and it does not invoke the alternate mesher if the main mesher fails.

ALTERNATE

The program uses the alternate quadrilateral mesher, and it does not invoke the Q-Morph mesher if the alternate mesher fails. To use the alternate quadrilateral mesher, you must also select **MOPT (p. 1151)**,AMESH,ALTERNATE or **MOPT (p. 1151)**,AMESH,ALT2.

VMESH

Tetrahedral element meshing option. Valid inputs for *Value* are:

DEFAULT

Let the program choose which tetrahedra mesher to use.

MAIN

Use the main tetrahedra mesher (Delaunay technique mesher). (GHS3D meshing technology by P. L. George, INRIA, France.) For most models, this mesher is significantly faster than the alternate mesher.

ALTERNATE

Use the alternate tetrahedra mesher (advancing front mesher). This mesher does not support the generation of a tetrahedral volume mesh from facets (**FVMESH (p. 784)**). If this mesher is selected and you issue the **FVMESH (p. 784)**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

command, the program uses the main tetrahedra mesher to create the mesh from facets and issues a warning message to notify you.

SPLIT

Quad splitting option for non-mapped meshing. If *Value* = 1, ON, or ERR, quadrilateral elements in violation of shape error limits are split into triangles (default). If *Value* = 2 or WARN, quadrilateral elements in violation of either shape error *or* warning limits are split into triangles. If *Value* = OFF, splitting does not occur, regardless of element quality.

LSMO

Line smoothing option. *Value* can be ON or OFF. If *Value* = ON, smoothing of nodes on area boundaries is performed during smoothing step of meshing. During smoothing, node locations are adjusted to achieve a better mesh. If *Value* = OFF (default), no smoothing takes place at area boundaries.

CLEAR

This option affects the element and node numbering after clearing a mesh. If *Value* = ON (default), the starting node and element numbers will be the lowest available number after the nodes and elements are cleared. If *Value* = OFF, the starting node and element numbers are not reset after the clear operation.

PYRA

Transitional pyramid elements option. *Value* can be ON or OFF. If *Value* = ON (default), the program automatically creates transitional pyramid elements, when possible. Pyramids may be created at the interface of tetrahedral and hexahedral elements, or directly from quadrilateral elements. For pyramids to be created, you must also issue the command **MSHAPE (p. 1188)**,1,3D (degenerate 3D elements). If *Value* = OFF, the program does not create transitional pyramid elements.

TIMP

Identifies the level of tetrahedra improvement to be performed when the next free volume meshing operation is initiated (**VMESH (p. 2140)**, **FVMESH (p. 784)**). (For levels 2-5, improvement occurs primarily through the use of face swapping and node smoothing techniques.) Valid inputs for *Value* are:

0

Turn off tetrahedra improvement. Although this value can lead to faster tetrahedral mesh creation, it is *not recommended* because it often leads to poorly shaped elements and mesh failures.

1

Do the minimal amount of tetrahedra improvement. (Default.) This option is supported by the main tetrahedra mesher only (**MOPT (p. 1151)**,VMESH,MAIN). If the alternate tetrahedra mesher (**MOPT (p. 1151)**,VMESH,ALTERNATE) is invoked with this setting, the program automatically performs tetrahedra improvement at level 3 instead (**MOPT (p. 1151)**,TIMP,3).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2

Perform the least amount of swapping/smoothing. No improvement occurs if all tetrahedral elements are within acceptable limits.

3

Perform an intermediate amount of swapping/smoothing. Some improvement is always done.

4

Perform the greatest amount of swapping/smoothing. Meshing takes longer with this level of improvement, but usually results in a better mesh.

5

Perform the greatest amount of swapping/smoothing, plus additional improvement techniques. This level of improvement usually produces results that are similar to those at level 4, except for very poor meshes.

6

For linear tetrahedral meshes, this value provides the same level of improvement as **MOPT (p. 1151)**,TIMP,5. For quadratic tetrahedral meshes, this value provides an additional pass of cleanup. This value is supported for both the main (**MOPT (p. 1151)**,VMESH,MAIN) and alternate (**MOPT (p. 1151)**,VMESH,ALTERNATE) tetrahedra meshers.

STAT

Display status of **MOPT (p. 1151)** settings. *Value* is ignored.

DEFA

Set all **MOPT (p. 1151)** options to default values. *Value* is ignored.

Value

Value, as described for each different *Lab* above.

Notes

See the *Modeling and Meshing Guide* for more information on the **MOPT (p. 1151)** command and its options.

This command is also valid for rezoning.

MORPH,*Option*,--,*Remeshopt*,*ElemSet*,*ARMAX*,*VOCH*,*ARCH*,*STEP*,*TIME*,*StrOpt*

Specifies morphing and remeshing controls.

PREP7 (p. 22): Morphing (p. 37)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

OFF

Turns off morphing for field elements (default).

ON

Turns on morphing for field elements.

--

Unused field

Remeshopt

OFF

Do not remesh (default).

ON

Remesh when element qualities fall below values specified by *ARMAX*, *VOCH*, or *ARCH* as explained below. Valid only when *Option* is ON.

ElemSet

ALL

Remesh all selected elements if the quality of the worst defined element falls below any quality requirement (default when *Remeshopt* = ON).

CompName

Specify a component name, up to 256 characters. All elements included in this component name are remeshed if the quality of the worst element falls below any quality requirement.

ARMAX

The maximum allowable element generalized aspect ratio. Defaults to 5.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VOCH

The maximum allowable change of element size (area or volume). Defaults to 3.

ARCH

The maximum allowable element aspect ratio change. Defaults to 3.

STEP

The frequency of element quality checking, based on time steps. A quality check takes place at the intervals defined by *STEP*. Defaults to 1 (quality check at every step).

TIME

A quality check takes place at the time point specified. Defaults to -1 (a quality check at every time point).

StrOpt

NO

There are no structural elements in the model (default).

YES

There are structural elements in the model and the morphing happens after the structural solution.

Notes

MORPH (p. 1156) is applicable to any non-structural field analysis. It activates displacement degrees of freedom for non-structural elements so that boundary conditions may be placed on the field mesh to constrain the movement of the non-structural mesh during morphing. It morphs the non-structural mesh using displacements transferred at the surface interface between the structural field and the non-structural field. The displacements of non-structural elements are mesh displacements to avoid mesh distortion, but have no physical meaning except at the interface. **MORPH (p. 1156)** does not support surface, link, or shell elements, or any element shape other than triangles, quads, tets, and bricks. Morphed fields must be in the global Cartesian system (**CSYS (p. 441)** = 0).

If *StrOpt* = YES, the following non-structural element types will be morphed:

- Acoustic: FLUID30, FLUID220, FLUID221, FLUID243, FLUID244,
- Electrostatic PLANE121, SOLID122, and SOLID123,
- Electric PLANE230, SOLID231, and SOLID232,
- Electromagnetic PLANE233, SOLID236, and SOLID237,
- Thermal PLANE35, PLANE55, PLANE77, PLANE292, PLANE293, SOLID70, SOLID87, SOLID90, SOLID278, SOLID279, and SOLID291,
- Diffusion PLANE238, SOLID239, and SOLID240,

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Coupled-field PLANE222, PLANE223, SOLID225, SOLID226, and SOLID227 with no structural degrees of freedom.

The following structural elements types are supported by *StrOpt* = YES:

- PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, SOLSH190,
- Coupled-field PLANE222, PLANE223, SOLID225, SOLID226, and SOLID227 with structural degrees of freedom.

After each remesh, new databases and results files are written with the extensions `.rth0`*n* and `.db0`*n*, where *n* is the remesh file number (`FieldName.rth01`, `FieldName.rth02`, ... and `FieldName.db01`, `FieldName.db02`, etc.). The original database file is `FieldName.dbo`. The `FieldName.db01`, `FieldName.db02`, etc. files have elements that are detached from the solid model.

Remeshing has the following restrictions:

- Valid only for the electrostatic elements (PLANE121, SOLID122, and SOLID123)
- Limited to triangle (2D) and tetrahedral (3D) options of these elements
- No body loads allowed in the interior nodes of the remeshing domain
- Nodes on the boundary cannot be remeshed; remeshing will not work if morphing failed on the surface nodes
- Not suitable for extreme area or volume changes

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Element Morphing

Main Menu>Solution>Load Step Opts>Other>Element Morphing

MOVE, *NODE*, *KC1*, *X1*, *Y1*, *Z1*, *KC2*, *X2*, *Y2*, *Z2*

Calculates and moves a node to an intersection.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Move this node. If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE*.

KC1

First coordinate system number. Defaults to 0 (global Cartesian).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X1, Y1, Z1

Input one or two values defining the location of the node in this coordinate system. Input "U" for unknown value(s) to be calculated and input "E" to use an existing coordinate value. Fields are R1, θ1, Z1 for cylindrical, or R1, θ1, Φ1 for spherical or toroidal.

KC2

Second coordinate system number.

X2, Y2, Z2

Input two or one value(s) defining the location of the node in this coordinate system. Input "U" for unknown value(s) to be calculated and input "E" to use an existing coordinate value. Fields are R2, θ2, Z2 for cylindrical, or R2, θ2, Φ2 for spherical or toroidal.

Notes

Calculates and moves a node to an intersection location. The node may have been previously defined (at an approximate location) or left undefined (in which case it is internally defined at the **SOURCE (p. 1824)** location). The actual location is calculated from the intersection of three surfaces (implied from three coordinate constants in two different coordinate systems). The three (of six) constants easiest to define should be used. The program will calculate the remaining three coordinate constants. All arguments, except *KC1*, must be input. Use the repeat command (***REPEAT (p. 1586)**) after the **MOVE (p. 1158)** command to define a line of intersection by repeating the move operation on all nodes of the line.

Surfaces of constant value are implied by some commands by specifying a single coordinate value. Implied surfaces are used with various commands (**MOVE (p. 1158)**, **KMOVE (p. 986)**, **NSEL (p. 1266)**, etc.). Three surfaces are available with each of the four coordinate system types. Values or X, Y, or Z may be constant for the Cartesian coordinate system; values of R, θ, or Z for the cylindrical system; and values of R, θ, Φ for the spherical and toroidal systems. For example, an X value of 3 represents the Y-Z plane (or surface) at X=3. In addition, the parameters for the cylindrical and spherical coordinate systems may be adjusted (**CS (p. 435)**, **LOCAL (p. 1059)**) to form elliptical surfaces. For surfaces in elliptical coordinate systems, a surface of "constant" radius is defined by the radius value at the X-axis. Surfaces of constant value may be located in local coordinate systems (**LOCAL (p. 1059)**, **CLOCAL (p. 352)**, **CS (p. 435)**, or **CSKP (p. 438)**) to allow for any orientation.

The intersection calculation is based on an iterative procedure (250 iterations maximum) and a tolerance of 1.0E-4. The approximate location of a node should be sufficient to determine a unique intersection if more than one intersection point is possible. Tangent "intersections" should be avoided. If an intersection is not found, the node is placed at the last iteration location.

This command is also valid in the **/MAP (p. 1107)** processor.

Menu Paths

MP,*Lab*,*MAT*,*C0*,*C1*,*C2*,*C3*,*C4*

Defines a linear material property as a constant or a function of temperature.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 1164)

Lab

Valid material property label. Applicable labels are listed under "Material Properties" in the input table for each element type in the *Element Reference*.

ALPD

Mass matrix multiplier for damping.

ALPX

Secant coefficients of thermal expansion (also ALPY, ALPZ).

BETD

Stiffness matrix multiplier for damping.

BETX

Coefficient of diffusion expansion (also BETY, BETZ)

BVIS

Bulk viscosity

C

Specific heat

CREF

Reference concentration (may not be temperature dependent)

CSAT

Saturated concentration

CTEX

Instantaneous coefficients of thermal expansion (also CTEY, CTEZ)

CVH

Heat coefficient at constant volume per unit of mass

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DENS

Mass density.

DMPR

Damping ratio.

DMPS

Constant structural damping coefficient.

DXX

Diffusivity coefficients (also DYY, DZZ)

EMIS

Emissivity. For default behavior, see Notes (p. 1164).

ENTH

Enthalpy. See Considerations for Enthalpy (p. 1164).

EX

Elastic moduli (also EY, EZ)

GXY

Shear moduli (also GYZ, GXZ)

HF

Convection or film coefficient

KXX

Thermal conductivities (also KYY, KZZ)

LSST

Electric loss tangent

LSSM

Magnetic loss tangent

MGXX

Magnetic coercive forces (also MGYY, MGZZ)

MURX

Magnetic relative permeabilities (also MURY, MURZ)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MU

Coefficient of friction

NUXY

Minor Poisson's ratios (also NUYZ, NUXZ) (NUXY = ν_{yx}, as described in Stress-Strain Relationships in the *Mechanical APDL Theory Reference*)

PERX

Electric relative permittivities (also PERY, PERZ)

Note:

If you enter permittivity values less than 1 for SOLID5, PLANE13, or SOLID98, the program interprets the values as absolute permittivity. Values input for PLANE222, PLANE223, SOLID225, SOLID226, or SOLID227 are always interpreted as relative permittivity.

PRXY

Major Poisson's ratios (also PRYZ, PRXZ) (PRXY = ν_{xy}, as described in Stress-Strain Relationships in the *Mechanical APDL Theory Reference*)

QRATE

Heat generation rate for thermal mass element MASS71. Fraction of plastic work converted to heat (Taylor-Quinney coefficient) or fraction of viscoelastic loss converted to heat for coupled-field elements PLANE222, PLANE223, SOLID225, SOLID226, and SOLID227.

REFT

Reference temperature. Must be defined as a constant; C1 through C4 are ignored.

RH

Hall Coefficient.

RSVX

Electrical resistivities (also RSVY, RSVZ).

SBKX

Seebeck coefficients (also SBKY, SBKZ).

SONC

Sonic velocity.

THSX

Thermal strain (also THSY, THSZ).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VISC

Viscosity.

MAT

Material reference number to be associated with the elements (defaults to the current MAT setting (**MAT (p. 1111)**)).

C0

Material property value, or if a property-versus-temperature polynomial is being defined, the constant term in the polynomial. *C0* can also be a table name (%*tabname*%); if *C0* is a table name, *C1* through *C4* are ignored.

C1, C2, C3, C4

Coefficients of the linear, quadratic, cubic, and quartic terms, respectively, in the property-versus-temperature polynomial. Leave blank (or set to zero) for a constant material property.

Notes

MP (p. 1160) defines a linear material property as a constant or in terms of a fourth order polynomial as a function of temperature. (See the **TB (p. 1899)** command for nonlinear material property input.) Linear material properties typically require a single substep for solution, whereas nonlinear material properties require multiple substeps.

If the constants C1 - C4 are input, the polynomial

$$\text{Property} = C0 + C1(\text{T}) + C2(\text{T})^2 + C3(\text{T})^3 + C4(\text{T})^4$$

is evaluated at discrete temperature points with linear interpolation between points (that is, a piecewise linear representation) and a constant-valued extrapolation beyond the extreme points. First-order properties use two discrete points (±9999°). The **MPTEMP (p. 1178)** or **MPTGEN (p. 1179)** commands must be used for second and higher order properties to define appropriate temperature steps. To ensure that the number of temperatures defined via the **MPTEMP (p. 1178)** and **MPTGEN (p. 1179)** commands is minimally sufficient for a reasonable representation of the curve, Mechanical APDL generates an error message if the number is less than N, and a warning message if the number is less than 2N. The value N represents the highest coefficient used; for example, if C3 is nonzero and C4 is zero, a cubic curve is being used which is defined using 4 coefficients so that N = 4.

Some elements (for example, FLUID116) support tabular input for material properties. Use the ***DIM (p. 530)** command to create the table of property values as a function of the independent variables. Then input this table name (*C0* = %*tabname*%) when defining the property via the **MP (p. 1160)** command. Tabular material properties are calculated before the first iteration (that is, using initial values (**IC (p. 921)**)). For a list of elements that support tabular material properties and associated primary variables, see Defining Linear Material Properties Using Tabular Input in the *Material Reference*.

When defining a reference temperature (**MP (p. 1160)**,REFT), you can convert temperature-dependent secant coefficients of thermal expansion (SCTE) data from the definition temperature to the reference temperature. To do so, issue the **MPAMOD (p. 1166)** command.

This command is also valid in SOLUTION.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Considerations for Enthalpy (*Lab* = ENTH)

- To ensure correct results, you must define enthalpy over a large enough temperature range to span all computed temperatures during the solution. The **TB (p. 1899)** command does not extrapolate enthalpy values beyond the specified temp range like the **MP (p. 1160)** command does.
- If both the **TB (p. 1899)** and **MP (p. 1160)** commands are used to specify enthalpy values, enthalpy values defined via the **TB (p. 1899)** command are used and those defined via the **MP (p. 1160)** command are ignored.

Default behavior for Emissivity (*Lab* = EMIS)

There is no command default (p. 3) value for emissivity, and you must specify it by issuing **MP (p. 1160)**,EMIS. Otherwise, an error message appears. If you issue **MP (p. 1160)**,EMIS without specifying *C0*, *C1*, *C2*, *C3*, *C4* values, emissivity defaults to 0.

---

MPAMOD, *MAT*, *DEFTEMP*

Modifies temperature-dependent secant coefficients of thermal expansion.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT

Material number for which the secant coefficients of thermal expansion (SCTE's) are to be modified. Defaults to 1.

DEFTEMP

Definition temperature at which the existing SCTE-versus-temperature tables were defined. Defaults to zero.

Notes

This command converts temperature-dependent SCTE data (properties ALPX, ALPY, ALPZ) from the definition temperature (*DEFTEMP*) to the reference temperature defined by **MP (p. 1160)**,REFT or **TREF (p. 2013)**. If both the **MP (p. 1160)**,REFT and **TREF (p. 2013)** commands have been issued, the reference temperature defined by the **MP (p. 1160)**,REFT command will be used.

This command does not apply to the instantaneous coefficients of thermal expansion (properties CTEX, CTEY, CTEZ) or to the thermal strains (properties THSX, THSY, THSZ).

This command is also valid in SOLUTION.

Menu Paths

MPCHG, *MAT*, *ELEM*

Changes the material number attribute of an element.

PREP7 (p. 22): Materials (p. 24)
SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT

Assign this material number to the element. Material numbers are defined with the material property commands (**MP (p. 1160)**).

ELEM

Element for material change. If ALL, change materials for all selected elements (**ESEL (p. 661)**).

Notes

Changes the material number of the specified element. Between load steps in SOLUTION, material properties cannot be changed from linear to nonlinear, nonlinear to linear, or from one nonlinear option to another.

If you change from one CHABOCHE model to another CHABOCHE model, the different models need to have the same number of data points.

MPCOPY, - -, *MATF*, *MATT*

Copies linear material model data from one material reference number to another.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

- -

Unused field

MATF

Material reference number from where material property data will be copied.

MATT

Material reference number to where material property data will be copied.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **MPCOPY (p. 1167)** command copies linear material properties only, which are all properties defined through the **MP (p. 1160)** command. If you copy a model that includes both linear and yield behavior constants (for example, a BKIN model), the **MPCOPY (p. 1167)** and **TBCOPY (p. 1959)**, ALL commands are used together to copy the entire model. All input data associated with the model is copied, that is, all data defined through the **MP (p. 1160)** and **TB (p. 1899)** commands.

Also, if you copy a material model using the Material Model Interface (**Edit> Copy**), both the commands **MPCOPY (p. 1167)** and **TBCOPY (p. 1959)**, ALL are issued, regardless of whether the model includes linear constants only, or if it includes a combination of linear and yield behavior constants.

This command is also valid in SOLUTION.

Main Menu>Preprocessor>Material Props>Material Models

Main Menu>Solution>Load Step Opts>Other>Change Mat Props>Material Models

---

MPDATA, *Lab*, *MAT*, *SLOC*, *C1*, *C2*, *C3*, *C4*, *C5*, *C6*

Defines property data to be associated with the temperature table.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 1171)

Lab

Valid property label. Applicable labels are listed under "Material Properties" in the input table for each element type in the *Element Reference*.

ALPD

Mass matrix multiplier for damping.

ALPX

Secant coefficients of thermal expansion (also ALPY, ALPZ). (See also **MPAMOD (p. 1166)** command for adjustment to reference temperature).

BETD

Stiffness matrix multiplier for damping.

BETX

Coefficient of diffusion expansion (also BETY, BETZ)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

C

Specific heat.

CREF

Reference concentration (may not be temperature dependent)

CSAT

Saturated concentration

CTEX

Instantaneous coefficients of thermal expansion (also CTEY, CTEZ).

DENS

Mass density.

DMPS

Constant material damping coefficient.

DXX

Diffusivity coefficients (also DYY, DZZ)

EMIS

Emissivity.

ENTH

Enthalpy.

EX

Elastic moduli (also EY, EZ).

GXY

Shear moduli (also GYZ, GXZ).

HF

Convection or film coefficient.

KXX

Thermal conductivities (also KYY, KZZ).

LSST

Dielectric loss tangent.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MGXX

Magnetic coercive forces (also MGYY, MGZZ).

MU

Coefficient of friction.

MURX

Magnetic relative permeabilities (also MURY, MURZ).

NUXY

Minor Poisson's ratios (also NUYZ, NUXZ).

PERX

Electric relative permittivities (also PERY, PERZ).

PRXY

Major Poisson's ratios (also PRYZ, PRXZ).

QRATE

Heat generation rate.

REFT

Reference temperature (may not be temperature dependent).

RH

Hall Coefficient.

RSVX

Electrical resistivities (also RSVY, RSVZ).

SBKX

Seebeck coefficients (also SBKY, SBKZ).

SONC

Sonic velocity.

THSX

Thermal strain (also THSY, THSZ).

VISC

Viscosity.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MAT

Material reference number to be associated with the elements (defaults to 1 if you specify zero or no material number).

SLOC

Starting location in table for generating data. For example, if *SLOC* = 1, data input in the *C1* field is the first constant in the table. If *SLOC* = 7, data input in the *C1* field is the seventh constant in the table, etc. Defaults to the last location filled + 1.

C1, C2, C3, . . . , C6

Property data values assigned to six locations starting with *SLOC*. If a value is already in this location, it is redefined. A blank (or zero) value for *C1* resets the previous value in *SLOC* to zero. A value of zero can only be assigned by *C1*. Blank (or zero) values for *C2* to *C6* leave the corresponding previous values unchanged.

Notes

Defines a table of property data to be associated with the temperature table. Repeat **MPDATA (p. 1168)** command for additional values (100 maximum). Temperatures must be defined first (**MPTEMP (p. 1178)**). Also stores assembled property function table (temperature and data) in virtual space.

This command is also valid in SOLUTION.

Product Restrictions

Ansys Mechanical Enterprise

The command **MPDATA (p. 1168)**,LSST is only available to the Ansys Mechanical Enterprise product family (Ansys Mechanical Enterprise, Ansys Mechanical Enterprise PrepPost, and Ansys Mechanical Enterprise Solver).

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Change Mat Props>Material Models

MPDELE, *Lab*, *MAT1*, *MAT2*, *INC*, *LCHK*

Deletes linear material properties.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Material property label (see **MP (p. 1160)** command for valid labels). If ALL, delete properties for all applicable labels.

MAT1*, *MAT2*, *INC

Delete materials from *MAT1* to *MAT2* (defaults to *MAT1*) in steps of *INC* (defaults to 1). If *MAT1* = ALL, *MAT2* and *INC* are ignored and the properties for all materials are deleted.

LCHK

Specifies the level of element-associativity checking:

NOCHECK

No element-associativity check occurs. This option is the default.

WARN

When a section, material, or real constant is associated with an element, Mechanical APDL issues a message warning that the necessary entity has been deleted.

CHECK

The command terminates, and no section, material, or real constant is deleted if it is associated with an element.

Notes

This command is also valid in SOLUTION.

The *LCHK* argument is valid only when *Lab* = ALL.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Change Mat Props>Material Models

Main Menu>Preprocessor>Material Props>Material Models

Main Menu>Solution>Load Step Opts>Other>Change Mat Props>Material Models

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MPDRES, *LabF*, *MATF*, *LabT*, *MATT*

Reassembles existing material data with the temperature table.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabF

Material property label associated with *MATF*.

MATF

Material reference number of property to restore from virtual space.

LabT

Material property label associated with *MATT* (defaults to label associated with *MATF*).

MATT

Material reference number assigned to generated property (defaults to *MATF*).

Notes

Restores into the database (from virtual space) a data table previously defined (**MP (p. 1160)**) for a particular property, assembles data with *current* database temperature table, and stores back in virtual space as a new property.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Loads>Other>Change Mat Props>Modify Temps

Main Menu>Preprocessor>Material Props>Modify Temps

Main Menu>Solution>Other>Change Mat Props>Modify Temps

/MPLIB, *R-W_opt*, *PATH*

Sets the default material library read and write paths.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

R-W_opt

Determines what path is being set. Possible values are:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

READ

Set the read path.

WRITE

Set the write path.

STAT

Report what read and write paths are currently in use.

PATH

The directory path to be used for material library files.

Notes

The **/MPLIB (p. 1173)** command sets two path strings used in conjunction with the material library feature and the **MPREAD (p. 1176)** and **MPWRITE (p. 1181)** commands.

For **MPREAD (p. 1176)**, when you use the *LIB* option and no directory path is given in the file name, the command searches for the file in these locations: the current working directory, the user's home directory, the user-specified material library directory (as defined by the **/MPLIB (p. 1173)**,READ,*PATH* command), and */ansys_dir*/matlib.

For **MPWRITE (p. 1181)**, when you use the *LIB* option and the directory portion of the specification for the material library file is blank, the command writes the material library file to the directory specified by the **/MPLIB (p. 1173)**,WRITE,*PATH* command (if that path has been set). If the path has not been set, the default is to write the file to the current working directory.

The Material Library files supplied with the distribution media are meant for demonstration purposes only. These files are not intended for use in customer applications.

MPLIST, *MAT1*, *MAT2*, *INC*, *Lab*, *TEVL*

Lists linear material properties.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT1*, *MAT2*, *INC

List materials from *MAT1* to *MAT2* (defaults to *MAT1*) in steps of *INC* (defaults to 1). If *MAT1*= ALL (default), *MAT2* and *INC* are ignored and properties for all material numbers are listed.

Lab

Material property label (see the **MP (p. 1160)** command for labels). If ALL (or blank), list properties for all labels. If EVLT, list properties for all labels evaluated at TEVL.

TEVL

Evaluation temperature for *Lab* = EVLT listing (defaults to **BFUNIF (p. 259)**).

Notes

For *Lab* = EVLT, when the property is from tables, the **MPPLOT (p. 1175)** command will not be valid because the property could be a function of more than temperature.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Properties>All Materials

Utility Menu>List>Properties>All Matls, All Temps

Utility Menu>List>Properties>All Matls, Specified Temp

Utility Menu>List>Properties>Specified Matl, All Temps

MPPLOT, *Lab*, *MAT*, *TMIN*, *TMAX*, *PMIN*, *PMAX*

Plots linear material properties as a function of temperature.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Linear material property label (EX, EY, etc.) (**MP (p. 1160)**).

MAT

Material reference number. Defaults to 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TMIN

Minimum abscissa value to be displayed.

TMAX

Maximum abscissa value.

PMIN

Minimum property (ordinate) value to be displayed.

PMAX

Maximum property value.

Notes

When the property is from tables, the **MPPLOT (p. 1175)** command will not be valid because the property could be a function of more than temperature.

This command is valid in any processor.

Menu Paths

Utility Menu>Plot>Materials

MPREAD,*Fname*,*Ext*,--,LIB

Reads a file containing material properties.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including directory). If you do not specify the LIB option, the default directory is the current working directory. If you specify the LIB option, the default is the following search path: the current working directory, the user's home directory, MPLIB_DIR (as specified by the **/MPLIB (p. 1173)**,READ,PATH command) and */ansys_dir/*matlib (as defined by installation). If you use the default for your directory, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

If you omit the default extension is MP. extension is units_MPL, where units is the system of units currently in use. (See the description of the **/UNITS (p. 2054)** command.) For example, if **/UNITS (p. 2054)** is set to SI, the extension defaults to SI_MPL.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

--

Unused field.

LIB

Reads material library files previously written with the **MPWRITE (p. 1181)** command. (See the description of the LIB option for the **MPWRITE (p. 1181)** command.) The only allowed value for LIB is LIB.

The LIB field indicates that the specified file was written by **MPWRITE (p. 1181)** using the LIB option, and that the file is consistent with the material library file format. When the **MPREAD (p. 1176)** command executes, Mechanical APDL reads material properties defined in the specified file into the current Mechanical APDL working database. The currently selected material, as defined by the **MAT (p. 1111)** command (**MAT (p. 1111)**,MAT), determines the material number used when reading the material properties. The LIB option for **MPREAD (p. 1176)** and **MPWRITE (p. 1181)** supports storing and retrieving both linear and nonlinear properties.

Notes

Material properties written to a file without the LIB option do not support nonlinear properties. Also, properties written to a file without the LIB option are restored in the same material number as originally defined. To avoid errors, use **MPREAD (p. 1176)** with the LIB option only when reading files written using **MPWRITE (p. 1181)** with the LIB option.

If you omit the LIB option for **MPREAD (p. 1176)**, this command supports only linear properties.

Material numbers are hardcoded. If you write a material file without specifying the LIB option, then read that file in via the **MPREAD (p. 1176)** command with the LIB option, Mechanical APDL does not write the file to a new material number; instead, it writes the file to the old material number (the number specified on the **MPWRITE (p. 1181)** command that created the file.)

This command is also valid in SOLUTION.

---

MPRINT, *KEY*

Specifies that radiation matrices are to be printed.

AUX12 (p. 62): Radiation Matrix Method (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Print key:

0

Do not print matrices.

1

Print matrices.

Command Default

Matrices are not printed.

Notes

Specifies that the element and node radiation matrices are to be printed when the **WRITE (p. 2185)** command is issued. If *KEY* = 1, form factor information for each element will also be printed.

Menu Paths

Main Menu>Radiation Opt>Matrix Method>Write Matrix

MPTEMP, *SLOC*, *T1*, *T2*, *T3*, *T4*, *T5*, *T6*

Defines a temperature table for material properties.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SLOC

Starting location in table for entering temperatures. For example, if *SLOC* = 1, data input in the *T1* field applies to the first constant in the table. If *SLOC* = 7, data input in the *T1* field applies to the seventh constant in the table, etc. Defaults to the last location filled + 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

T1, T2, T3, . . . , T6

Temperatures assigned to six locations starting with *SLOC*. If a value is already in this location, it will be redefined. A blank (or zero) value for *T1* resets the previous value in *SLOC* to zero. A value of zero can only be assigned by *T1*. Blank (or zero) values for *T2* to *T6* leave the corresponding previous values unchanged.

Command Default

No temperature table defined (that is, properties must be defined as a constant or linear function of temperature via the **MP (p. 1160)** command).

Notes

Defines a temperature table to be associated with the property data table (**MPDATA (p. 1168)**). These temperatures are also used for polynomial property evaluation, if defined (**MP (p. 1160)**). Temperatures must be defined in non-descending order. Issue **MATER (p. 1112)** $ **STAT (p. 1861)** to list the current temperature table. Repeat **MPTEMP (p. 1178)** command for additional temperatures (100 maximum). If all arguments are blank, the temperature table is erased.

For clear definition, the temperature range you define with the **MPTEMP (p. 1178)** command should include the entire range you'll use in subsequently defined materials. To assist the user in this, the first (and only the first) excursion out of the temperature range defined by the **MPTEMP (p. 1178)** commands is flagged with a warning message. Similarly, the reference temperature (**TREF (p. 2013)** or **MP (p. 1160)**,REFT commands) should also fall in this same temperature range. If not and **MP (p. 1160)**,ALPX was used, a note will be output. If not, and **MP (p. 1160)**,CTEX or **MP (p. 1160)**,THSX was used, an error message will be output.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Change Mat Props>Material Models

Main Menu>Preprocessor>Material Props>Material Models

Main Menu>Solution>Load Step Opts>Other>Change Mat Props>Material Models

---

MPTGEN,*STLOC*,*NUM*,*TSTRT*,*TINC*

Adds temperatures to the temperature table by generation.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

STLOC

Starting location in table for generating temperatures. Defaults to last location filled + 1.

NUM

Number of temperatures to be generated (1-100).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TSTRT

Temperature assigned to *STLOC* location.

TINC

Increment previous temperature by *TINC* and assign to next location until all *NUM* locations are filled.

Notes

Adds temperatures to the temperature table by generation. May be used in combination (or in place of) the **MPTEMP (p. 1178)** command.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Loads>Other>Change Mat Props>Generate Temp

Main Menu>Preprocessor>Material Props>Generate Temp

Main Menu>Solution>Other>Change Mat Props>Generate Temp

MPTRES, *Lab*, *MAT*

Restores a temperature table previously defined.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Material property label (**MP (p. 1160)**).

MAT

Material reference number.

Notes

Restores into the database (from virtual space) a temperature table previously defined (**MP (p. 1160)**) for a particular property. The existing temperature table in the database is erased before this operation.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Loads>Other>Change Mat Props>Restore Temps

Main Menu>Preprocessor>Material Props>Restore Temps

Main Menu>Solution>Other>Change Mat Props>Restore Temps

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MPWRITE, *Fname*, *Ext*, --, LIB, *MAT*

Writes linear material properties in the database to a file (if the LIB option is not specified) or writes both linear and nonlinear material properties (if LIB is specified) from the database to a file.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including directory). If you do not specify the LIB option, the default directory is the current working directory. If you specify LIB and you have specified a material library directory (via the **/MPLIB (p. 1173)** command), that directory is the default. Otherwise, the default is the current working directory. If you use the default for your directory, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

If you omit the LIB option, the default extension is MP. If you specify the LIB option, the default extension is units_MPL, where units is the system of units currently in use. (See the description of the **/UNITS (p. 2054)** command.) For example, if **/UNITS (p. 2054)** is set to BIN, the extension defaults to BIN_MPL.

--

Unused field.

LIB

The only value allowed for this field is the string "LIB."

The LIB option indicates that you wish to have properties associated with the material (MAT) written to the specified material library file using the material library file format. The material library file format is ASCII-text-based Mechanical APDL command input. Certain commands associated with this format have been modified to interpret the string "_MATL" to mean the currently selected material. This feature makes the material library file independent of the material number in effect when the file was written; this enables you to restore the properties into the Mechanical APDL database using the material number of your choice. The LIB option also enables you to save both linear and nonlinear properties. If you omit the LIB option, you can save linear properties only.

MAT

Specifies the material to be written to the named material library file. *There is no default; you must either specify a material or omit the MAT argument.* Even if you specify a *MAT* value, Mechanical APDL ignores it if the LIB argument is not specified.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Writes linear material properties currently in the database to a file. The file is rewound before and after writing.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Change Mat Props>Material Library>Export Library

---

/MREP, *NAME*, *ARG1*, *ARG2*, *ARG3*, . . . , *ARG4*, *ARG5*, *ARG6*, *ARG7*, *ARG8*, *ARG9*, *ARG10*, *ARG11*, *ARG12*, *ARG13*, *ARG14*, *ARG15*, *ARG16*, *ARG17*, *ARG18*

Enables you to reissue the graphics command macro "name" during a replot or zoom operation.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NAME

The name identifying the macro file or macro block on a macro library file. The name can contain up to eight characters maximum and must begin with a letter.

ARG1, ARG2, ARG3, . . . , ARG18

Values to be passed into the file or block.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command reissues the graphics command macro "name" during a replot operation (**/REPLOT (p. 1587)**) or a zoom (**/ZOOM (p. 2203)**) operation. The program passes the command macro arguments to the replot and zoom feature for use by the graphics macro. You should place the **s-MREP (p. 1182)** command at the end of the graphics command macro, following the last graphics command within the macro, to enable the replot or zoom feature.

Menu Paths

This command cannot be accessed from a menu.

MRPM, *VAL1*

Defines the revolutions per minute (RPM) for a machine rotation.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAL1

The RPM value (no default).

Notes

A different RPM value can be defined at each load step. The RPM value is used to postprocess the equivalent radiated power from the structural surface (the **PRAS (p. 1464)** and **PLAS (p. 1387)** commands) or the radiated sound power level (the **PRFAR (p. 1490)** and **PLFAR (p. 1412)** commands).

Menu Paths

This command cannot be accessed from a menu.

MSAVE, *Key*

Sets the solver memory saving option. This option only applies to the PCG solver (including PCG Lanczos).

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Activation key:

0 or OFF

Use global assembly for the stiffness matrix (and mass matrix, when using PCG Lanczos) of the entire model.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1 or ON

Use an element-by-element approach when possible to save memory during the solution. In this case, the global stiffness (and mass) matrix is not assembled; element stiffness (and mass) is regenerated during PCG or PCG Lanczos iterations.

Notes

MSAVE (p. 1183),ON only applies to and is the default for parts of the model using the following element types with linear material properties that meet the conditions listed below.

- SOLID186 (Structural Solid only)
- SOLID187

The following conditions must also be true:

- The PCG solver has been specified.
- Small strains are assumed (**NLGEOM (p. 1231)**,OFF).
- No prestress effects (**PSTRES (p. 1551)**) are included.
- All nodes on the supported element types must be defined (that is, the midside nodes cannot be removed using the **EMID (p. 624)** command).
- For elements with thermally dependent material properties, **MSAVE (p. 1183)**,ON applies only to elements with uniform temperatures prescribed.
- The default element coordinate system must be used.

If you manually force **MSAVE (p. 1183)**,ON by including it in the input file, the model can include the following additional conditions:

- The analysis can be a modal analysis using the PCG Lanczos method (**MODOPT (p. 1140)**,LANPCG).
- Large deflection effects (**NLGEOM (p. 1231)**,ON) can be included for SOLID186 and/or SOLID187 elements.
- SOLID185 (brick shapes and KEYOPT(2) = 3 only) elements can be included for small strains (**NLGEOM (p. 1231)**,OFF).

All other element types or other parts of the model that don't meet the above criteria will be solved using global assembly (**MSAVE (p. 1183)**,OFF). This command can result in memory savings of up to 70 percent over the global assembly approach for the part of the model that meets the criteria. Depending on the hardware (for example, processor speed, memory bandwidth, etc.), the solution time may increase or decrease when this feature is used.

This memory-saving feature runs in parallel when multiple processors are used with the **/CONFIG (p. 410)** command or in a distributed-memory parallel (DMP) solution. The gain in performance with using multiple processors with this feature turned on should be similar to the default case when this feature is turned off. Performance also improves when using the uniform reduced integration option for SOLID186 elements.

This command does not support the *layered* option of the SOLID185 and SOLID186 elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **MSAVE (p. 1183)** command is not valid in these circumstances:

- When the PCG solver is used in harmonic analyses.
- When the matrix is unsymmetric.

When using **MSAVE (p. 1183)**,ON with the **PCGOPT (p. 1365)** command, note the following restrictions:

- For static and modal analyses, **MSAVE (p. 1183)**,ON is not valid when using a *Lev_Diff* value of 5 on the **PCGOPT (p. 1365)** command; *Lev_Diff* is automatically reset to 2.
- For modal analyses, **MSAVE (p. 1183)**,ON is not valid with the *StrmCk* option of the **PCGOPT (p. 1365)** command; *Strmck* is set to OFF.
- For all analysis types, **MSAVE (p. 1183)**,ON is not valid when the Lagrange multiplier option (*LM_Key*) of the **PCGOPT (p. 1365)** command is set to ON; the **MSAVE (p. 1183)** activation key is set to OFF.
- For linear perturbation static and modal analyses, **MSAVE (p. 1183)**,ON is not valid; the **MSAVE (p. 1183)** activation key is set to OFF.
- For static analyses, **MSAVE (p. 1183)**,ON is not valid when the *Fallback* option of the **PCGOPT (p. 1365)** command is enabled; *Fallback* is automatically reset to OFF.

When using **MSAVE (p. 1183)**,ON for modal analyses, no `.full` file will be created. The `.full` file may be necessary for subsequent analyses (for example, harmonic, transient mode-superposition, or spectrum analyses). To generate the `.FULL` file, rerun the modal analysis using the **WRFULL (p. 2184)** command.

***MSG**, *Lab*, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*, *VAL7*, *VAL8*

Writes an output message via the Mechanical APDL message subroutine.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Lab

Label for output and termination control:

INFO --

Writes the message with no heading (default).

NOTE --

Writes the message with a "NOTE" heading.

WARN --

Writes the message with a "WARNING" heading. Also writes the message to the errors file, `Jobname.err`.

ERROR --

Writes the message with a "ERROR" heading and causes run termination (if batch) at earliest "clean exit" point. Also writes the message to the errors file, `Jobname.err`.

FATAL --

Writes the message with a "FATAL ERROR" heading and causes run termination immediately. Also writes the message to the errors file, `Jobname.err`.

UI --

Writes the message with a "NOTE" heading and displays it in the message dialog box. This option is most useful in GUI mode.

VAL1*, *VAL2*, *VAL3*, . . . , *VAL8

Numeric or alphanumeric character values to be included in message. Values may be the results of parameter evaluations. All numeric values are assumed to be double precision. The FORTRAN nearest integer (NINT) function is used to form integers for the %I specifier.

Notes

Allows writing an output message via the Mechanical APDL message subroutine. Also allows run termination control. This command is used only when contained in a prepared file read into the Mechanical APDL program (that is, ***USE (p. 2059)**,**/INPUT (p. 948)**, etc.). A message format must immediately follow the ***MSG (p. 1185)** command (on a separate line, without parentheses, as described below).

The message format may be up to 80 characters long, consisting of text strings and predefined "data descriptors" between the strings where numeric or alphanumeric character data are to be inserted. The normal descriptors are %I for integer data, %G for double precision data, %C for alphanumeric character data, and %/ for a line break. The corresponding FORTRAN data descriptors are I9, 1PG16.9 and A8, respectively. Each descriptor must be preceded by a blank. There must be one data descriptor for each specified value (8 maximum) in the order of the specified values.

Enhanced descriptions may also be used:

%w.pE	w is field width
%w.pG	p is precision
%w.pF	
%%	a single percent sign
%wC; %wS	character string

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

%-wC; %-wS	left justify string
%wX	w blank characters
%wI	integer format
%0wI	pad integer with leading zeros rather than blanks
%0w.pI	w is field width; p is number of characters filled

Do not begin ***MSG (p. 1185)** format lines with ***IF (p. 927)**, ***ELSE (p. 620)**, ***ELSEIF (p. 620)**, or ***ENDIF (p. 636)**. If the last nonblank character of the message format is an ampersand (&), a second line will also be read as a continuation of the format. Up to nine continuations (ten total lines) may be read. If normal descriptions are used, then consecutive blanks are condensed into one blank upon output, and a period is appended. Up to ten lines of output of 72 characters each may be produced (using the %/ descriptor). Two examples follow.

Here is an example of the ***MSG (p. 1185)** command and a format to print a message with two integer values and one real value:

```
*MSG, INFO, 'Inner',25,1.2,148
Radius ( %C) = %I, Thick = %G, Length = %I
```

The output line is:

```
Radius (Inner) = 25, Thick = 1.2, Length = 148.
```

Here is an example illustrating multiline displays in GUI message windows:

```
*MSG,UI,Vcoilrms,THTAv,Icoilrms,THTAi,Papprnt,Pelec,PF,indctnc
Coil RMS voltage, RMS current, apparent pwr, actual pwr, pwr factor: %/&
Vcoil = %G V (electrical angle = %G DEG) %/&
Icoil = %G A (electrical angle = %G DEG) %/&
APPARENT POWER = %G W %/&
ACTUAL POWER = %G W %/&
Power factor: %G %/&
Inductance = %G %/&
VALUES ARE FOR ENTIRE COIL (NOT JUST THE MODELED SECTOR)
```

Note:

The **/UIS (p. 2045)**,MSGPOP command controls which messages are displayed in the message dialog box when the GUI is active. All messages produced by the ***MSG (p. 1185)** command are subject to the **/UIS (p. 2045)** specification, with one exception, If *Lab* = UI, the message will be displayed in the dialog box regardless of the **/UIS (p. 2045)** specification.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MSHAPE, *KEY*, *Dimension*

For elements that support multiple shapes, specifies the element shape to be used for meshing.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Key indicating the element shape to be used:

0

Mesh with quadrilateral-shaped elements when *Dimension* = 2D mesh with hexahedral-shaped elements when *Dimension* = 3D.

1

Mesh with triangle-shaped elements when *Dimension* = 2D mesh with tetrahedral-shaped elements when *Dimension* = 3D.

Dimension

Specifies the dimension of the model to be meshed:

2D

2D model (area mesh).

3D

3D model (volume mesh).

Command Default

Since specification of element shape (**MSHAPE (p. 1188)**) and meshing type (**MSHKEY (p. 1190)**) are so closely related, the element shape that Mechanical APDL meshes with depends on the combination of the values that are set for the two commands. The table below explains what happens when you fail to specify values for these settings.

Your action...	How it affects the mesh...
You issue the **MSHAPE (p. 1188)** command with no arguments.	The program uses quadrilateral-shaped or hexahedral-shaped elements to mesh the model, depending on whether you are meshing an area or a volume.
You do not specify an element shape, but you do specify the type of meshing to be used (**MSHKEY (p. 1190)**).	The program uses the default shape of the element to mesh the model. It uses the type of meshing that you specified.
You specify neither an element shape nor the type of meshing to be used.	The program uses the default shape of the element to mesh the model. It uses

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Your action...	How it affects the mesh...
	whichever type of meshing is the default for that shape.

Notes

If no value is specified for *Dimension* the value of *KEY* determines the element shape that will be used for both 2D and 3D meshing. In other words, if you specify **MSHAPE (p. 1188)**,0, quadrilateral-shaped and hexahedral-shaped elements will be used. If you specify **MSHAPE (p. 1188)**,1, triangle-shaped and tetrahedral-shaped elements will be used.

This command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh>Volumes>Mapped>4 to 6 sided

Main Menu>Preprocessor>Meshing>Mesher Opts

Main Menu>Solution>Manual Rezoning>Create Remesh Zone(s)>Mesh Controls>Global Meshing Options

---

MSHCOPY, *KEYLA*, *LAPTRN*, *LACOPY*, *KCN*, *DX*, *DY*, *DZ*, *TOL*, *LOW*, *HIGH*

Simplifies the generation of meshes that have matching node element patterns on two different line groups (in 2D) or area groups (3D).

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEYLA

Copy line mesh (default) if LINE, 0 or 1. Copy area mesh if AREA, or 2.

LAPTRN

Meshed line/area to be copied, or a component name containing a list. If *LAPTRN* = P, graphical picking is enabled (valid only in the GUI).

LACOPY

Unmeshed line/area to get copied mesh, or a component name containing a list. If *LACOPY* = P, graphical picking is enabled (valid only in the GUI).

KCN

In coordinate system *KCN*, *LAPTRN* + *DX DY DZ* = *LACOPY*.

DX, DY, DZ

Node location increments in the active coordinate system (DR, Dθ, DZ for cylindrical, DR, Dθ, DΦ for spherical or toroidal).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TOL

Tolerance. Defaults to 1.e--4.

LOW

Name of low node component to be defined (optional).

HIGH

Name of high node component to be defined (optional).

Notes

Matching meshes are used for rotational (cyclic) symmetry, or for contact analysis using coupling or node-to-node gap elements. See Using CPCYC and MSHCOPY Commands in the *Modeling and Meshing Guide* for more information.

Menu Paths

Main Menu>Preprocessor>Modeling>Copy>Area Mesh

Main Menu>Preprocessor>Modeling>Copy>Line Mesh

MSHKEY, *KEY*

Specifies whether free meshing or mapped meshing should be used to mesh a model.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Key indicating the type of meshing to be used:

0

Use free meshing (the default).

1

Use mapped meshing.

2

Use mapped meshing if possible; otherwise, use free meshing. If you specify **MSHKEY (p. 1190)**,2, SmartSizing will be inactive even while free meshing non-map-meshable areas.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

As stated above, free meshing is the default. However, since the **MSHKEY (p. 1190)** and **MSHAPE (p. 1188)** settings are closely related, you should refer to the table in the **MSHAPE (p. 1188)** command description for more information about defaults.

Notes

This command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh>Areas>Mapped>3 or 4 sided

Main Menu>Preprocessor>Meshing>Mesh>Areas>Target Surf

Main Menu>Preprocessor>Meshing>Mesh>Volumes>Mapped>4 to 6 sided

---

MSHMID, *KEY*

Specifies placement of midside nodes.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Key indicating placement of midside nodes:

0

Midside nodes (if any) of elements on a region boundary follow the curvature of the boundary line or area (the default).

1

Place midside nodes of all elements so that element edges are straight. Allows coarse mesh along curves.

2

Do not create midside nodes (elements will have removed midside nodes).

Notes

This command is also valid for rezoning.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesher Opts

Main Menu>Solution>Manual Rezoning>Create Remesh Zone(s)>Mesh Controls>Global Meshing Options

---

MSHPATTERN, *KEY*

Specifies pattern to be used for mapped triangle meshing.

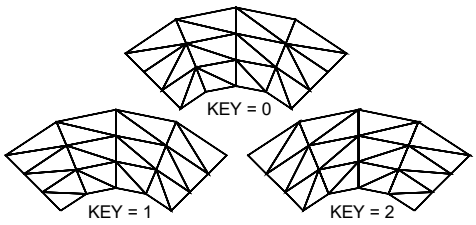
PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Key indicating triangle pattern to be used (the figures below illustrate the pattern that will be used for each value of *KEY*):

0



Allow Mechanical APDL choose the pattern (default). The program maximizes the minimum angle of the triangular-shaped elements that are created.

1

Unidirectional split at node I.

2

Unidirectional split at node J.

Notes

"Mapped triangle meshing" refers to the Mechanical APDL program's ability to take a map-meshable area and mesh it with triangular elements, based on the value of **MSHPATTERN (p. 1192)**,*KEY*. This type of meshing is particularly useful for analyses that involve the meshing of rigid contact elements.

This command is valid only when you have specified that Mechanical APDL use triangle-shaped elements (**MSHAPE (p. 1188)**,1,2D)--or you are meshing with an element that supports only triangles--*and* you have specified mapped meshing (**MSHKEY (p. 1190)**,1) to mesh an area.

For details about mapped meshing with triangles, see the *Modeling and Meshing Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

---

MSOLVE, *NUMSLV*, *VAL1*, *VAL2*, *Lab*, *ANGFIX*

Starts multiple solutions for an acoustic analysis.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NUMSLV

Number of multiple solutions (load steps). This number corresponds to the number of random samplings for the diffuse sound field in a random acoustic analysis, or the incident angles of the plane wave when the Floquet periodic boundary condition is present. Default = 1.

VAL1

The meaning of *VAL1* depends on the *Lab* value.

For *Lab* = DSF, *VAL1* is the norm convergence tolerance defined by comparing the averaged radiated diffuse sound power of two multiple sampling sets over the frequency range for the diffuse sound field (default = 0.05).

For *Lab* = APHI or ATHETA, *VAL1* is the beginning angle for the incident angle sweep of the plane wave (default = 0).

VAL2

The meaning of *VAL2* depends on the *Lab* value.

For *Lab* = DSF, *VAL2* is the interval of the norm convergence check for the diffuse sound field (default = 5).

For *Lab* = APHI or ATHETA, *VAL2* is the ending angle for the incident angle sweep of the plane wave (default = 0).

Lab

Label indicating the type of acoustic analysis:

DSF

Diffuse sound field with multiple solutions (default).

APHI

Plane wave angle sweep with fixed ϕ angle and varied θ angle (see the **APORT (p. 170)** command).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ATHETA

Plane wave angle sweep with fixed θ angle and varied ϕ angle (see the **APORT (p. 170)** command).

ANGFIX

The value of the fixed incident angle for the plane wave angle sweep (used only when *Lab* = APHI or ATHETA).

Notes

The **MSOLVE (p. 1193)** command starts multiple solutions (load steps) for a random acoustic analysis with multiple samplings or for the angle sweep of the incident plane wave with the Floquet periodic boundary condition, as described below.

Random Acoustic Analysis (*Lab* = DSF)

Use *Lab* = DSF for a random acoustic analysis. The process is controlled by the norm convergence tolerance (*VAL1*) or the number of multiple solutions (*NUMSLV*) if the solution steps reach the defined number.

The program checks the norm convergence by comparing two averaged sets of radiated sound powers with the interval *VAL2* over the frequency range. For example, if *VAL2* = 5, the averaged values from 5 solutions are compared with the averaged values from 10 solutions, then the averaged values from 10 solutions are compared with the averaged values from 15 solutions, and so on.

The incident diffuse sound field is defined via the **DFSWAVE (p. 529)** command.

The average result of multiple solutions with different samplings is calculated via the **PRAS (p. 1464)** or **PLAS (p. 1387)** command.

Plane Wave Incident Angle Sweep (*Lab* = APHI or ATHETA)

Use *Lab* = APHI or ATHETA to perform an angle sweep for the incident plane wave defined by the **APORT (p. 170)** command. The process is controlled by the number of multiple solutions (*NUMSLV*). The plane wave port must be defined with the default values of incident angles prior to the **MSOLVE (p. 1193)** command.

The sound power parameters are calculated over the sweeping angles during postprocessing by the **PRAS (p. 1464)** or **PLAS (p. 1387)** command.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MSOPT, *Option*, *Sname*, *Value1*, *Value2*, *Value3*, *Value4*, *Value5*, *Value6*, *Value7*

Specifies solution options for a multistage cyclic symmetry analysis.

PREP7 (p. 22): Special Purpose (p. 37)
SOLUTION (p. 38): Dynamic Options (p. 40)
POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Multistage cyclic symmetry analysis option. There is no default. You must choose one of the following options:

CSYS

Activates a previously defined cyclic coordinate system by the reference number specified in *Value1*. *Sname* is ignored. This option is only valid in the /PREP7 processor.

Value1

Cylindrical coordinate system reference number. You must have already created the coordinate system by issuing prior commands like **CS (p. 435)** or **LOCAL (p. 1059)** to define it. Defaults to 1 where the global Cartesian Z axis is the cyclic symmetry axis.

Note:

You must define the coordinate system before defining the stages.

NEW

Creates a new stage with the name entered in *Sname* and the *Value1* - *Value6* specifications listed in the table below. This option is only valid in the /PREP7 processor.

Sname

An alphanumeric name used to identify the stage. *Sname* may be up to 32 characters, beginning with a letter and containing only letters, numbers, and underscores. Names beginning with an underscore (for example, _LOOP) are reserved for use by Mechanical APDL and should be avoided. The component name ALL is not permitted.

Specifications for a new stage created via MSOPT (p. 1195) (*Option* = NEW):	
Argument	**Description**
Value1	The number of sectors.
Value2	The harmonic index.
Value3	The name of a component[a] containing all base sector elements (defaults to '_*Sname*_BASE_ELM').

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Value4	The name of a component[a] containing all base sector nodes (defaults to '*_Sname*_BASE_NOD').
Value5	The name of a component[a] containing all duplicate sector elements (defaults to '*_Sname*_DUPL_ELM)'. The duplicate sector[b] is not included in the analysis if this argument is blank and no '*_Sname*_DUPL_ELM' component exists.
Value6	The name of a component[a] containing all duplicate sector nodes (defaults to '*_Sname*_DUPL_NOD'). The duplicate sector[b] is not included in the analysis if this argument is blank and no '*_Sname*_DUPL_NOD' component exists.
Value7	The name of the lead harmonic stage if the stage being defined is a member of a multiharmonic group and is not the lead harmonic. **Note:** A multiharmonic group is composed of a single lead harmonic stage and one or more secondary harmonic stages formed by stage cloning. To properly set up the multiharmonic group, you must specify the name of the lead harmonic stage using *Value7* for all secondary harmonic stages or stage clones. Leave *Value7* blank if you are issuing **MSOPT (p. 1195)**,NEW to define: • the lead harmonic stage in a multiharmonic group • a stage that is not part of a multiharmonic group.

[a] Up to 256 characters (see **CM (p. 356)** command).

[b] A duplicate sector can always be present in the model even if it is not required in the analysis. For a more detailed discussion on duplicate sectors in multistage analyses, see Requirements for Stage Meshes in the *Multistage Cyclic Symmetry Analysis Guide*.

Important:

When creating a new stage, the base and duplicate sector meshes should be coincident. The offset between the number of base and duplicate coincident nodes is constant throughout the whole model. The same is true for the element numbers.

DELETE

Deletes the stage identified by *Sname*.

Sname

The name of the stage to be deleted. Entities such as nodes and elements contained in the stage are unaffected. Only the grouping and the related constraint equations are concerned.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EXPAND

Specifies stages (identified by *Sname*) and sectors (sector number specified in *Value1*) for subsequent expansion. This option is only valid in the /POST1 processor.

Sname

The name of the stage to be expanded. A value of 0 resets all expansion settings. A value of ALL means all existing stages will be expanded (default).

Value1

The sector number. A value of 0 resets all sector settings. A value of ALL means all sectors will be expanded (default).

LIST

Lists the stage identified by *Sname* with the level of detail specified in *Value1*.

Sname

The name of the stage to be listed. If blank, list all stages (default).

Value1

Key for specifying the level of detail.

0 (*or* OFF)

Basic listing (default).

1 (*or* ON)

Detailed listing, including constraint equations information. Note that the interstage constraint equations number information is only listed for the stage with the smallest number of sectors.

MODIFY

Sets the harmonic index of a stage identified by *Sname* to the integer specified in *Value1*.

Sname

The name of the stage to be modified.

Value1

The new harmonic index. Existing cyclic and multistage interface constraint equations will be deleted.

RESET

Deletes all stages and resets all multistage analysis settings.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **MSOPT (p. 1195)** command is used to specify solution options for a multistage cyclic symmetry analysis. It is not part of the **CYCLIC (p. 462)** procedure for a cyclic symmetry analysis.

When you issue **MSOPT (p. 1195)**,EXPAND, subsequent **SET (p. 1724)** commands read the data set from the specified `.rst` file and expand the nodes and elements to the stages and sectors specified via **MSOPT (p. 1195)**,EXPAND.

Example Usage

Example: Static Analysis of a Compressor Model with 4 Axial Stages Without a Duplicate Sector

Example: Linear Perturbation Modal Analysis of a Simplified Model with 2 Axial Stages and a Non-planar Interstage Boundary

Example: Modal Analysis of Turbomachinery Stage Modeled as 2 Radial Stages with Offset Cyclic Edge Starting Points

Example: Mutistage Multiharmonic Modal Analysis of a Hollow Cylinder Modeled Using 2 Stages

Example: Multiharmonic Linear Perturbation Modal Analysis of a Simplified Model with 3 Axial Stages

Menu Paths

This command cannot be accessed from a menu.

/MSTART, *Label*, *KEY*

Controls the initial GUI components.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Label identifying the GUI component:

ZOOM

Pan, Zoom, Rotate dialog box, off by default.

WORK

Offset Working Plane dialog box, off by default.

WPSET

Working Plane Settings dialog box, off by default.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ABBR

Edit Toolbar/Abbreviations dialog box, off by default.

PARM

Scalar Parameters dialog box, off by default.

SELE

Select Entities dialog box, off by default.

ANNO

Annotation dialog box, off by default.

HARD

Hard Copy dialog box, off by default.

UTIL

Activates the pre-6.1 (UIDL) GUI (off by default).

KEY

Switch value:

OFF or 0

Component does not appear when GUI is initialized.

ON or 1

Component appears when GUI is initialized.

Command Default

Same as *Label* defaults.

Notes

Controls which components appear when the Graphical User Interface (GUI) is initially brought up. This command is valid only *before* the GUI is brought up (**/MENU (p. 1121)**,ON) and is intended to be used in the `start.ans` file. It only affects how the GUI is *initialized*; you can always bring up or close any component once you are in the GUI.

This command is valid only at the Begin Level.

Menu Paths

This command cannot be accessed from a menu.

MSTOLE,*METHOD*,*Namesurf*,*Namefluid*

Adds two extra nodes from FLUID116 elements to SURF151 or SURF152 elements for convection analyses.

PREP7 (p. 22): Special Purpose (p. 37)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

METHOD

Mapping method:

0

Hybrid method (default).

1

Projection method.

2

Minimum centroid distance method.

Namesurf

Component name for a group of SURF151 or SURF152 elements. The component name must be 32 characters or less, and it must be enclosed in single quotes (for example, 'COM152') when the **MSTOLE (p. 1200)** command is manually typed in.

Namefluid

Component name for a group of FLUID116 elements. The component name must be 32 characters or less, and it must be enclosed in single quotes (for example, 'COM116') when the **MSTOLE (p. 1200)** command is manually typed in.

Notes

For convection analyses, the **MSTOLE (p. 1200)** command adds two extra nodes from FLUID116 elements to SURF151 or SURF152 elements by employing the specified mapping method. In the hybrid method, the projection method is tried first and if it fails the centroid distance method is used. The SURF151 or SURF152 elements and the FLUID116 elements must be grouped into components and named using the **CM (p. 356)** command.

The SURF151 or SURF152 extra node option must be set for two extra nodes (KEYOPT(5) = 2).

For more information, see Using the Surface Effect Elements in the *Thermal Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*MULT, *M1*, *T1*, *M2*, *T2*, *M3*

Performs the matrix multiplication M3 = $M1^{(T1)}$*$M2^{(T2)}$.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

M1

Name of matrix *M1*. Must have been previously specified by a ***DMAT (p. 551)** or ***SMAT (p. 1801)** command.

T1

Transpose key. Set *T1* = TRANS to use the non-conjugate transpose of *M1*. Set *T1* = CTRANS to use the conjugate transpose of *M1*. CTRANS is only applicable when the *M1* matrix is complex. If blank, transpose will not be used.

M2

Name of matrix *M2*. Must have been previously specified by a ***DMAT (p. 551)** command.

T2

Transpose key. Set *T2* = TRANS to use the non-conjugate transpose of *M2*. Set *T2* = CTRANS to use the conjugate transpose of *M2*. CTRANS is only applicable when the *M2* matrix is complex. If blank, transpose will not be used.

M3

Name of resulting matrix, *M3*. Must be specified.

Notes

The matrices must be dimensionally consistent such that the number of columns of *M1* (or the transposed matrix, if requested) is equal to the number of rows of *M2* (or the transposed matrix, if requested).

You cannot multiply two sparse matrices with this command (that is, *M1* and *M2* cannot both be sparse). The resulting matrix, *M3*, will always be a dense matrix, no matter what combination of input matrices is used (dense*sparse, sparse*dense, or dense*dense).

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*MWRITE,*ParR*,*Fname*,*Ext*,--,*Label*,*n1*,*n2*,*n3*

Writes a matrix to a file in a formatted sequence.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the array parameter. See ***SET (p. 1720)** for name restrictions.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

If the file name fields are left blank, the default file is the current output file.

Ext

Filename extension (eight-character maximum).

--

Unused field.

Label

Can use a value of IJK, IKJ, JIK, JKI, KIJ, KJI, or blank (JIK).

n1, n2, n3

Write as (((*ParR*(i,j,k), k = 1,n1), i = 1, n2), j = 1, n3) for *Label* = KIJ. *n1*, *n2*, and *n3* default to the corresponding dimensions of the array parameter ParR.

Notes

Writes a matrix or vector to a specified file in a formatted sequence. You can also use the ***VWRITE (p. 2174)** command to write data to a specified file. Both commands contain format descriptors on the line immediately following the command. The format descriptors can be in either FORTRAN or C format.

FORTRAN format descriptors are enclosed in parentheses. They must immediately follow the ***MWRITE (p. 1202)** command on a separate line of the same input file. The word FORMAT should not be included. The format must specify the number of fields to be written per line, the field width, the placement of the decimal point, etc. There should be one field descriptor for each data item written. The write operation uses the available system FORTRAN FORMAT conventions (see your system FORTRAN manual). Any standard FORTRAN *real* format (such as (4F6.0), (E10.3,2X,D8.2), etc.) and character format (A) may be used. Integer (I) and list-directed (*) descriptors may *not* be used. Text may be included in

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the format as a quoted string. *The FORTRAN descriptor must be enclosed in parentheses* and the format must not exceed 80 characters (including parentheses).

The "C" format descriptors are used if the first character of the format descriptor line is not a left parenthesis. "C" format descriptors may be up to 80 characters long, consisting of text strings and predefined "data descriptors" between the strings where numeric or alphanumeric character data are to be inserted. The normal descriptors are %I for integer data, %G for double precision data, %C for alphanumeric character data, and %/ for a line break. There must be one data descriptor for each specified value in the order of the specified values. The enhanced formats described in ***MSG (p. 1185)** can also be used.

The starting array element number must be defined. Looping continues in the directions indicated by the Label argument. The number of loops and loop skipping may also be controlled via ***VLEN (p. 2136)** and ***VMASK (p. 2139)**, which work in the *n2* direction (by row on the output file), and by ***VCOL (p. 2077)** , which works in the *n1* direction (by column in the output file). The vector specifications ***VABS (p. 2072)** and ***VFACT (p. 2092)** apply to this command, while ***VCUM (p. 2080)** does not apply to this command. See ***VOPER (p. 2142)** for details. If you are in the GUI, the ***MWRITE (p. 1202)** command must be contained in an externally prepared file and read into Mechanical APDL (that is, ***USE (p. 2059)**, **/INPUT (p. 948)**, etc.).

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Parameters>Write to File

MXPAND,*NMODE*,*FREQB*,*FREQE*,*Elcalc*,*SIGNIF*,*MSUPkey*,*ModeSelMethod*,*EngCalc*

Specifies modal or buckling analysis expansion options.

SOLUTION (p. 38): Dynamic Options (p. 40)
SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NMODE

Number of modes or array name (enclosed in percent signs) to expand and write. If blank or ALL, expand and write all modes within the frequency range specified. If -1, do not expand and do not write modes to the results file during the analysis. If an array name is input, the array must contain 1 for the expanded modes and zero otherwise, where the array index corresponds to the mode number. To specify an array containing the individual modes to expand, enclose the array name in percent (%) signs (for example, **MXPAND (p. 1203)**,%arrname%). Use the ***DIM (p. 530)** command to define the array.

FREQB

Beginning, or lower end, of frequency range of interest. If *FREQB* and *FREQE* are both blank, expand and write the number of modes specified without regard to the frequency range. Defaults to the entire range.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FREQE

Ending, or upper end, of frequency range of interest.

Elcalc

Element calculation key:

NO

Do not calculate element results, reaction forces, and energies (default).

YES

Calculate element results, reaction forces, energies, and the nodal degree of freedom solution.

SIGNIF

Expand only those modes whose significance level exceeds the *SIGNIF* threshold (only applicable when *ModeSelMethod* is defined).

If *ModeSelMethod* = MODC, the significance level of a mode is defined as the mode coefficient divided by the maximum mode coefficient of all modes.

If *ModeSelMethod* = EFFM, the significance level of a mode is defined as the modal effective mass, divided by the total mass.

If *ModeSelMethod* = DDAM, the significance level of a mode is defined as the modal effective weight, divided by the total weight.

Any mode whose significance level is less than *SIGNIF* is considered insignificant and is not expanded. The higher the *SIGNIF* threshold, the fewer the number of modes expanded. *SIGNIF* defaults to 0.001, except for the case of DDAM mode selection method where it defaults to 0.01. If *SIGNIF* is specified as 0.0, it is taken as 0.0.

MSUPkey

Element result superposition key:

NO

Do not write element results to the mode file `Jobname.mode`.

YES

Write element result to the mode file for use in the expansion pass of a subsequent mode-superposition PSD, spectrum, transient, or harmonic analysis. This value is the default if all of the following conditions exist:

- *Elcalc* = YES.
- The mode shapes are normalized to the mass matrix.
- *FREQB* and *FREQE* are blank or 0.0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- No superelement is defined.

ModeSelMethod

Methods for mode selection (not supported for complex eigensolvers):

blank

No mode selection is performed (default).

EFFM

The mode selection is based on the modal effective masses.

MODC

The mode selection is based on the mode coefficients.

DDAM

The mode selection is based on DDAM procedure (see Mode Selection Based on the DDAM Method in the *Structural Analysis Guide* for more information).

EngCalc

Additional element energies calculation key:

NO

Do not calculate additional energies (default).

YES

Calculate average, amplitude, and peak values for the following: stiffness and kinetic energies, and damping energy.

Command Default

Mode shapes (displacements) are expanded and output to the results file (so that if you need to inspect the mode shapes, it is not necessary to run the analysis again). Element stresses are not expanded.

Notes

Specifies the number of modes to expand and write over a frequency range for a modal (**ANTYPE (p. 162)**,MODAL) or buckling (**ANTYPE (p. 162)**,BUCKLE) analysis. If used in SOLUTION, this command is valid only within the first load step.

There is no limit on the number of expanded modes (*NMODE*). However, there *is* a limit on the maximum number of modes used via the ***GET (p. 797)**,,MODE (p. 831) command, mode combinations, and the **MDAMP (p. 1117)** command.

With *MSUPkey* = YES, the computed element results (*Elcalc* = YES) are written to `Jobname.mode` for use in subsequent downstream mode-superposition analyses, including harmonic, transient, and all spectrum analyses. This significantly reduces computation time for the combination or expansion passes.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For limitations and available elemental results, see Option: Number of Modes to Expand (**MXPAND**) in the *Structural Analysis Guide*.

The calculation of additional energies (*EngCalc* = YES) is valid only for *Method* = DAMP on the **MODOPT (p. 1140)** command and *Method* = QRDAMP with *Cpxmod* = CPLX on the **MODOPT (p. 1140)** command. The average, amplitude, and peak potential energies for complex results (see Potential Energy (or Stiffness Energy) for Complex Results) calculated for a linear perturbation full harmonic analysis with a nonlinear base analysis are approximate solutions and may not be accurate.

If a mode selection method (*ModeSelMethod*) is defined, only the selected modes will be expanded. See Using Mode Selection in the *Structural Analysis Guide* for more details about the procedure.

For array input (*NMODE*), the array must be dimensioned to be the size of the number of modes extracted (*NMODE* on the **MODOPT (p. 1140)** command). A value of 1 in the array indicates the mode is to be expanded, and a value of 0 indicates not to expand the mode. For the DAMP modal solution, the modes are in pairs, so be sure to verify that both modes of a pair have the same value. (For example, if modes #3 and #4 are a pair, indices 3 and 4 in the array should have the same value, 0 or 1.)

For linear perturbation modal analyses, you must set both *Elcalc* and *MSUPkey* to YES so that the downstream stress expansion pass can produce a solution consistent with the linear or nonlinear base (static or full transient) analysis. The prestressed nonlinear element history (saved variables) is accessible only in the first and second phases of the linear perturbation. The downstream mode superposition analysis (such as MSUP or PSD) can only reuse the nonlinear information contained in the `Jobname.mode` file that is generated in the linear perturbation.

In a distributed-memory parallel (DMP) analysis, you must issue **MXPAND (p. 1203)** to specify the number of modes to expand when computing the modes and mode shapes. In a DMP run, **MXPAND (p. 1203)** cannot be issued in an expansion pass (**EXPASS (p. 714)**).

This command is also valid in PREP7.

N Commands

N, *NODE*, *X*, *Y*, *Z*, *THXY*, *THYZ*, *THZX*

Defines a node.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Node number to be assigned. A previously defined node of the same number will be redefined. Defaults to the maximum node number used +1.

X, Y, Z

Node location in the active coordinate system (R, θ, Z for cylindrical, R, θ, Φ for spherical or toroidal). If *X* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

THXY

First rotation about nodal Z (positive X toward Y).

THYZ

Second rotation about nodal X (positive Y toward Z).

THZX

Third rotation about nodal Y (positive Z toward X).

Notes

Defines a node in the active coordinate system (**CSYS (p. 441)**). The nodal coordinate system is parallel to the global Cartesian system unless rotated. Rotation angles are in degrees and redefine any previous rotation angles. See the **NMODIF (p. 1247)**, **NANG (p. 1208)**, **NROTAT (p. 1264)**, and **NORA (p. 1252)** commands for other rotation options.

Menu Paths

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NANG, *NODE, X1, X2, X3, Y1, Y2, Y3, Z1, Z2, Z3*

Rotates a nodal coordinate system by direction cosines.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Rotate coordinate system of this node.

X1, X2, X3

Global X, Y, Z components of a unit vector in new nodal X direction.

Y1, Y2, Y3

Global X, Y, Z components of a unit vector in new nodal Y direction.

Z1, Z2, Z3

Global X, Y, Z components of a unit vector in new nodal Z direction.

Notes

Rotates a nodal coordinate system to the orientation specified by the X, Y and Z direction cosines. Existing rotation specifications on the node are redefined. If only two of the three unit vectors are specified, the third is defined according to the right hand rule. It is the responsibility of the user to ensure that input direction cosines are orthogonal in a right-handed system.

See the **NMODIF (p. 1247)**, **NROTAT (p. 1264)**, and **NORA (p. 1252)** commands for other rotation options.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Nodes>RotateNode>By Vectors

Main Menu>Preprocessor>Modeling>Move / Modify>RotateNode>By Vectors

NAXIS, *Action, Val*

Generates nodes for general axisymmetric element sections.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Specifies one of the following command behaviors:

GEN

Generates nodes around the axis of an axisymmetric section (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CLEAR

Clears all nodes around the axis of an axisymmetric section.

EFACET

Specifies the number of facets per edge between nodal planes and integration planes in the circumferential direction to display using PowerGraphics. This option is only valid with **/ESHAPE (p. 665)**,1 and **RSYS (p. 1639)**,SOLU commands.

Val

Tolerance value *or* number of facets per edge:

TOLER

When *Action* = GEN, the tolerance to use for merging the generated nodes around the axis.

NUM

When *Action* = EFACET, the number of facets per element edge for element plots:

AUTO

Use program-chosen facets per edge (default).

1

Use 1 facet per edge (default for elements with 9, 10, 11, or 12 nodal planes). Shows nodal and integration planes only.

2

Use 2 facets per edge (default for elements with 5, 6, 7, or 8 nodal planes, and maximum for elements with 9, 10, 11, or 12 nodal planes).

3

Use 3 facets per edge (default for elements with 3 or 4 nodal planes, and maximum for elements with 6, 7, or 8 nodal planes).

4

Use 4 facets per edge (maximum for elements with 5 nodal planes).

5

Use 5 facets per edge (maximum for elements with 4 nodal planes).

6

Use 6 facets per edge (maximum for elements with 3 nodal planes).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **NAXIS (p. 1208)** command generates or clears the nodes for general axisymmetric element sections. The command applies to elements SURF159, SOLID272, and SOLID273.

The generate option (*Action* = GEN) operates automatically on any current-technology axisymmetric element. Any nodes within the tolerance value (*TOLER*) of the axis are merged into a single node. The default tolerance is 1.0e-4.

If you want to change the number of nodes, use the clear option (*Action* = CLEAR) before regenerating the nodes.

To cause the 3D element plot to appear more like the actual 3D model, use **NAXIS (p. 1208)**,EFACET,*NUM*, where *NUM* > 1. In this case, the coordinate system specified for displaying element and nodal results (RSYS) must be solution (**RSYS (p. 1639)**,SOLU); otherwise, Ansys resets *NUM* to 1.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Nodes>About AXIS Section

---

NCNV, *KSTOP*, *DLIM*, *ITLIM*, *ETLIM*, *CPLIM*

Sets the key to terminate an analysis.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KSTOP

Program behavior upon nonconvergence:

0

Do not terminate the analysis if the solution fails to converge.

1

Terminate the analysis and the program execution if the solution fails to converge (default).

2

Terminate the analysis, but not the program execution, if the solution fails to converge.

DLIM

Terminates program execution if the largest nodal DOF solution value (displacement, temperature, etc.) exceeds this limit. Defaults to 1.0E6 for all DOF except MAG and A. Defaults to 1.0E10 for MAG and A.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ITLIM

Terminates program execution if the cumulative iteration number exceeds this limit (defaults to infinity).

ETLIM

Terminates program execution if the elapsed time (seconds) exceeds this limit (defaults to infinity).

CPLIM

Terminates program execution if the CPU time (seconds) exceeds this limit (defaults to infinity).

Command Default

As described for each argument above.

Notes

Sets the key to terminate an analysis if not converged, or if any of the following limits are exceeded for nonlinear and full transient analyses: DOF (displacement), cumulative iteration, elapsed time, or CPU time limit. Applies only to static and transient analyses (**ANTYPE (p. 162)**,STATIC and **ANTYPE (p. 162)**,TRANS). Time limit checks are made at the end of each equilibrium iteration.

This command is also valid in PREP7.

Menu Paths

Main Menu>Solution>Analysis Type>Sol'n Controls>Advanced NL

Main Menu>Solution>Load Step Opts>Nonlinear>Criteria to Stop

NDELE,*NODE1*,*NODE2*,*NINC*

Deletes nodes.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE1*, *NODE2*, *NINC

Delete nodes from *NODE1* to *NODE2* (defaults to *NODE1*) in steps of *NINC* (defaults to 1). If *NODE1* = ALL, *NODE2* and *NINC* are ignored and all selected nodes (**NSEL (p. 1266)**) are deleted. If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE1*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Deletes selected nodes that are not connected to elements. Nodes may also be redefined instead of deleted, if desired. Boundary conditions (displacements, forces, etc.) as well as any coupling or constraint equations containing the deleted nodes are also deleted.

This command is also valid in the **/MAP (p. 1107)** processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Circuit>Delete Elements

Main Menu>Preprocessor>Modeling>Delete>Nodes

NDIST, *ND1*, *ND2*

Calculates and lists the distance between two nodes.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ND1

First node in distance calculation. If *ND1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

ND2

Second node in distance calculation.

Notes

NDIST (p. 1212) lists the distance between nodes *ND1* and *ND2*, as well as the current coordinate system offsets from *ND1* to *ND2*, where the X, Y, and Z locations of *ND1* are subtracted from the X, Y, and Z locations of *ND2* (respectively) to determine the offsets. **NDIST (p. 1212)** is valid in any coordinate system except toroidal (**CSYS (p. 441)**,3).

NDIST (p. 1212) returns a variable, called "*_RETURN*," which contains the distance value. You can use this value for various purposes, such as the calculation of distributed loads. In interactive mode, you can access this command by using the Model Query Picker (**Utility Menu> List> Picked Entities**), where you can also access automatic annotation functions and display the value on your model.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Check Geom>ND distances

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NDSURF, *Snode*, *Telem*, *DIMN*

Generates surface elements overlaid on the edge of existing elements and assigns the extra node as the closest fluid element node.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Snode

Component name for the surface nodes of the solid elements. The component name must be 32 characters or less.

Telem

Component name for the target fluid elements. The component name must be 32 characters or less.

DIMN

Model dimensionality:

2

2D model.

3

3D model.

Notes

This command macro is used to generate surface effect elements (SURF151 or SURF152) overlaid on the surface of existing plane or solid elements and, based on proximity, to determine and assign the extra node (FLUID116) for each surface element. The active element type must be SURF151 or SURF152 with appropriate settings for KEYOPT(4), KEYOPT(5), KEYOPT(6), and KEYOPT(8).

The surface nodes of the plane or solid elements must be grouped into a node component and the fluid elements must be grouped into an element component and named using the **CM (p. 356)** command. The names must be enclosed in single quotes (for example, 'NOD') when the **NDSURF (p. 1213)** command is manually typed in.

When using the GUI method, node and element components are created through the picking dialog boxes associated with this command.

The macro is applicable for the SURF151, SURF152, and FLUID116 element types.

---

NEQIT,*NEQIT*,*FORCEkey*

Specifies the maximum number of equilibrium iterations for nonlinear analyses.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NEQIT

Maximum number of equilibrium iterations allowed each substep.

FORCEkey

One iteration forcing key:

FORCE

Forces one iteration per substep. Leave this field blank otherwise.
Using one iteration per substep may result in unconverged solutions for nonlinear analysis, and the program may not indicate divergence in this case. This option is intended primarily for use by the Ansys Workbench interface. Keep in mind that forcing one iteration per substep is only recommended under very specific conditions; for example, nonlinearity in bonded penalty type contact. Under these conditions the solution typically converges in one iteration.

Command Default

The maximum number of equilibrium iterations per substep is set between 15 and 26, depending on the physics of the problem.

Notes

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Sol'n Controls>Nonlinear

Main Menu>Preprocessor>Loads>Load Step Opts>Nonlinear>Equilibrium Iter

Main Menu>Solution>Analysis Type>Sol'n Controls>Nonlinear

Main Menu>Solution>Load Step Opts>Nonlinear>Equilibrium Iter

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/NERR, *NMERR*, *NMABT*, - -, *IFKEY*, *NUM*

Limits the number of warning and error messages displayed.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NMERR

Maximum number of warning and error messages displayed per command. Defaults to 5 for interactive runs with the GUI turned on, 20 for interactive runs with the GUI turned off, 200 for batch runs. If *NMERR* is negative, the absolute value of *NMERR* is used as the maximum number of warning and error messages written to the error file (`Jobname.err`) per command, as well as the maximum number of messages displayed per command.

NMABT

Maximum number of warning and error messages allowed per command before run aborts (must be greater than zero). Maximum value is 99,999,999. Defaults to 10,000.

- -

Unused field.

IFKEY

Specifies whether or not to abort if an error occurs during a **/INPUT (p. 948)** operation:

0 *or* OFF

Do not abort. This option is the default.

1 *or* ON

Abort.

NUM

The number of invalid command warnings before a stop warning will be issued:

0

Disables the stop warning/error function.

n

An integer value representing the number of warnings that will be encountered before prompting the user to stop (default = 5). The first error encountered will ALWAYS result in a prompt.

Note:

Invalid command warnings and error tracking are mutually exclusive.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

As described above.

Notes

Limits the number of warning and error messages displayed for any one command in an interactive run.

Warning and error messages continue to be written to `Jobname.err` regardless of these limits, unless *NMERR* is negative. There is no way to totally suppress writing of warning and error messages to the error file.

Issue this command with *NUM* = *n* to specify the number of "invalid command" warnings to be encountered before the user is prompted to stop. You can then continue or abort the run. If you choose to abort the run, the log file can be saved so that any of the processing up to that point can be appended to an input that rectifies the condition. A batch run always aborts on the first error. Issue **/NERR (p. 1215)**,STAT to list current settings.

Issue **/NERR (p. 1215)**,DEFA to reset values to initial defaults.

An *IFKEY* value of 1 or ON causes Mechanical APDL to terminate immediately upon encountering an error during a file **/INPUT (p. 948)** operation. However, use of this option may cause the following conditions to occur:

- The **/INPUT (p. 948)** command may abort if issued for a log file (*jobname*`.log`).
- Some macros may terminate.
- A CAD connection may fail after reading only a small portion of a CAD model.

The command is valid in any processor.

Menu Paths

Utility Menu>MenuCtrls>Message Controls

NFORCE, *ITEM*

Sums the nodal forces and moments of elements attached to nodes.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITEM

Specifies the selected set of nodes for summing forces and moments for contact elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(blank)

Sums the nodal forces of elements for all selected nodes and excludes contact elements (elements 169-177).

CONT

Sums the nodal forces of elements for contact nodes only.

BOTH

Sums the nodal forces of elements for all selected nodes, including contact elements.

Notes

Sums and prints, in each component direction for each selected node, the nodal force and moment contributions of the selected elements attached to the node. If all elements are selected, the sums are usually zero except where constraints or loads are applied. The nodal forces and moments may be displayed (**/PBC (p. 1356)**,FORC and **/PBC (p. 1356)**,MOME). Use **PRESOL (p. 1481)** to print nodal forces and moments on an element-by-element basis. You can use the **FORCE (p. 772)** command to specify which component (static, damping, inertia, or total) of the nodal load is to be used. Nodal forces associated with surface loads are not included.

This vector sum is printed in the global Cartesian system. Moment summations are about the global origin unless another point is specified with the **SPOINT (p. 1836)** command. The summations for each node are printed in the global Cartesian system unless transformed (**RSYS (p. 1639)**). This command is generally not applicable to axisymmetric models because moment information from the NFORCE command is not correct for axisymmetric elements.

Selecting a subset of elements (**ESEL (p. 661)**) and then issuing this command will give the forces and moments required to maintain equilibrium of that set of elements. The effects of nodal coupling and constraint equations are ignored. The option *ITEM* = CONT provides the forces and moments for the contact elements (CONTA172, CONTA174, CONTA175, and CONTA177). Setting *ITEM* = BOTH provides the forces and moments for all selected nodes, including contact elements.

This command also includes the **FSUM (p. 780)** command function which vectorially sums and prints, in each component direction for the total selected node set, the nodal force and moment contributions of the selected elements attached to the selected node set.

Using NFORCE (p. 1216) in a Spectrum or PSD Analysis (ANTYPE (p. 162), SPECTR)

When using **NFORCE (p. 1216)** in a spectrum analysis (after the combination file has been input through **/INPUT (p. 948)**,,MCOM and when **SPOPT (p. 1837)** has not been issued with *Elcalc* = YES during the spectrum analysis), or in a PSD analysis when postprocessing 1-sigma results (loadstep 3, 4, or 5), the following message will display in the printout header:

```
(Spectrum analysis summation is used)
```

This message means that the summation of the element nodal forces is performed prior to the combination of those forces. In this case, **RSYS (p. 1639)** does not apply. The forces are in the nodal coordinate systems, and the vector sum is always printed in the global coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The spectrum analysis summation is available when the element results are written to the mode file, Jobname.mode (*MSUPkey* = Yes on the **MXPAND (p. 1203)** command).

Because modal displacements cannot be used to calculate contact element nodal forces, *ITEM* does not apply to spectrum and PSD analyses.

Menu Paths

Main Menu>General Postproc>Nodal Calcs>Sum @ Each Node

NGEN, *ITIME*, *INC*, *NODE1*, *NODE2*, *NINC*, *DX*, *DY*, *DZ*, *SPACE*

Generates additional nodes from a pattern of nodes.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITIME*, *INC

Do this generation operation a total of *ITIME* times, incrementing all nodes in the given pattern by *INC* each time after the first. *ITIME* must be > 1 for generation to occur.

NODE1*, *NODE2*, *NINC

Generate nodes from the pattern of nodes beginning with *NODE1* to *NODE2* (defaults to *NODE1*) in steps of *NINC* (defaults to 1). If *NODE1* = ALL, *NODE2* and *NINC* are ignored and the pattern is all selected nodes (**NSEL (p. 1266)**). If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE1* (*NODE2* and *NINC* are ignored).

DX*, *DY*, *DZ

Node location increments in the active coordinate system (DR, Dθ, DZ for cylindrical, DR, Dθ, DΦ for spherical or toroidal).

SPACE

Spacing ratio. Ratio of last division size to first division size. If > 1.0, divisions increase. If < 1.0, divisions decrease. Ratio defaults to 1.0 (uniform spacing).

Note:

The *average* spacing ratio remains 1.0, such that the location of the last generated set will be the same regardless of *SPACE*. *SPACE* only serves to skew the position of the nodes between the pattern set and the last set.

Notes

Generates additional nodes from a given node pattern. Generation is done in the active coordinate system. Nodes in the pattern may have been generated in any coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is also valid in the **/MAP (p. 1107)** processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Copy>Nodes>Copy

NKPT, *NODE*, *NPT*

Defines a node at an existing keypoint location.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Arbitrary reference number for node. If zero or blank, defaults to the highest node number +1 (**NUMSTR (p. 1301)**).

NPT

Keypoint number defining global X, Y, Z location. If *NPT* = All, then a node will be placed at each selected keypoint. If *NPT* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NPT*.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Nodes>On Keypoint

NLADAPTIVE, *Component*, *Action*, *Criterion*, *Option*, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*, *VAL7*

Defines the criteria under which the mesh is refined or modified during a nonlinear solution.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Component

Specifies the element component upon which this command should act:

ALL

All selected components, or all selected elements if no component is selected (default).

Name

Component name.

Action

Action to perform on the selected component(s):

ADD

Add a criterion to the database.

LIST

List the criteria defined for the specified component(s).

DELETE

Delete the criteria defined for the specified component(s).

ON

Enable the defined criteria for the specified component(s) and specify how frequently and when to check them (via ON,,,*VAL1*,*VAL2*,*VAL3*):

VAL1 -- Checking frequency. If > 0, check criteria at every *VAL1* substeps. If < 0, check criteria at each of the *VAL1* points (approximately equally spaced) between *VAL2* and *VAL3*. (Default = -1.)

VAL2 -- Checking start time, where *VAL2* < *VAL3*. (Default = Start time of load step.)

VAL3 -- Checking end time, where *VAL3* > *VAL2*. (Default = End time of load step.)

VAL4 -- SOLID187 element type ID (defined prior to issuing this command). Valid only for SOLID185 or SOLID186 components in a NLAD-ETCHG analysis.

OFF

Disable the defined criteria for the specified component(s).

Criterion

Type of criterion to apply to the selected component(s):

CONTACT

Contact-based. Valid only for *Action* = ADD, *Action* = LIST, or *Action* = DELETE.

ENERGY

Energy-based. Valid only for *Action* = ADD, *Action* = LIST, or *Action* = DELETE.

BOX

A position-based criterion, defined by a box. Valid only for *Action* = ADD, *Action* = LIST, or *Action* = DELETE.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MESH

A mesh-quality-based criterion. Valid only for *Action* = ADD, *Action* = LIST, or *Action* = DELETE.

AM

Criterion used with Additive Manufacturing analyses. Valid only for *Action* = ADD, *Action* = LIST, or *Action* = DELETE.

ALL

All criteria and options. Valid only for *Action* = LIST or *Action* = DELETE. *Option* and all subsequent arguments are ignored.

Option

Criterion option to apply to the selected component(s):

NUMELEM

For target elements only, defines the minimum number of contact elements to contact with each target element. If this criterion is not satisfied, the program refines the contact elements and the associated solid elements. For this option, *VAL1* must be a positive integer.

Valid only for *Criterion* = CONTACT and *Action* = ADD, LIST, or DELETE.

MEAN

Checks the strain energy of any element that is part of the defined component for the condition $E_e \geq c_1 * E_{total} / NUME$ (where c_1 = *VAL1*, E_{total} is the total strain energy of the component, and *NUME* is the number of elements of the component). If this criterion is satisfied at an element, the program refines the element. *VAL1* must be non-negative. Default = 1.

Valid only for *Criterion* = ENERGY and *Action* = ADD, LIST, or DELETE.

XYZRANGE

Defines the location box in which all elements within are to be split or refined. Up to six values following the *Option* argument (representing the x1, x2, y1, y2, z1, and z2 coordinates) are allowed. An unspecified coordinate is not checked.

Valid only for *Criterion* = BOX and *Action* = ADD, LIST, or DELETE.

OCTREE

Sets octree options for AM octree adaptive meshing for additive simulations.

VAL1 – Number of layers to keep at fine mesh resolution between the current, top layer and the layers to be remeshed. Default = 2.

VAL2 – Number of buffer elements to keep at fine mesh resolution between the part edges and the remeshed elements. Default = 2.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Valid only for *Criterion* = AM and *Action* = ADD, LIST, or DELETE.

SKEWNESS

Mesh-quality-control threshold for elements SOLID187, SOLID285, and SOLID227:

VAL1 – Defines skewness. Valid values: 0.0 through 1.0. Default = 0.9.

VAL2 – Maximum Jacobian ratio at element integration points (SOLID187 and SOLID227 only). Valid values: 0.0 to 1.0. Default = 0.1.

Valid only for *Criterion* = MESH and *Action* = ADD, LIST, or DELETE.

SHAPE

Mesh-quality control threshold for elements PLANE182 and PLANE222. Also applies to SOLID185 and SOLID186 in a NLAD-ETCHG analysis.

VAL1 -- Maximum corner angle of an element in degrees. Valid values are 0 through 180. Default = 160 (2D analysis) or 155 (3D analysis). An element is remeshed when any of its corner angles reach the specified value.

Valid only for *Criterion* = MESH and *Action* = ADD, LIST, or DELETE.

WEAR

For contact elements having surface wear specified (**TB (p. 1899)**,WEAR) only, defines *VAL1* as a critical ratio of magnitude of wear to the average depth of the solid element underlying the contact element. Once this critical ratio is reached for any element, the program morphs the mesh to improve the quality of the elements. *VAL1* must be a positive integer.

Valid only for *Criterion* = CONTACT and *Action* = ADD, *Action* = LIST, or *Action* = DELETE. Cannot be combined with any other option during solution.

CZM

For contact elements with cohesive zone material (**TB (p. 1899)**,CZM) only, defines *VAL1* as a critical value of change in released energy due to debonding between reference and current substep, and *VAL2* as the critical value for the change in the damage parameter between neighboring elements. Both values can be applied separately or together.

When the critical value is reached (for either of the defined options) for one contact element, the solid elements underlying that contact element and the corresponding deformable target element are selected as candidates for remeshing.

Required: *VAL1* > 0, and $1 \leq$ *VAL2* ≤ 1. No default.

If issuing **NLMESH (p. 1240)**,,,*VAL3* where *VAL3* > 1.0, the criterion also checks for coarsening of solid elements underlying the debonded contact element and the corresponding deformable target element.

Valid only for *Criterion* = CONTACT and *Action* = ADD, LIST, or DELETE. Combining the CZM criterion with mesh-quality-based criteria may be necessary to improve distorted elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

All options. Valid only for *Action* = LIST or *Action* = DELETE. All subsequent arguments are ignored.

Notes

If a specified component (*Component*) is an assembly, the defined criterion applies to all element components included in the assembly.

All components must be defined and selected *before* the first solve (**SOLVE (p. 1822)**), although their nonlinear adaptivity criteria can be modified from load step to load step, and upon restart. For nonlinear adaptivity to work properly, ensure that all components are selected before each solve.

After issuing this command to define a new criterion, the new criterion becomes active. The program checks the new criterion once per load step, roughly in mid-loading (unless this behavior is changed via *Action* = ON).

When a criterion is defined, it overwrites a previously defined criterion (if one exists) through the same component, or through the component assembly that includes the specified component.

During solution, the same criteria defined for an element through different components are combined, and the tightest criteria and action control (*Action*,ON,,,*VAL1*) are used. If an ON action is defined by a positive *VAL1* value through one component and a negative *VAL1* value through another, the program uses the positive value.

When the AM octree option is specified (*Action* = ADD, *Criterion* = AM, *Option* = OCTREE), the checking frequency (*Action*,ON,,,*VAL1*), checking start time (*Action*,ON,,,*VAL2*), and checking end time (*Action*,ON,,,*VAL3*) control the checking layer frequency, start layer, and end layer respectively. If start and end layers are not specified, the start layer will default to the checking frequency, and the end layer will default to the final layer of the AM simulation.

Action = ON

If *VAL1* < 0, the program checks *VAL1* points between *VAL2* and *VAL3*. The time interval between each check points is determined by (*VAL3* - *VAL2*) / (*VAL1* + 1), with the first check point as close to *VAL2* + (*VAL3* - *VAL2*) / (*VAL1* + 1) as possible. Fewer check points can be used if the number of substeps during solution is insufficient (as the program can only check at the *end* of a substep).

If *VAL2* (start time) and/or *VAL3* (end time) are unspecified or invalid, the program uses the start and/or end time (respectively) of the load step.

Option = SKEWNESS

VAL1 applies to tetrahedral elements SOLID187, SOLID227, and SOLID285. When the skewness of an element is >= *VAL1*, the element is used as the core (seed) element of the remeshed region(s). The most desirable skewness value is 0, applicable when the element is a standard tetrahedral element; the highest value is 1, applicable when the element becomes flat with zero volume. To bypass skewness checking (not recommended), set *VAL1* = 0.

VAL2 represents the Jacobian ratio and is required for tetrahedral elements SOLID187 and SOLID227. When the maximum Jacobian ratio of an element is <= *VAL2*, the element is used as the core (seed)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

element of the remeshed region(s). The most desirable maximum Jacobian ratio is 1, when the element is a standard tetrahedral element; the lowest reported value is -1, when the element is turned inside out. To bypass maximum Jacobian ratio checking (not recommended), set *VAL2* = 0.

If this criterion is used with any other criteria defined for the same component, and a mesh change is requested at the same substep, *all* criteria defined are considered together. For more information about this special case, see Simultaneous Quality- and Refinement-Based Remeshing in the *Nonlinear Adaptivity Analysis Guide*.

Resources

For more information about skewness, maximum Jacobian ratio, and remeshing, see Nonlinear Mesh Adaptivity in the *Nonlinear Adaptivity Analysis Guide*.

For more granular control of the source mesh geometry, see **NLMESH (p. 1240)**.

Menu Paths

This command cannot be accessed from a menu.

NLDIAG, *Label*, *Key*, *MAXFILE*

Sets nonlinear diagnostics functionality.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Diagnostic function:

NRRE

Store the Newton-Raphson residuals information.

EFLG

Identify or display elements or nodes that violate the criteria.

CONT

Write contact information to a single `Jobname.cnd` diagnostic text file during solution.

Key

Diagnostic function characteristics:

OFF or 0

Suppresses writing of diagnostic information (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON or 1

Writes diagnostic information to the Jobname.nd*xxx*, Jobname.nr*xxx*, or Jobname.cnd file. (If *Label* = CONT, this option is the same as the SUBS option described below.)

ITER

Writes contact diagnostic information at each iteration. Valid only when *Label* = CONT.

SUBS

Writes contact diagnostic information at each substep. Valid only when *Label* = CONT.

LSTP

Writes contact diagnostic information at each load step. Valid only when *Label* = CONT.

STAT

Lists information about the diagnostic files in the current working directory.

DEL

Deletes all diagnostic files in the current working directory.

MAXFILE

Maximum number of diagnostic files to create. Valid values are 1 through 999. Default = 4. Valid only when *Label* = NRRE or EFLG.

Information is written to Jobname.nd*xxx* or Jobname.nr*xxx*, where *xxx* iterates from 001 through *MAXFILE*. When the specified maximum number of diagnostic files is reached, the counter resets to 001 and earlier files are overwritten. The *MAXFILE* value specified for this *Label* function applies until a new value is specified.

Command Default

No nonlinear diagnostic files are written.

Notes

The **NLDIAG (p. 1224)** command is a nonlinear diagnostics tool valid for nonlinear analyses that include structural degrees of freedom. It is a debugging tool for use when you must restart after an unconverged solution. The command creates Jobname.nd*xxx*, Jobname.nr*xxx*, or Jobname.cnd files in the working directory to store the information you specify.

For more information, see Performing Nonlinear Diagnostics.

Newton-Raphson Residual

Issue the **NLDIAG (p. 1224)**,NRRE,ON command to create Jobname.nr*xxx* diagnostic files (for each equilibrium iteration after the first) in which to store the relevant Newton-Raphson residual information

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

of FX, FY, FZ (forces), MX, MY, MZ (moments), HEAT (heat flow), AMPS (current flow), CHRG (electric charge), or RATE (diffusion flow rate) for the last *MAXFILE* equilibrium iterations.

Issue a **NLDPOST (p. 1229)**,NRRE,STAT command to list the load step, substep, time, and equilibrium iteration corresponding to each of the Jobname.nr*xxx* diagnostic files in the working directory, then issue a **PLNSOL (p. 1425)**,NRRES,,,,*FileID* command to point to the file from which you want to create a contour plot of your Newton-Raphson residuals.

If you restart or issue a new **SOLVE (p. 1822)** command, any Jobname.nr*xxx* diagnostic files in the current (working) directory are overwritten.

Element Components That Violate Criteria

Issue a **NLDIAG (p. 1224)**,EFLG,ON command to create Jobname.nd*xxx* diagnostic files which store IDs for elements violating the following criteria:

- Too large a distortion (HDST)
- Elements contain nodes that have near zero pivots (PIVT) for nonlinear analyses
- Too large a plastic/creep (EPPL/EPCR) strain increment (**CUTCONTROL (p. 445)**)
- Elements for which mixed u-P constraints are not satisfied (mixed U-P option of 18*x* solid elements only) (MXUP)
- Hyperelastic element (EPHY), cohesive zone material (EPCZ), or damage strain (EPDM) not converged
- Radial displacement (RDSP) not converged
- MPC184 multipoint constraint elements using KEYOPT(1) = 6 through 16 with the Lagrange multiplier option fail to satisfy constraint conditions (184J)

For **NLDIAG (p. 1224)**,EFLG,ON, all Jobname.nd*xxx* diagnostic files (for each equilibrium iteration after the first) in the current (working) directory are deleted when you issue a new **SOLVE (p. 1822)** command (or restart).

In the solution processor (**/SOLU (p. 1821)**), use the STAT option to list the active status of this command. In the postprocessor (**/POST1 (p. 1461)**), issue a **NLDPOST (p. 1229)**,EFLG,STAT command to list the load step, substep, time, and equilibrium iteration corresponding to each of the Jobname.nd*xxx* diagnostic files in the working directory, then issue a **NLDPOST (p. 1229)**,EFLG,CM,*FileID* command to create element components that violate the criteria.

Contact Diagnostic

Issue the **NLDIAG (p. 1224)**,CONT,ON command to create a Jobname.cnd diagnostic file which stores contact information for all defined contact pairs at all substeps. Alternatively, you may issue one of the following commands to store contact information at a specific frequency:

- **NLDIAG (p. 1224)**,CONT,ITER to write at each iteration
- **NLDIAG (p. 1224)**,CONT,SUBS to write at each substep (default)
- **NLDIAG (p. 1224)**,CONT,LSTP to write at each load step

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Contact diagnostic information is available for elements CONTA172, CONTA174, CONTA175, and CONTA177; it is not available for CONTA178.

Diagnostic file `Jobname.cnd` is written during solution and lists, on a pair-base, the following contact information:

- Contact pair ID[1] (p. 1228)
- Number of contact elements in contact[2] (p. 1228)
- Number of contact elements in "sticking" contact status
- Maximum chattering level
- Maximum contact penetration/Minimum gap[3] (p. 1228)
- Maximum geometric gap
- Maximum normal contact stiffness
- Minimum normal contact stiffness
- Maximum resulting pinball
- Maximum elastic slip distance
- Maximum tangential contact stiffness
- Minimum tangential contact stiffness
- Maximum sliding distance (algebraic sum)
- Maximum contact pressure
- Maximum friction stress
- Average contact depth
- Maximum geometric penetration
- Number of contact points having too much penetration
- Contacting area
- Maximum contact damping pressure
- Maximum tangential contact damping stress
- Maximum total sliding distance (GSLID), including near-field
- Minimum total sliding distance (GSLID), including near-field
- Maximum normal fluid penetration pressure on contact surface
- Maximum normal fluid penetration pressure on target surface

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Total volume lost due to wear for the contact pair
- Total strain energy due to contact constraint[6] (p. 1229)
- Total frictional dissipation energy[6] (p. 1229)
- Total contact stabilization energy[6] (p. 1229)
- Ansys Workbench contact pair ID[4] (p. 1228)
- Total force due to contact pressure - X component
- Total force due to contact pressure - Y component
- Total force due to contact pressure - Z component[5] (p. 1228)
- Total force due to tangential stress - X component
- Total force due to tangential stress - Y component
- Total force due to tangential stress - Z component[5] (p. 1228)
- Number of contact points having too much sliding for small sliding contact
- Pair-based force convergence norm[7] (p. 1229)
- Pair-based force convergence criterion[7] (p. 1229)
- Maximum tangential fluid penetration pressure on contact surface
- Maximum tangential fluid penetration pressure on target surface
- Maximum sliding distance for closed contact in the current substep

1. Contact pair ID. A positive number refers to a real constant ID for a pair-based contact definition. A negative number refers to a section ID of a surface in a general contact definition. (See Comparison of Pair-Based Contact and General Contact.)
2. Number of contact elements in contact. Other values are interpreted as follows:

   0 indicates that the contact pair is in near-field contact status.

   -1 indicates that the contact pair is in far-field contact status.

   -2 indicates that the contact pair is inactive (symmetric to asymmetric contact).
3. A positive value indicates penetration and a negative value indicates a gap. If the contact pair has a far-field contact status, penetration and gap are not available and the value stored is the current pinball radius.
4. Intended primarily for internal use in the contact tracking of Ansys Workbench.
5. In a 3D model, the reported item is total force along the Z-axis. In a 2D axisymmetric model (with or without ROTY), the reported item is maximum torque that can potentially act on the Y-axis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. The pair-based dissipation energy and stabilization energy do not include contributions from contact elements that are in far-field. The pair-based strain energy does not include the frictional dissipation energy and stabilization energy; it only contains an elastic recovery energy when the contact status changes from closed to open.

7. The program uses a default tolerance value of 0.1 to calculate the *pair-based force convergence norm* and *pair-based force convergence criterion*. This is not a check for local convergence. It is for monitoring purposes only and is useful for nonlinear contact diagnostics.

In the solution processor (**/SOLU (p. 1821)**), use the **NLDIAG (p. 1224)**,CONT,STAT command to list the active status of the contact information. If you subsequently issue a new **SOLVE (p. 1822)** command (or restart), the `Jobname.cnd` diagnostic file in the current (working) directory is not deleted; information is appended to it. Delete the existing diagnostic file (**NLDIAG (p. 1224)**,CONT,DEL command) if you do not want to retain diagnostic information from previous solutions.

Menu Paths

Main Menu>Solution>Diagnostics>Nonlinear Diagnostics

NLDPOST, *Label*, *Key*, *FileID*, *Prefix*

Gets element component information from nonlinear diagnostic files.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Specifies the type of command operation:

EFLG

Element flag for nonlinear diagnostics.

NRRE

Newton-Raphson residuals.

Key

Specifies the command action:

STAT

List information about the diagnostic files (`Jobname.nd`*xxx* or `Jobname.nr`*xxx*) in the current directory.

For *Label* = EFLG, the listing gives a summary that associates the loadstep, substep, time, equilibrium iteration number, cumulative iteration number, and the number of elements that fail each criteria with a specific file ID (`Jobname.nd`*xxx*). Use the list to create element components (via the CM option) based on the cumulative iteration number.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For *Label* = NRRE, the listing provides a summary that associates the loadstep, substep, time, equilibrium iteration number, and cumulative iteration number with a specific file ID (Jobname.nr*xxx*). Use the list to identify the respective file ID for creating Newton-Raphson residual contour plots (**PLNSOL (p. 1425)**,NRRE,...,*FileID*).

DEL

Delete Jobname.nd*xxx* or Jobname.nr*xxx* files in the working directory, if any exist.

CM

Create components for elements that violate criteria. This value is valid only when *Label* = EFLG.

FileID

Valid only when *Label* = EFLG and *Key* = CM, this value specifies file IDs:

IDnum

The file ID number. Creates the element components from the diagnostic files corresponding to the specified file ID number in the working directory.

ALL

Creates element components from all available diagnostic files residing in the working directory. This value is the default if you do not specify an *IDnum* value.

Prefix

Sets the prefix name for components. Specify up to 21 alphanumeric characters.

Command Default

The **NLDPOST (p. 1229)** command returns no nonlinear diagnostic information.

Notes

Based on the nonlinear diagnostic results (created via the **NLDIAG (p. 1224)**,EFLG command), the **NLDPOST (p. 1229)** command creates element components with predefined names.

The following table lists the diagnostic criteria and component names (with specified prefix and without). Here *xxx* corresponds to the file ID (*FileID*) of Jobname.nd*xxx* or Jobname.nr*xxx*.

Elements with:	If prefix is specified:	Without prefix specified:
Too large a plastic strain increment	*prefix_xxx*_eppl	nd*xxx*_eppl
Too large a creep strain increment	*prefix_xxx*_epcr	nd*xxx*_epcr nd*xxx*_ephy

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Elements with:	If prefix is specified:	Without prefix specified:
		ndxxx_epcz ndxxx_epdm
Too much distortion	*prefix_xxx*_hdst	ndxxx_hdst ndxxx_rdsp
Unsatisfied mixed u-P constraints	*prefix_xxx*_mxup	ndxxx_mxup
Unconverged MPC184 multipoint constraint elements	*prefix_xxx*_184j	ndxxx_184j
Negative/small pivots	*prefix_xxx*_pivt	ndxxx_pivt

If you have trouble viewing specific element components, see Viewing Hidden Element Components in the *Basic Analysis Guide*.

For more information, see Performing Nonlinear Diagnostics.

Main Menu>General Postproc>Nonlinear Diagnostics

NLGEOM, *Key*

Includes large-deflection effects in a static or full transient analysis.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Large-deflection key:

OFF

Ignores large-deflection effects (that is, a small-deflection analysis is specified). This option is the default.

ON

Includes large-deflection (large rotation) effects or large strain effects, according to the element type.

Command Default

Large-deflection effects are ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Large-deflection effects are categorized as either large deflection (or large rotation) or large strain, depending on the element type. These are listed (if available) under Special Features in the input data table for each element in the *Element Reference*. When large deflection effects are included (**NLGEOM (p. 1231)**,ON), stress stiffening effects are also included automatically.

If used during the solution (**/SOLU (p. 1821)**), this command is valid only within the first load step.

In a large-deflection analysis, pressure loads behave differently than other load types. For more information, see Load Direction in a Large-Deflection Analysis.

The gyroscopic matrix (that occurs due to rotational angular velocity) does not support large-deflection effects. The theoretical formulations for the gyroscopic matrix support small deflection (linear formulation) only.

When large-deflection effects are included in a substructure or CMS transient analysis use pass, the **OUTRES (p. 1336)** command ignores *DSUBres* = ALL.

This command is also valid in PREP7.

NLHIST,*Key*,*Name*,*Item*,*Comp*,*NODE*,*ELEM*,*SHELL*,*LAYER*,*STOP_VALUE*,*STOP_COND*

Specify results items to track during solution.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Specifies the command operation:

NSOL

Nodal solution data.

ESOL

Element nodal data.

PAIR

Contact data (for pair-based contact).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

GCN

Contact data (for general contact).

RSEC

Result section data.

STAT

Displays a list of items to track.

OFF or 0

Deactivates tracking of all variables. This value is the default.

ON or 1

Activates tracking of all variables. Tracking also activates whenever any specification changes.

DEL

Removes the specified variable from the set of result items to track. If *Name* = ALL (default), all specifications are removed.

Name

The 32-character user-specified name.

Item,Comp

Predetermined output item and component label for valid elements. See the *Element Reference* for more information.

NODE

Number identifying one of the following:

Valid node number (if *Key* = NSOL or ESOL).

Valid real constant set number identifying a contact pair (if *Key* = PAIR).

Valid section ID number identifying a surface of a general contact definition (if *Key* = GCN).

Valid real constant set number identifying a result section (if *Key* = RSEC).

NODE is required input when *Key* = NSOL, ESOL, PAIR, GCN, or RSEC.

ELEM

Valid element number for element results. Used for ESOL items. If *ELEM* is specified, then a node number that belongs to the element must also be specified in the *NODE* field.

SHELL

Valid labels are TOP, MID or BOT. This field can specify the location on shell elements for which to retrieve data. Used only for element nodal data (ESOL).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LAYER

Layer number (for layered elements only). Used only for element nodal data (ESOL).

STOP_VALUE

Critical value of the tracked variable. This value is used to determine if the analysis should be terminated.

STOP_COND

Specifies the conditional relationship between the variable being tracked and the *STOP_VALUE* upon which the analysis will be terminated:

-1

Terminate the analysis when the tracked variable is less than or equal to *STOP_VALUE*.

0

Terminate the analysis when the tracked variable equals *STOP_VALUE*.

1

Terminate the analysis when the tracked variable is greater than or equal to *STOP_VALUE*.

Notes

The **NLHIST (p. 1232)** command is a nonlinear diagnostics tool that enables you to monitor diagnostics results of interest in real time during a solution.

You can track a maximum of 50 variables during solution. The specified result quantities are written to the file `Jobname.nlh`. Nodal results and contact results are written for every converged substep (irrespective of the **OUTRES (p. 1336)** command setting), while element results are written only at time points specified via the **OUTRES (p. 1336)** command. Result section data is written only at time points specified via the **OUTPR (p. 1332)**,RSO,*Freq* command.

For time points where element results data is not available, a very small number is written instead. If the conditions for contact to be established are not satisfied, 0.0 will be written for contact results.

Results tracking is available for:

- nonlinear structural analyses (static or transient)
- nonlinear steady-state thermal analyses
- transient thermal analyses (linear or nonlinear)
- nonlinear coupled structural-thermal analyses (static or transient)

All results are tracked in the Solution Coordinate System (that is, nodal results are in the nodal coordinate system and element results are in the element coordinate system).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Contact results can be tracked for elements CONTA172, CONTA174, CONTA175, and CONTA177; they cannot be tracked for CONTA178.

Result section data can be tracked for elements CONTA172 and CONTA174.

When contact results (*Key* = PAIR or GCN) or result section data (*Key* = RSEC) are tracked , the user-specified name (*Name* argument) is used to create a user-defined parameter. This enables you to monitor the parameter during solution. As an example, you can use a named parameter to easily convert the contact stiffness units from FORCE/LENGTH^3 to FORCE/LENGTH based on the initial contact area CAREA. Be sure to specify *Name* using the APDL parameter naming convention.

The *STOP_VALUE* and *STOP_COND* arguments enable you to automatically terminate the analysis when a desired value for a tracked contact result or section result has been reached.

The `Jobname.nlh` file is an ASCII file that lists each time point at which a converged solution occurs along with the values of the relevant result quantities.

The GUI option **Solution> Results tracking** provides an interface to define the result items to be tracked. The GUI also allows you to graph one or more variables against time or against other variables during solution. You can use the interface to graph or list variables from any `.nlh` file generated by Mechanical APDL.

You can also track results during batch runs. Either access the launcher and select **Run Results Tracker Utility** from the **Tools** menu, or type `nlhist241` at the command line. Use the supplied file browser to navigate to your `Jobname.nlh` file, and click on it to invoke the tracking utility. You can use this utility to read the file at any time, even after the solution is complete (the data in the file must be formatted correctly).

Table 194: NLHIST - Valid NSOL (p. 1281) Item and Component Labels

Item	Comp	Description
U	X, Y, Z	X, Y, or Z structural displacement.
ROT	X, Y, Z	X, Y, or Z structural rotation.
F	X, Y, Z	X, Y, or Z structural reaction force.
M	X, Y, Z	X, Y, or Z structural reaction moment.
TEMP [1]	-	Temperature.
TEMP	MAX, MIN	Maximum or minimum temperature in the model.
HEAT [2]	-	Reaction heat flow.

1. For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use the labels TBOT, TE2, TE3, . . ., TTOP instead of TEMP.

2. For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use the labels HBOT, HE2, HE3, . . ., HTOP instead of HEAT.

Table 195: NLHIST - Valid ESOL (p. 672) Item and Component Labels

Item	Comp	Description

TG	X, Y, Z, SUM	Component thermal gradient or vector sum.
TF	X, Y, Z, SUM	Component thermal flux or vector sum.

ETABLE items are not supported for **ESOL (p. 672)** items.

PAIR solution quantities are output on a "per contact pair" basis. GCN solution quantities are output on a “per general contact section” basis. (See Comparison of Pair-Based Contact and General Contact.) As

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

a consequence, the corresponding values listed in the `Jobname.nlh` file represent a minimum or a maximum over the associated contact pair or general contact surface, as detailed in the table below.

Table 196: NLHIST - Valid Contact (PAIR or GCN) Item and Component Labels

Item	Comp	Description
CONT	ELCN	If >0, number of contact elements in contact. Other values are interpreted as follows: 0 indicates the contact pair (or GCN surface) is in near-field contact status. -1 indicates the contact pair (or GCN surface) is in far-field contact status. -2 indicates that the contact pair (or GCN surface) is inactive (symmetric to asymmetric contact).
"	ELST	Number of contact elements in sticking contact status
"	CNOS	Maximum chattering level
"	PENE	Maximum penetration (or minimum gap) [1]
"	CLGP	Maximum geometric gap
"	SLID	Maximum total sliding distance (algebraic sum)
"	SLMX	Maximum total sliding distance for closed contact in the current substep
"	ESLI	Maximum elastic slip distance
"	KNMX	Maximum normal contact stiffness
"	KTMX	Maximum tangential contact stiffness
"	KNMN	Minimum normal contact stiffness
"	KTMN	Minimum tangential contact stiffness
"	PINB	Maximum pinball radius
"	PRES	Maximum contact pressure
"	SFRI	Maximum frictional stress
"	CNDP	Average contact depth
"	CLPE	Maximum geometric penetration
"	LGPE	Number of contact points having too much penetration
"	CAREA	Contacting area
"	NDMP	Maximum contact damping pressure
"	TDMP	Maximum tangential contact damping stress
"	GSMX	Maximum total sliding distance (GSLID), including near-field
"	GSMN	Minimum total sliding distance (GSLID), including near-field
"	FPSC	Maximum normal fluid penetration pressure on contact surface
"	FPST	Maximum normal fluid penetration pressure on target surface
"	WEAR	Total volume lost due to wear for the contact pair (not available for general contact, *Key* = GCN)
"	CTEN	Total strain energy due to contact constraint [2]

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item	Comp	Description
"	CFEN	Total frictional dissipation energy [2]
"	CDEN	Total contact stabilization energy [2]
"	CFNX	Total force due to contact pressure - X component [4]
"	CFNY	Total force due to contact pressure - Y component [4]
"	CFNZ	Total force due to contact pressure - Z component [4] [5]
"	CFSX	Total force due to tangential stress - X component [4]
"	CFSY	Total force due to tangential stress - Y component [4]
"	CFSZ	Total force due to tangential stress - Z component [4] [5]
"	CTRQ	Maximum torque in an axisymmetric analysis with MU = 1.0
"	LGSL	Number of contact points having too much sliding for small sliding contact
"	NORM	Pair-based force convergence norm [3]
"	CRIT	Pair-based force convergence criterion [3]
"	FPTC	Maximum tangential fluid penetration pressure on contact surface
"	FPTT	Maximum tangential fluid penetration pressure on target surface

1. For PENE, a positive value indicates a penetration, and a negative value indicates a gap. If the contact pair (or GCN surface) has a far-field contact status, penetration and gap are not available, and the value stored for PENE is the current pinball radius.

2. The pair-based dissipation energy (CFEN) and stabilization energy (CDEN) do not include contributions from contact elements that are in far-field. The pair-based strain energy (CTEN) does not include the frictional dissipation energy and stabilization energy; it only contains an elastic recovery energy when the contact status changes from closed to open.

3. The program uses a default tolerance value of 0.1 to calculate the *pair-based force convergence norm* and *pair-based force convergence criterion*. This is not a check for local convergence. It is for monitoring purposes only and is useful for nonlinear contact diagnostics.

4. If the specified contact pair is a rigid surface or force-distributed constraint that includes stress stiffening effects, this quantity represents a total constraint force or moment at the pilot node as shown below:

CFNX	Total constraint force - X component
CFNY	Total constraint force - Y component
CFNZ	Total constraint force - Z component
CFSX	Total constraint moment - X component
CFSY	Total constraint moment - Y component
CFSZ	Total constraint moment - Z component

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. For the case of 2D axisymmetric with torsion (CONTA172 with a ROTY DOF), CFNZ and CFSZ represent moments along the Y direction.

Table 197: NLHIST - Valid Result Section (RSEC) Item and Component Labels

Item	Comp	Description
REST	SECF	Total section force
"	SECM	Total section moment
"	AXST	Section axial stress
"	BDST	Section bending stress
"	SPTX	Section center X coordinate
"	SPTY	Section center Y coordinate
"	SPTZ	Section center Z coordinate
"	THXY	Rotation about local z
"	THYZ	Rotation about local x
"	THZX	Rotation about local y

Menu Paths

Main Menu>Solution>Results Tracking

NLIST,*NODE1*,*NODE2*,*NINC*,*Lcoord*,*SORT1*,*SORT2*,*SORT3*,*KINTERNAL*

Lists nodes.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE1*, *NODE2*, *NINC

List nodes from *NODE1* to *NODE2* (defaults to *NODE1*) in steps of *NINC* (defaults to 1). If *NODE1* = ALL (default), *NODE2* and *NINC* are ignored and all selected nodes (**NSEL (p. 1266)**) are listed. If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE1* (*NODE2* and *NINC* are ignored).

Lcoord

Coordinate listing key:

(blank)

List all nodal information

COORD

Suppress all but the XYZ coordinates (shown to a higher degree of accuracy than when displayed with all information).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SORT1

First item on which to sort. Valid item names are NODE, X, Y, Z, THXY, THYZ, THXZ

SORT2, SORT3

Second and third items on which to sort. Valid item names are the same as for *SORT1*.

KINTERNAL

Internal nodes listing key:

(blank)

List only external nodes.

INTERNAL

List all nodes, including internal nodes.

Notes

Lists nodes in the active display coordinate system (**DSYS (p. 582)**). Nodal coordinate rotation angles are also listed (relative to the global Cartesian coordinate system).

Node listing can be in a sorted order (ascending). *SORT2*, for example, will be carried out on nodes having equal values of *SORT1*.

This command is valid in any processor.

Menu Paths

Main Menu>General Postproc>List Results>Sorted Listing>Sort Nodes

Utility Menu>List>Nodes

NLMESH, *Control*, *VAL1*, *VAL2*, *VAL3*

Controls remeshing in nonlinear adaptivity.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Control

The mesh-quality control to adjust:

NLAY

The *sculpting layer* adjustment:

VAL1 – The number of sculpting layers, beginning with detected seed elements. Valid for 2D and 3D analysis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Default = 10 for 2D analysis, 2 for 3D analysis.

For local (partial) remeshing, this option helps the remesher to detect remeshing regions from the whole deformed model.

Generally, a larger *VAL1* leads to larger remeshing regions and tends to unite isolated multiple regions. A larger value also tends to result in better remeshing quality (and increases mapping and solution overhead accordingly).

Only elements with the same element and material properties as seed elements are included into the remeshing regions.

VAL1 = 0 is not valid, as the remeshing regions would contain only the detected seed elements, resulting in many small cavities within remeshing regions (especially if the specified mesh-quality metric threshold (**NLADAPTIVE (p. 1219)**) is relatively large).

VAL2 – Same as *VAL1*, except that *VAL1* controls remeshing to remove distortion and *VAL2* controls element refinement. Default = 1 for 2D analysis, 2 for 3D analysis.

Not used in a NLAD-ETCHG analysis.

For more information about this control, see Sculpting Layers Control in the *Nonlinear Adaptivity Analysis Guide*.

BDRA

The *boundary angle threshold* in degrees. Use this adjustment to retain geometry features of the original (source) mesh. Valid for both 2D and 3D analysis.

In a 3D analysis, this value is the dihedral angle (the angle between the normal vectors from two neighboring surface facets). In a 2D analysis, this value is the 2D patch boundary edge normal angle. If the edge angle or dihedral angle is larger than the specified threshold, the node shared by 2D edges or edges shared by 3D facets are retained during remeshing.

Valid values: 0 < *VAL1* < 80.

Default = 10 for 2D analysis, 15 for 3D analysis.

Generally, a larger *VAL1* improves the quality of the new mesh (and may even repair local tiny edges or facets of poor quality). Too large a value, however, may also smooth out some geometric features, leading to slightly different results and possibly causing convergence issues in the substeps immediately following remeshing.

For more information about this control, see Boundary-Angle and Edge-Angle Control in the *Nonlinear Adaptivity Analysis Guide*.

AEDG

The *edge angle threshold* in degrees. Valid for 3D analysis only.

Use this control to split 3D patch segments. The edge angle is the angle between adjacent surface segment edges sharing a node. If the edge angle is larger than the specified threshold (*VAL1*), the segment splits and the node is automatically treated as a node to be retained.

Default = 10.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Generally, a larger *VAL1* improves the quality of the new mesh, but may result in loss of feature nodes. The effect is similar to that of boundary angles (*Control* = BDRA).

For more information about this control, see Boundary-Angle and Edge-Angle Control in the *Nonlinear Adaptivity Analysis Guide*.

SRAT

The *global sizing ratio*. Valid for 2D and 3D analysis.

VAL1 – Global sizing ratio for remeshing.

This value controls remeshing to remove mesh distortion. Default = 1.0. The default value results in the new mesh having a size similar to that of the original mesh.

Generally, set *VAL1* $\geq$ 0.7. The model can be refined (< 1.0) or coarsened (> 1.0) up to 3x depending on the mesh-sizing gradient and number of 3D elements, and approximately 2x for 2D elements.

VAL2 – Similar to *VAL1*, but controls element refinement. Default = 0.75.

VAL3 – Equivalent element-size expansion ratio.

Used only for contact elements with cohesive zone material (**NLADAPTIVE (p. 1219)**,,,CONTACT,CZM).

VAL3 > 1.0 activates mesh coarsening in regions of debonding.

Recommendation: For most common mode I or mode II delamination problems, 1.5 < *VAL3* < 2 for 2D and 3D analysis. For complex models (such as mixed-mode, nonplanar delamination surfaces, and models with multiple surfaces close to each other), you must determine the most appropriate *VAL3*. Remeshing frequency and the quality of the starting mesh also affect your choice of *VAL3*.

VAL3 has no default value.

Not used in an NLAD-ETCHG analysis.

For more information about this control, see Global Sizing Control in the *Nonlinear Adaptivity Analysis Guide*.

GRAD

Adjusts the *new mesh-sizing gradient* during remeshing. Valid for 2D and 3D analysis.

Valid values: *VAL1* = 0, 1, 2, or 3. Default = 2 for 2D analysis, 3 for 3D analysis.

VAL1 = 0 -- The mesh-sizing gradient is not retained. The new mesh is uniform and has an approximate average size on the entire remeshed domain(s), even if the original mesh has sizing gradients.

VAL1 = 1 -- The new mesh follows the original mesh-sizing gradient to retain the element averaged-edge length. This value tends to coarsen the mesh in the location of the distorted elements during remeshing.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL1 = 2 -- The new mesh follows the sizing gradient of the original mesh, with additional sizing compensation based on the element size change due to deformation during solution. This value tends to refine the mesh at the location of the distorted elements, where the distortion may have originated from deformation during solution.

VAL1 = 3 -- Similar to *VAL1* = 2, but assumes that perfect mesh quality is not required, thus avoiding over-refinement of minor distorted regions. Valid for 3D analysis only.

For more information about this control, see Gradient Control in the *Nonlinear Adaptivity Analysis Guide*.

QTOL

The new *mesh-acceptance tolerance* (PLANE182, PLANE222, SOLID187, SOLID227, and SOLID285).

VAL1 – Controls remeshing to remove distortion. Default = 0.05.

VAL2 – Controls element refinement. Default = 0.5.

For PLANE182 and PLANE222, *VAL2* is the only valid option (for mesh refinement), and the new mesh is accepted when (*MaxCornerAngleNew* - *MaxCornerAngleOld*) / *MaxCornerAngleOld* <= *QTOL*.

For SOLID285, the new mesh is accepted when (*SkewnessNew* - *SkewnessOld*) / *SkewnessOld* <= *QTOL*.

For SOLID187 and SOLID227, the new mesh is accepted when, in addition to skewness, (*JacobianOld* - *JacobianNew*) / *JacobianOld* <= *QTOL*.

The program uses both tolerance and mesh-quality parameters to determine whether or not a new mesh is accepted.

Not used in a NLAD-ETCHG analysis.

REFA

The *refinement algorithm* adjustment (PLANE182, PLANE222, and SOLID285). Valid for 2D and 3D analysis.

VAL1 –

SPLIT – Use mesh splitting instead of general remeshing. This is the only valid value.

If not specified, mesh refinement occurs via general remeshing (except for PLANE183).

Not used in a NLAD-ETCHG analysis.

TCOR

Coordinate truncation adjustments for nodal locations of the meshes during remeshing. Valid for 2D and 3D analysis.

VAL1 –

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON – Truncates the decimal value after the seventh position. Default behavior for PLANE182, PLANE222, and SOLID285 (augmented Lagrange and penalty contact formulations only).

OFF – No truncation occurs on the decimal value. Default behavior for SOLID187 and SOLID227 (all contact formulations), and PLANE182 and PLANE222 (Lagrange multiplier contact formulation only).

AGGR

Aggressive remeshing. Creates meshes with improved shape metrics. May change some global remeshing control parameters applied by other **NLMESH (p. 1240)** commands, and may increase remeshing time. Valid for both 2D and 3D nonlinear adaptivity analysis.

VAL1 –

ON – Enable aggressive remeshing.

OFF – Disable aggressive remeshing (default).

ELSZ

Reduces the set of remeshable (seed) elements used for remeshing by filtering out elements based on their size, preventing over- or under-refinement in the remeshing regions. Valid only in general remeshing using an energy-, position-, or contact-based refinement criterion.

Val1 is a user-defined lower bound of the element size, and *Val2* is a user-defined upper bound of the element size. If both are specified, seed elements selected via the specified criterion are filtered out if their size is <*Val1* or >*Val2*. If *Val1* is unspecified, only the size check with *Val2* occurs. If *Val2* is unspecified, only the size check with *Val1* occurs.

NSTR

Reduces the set of remeshable (seed) elements used for remeshing by filtering out elements based on their (maximum) equivalent stress level, preventing over- or under-refinement in the remeshing regions based on the stress state. Valid only in general remeshing using an energy-, position-, or contact-based refinement criterion.

Val1 is a user-defined lower bound of element equivalent stress, and *Val2* is a user-defined upper bound of the element equivalent stress. If both are specified, seed elements selected by the specified criterion are filtered out if their (maximum) equivalent stress is <*Val1* or >*Val2*. If *Val1* is unspecified, only the equivalent stress check with *Val2* occurs. If *Val2* is unspecified, only the equivalent stress check with *Val1* occurs.

Important: Before specifying this option, copy the integration-point results to the nodes (**ERESX (p. 658)**,NO).

NSTN

Reduces the set of remeshable (seed) elements used for remeshing by filtering out elements based on their (maximum) equivalent strain level, preventing over- or under-refinement in the remeshing regions based on the strain state. Valid only in general remeshing using an energy-, position-, or contact-based refinement criterion.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Val1 is a user-defined lower bound of the element equivalent strain, and *Val2* is a user-defined upper bound of the element equivalent strain. If both are specified, seed elements selected by the specified criterion are filtered out if their (maximum) equivalent strain is <*Val1* or >*Val2*. If *Val1* is unspecified, only the equivalent strain check with *Val2* occurs. If *Val2* is unspecified then only the equivalent strain check with *Val1* occurs.

Important: Before specifying this option, copy the integration-point results to the nodes (**ERESX (p. 658)**,NO).

LIST

Lists all mesh-quality control parameters.

If *VAL1* has been specified for a given mesh control, the most recently specified value is listed. If a value was not explicitly specified, the default value is listed (assuming that the problem has been solved at least once).

VAL1

Numerical input value that varies according to the specified *Control* option.

Valid for all *Control* options. Can be used when controlling remeshing for both distortion removal and for element refinement.

VAL2

Numerical input value that varies according to the specified *Control* option.

Valid only for these *Control* options: NLAY, SRAT, and QTOL. Also used for controlling remeshing for element refinement.

Notes

NLMESH (p. 1240) is a global control command enabling mesh-quality adjustments for remeshing in nonlinear adaptivity. The command can be used when components are associated with mesh-quality criteria (**NLADAPTIVE (p. 1219)** with *Criterion* = MESH, or another criterion with mesh change through general refinement).

Issue the **NLMESH (p. 1240)** command only in cases where advanced mesh-quality control is desirable for remeshing in nonlinear adaptivity. The control values specified apply to all components having mesh-quality-based criteria defined, or components having mesh change through general refinement, and can be modified at every load step during the nonlinear adaptive solution or when performing a restart analysis.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NLOG, *IR*, *IA*, - -, - -, *Name*, - -, - -, *FACTA*, *FACTB*

Forms the natural log of a variable.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA

Reference number of the variable to be operated on.

--,--

Unused fields.

Name

Thirty-two character name identifying the variable on printouts and displays. Embedded blanks are compressed for output.

--,--

Unused fields.

FACTA

Scaling factor applied to variable *IA* (defaults to 1.0).

FACTB

Scaling factor (positive or negative) applied to the operation (defaults to 1.0).

Notes

Forms the natural log of a variable according to the operation:

$$IR = FACTB * \mathrm{LN}(FACTA \times IA)$$

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Natural Log

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NLOPT

Specifies "Nonlinear analysis options" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.LOG`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Nonlinear Options

NMODIF, *NODE*, *X*, *Y*, *Z*, *THXY*, *THYZ*, *THZX*

Modifies an existing node.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Modify coordinates of this node. If ALL, modify coordinates of all selected nodes (**NSEL (p. 1266)**). If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE*.

X, Y, Z

Replace the previous coordinate values assigned to this node with these corresponding coordinate values. Values are interpreted in the active coordinate system (R, θ, Z for cylindrical; R, θ, Φ for spherical or toroidal). Leaving any of these fields blank retains the previous value(s).

THXY

First rotation of nodal coordinate system about nodal Z (positive X toward Y). Leaving this field blank retains the previous value.

THYZ

Second rotation of nodal coordinate system about nodal X (positive Y toward Z). Leaving this field blank retains the previous value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

THZX

Third rotation of nodal coordinate system about nodal Y (positive Z toward X). Leaving this field blank retains the previous value.

Notes

Modifies an existing node. Nodal coordinate system rotation angles are in degrees and redefine any existing rotation angles. Nodes can also be redefined with the **N (p. 1207)** command.

See the **NROTAT (p. 1264)**, **NANG (p. 1208)**, and **NORA (p. 1252)** commands for other rotation options.

This command is also valid in the **/MAP (p. 1107)** processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Nodes>RotateNode>By Angles

Main Menu>Preprocessor>Modeling>Move / Modify>Nodes>Set of Nodes

Main Menu>Preprocessor>Modeling>Move / Modify>Nodes>Single Node

Main Menu>Preprocessor>Modeling>Move / Modify>RotateNode>By Angles

---

NODES

Specifies "Nodes" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Nodes

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/NOERASE

Prevents the screen erase between displays.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Command Default

Issue the command with no arguments to prevent automatic screen erase before creating the next display.

Notes

Preventing the normal screen erase between requested displays allows you to overlay multiple views.

Clearing the screen with the **ERASE (p. 652)** command (**Utility Menu> PlotCtrls> Erase Options> Erase screen**) active simply clears the display area. Subsequent replots will provide the cumulative plots previously generated by the **/NOERASE (p. 1249)** command.

For 3D devices, you can issue **/DV3D (p. 584)**,DELS to suppress repeated screen overlays and generate clear contour plots.

Use the **/ERASE (p. 653)** command to reactivate automatic screen erase.

For 3D devices (**/SHOW (p. 1785)**,3D), the model in all active windows will be the same, even if you issue a different display command (**NPLOT (p. 1254)**, **EPLOT (p. 648)**, etc.) for each active window. Use the Multi-Plot command (**GPLOT (p. 866)**) to display different entities, in different windows, on 3D devices.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Erase Options>Erase between Plots

/NOLIST

Suppresses the data input listing.

SESSION (p. 11): List Controls (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Command Default

Issue the command with no arguments to suppress the data input listing.

Notes

Printout is suppressed until a **/GOLIST (p. 865)** command is read or the end of the listing is encountered.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is valid in any processor, but only within a batch run (**/BATCH (p. 217)**).

Menu Paths

This command cannot be accessed from a menu.

NOOFFSET, *Label*

Prevents the CDREAD (p. 291) command from offsetting specified data items

PREP7 (p. 22): Database (p. 22)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Specifies items not to be offset.

NODE

Node numbers

ELEM

Element numbers

KP

Keypoint numbers

LINE

Line numbers

AREA

Area numbers

VOLU

Volume numbers

MAT

Material numbers

TYPE

Element type numbers

REAL

Real constant numbers

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CSYS

Coordinate system numbers

SECN

Section numbers

CP

Coupled set numbers

CE

Constraint equation numbers

CLEAR

All items will be offset

STATUS

Shows which items are specified *not*to be offset.

Notes

The **NOOFFSET (p. 1250)** command specifies data items not to be offset by a set of data read from a **CDREAD (p. 291)** command.

Menu Paths

This command cannot be accessed from a menu.

/NOPR

Suppresses the expanded interpreted input data listing.

SESSION (p. 11): List Controls (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Command Default

Issuing this command with no arguments suppresses the interpreted data input print out.

Notes

Suppresses printout of interpreted input data, including information labeled as "Notes." When this printout is not suppressed, the data input to the analysis is echoed to the output file in an expanded format. Printout is suppressed until a **/GOPR (p. 865)** or **/GO (p. 865)** command is read.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Use of **/NOPR (p. 1251)** is not recommended when the graphical user interface (GUI) is active. The GUI sometimes issues "hidden" **/NOPR (p. 1251)** and **/GOPR (p. 865)** command sequences, which will countermand user-issued **/NOPR (p. 1251)** commands, thus making the use of **/NOPR (p. 1251)** in the GUI environment unpredictable.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

NORA, *AREA*, *NDIR*

Rotates nodal coordinate systems to surface normal

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AREA

The area number containing the nodes to be rotated to their normals. If ALL, applies to all selected areas (see the **ASEL (p. 192)** command). If AREA = P, graphical picking is enabled.

NDIR

Direction of the normal. If NDIR = -1, the nodal coordinate system is rotated in the opposite direction of the surface normal. The default is the same direction as the surface normal.

Notes

The NORA command rotates the X-axis of the nodal coordinate system to the surface normal. The rotated nodal coordinate systems may be displayed through the **/PSYMB (p. 1552)** command. In case multiple areas are selected, there could be conflicts at the boundaries. If a node belongs to two areas that have a different normal, its nodal coordinate system will be rotated to the area normal with the lowest number. You can use the **AREVERSE (p. 181)** and **ANORM (p. 147)** commands to rotate the surface normals in the appropriate direction. Keep the following in mind when using the NORA command:

- If the nodal coordinate system is parallel to the global Cartesian system, it is not displayed through the **/PSYMB (p. 1552)** command.
- Previously specified rotation on the selected nodes are overridden.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>RotateNode>To Surf Norm>On Areas

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NORL, *LINE*, *AREA*, *NDIR*

Rotates nodal coordinate systems perpendicular to line normal

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LINE

Line number containing the nodes to be rotated. If ALL, applies to all selected lines (see the **LSEL (p. 1074)** command). If *LINE* = P, graphical picking is enabled.

AREA

The area number containing the selected lines. The normal of the line(s) selected is supposed to lie on this area. Defaults to the lowest numbered selected area containing the line number.

NDIR

Direction of the normal. If *NDIR* = -1, the nodal coordinate system is rotated in the opposite direction of the line normal. The default is the same direction as the surface normal.

Notes

The NORL command rotates the X-axis of the nodal coordinate perpendicular to the line normal. The rotated nodal coordinate systems may be displayed through the **/PSYMB (p. 1552)** command. In case multiple lines are selected, there could be conflicts at the boundaries. If a node belongs to two lines that have a different normal, its nodal coordinate system will be rotated to the line normal with the lowest number. Keep the following in mind when using the NORL command:

- If the nodal coordinate system is parallel to the global Cartesian system, it is not displayed through the **/PSYMB (p. 1552)** command.
- Previously specified rotation on the selected nodes are overridden.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>RotateNode>To Surf Norm>On Lines

Main Menu>Preprocessor>Modeling>Move / Modify>RotateNode>To Surf Norm>with Area

/NORMAL, *WN*, *KEY*

Allows displaying area elements by top or bottom faces.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KEY

Display key:

0

No face distinction.

1

Show only area elements having their positive normals directed toward the viewing point.

-1

Show only area elements having their positive normals directed away from the viewing point.

Command Default

Do not distinguish between top face and bottom face elements.

Notes

/NORMAL (p. 1253) allows you to select area elements and area plots by the top or bottom faces. It is useful for checking the normal directions on shell elements. The positive normal (element Z direction) is defined by the right-hand rule following the node I, J, K, L input direction. This command is available only with raster or hidden-line displays, for WIN32 or X11 2D displays only.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Shell Normals

NPLOT, *KNUM*

Displays nodes.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KNUM

Node number key:

0

No node numbers on display.

1

Include node numbers on display. See also **/PNUM (p. 1457)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Produces a node display. Only selected nodes (**NSEL (p. 1266)**) are displayed. Elements need not be defined. See the **DSYS (p. 582)** command for display coordinate system.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>RotateNode>To Surf Norm>On Areas

Main Menu>Preprocessor>Modeling>Move / Modify>RotateNode>To Surf Norm>On Lines

Main Menu>Preprocessor>Modeling>Move / Modify>RotateNode>To Surf Norm>with Area

Utility Menu>Plot>Nodes

NPRINT, *N*

Defines which time points stored are to be listed.

POST26 (p. 58): Listing (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

N

List data associated with every *N* time (or frequency) point(s), beginning with the first point stored (defaults to 1).

Command Default

List all stored points.

Notes

Defines which time (or frequency) points within the range stored are to be listed.

Menu Paths

Main Menu>TimeHist Postpro>Settings>List

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NREAD, *Fname*, *Ext*, - -

Reads nodes from a file.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to NODE if *Fname* is blank.

- -

Unused field.

Notes

The read operation is not necessary in a standard Mechanical APDL run but is provided as a convenience for those who want to read a coded node file (such as from another mesh generator or from a CAD/CAM program).

Data should be formatted as produced via **NWRITE (p. 1305)**.

Only nodes within the node range specified via **NRRANG (p. 1265)** are read from the file. Duplicate nodes already in the database are overwritten.

The file is rewound before and after reading. Reading continues until the end of the file.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Nodes>Read Node File

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NREFINE, *NN1*, *NN2*, *NINC*, *LEVEL*, *DEPTH*, *POST*, *RETAIN*

Refines the mesh around specified nodes.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NN1, NN2, NINC

Nodes (*NN1* to *NN2* in increments of *NINC*) around which the mesh is to be refined. *NN2* defaults to *NN1*, and *NINC* defaults to 1. If *NN1* = ALL, *NN2* and *NINC* are ignored and all selected nodes are used for refinement. If *NN1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NN1* (*NN2* and *NINC* are ignored).

LEVEL

Amount of refinement to be done. Specify the value of *LEVEL* as an integer from 1 to 5, where a value of 1 provides minimal refinement, and a value of 5 provides maximum refinement (defaults to 1).

DEPTH

Depth of mesh refinement in terms of number of elements outward from the indicated nodes (defaults to 1).

POST

Type of postprocessing to be done after element splitting, in order to improve element quality:

OFF

No postprocessing will be done.

SMOOTH

Smoothing will be done. Node locations may change.

CLEAN

Smoothing and cleanup will be done. Existing elements may be deleted, and node locations may change (default).

RETAIN

Flag indicating whether quadrilateral elements must be retained in the refinement of an all-quadrilateral mesh. (Mechanical APDL ignores this argument if you are refining anything other than a quadrilateral mesh.)

ON

The final mesh will be composed entirely of quadrilateral elements, regardless of the element quality (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

The final mesh may include some triangular elements to maintain element quality and provide transitioning.

Notes

This command refines all area elements and tetrahedral volume elements adjacent to the specified nodes.

Mesh refinement is not available on a solid model containing initial conditions at nodes (**IC (p. 921)**), coupled nodes (**CP (p. 421)** family of commands), constraint equations (**CE (p. 297)** family of commands), or boundary conditions or loads applied directly to any of its nodes or elements. This restriction applies to nodes and elements anywhere in the model, not just in the region where you want to request mesh refinement. For more information about mesh refinement, see Revising Your Model.

This command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Modify Mesh>Refine At>Nodes

NRLSUM,*SIGNIF*,*Label*,*LabelCSM*,*ForceType*

Specifies the Naval Research Laboratory (NRL) sum mode combination method.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SIGNIF

Combine only those modes whose significance level exceeds the *SIGNIF* threshold. For single-point, multi-point, or DDAM response spectrum (*Spectype* = SPRS, MPRS, or DDAM on **SPOPT (p. 1837)**), the significance level of a mode is defined as the mode coefficient divided by the maximum mode coefficient of all modes. Any mode whose significance level is less than *SIGNIF* is considered insignificant and is not contributed to the mode combinations. The higher the *SIGNIF* threshold, the fewer the number of modes combined. *SIGNIF* defaults to 0.001. If *SIGNIF* is specified as 0.0, it is taken as 0.0. (This mode combination method is not valid for **SPOPT (p. 1837)**,PSD.)

Label

Label identifying the combined mode solution output.

DISP

Displacement solution (default). Displacements, stresses, forces, etc., are available.

VELO

Velocity solution. Velocities, "stress velocities," "force velocities," etc., are available.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ACEL

Acceleration solution. Accelerations, "stress accelerations," "force accelerations," etc., are available.

LabelCSM

Label identifying the CSM (Closely Spaced Modes) method.

CSM

Use the CSM method.

Blank

Do not use the CSM method (default).

ForceType

Label identifying the forces to be combined:

STATIC

Combine the modal static forces (default).

TOTAL

Combine the modal static plus inertial forces.

Notes

This command is also valid in PREP7. This mode combination method is usually used for **SPOPT (p. 1837)**,DDAM.

This CSM method is only applicable in a DDAM analysis (**SPOPT (p. 1837)**,*DDAM*). Element results calculation based on modal element results (*Elcalc* on **SPOPT (p. 1837)**) is not supported and is automatically reset for this method. The CSM method combines two closely spaced modes into one mode when their frequencies are within 10 percent of the common mean frequency and their responses are opposite in sign. The contribution of these closely spaced modes is then included in the NRL sum as a single effective mode. Refer to Closely Spaced Modes (CSM) Method in the *Theory Reference* for more information.

Menu Paths

Main Menu>Solution>Load Step Opts>Spectrum>MultiPt>Mode Combine>NRLSUM Method

Main Menu>Solution>Load Step Opts>Spectrum>SinglePt>Mode Combine>NRLSUM Method

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*NRM,*Name*,*NormType*,*ParR*,*Normalize*

Computes the norm of the specified matrix or vector.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Name

Matrix or vector for which the norm will be computed. This can be a dense matrix (created by the ***DMAT (p. 551)** command), a sparse matrix (created by the ***SMAT (p. 1801)** command) or a vector (created by the ***VEC (p. 2085)** command)

NormType

Mathematical norm to use:

NRM2 --

L2 (Euclidian or SRSS) norm (default).

NRM1 --

L1 (absolute sum) norm (vectors and dense matrices only).

NRMINF --

Maximum norm.

ParR

Parameter name that contains the result.

Normalize

Normalization key; to be used only for vectors created by ***VEC (p. 2085)**:

YES --

Normalize the vector such that the norm is 1.0.

NO --

Do not normalize the vector (default).

Notes

The NRM2 option corresponds to the Euclidian or L2 norm and is applicable to either vectors or matrices:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$\forall x \in \mathbb{R}^n, \|x\|_2 = \left(\sum_{i=1}^{n} |x_i|^2 \right)^{\frac{1}{2}}$

$\forall x \in \mathbb{C}^n, \|x\|_2 = \left(\sum_{i=1}^{n} \overline{x}_I \cdot x_i \right)^{\frac{1}{2}}$ where $\overline{x}_I$ is the complex conjugate of x_i

$\forall A \in \mathbb{R}^{nxn}, \|A\|_2 = \sqrt{\rho\left(A^* A\right)}$ = largest eigenvalue of $\left(A^* A\right)^{\frac{1}{2}}$

The NRM1 option corresponds to the L1 norm and is applicable to vectors and dense matrices:

$\forall x \in \mathbb{R}^n$ or $\mathbb{C}^n, \|x\|_1 = \sum_{i=1}^{n} |x_i|$

$\forall A \in \mathbb{R}^{nxn}$ or $\mathbb{C}^{nxn}, \|A\|_1 = \max_{j \in [i,n]} \sum_{i=1}^{n} |a_{ij}|$

The NRMINF option is the maximum norm and is applicable to either vectors or matrices:

$\forall x \in \mathbb{R}^n$ or $\mathbb{C}^n, \|x\|_\infty = \max_{i \in [i,n]} |x_i|$

$\forall A \in \mathbb{R}^{nxn}$ or $\mathbb{C}^{nxn}, \|A\|_\infty = \max_{i \in [i,n]} \sum_{j=1}^{n} |a_{ij}|$

Menu Paths

This command cannot be accessed from a menu.

NROPT,*Option1*,*Option2*,*Optval*

Specifies the Newton-Raphson options in a static or full transient analysis.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option1

Option key:

AUTO

Let the program choose the option (default).

FULL

Use full Newton-Raphson.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MODI

Use modified Newton-Raphson.

INIT

Use the previously computed matrix (initial-stiffness).

UNSYM

Use full Newton-Raphson with unsymmetric matrices of elements where the unsymmetric option exists.

Option2

Option key:

CRPL

When applicable in a static creep analysis, activates modified Newton-Raphson with a creep-ratio limit. Valid only when *Option1* = AUTO.

Optval

If *Option2* is blank, *Optval* is the Adaptive Descent Key (*Adptky*):

ON

Use adaptive descent (default if frictional contact exists). Explicit ON is valid only if *Option* = FULL.

OFF

Do not use adaptive descent (default in all other cases).

If *Option2* = CRPL, *Optval* is the creep ratio limit:

CRLIMIT

The creep ratio limit for use with the modified Newton-Raphson procedure. Valid only when *Option1* = AUTO (default) and *Option2* = CRPL. Typically, this value should not exceed 0.15 in order to make the modified Newton-Raphson solution converge efficiently. For more information about the creep ratio limit, see the **CUTCONTROL (p. 445)** command.

Notes

The **NROPT (p. 1261)** command specifies the Newton-Raphson option used to solve the nonlinear equations in a static or full transient analysis.

The automatic modified Newton-Raphson procedure with creep-ratio limit control (**NROPT (p. 1261)**,AUTO,CRPL,*CRLIMIT*) applies to static creep analysis only. When the creep ratio is smaller than the value of the creep ratio limit specified, the modified Newton-Raphson procedure is used. If convergence difficulty occurs during solution, use the full Newton-Raphson procedure.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The command **NROPT (p. 1261)**,UNSYM is also valid in a linear non-prestressed modal analysis that is used to perform a brake squeal analysis. In this special case, the command is used only to generate the unsymmetric stiffness matrix; no Newton-Raphson iterations are performed.

NROPT (p. 1261),MODI and **NROPT (p. 1261)**,INIT are only applicable with the sparse solver (**EQSLV (p. 648)**,SPARSE). Thermal analyses will always use full Newton-Raphson irrespective of the *Option1* value selected.

See Newton-Raphson Option in the *Structural Analysis Guide* for more information.

This command is also valid in PREP7.

Switching Between the Symmetric and Unsymmetric Option

Normally, switching from the symmetric Newton-Raphson option (**NROPT (p. 1261)**,FULL) to the unsymmetric option (**NROPT (p. 1261)**,UNSYM) or from the unsymmetric option to the symmetric option is allowed between load steps within the same analysis type. This is applicable to linear and nonlinear, static and full transient analyses.

Under the following circumstances, the solution could be slightly different or inaccurate if you switch from symmetric to unsymmetric or vice versa:

- The underlying elements or materials are unsymmetric by their mathematical definition, and you switch from unsymmetric to symmetric.
- You change analysis types and also switch from symmetric to unsymmetric (or vise versa) at the same time. This situation could result in failures such as data corruption or a core dump and should therefore be avoided.
- In some rare cases, switching between the symmetric and unsymmetric options can cause a system core dump when reading/writing the `.esav` or `.osav` file, and the analysis terminates. Typically, this happens when the record length of the element nonlinear saved variables cannot be altered between load steps by their mathematical definition.

If all the elements and the material are symmetric by their mathematical definition and you use the unsymmetric option, the solution accuracy is the same as the symmetric option. However, the analysis will run twice as slow as the symmetric case.

In a static or full transient linear perturbation base analysis, be aware that if the unsymmetric Newton-Raphson procedure is used, you must specify the UNSYM or DAMP eigensolver option in the downstream modal analysis, which may be more expensive than symmetric modal analysis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NROTAT, *NODE1*, *NODE2*, *NINC*

Rotates nodal coordinate systems into the active system.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE1*, *NODE2*, *NINC

Rotate nodes from *NODE1* to *NODE2* (defaults to *NODE1*) in steps of *NINC* (defaults to 1). If *NODE1* = ALL, *NODE2* and *NINC* are ignored and all selected nodes (**NSEL (p. 1266)**) are rotated. If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE1* (*NODE2* and *NINC* are ignored).

Command Default

No automatic nodal rotation.

Notes

Rotates nodal coordinate systems into the active coordinate system. Nodal coordinate systems may be automatically rotated into the active (global or local) coordinate system as follows: Rotations in Cartesian systems will have nodal x directions rotated parallel to the Cartesian X direction. Rotations in cylindrical, spherical or toroidal systems will have the nodal x directions rotated parallel to the R direction. Nodes at (or near) a zero radius location should not be rotated. Nodal coordinate directions may be displayed (**/PSYMB (p. 1552)**). Nodal forces and constraints will also appear rotated when displayed if the nodal coordinate system is rotated.

Note:

When the nodal coordinate systems are defined, they remain parallel to the global Cartesian system unless subsequently rotated.

Previously specified rotations on the specified nodes are overridden.

See the **NMODIF (p. 1247)**, **NANG (p. 1208)**, and **NORA (p. 1252)** commands for other rotation options.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>RotateNode>To Active CS

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NRRANG, *NMIN*, *NMAX*, *NINC*

Specifies the range of nodes to be read from the node file.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NMIN*, *NMAX*, *NINC

Node range is defined from *NMIN* (defaults to 1) to *NMAX* (defaults to 999999999) in steps of *NINC* (defaults to 1).

Notes

Defines the range of nodes to be read (**NREAD (p. 1256)**) from the node file. Also implies an element range since only elements fully attached to these nodes will be read from the element file.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Nodes>Read Node File

NSCALE, *INC*, *NODE1*, *NODE2*, *NINC*, *RX*, *RY*, *RZ*

Generates a scaled set of nodes from a pattern of nodes.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

INC

Do this scaling operation one time, incrementing all nodes in the given pattern by *INC*. If *INC* = 0, nodes will be redefined at the scaled locations.

NODE1*, *NODE2*, *NINC

Scale nodes from pattern of nodes beginning with *NODE1* to *NODE2* (defaults to *NODE1*) in steps of *NINC* (defaults to 1). If *NODE1* = ALL, *NODE2* and *NINC* are ignored and pattern is all selected nodes (**NSEL (p. 1266)**). If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE1* (*NODE2* and *NINC* are ignored).

RX*, *RY*, *RZ

Scale factor ratios. Scaling is relative to the origin of the active coordinate system (RR, Rθ, RZ for cylindrical, RR, Rθ, RΦ for spherical or toroidal). If absolute value of ratio > 1.0, pattern is enlarged. If < 1.0, pattern is reduced. Ratios default to 1.0 (each).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Generates a scaled pattern of nodes from a given node pattern. Scaling is done in the active coordinate system. Nodes in the pattern may have been generated in any coordinate system.

This command is also valid in the **/MAP (p. 1107)** processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Copy>Nodes>Scale & Copy

---

NSEL, *Type*, *Item*, *Comp*, *VMIN*, *VMAX*, *VINC*, *KABS*

Selects a subset of nodes.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

ALL

Restore the full set.

NONE

Unselect the full set.

INVE

Invert the current set (selected becomes unselected and vice versa).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

STAT

Display the current select status.

The following fields are used only with *Type* = S, R, A, or U:

Item

Label identifying data. Valid item labels are shown in the table below. Some items also require a component label. If *Item* = PICK (or simply "P"), graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). Defaults to NODE.

Comp

Component of the item (if required). Valid component labels are shown in the table below.

VMIN

Minimum value of item range. Ranges are node numbers, set numbers, coordinate values, load values, or result values as appropriate for the item. A component name (as specified on the **CM (p. 356)** command) may also be substituted for *VMIN* (*VMAX* and *VINC* are ignored).

VMAX

Maximum value of item range. *VMAX* defaults to *VMIN* for input values. For result values, *VMAX* defaults to infinity if *VMIN* is positive, or to zero if *VMIN* is negative.

VINC

Value increment within range. Used only with integer ranges (such as for node and set numbers). Defaults to 1. *VINC* cannot be negative.

KABS

Absolute value key:

0

Check sign of value during selection.

1

Use absolute value during selection (sign ignored).

Command Default

All nodes are selected.

Notes

Selects a subset of nodes. For example, to select a new set of nodes based on node numbers 1 through 7, use **NSEL (p. 1266)**,S,NODE,,1,7. The subset is used when the ALL label is entered (or implied) on other

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

commands, such as **NLIST (p. 1239)**,ALL. Only data identified by node number are selected. Data are flagged as selected and unselected; no data are actually deleted from the database.

When selecting nodes by results, the full graphics value is used, regardless of whether PowerGraphics is on.

Solution result data consists of two types, 1) nodal degree of freedom--results initially calculated at the nodes (such as displacement, temperature, pressure, etc.), and 2) element--results initially calculated elsewhere (such as at an element integration point or thickness location) and then recalculated at the nodes (such as stresses, strains, etc.). Various element results also depend upon the recalculation method and the selected results location (**AVPRIN (p. 210)**, **RSYS (p. 1639)**, **FORCE (p. 772)**, **LAYER (p. 1015)** and **SHELL (p. 1784)**).

You must have all the nodes (corner and midside nodes) on the external face of the element selected to use *Item* = EXT.

This command is valid in any processor.

For Selects based on non-integer numbers (coordinates, results, etc.), items that are within the range VMIN-*Toler* and VMAX+*Toler* are selected. The default tolerance *Toler* is based on the relative values of VMIN and VMAX as follows:

- If VMIN = VMAX, *Toler* = 0.005 x VMIN.
- If VMIN = VMAX = 0.0, *Toler* = 1.0E-6.
- If VMAX ≠ VMIN, *Toler* = 1.0E-8 x (VMAX-VMIN).

Use the **SELTOL (p. 1710)** (p. 1710) command to override this default and specify *Toler* explicitly.

Table 198: NSEL (p. 1266) - Valid Item and Component Labels

Valid Item and Component Labels NSEL (p. 1266), *Type,Item,Comp,VMIN,VMAX,VINC,KABS*

Valid item and component labels for input values are:

Item	Comp	Description
NODE		Node number.
EXT		Nodes on exterior of selected elements (ignore remaining fields).
LOC	X, Y, Z	X, Y, or Z location in the active coordinate system.
ANG	XY, YZ, ZX	THXY, THYZ, or THZX rotation angle.
M		Master node number.
CP		Coupled set number.
CE		Constraint equation set number.
D	U	Any of X, Y, or Z structural displacements. Amplitude only, if complex.
"	UX, UY, UZ	X, Y, or Z structural displacement. Amplitude only, if complex.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Valid Item and Component Labels NSEL (p. 1266),
Type,Item,Comp,VMIN,VMAX,VINC,KABS

Valid item and component labels for input values are:

Item	Comp	Description
"	ROT	Any of X, Y, or Z structural rotations. Amplitude only, if complex.
"	ROTX, ROTY, ROTZ	X, Y, or Z structural rotation. Amplitude only, if complex.
"	TEMP, TBOT, TE2, TE3, . . ., TTOP	Temperature.
"	PRES	Pressure (for example, PRES degree of freedom for acoustic elements).
"	VOLT	Electric potential.
"	MAG	Magnetic scalar potential.
"	V	Any of X, Y, or Z fluid velocities.
"	VX, VY, VZ	X, Y, or Z fluid velocity.
"	AZ	2D magnetic vector potential. Amplitude only, if complex.
"	CURR	Current.
"	EMF	Electromotive force drop.
F	F	Any of X, Y, or Z structural forces. Amplitude only, if complex.
"	FX, FY, FZ	X, Y, or Z structural force. Amplitude only, if complex.
"	M	Any of X, Y, or Z structural moments. Amplitude only, if complex
"	MX, MY, MZ	X, Y, or Z structural moment. Amplitude only, if complex.
"	HEAT, HBOT, HE2, HE3, . . ., HTOP	Heat flow.
"	FLOW	Fluid flow.
"	AMPS	Current flow.
"	FLUX	Magnetic flux.
"	CSGZ	Magnetic current segment component. Amplitude only, if complex.
	RATE	Diffusion flow rate.
"	CHRG	Electric charge.
"	CHRGD	Electric charge density.
BF	TEMP	Nodal temperature.
"	FLUE	Nodal fluence.
"	HGEN	Nodal heat generation rate.
"	JS	Any of X, Y, or Z current densities. Amplitude only, if complex.
"	JSX, JSY, JSZ	X, Y, or Z current density. Amplitude only, if complex.
"	MVDI	Magnetic virtual displacements flag.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Valid Item and Component Labels NSEL (p. 1266),
Type,Item,Comp,VMIN,VMAX,VINC,KABS

Valid item and component labels for input values are:

Item	Comp	Description
"	DGEN	Nodal diffusing substance generation rate.

Table 199: NSEL - Valid Item and Component Labels for Nodal DOF Result Values

Item	Comp	Description
U	X, Y, Z, SUM	X, Y, or Z structural displacement or vector sum.
ROT	X, Y, Z, SUM	X, Y, or Z structural rotation or vector sum.
TEMP		Temperature.
PRES		Pressure.
VOLT		Electric potential.
MAG		Magnetic scalar potential.
V	X, Y, Z, SUM	X, Y, or Z fluid velocity or vector sum.
A	X, Y, Z, SUM	X, Y, or Z magnetic vector potential or vector sum.
CONC		Concentration.
CURR		Current.
EMF		Electromotive force drop.

Table 200: NSEL - Valid Item and Component Labels for Element Result Values

Item	Comp	Description
S	X, Y, Z, XY, YZ, XZ	Component stress.
"	1, 2, 3	Principal stress.
"	INT, EQV	Stress intensity or equivalent stress.
EPTO	X, Y, Z, XY, YZ, XZ	Component total strain (EPEL + EPPL + EPCR).
"	1,2,3	Principal total strain.
"	INT, EQV	Total strain intensity or total equivalent strain.
EPEL	X, Y, Z, XY, YZ, XZ	Component elastic strain.
"	1, 2, 3	Principal elastic strain.
"	INT, EQV	Elastic strain intensity or elastic equivalent strain.
EPPL	X, Y, Z, XY, YZ, XZ	Component plastic strain.
"	1,2,3	Principal plastic strain.
"	INT, EQV	Plastic strain intensity or plastic equivalent strain.
EPCR	X, Y, Z, XY, YZ, XZ	Component creep strain.
"	1,2,3	Principal creep strain.
"	INT, EQV	Creep strain intensity or creep equivalent strain.
EPTH	X, Y, Z, XY, YZ, XZ	Component thermal strain.
"	1, 2, 3	Principal thermal strain.
"	INT, EQV	Thermal strain intensity or thermal equivalent strain.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item	Comp	Description
EPSW		Swelling strain.
EPDI	X, Y, Z, XY, YZ, XZ	Component diffusion strain.
"	1, 2, 3	Principal diffusion strain.
"	INT, EQV	Diffusion strain intensity or diffusion equivalent strain.
NL	SEPL	Equivalent stress (from stress-strain curve).
"	SRAT	Stress state ratio.
"	HPRES	Hydrostatic pressure.
"	EPEQ	Accumulated equivalent plastic strain.
"	CREQ	Accumulated equivalent creep strain.
"	PSV	Plastic state variable.
"	PLWK	Plastic work/volume.
CONT	STAT[1]	Contact status.
"	PENE	Contact penetration.
"	PRES	Contact pressure.
"	SFRIC	Contact friction stress.
"	STOT	Contact total stress (pressure plus friction).
"	SLIDE	Contact sliding distance.
TG	X, Y, Z, SUM	Component thermal gradient or vector sum.
TF	X, Y, Z, SUM	Component thermal flux or vector sum.
PG	X, Y, Z, SUM	Component pressure gradient or vector sum.
EF	X, Y, Z, SUM	Component electric field or vector sum.
D	X, Y, Z, SUM	Component electric flux density or vector sum.
H	X, Y, Z, SUM	Component magnetic field intensity or vector sum.
B	X, Y, Z, SUM	Component magnetic flux density or vector sum.
CG	X, Y, Z, SUM	Component concentration gradient or vector sum
DF	X, Y, Z, SUM	Component diffusion flux density or vector sum
FMAG	X, Y, Z, SUM	Component electromagnetic forces or vector sum.

1. For more information on the meaning of contact status and its possible values, see Reviewing Results in POST1 in the *Contact Technology Guide*.

NSLA, *Type*, *NKEY*

Selects those nodes associated with the selected areas.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of node select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

NKEY

Specifies whether only interior area nodes are to be selected:

0

Select only nodes interior to selected areas.

1

Select all nodes (interior to area, interior to lines, and at keypoints) associated with the selected areas.

Notes

Valid only if the nodes were generated by an area meshing operation (**AMESH (p. 121)**, **VMESH (p. 2140)**) on a solid model that contains the selected areas.

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NSLE, *Type*, *NodeType*, *Num*

Selects those nodes attached to the selected elements.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of node select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

NodeType

Label identifying type of nodes to consider when selecting:

ALL

Select all nodes of the selected elements (default).

ACTIVE

Select only the active nodes. An active node is a node that contributes DOFs to the model.

INACTIVE

Select only inactive nodes (such as orientation or radiation).

CORNER

Select only corner nodes.

MID

Select only midside nodes.

POS

Select nodes in position *Num*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FACE

Select nodes on face *Num*.

Num

Position or face number for *NodeType* = POS or FACE.

Notes

NSLE (p. 1273) selects *NodeType* nodes attached to the currently-selected set of elements. Only nodes on elements in the currently-selected element set can be selected.

Note:

When using degenerate hexahedral elements, **NSLE (p. 1273)**, *U*,*CORNER* and **NSLE (p. 1273)**,*S*,*MID* will not select the same set of nodes because some nodes appear as both corner and midside nodes.

This command is valid in any processor.

NSMASS,*Elem*,*Action*,*UNIT*,*VAL*,*DISTRB*

Applies nonstructural mass to selected elements.

PREP7 (p. 22): Materials (p. 24)
SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Elem

Element on which to apply nonstructural mass. If ALL, the command applies nonstructural mass to *all* selected elements (**ESEL (p. 661)**). A component name is also valid.

Action

Command action requested:

ADD – Add nonstructural mass to the specified element or elements.

DEL – Delete all previously defined nonstructural mass from selected element(s).

LIST – List the input value of nonstructural mass. If multiple **NSMASS (p. 1277)** commands are issued, this option lists the total accumulated nonstructural mass.

The following options apply only when *Action* = ADD:

UNIT

Unit of the input value of nonstructural mass:

0 – Total Mass (default).

1 – Mass per unit volume.

2 – Mass per unit area.

3 – Mass per unit length.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL

Input value of the nonstructural mass. A positive value increases (accumulates) the total nonstructural mass. A negative value reduces the total nonstructural mass.

DISTRB

Nonstructural mass distribution method. Valid only when *UNIT* = 0.

0 – Mass proportional distribution (default).

1 – Volume proportional distribution.

2 – Area proportional distribution.

3 – Length proportional distribution.

Notes

NSMASS (p. 1277) supports current-technology structural elements only:

Table 201: Supported Elements

Category	Element Types
2D/3D Structural Solid	PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, SOLSH190, SOLID285
2D/3D Structural Shell	SHELL208, SHELL209, SHELL181, SHELL281
2D/3D Surface Effect	SURF153, SURF154, SURF156
2D/3D Structural Link, Beam, Pipe, and Elbow	LINK180, CABLE280, BEAM188, BEAM189, PIPE288, PIPE289, ELBOW290
2D/3D Gasket	INTER192, INTER193, INTER194, INTER195

Applying Nonstructural Mass

NSMASS (p. 1277) offers two methods for nonstructural mass application:

- Distribution of total nonstructural mass (p. 1279)
- Direct input of nonstructural mass density (p. 1279)

For consecutive accumulation or reduction of total nonstructural mass to the same elements, you can issue multiple **NSMASS (p. 1277)** commands, each specifying a different unit (*UNIT*) or distribution method (*DISTRB*).

Use care when selecting the unit and distribution method to ensure compatibility with the selected elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Distribution of Total Nonstructural Mass (*UNIT* = 0)

Specify *UNIT* = 0 to distribute the total nonstructural mass over all selected elements proportionally to the mass, volume, area, or length (*DISTRB* = 0, 1, 2, or 3, respectively):

Table 202: Supported Total Mass Distribution Methods

DISTRB	Applicable Element Types
0, 1	Supports all element types listed in Table 201: Supported Elements (p. 1278) with the exception of SURF156.
2	Supports these structural shell and surface-effect elements: SHELL208, SHELL209, SHELL181, SHELL281, SURF153, and SURF154.
3	Supports structural link, beam, pipe, and elbow elements, and the SURF156 structural surface line-load-effect element.

Direct Input of Nonstructural Mass Density (*UNIT* = 1, 2, or 3)

The nonstructural mass is applied directly to the selected element in one form of mass densities: mass per unit volume (*UNIT* = 1), mass per unit area (*UNIT* = 2), or mass per unit length (*UNIT* = 3):

Table 203: Supported Units for Direct Input of Mass Density

DISTRB	Applicable Element Types
1	Supports all element types listed in Table 201: Supported Elements (p. 1278) with the exception of SURF156.
2	Supports these structural shell and surface-effect elements: SHELL208, SHELL209, SHELL181, SHELL281, SURF153, and SURF154.
3	Supports structural link, beam, pipe, and elbow elements, and the SURF156 structural surface line-load-effect element.

Nonstructural Mass Behavior: Saturated Mass vs. Attached Mass

NSMASS (p. 1277) accounts for two behaviors of the nonstructural mass:

- **The nonstructural mass is applied uniformly to the entire volume of the element (that is, the saturated nonstructural mass).**

  Example: The moisture content in a structure can be simulated with the saturated nonstructural mass.

  This behavior of the nonstructural mass can be defined via a mass- or volume-proportional distribution of total nonstructural mass (*DISTRB* = 0 or 1), or direct input of mass density (*UNIT* = 1).

- **The nonstructural mass is attached to the element at the location where element nodes are defined (that is, at the attached nonstructural mass).**

  Example: The thin exterior insulation on a pipe can be simulated with the attached nonstructural mass.

  This behavior of the nonstructural mass can be defined via area or length proportional distribution of total nonstructural mass (*DISTRB* = 2 or 3), or via direct input of mass density (*UNIT* = 2 or 3).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The attached nonstructural mass is assumed to have a negligible thickness or cross-sectional area. Therefore, for structural elements with rotational degrees of freedom, element rotational inertia is not affected by the attached nonstructural mass. To properly account for the attached nonstructural mass on these elements, position the element nodes (**SECOFFSET (p. 1685)**) at the locations where the nonstructural mass is applied (for example, at the top surface of a shell element).

Assumptions and Limitations

- Elements with inhomogeneous materials (such as a structural shell with a composite section) are not supported for mass proportional distribution (*DISTRIB* = 0).
- Elements with a TAPER, GENB, COMB, or GENS section type are not supported.
- The element volume, area, or length used for total nonstructural mass distribution (*DISTRIB* = 0, 1, 2, or 3 respectively) are calculated using the undeformed element geometry.
- The element mass used for total nonstructural mass distribution (*DISTRB* = 0) is calculated using undeformed element geometry and mass density at the reference temperature.
- **NSMASS (p. 1277)** does not account for subsequent modifications made to the selected elements. Issue **NSMASS (p. 1277)** only *after* defining the selected elements.

Menu Paths

This command cannot be accessed from a menu.

NSMOOTH, *NPASS*

Smooths selected nodes among selected elements.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NPASS

Number of smoothing passes. Defaults to 3.

Notes

Repositions each selected node at the average position of its immediate neighbors on the selected elements. The node positions converge after some number of smoothing passes. For some initial conditions, *NPASS* may need to be much larger than 3. If the boundary of a mesh is to be undisturbed (usually desirable), the boundary nodes should be unselected before issuing **NSMOOTH (p. 1280)**.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NSOL, *NVAR*, *NODE*, *Item*, *Comp*, *Name*, *SECTOR*

Specifies nodal data to be stored from the results file.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR

Arbitrary reference number assigned to this variable. Variable numbers can be 2 to *NV* (**NUMVAR (p. 1302)**). Overwrites any existing results for this variable.

NODE

Node for which data are to be stored.

Item

Label identifying the item. Valid item labels are shown in the table below. Some items also require a component label.

Comp

Component of the item (if required). Valid component labels are shown in the table below.

Name

Thirty-two character name identifying the item on printouts and displays. Defaults to a label formed by concatenating the first four characters of the *Item* and *Comp* labels.

SECTOR

For a full harmonic cyclic symmetry solution, the sector number for which the results from NODE are to be stored.

Notes

Stores nodal degree of freedom and solution results in a variable. For more information, see Data Interpreted in the Nodal Coordinate System in the *Modeling and Meshing Guide*.

For *SECTOR*>1, the result is in the nodal coordinate system of the base sector, and it is rotated to the expanded sector's location. Refer to Using the /CYCEXPAND Command in the *Cyclic Symmetry Analysis Guide* for more information.

Table 204: NSOL (p. 1281) - Valid Item and Component Labels

Valid Item and Component Labels NSOL (p. 1281), *NVAR*, *NODE*, *Item*, *Comp*, *Name*

Valid item and component labels for nodal degree of freedom results are:

Item	Comp	Description
U	X, Y, Z	X, Y, or Z structural displacement.
ROT	X, Y, Z	X, Y, or Z structural rotation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Valid Item and Component Labels NSOL (p. 1281), *NVAR, NODE, Item, Comp, Name*

Valid item and component labels for nodal degree of freedom results are:

Item	Comp	Description
TEMP[1]		Temperature.
PRES		Pressure.
GFV1, GFV2, GFV3		Nonlocal field values 1, 2, and 3.
VOLT		Electric potential.
MAG		Magnetic scalar potential.
V	X, Y, Z	X, Y, or Z fluid velocity in a fluid analysis.
A	X, Y, Z	X, Y, or Z magnetic vector potential in an electromagnetic analysis.
CONC		Concentration.
VEL	X, Y, Z	X, Y, or Z velocity in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
ACC	X, Y, Z	X, Y, or Z acceleration in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
OMG	X, Y, Z	X, Y, or Z rotational velocity in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
DMG	X, Y, Z	X, Y, or Z rotational acceleration in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
CURR		Current.
EMF		Electromotive force drop.
SPL		Sound pressure level.
SPLA		A-weighted sound pressure level (dBA).
ENKE		Acoustic energy density

1. For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use the labels TBOT, TE2, TE3, . . ., TTOP instead of TEMP.

Menu Paths

Main Menu>TimeHist Postpro>Define Variables

Main Menu>TimeHist Postpro>Elec&Mag>Circuit>Define Variables

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NSORT, *Item*, *Comp*, *ORDER*, *KABS*, *NUMB*, *SEL*

Sorts nodal data.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Label identifying the item to be sorted on. Valid item labels are shown in the table below. Some items also require a component label.

Comp

Component of the item (if required). Valid component labels are shown in the table below.

ORDER

Order of sort operation:

0

Sort into descending order.

1

Sort into ascending order.

KABS

Absolute value key:

0

Sort according to real value.

1

Sort according to absolute value.

NUMB

Number of nodal data records to be sorted in ascending or descending order (*ORDER*) before sort is stopped (remainder will be in unsorted sequence) (defaults to all nodes).

SEL

Allows selection of nodes in the sorted field.

(blank)

No selection (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SELECT

Select the nodes in the sorted list.

Command Default

Use ascending node-number order.

Notes

Values are in the active coordinate system (**CSYS (p. 441)** for input data or **RSYS (p. 1639)** for results data). Various element results also depend upon the recalculation method and the selected results location (**AVPRIN (p. 210)**, **RSYS (p. 1639)**, **SHELL (p. 1784)**, **ESEL (p. 661)**, and **NSEL (p. 1266)**). If simultaneous load cases are stored, the last sorted sequence formed from any load case applies to all load cases. Use **NUSORT (p. 1303)** to restore the original order. This command is not valid with PowerGraphics.

Table 205: NSORT (p. 1283) - Valid Item and Component Labels

Valid Item and Component Labels NSORT (p. 1283), *Item,Comp,ORDER,KABS,NUMB,SEL*

Valid item and component labels for input values are:

Item	Comp	Description
LOC	X, Y, Z	X, Y, or Z location.
ANG	XY, YZ, ZX	THXY, THYZ, or THZX rotation angle.

Table 206: NSORT (p. 1283) - Valid Item and Component Labels for Nodal DOF Result Values

Item	Comp	Description
U	X, Y, Z, SUM	X, Y, or Z structural displacement or vector sum.
ROT	X, Y, Z, SUM	X, Y, or Z structural rotation or vector sum.
TEMP		Temperature (includes TEMP, TBOT, TE2, TE3, . . ., TTOP values).
PRES		Pressure.
VOLT		Electric potential.
MAG		Magnetic scalar potential.
V	X, Y, Z, SUM	X, Y, or Z fluid velocity or vector sum.
A	X, Y, Z, SUM	X, Y, or Z magnetic vector potential or vector sum.
CONC		Concentration
CURR		Current.
EMF		Electromotive force drop.

Table 207: NSORT (p. 1283) - Valid Item and Component Labels for Element Result Values

Item	Comp	Description
S	X, Y, Z, XY, YZ, XZ	Component stress.
"	1, 2,3	Principal stress.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item	Comp	Description
"	INT, EQV	Stress intensity or equivalent stress.
EPTO	X, Y, Z, XY, YZ, XZ	Component total strain (EPEL + EPPL + EPCR).
"	1, 2, 3	Principal total strain.
"	INT, EQV	Total strain intensity or total equivalent strain.
EPEL	X, Y, Z, XY, YZ, XZ	Component elastic strain.
"	1, 2, 3	Principal elastic strain.
"	INT, EQV	Elastic strain intensity or elastic equivalent strain.
EPPL	X, Y, Z, XY, YZ, XZ	Component plastic strain.
"	1, 2, 3	Principal plastic strain.
"	INT, EQV	Plastic strain intensity or plastic equivalent strain.
EPCR	X, Y, Z, XY, YZ, XZ	Component creep strain.
"	1, 2, 3	Principal creep strain.
"	INT, EQV	Creep strain intensity or creep equivalent strain.
EPTH	X, Y, Z, XY, YZ, XZ	Component thermal strain.
"	1, 2, 3	Principal thermal strain.
"	INT, EQV	Thermal strain intensity or thermal equivalent strain.
EPSW		Swelling strain.
EPDI	X, Y, Z, XY, YZ, XZ	Component diffusion strain.
"	1, 2, 3	Principal diffusion strain.
"	INT, EQV	Diffusion strain intensity or diffusion equivalent strain.
NL	SEPL	Equivalent stress (from stress-strain curve).
"	SRAT	Stress state ratio.
"	HPRES	Hydrostatic pressure.
"	EPEQ	Accumulated equivalent plastic strain.
"	CREQ	Accumulated equivalent creep strain.
"	PSV	Plastic state variable.
"	PLWK	Plastic work/volume.
FAIL	MAX	Maximum of all active failure criteria defined at the current location. (See the **FCTYP (p. 740)** command for details.) [1]
"	EMAX	Maximum Strain Failure Criterion [1]
"	SMAX	Maximum Stress Failure Criterion [1]
"	TWSI	Tsai-Wu Strength Index Failure Criterion [1]
"	TWSR	Inverse of Tsai-Wu Strength Ratio Index Failure Criterion [1]
"	HFIB	Hashin Fiber Failure Criterion. [1][2]
"	HMAT	Hashin Matrix Failure Criterion. [1][2]
"	PFIB	Puck Fiber Failure Criterion. [1][2]
"	PMAT	Puck Matrix Failure Criterion. [1][2]

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item	Comp	Description
"	USR1, USR2, ..., USR9	User-defined failure criteria [1][2][3]
CONT	STAT [4]	Contact status.
"	PENE	Contact penetration.
"	PRES	Contact pressure.
"	SFRIC	Contact friction stress.
"	STOT	Contact total stress (pressure plus friction).
"	SLIDE	Contact sliding distance.
TG	X, Y, Z, SUM	Component thermal gradient or vector sum.
TF	X, Y, Z, SUM	Component thermal flux or vector sum.
PG	X, Y, Z, SUM	Component pressure gradient or vector sum.
EF	X, Y, Z, SUM	Component electric field or vector sum.
D	X, Y, Z, SUM	Component electric flux density or vector sum.
H	X, Y, Z, SUM	Component magnetic field intensity or vector sum.
B	X, Y, Z, SUM	Component magnetic flux density or vector sum.
CG	X, Y, Z, SUM	Component concentration gradient or vector sum
DF	X, Y, Z, SUM	Component diffusion flux density or vector sum
FMAG	X, Y, Z, SUM	Component electromagnetic forces or vector sum.

1. Works only if failure criteria information is provided. (For more information, see the documentation for the **FC (p. 732)** and **TB (p. 1899)** commands.)
2. Must be added via the **FCTYP (p. 740)** command first.
3. Works only if user failure criteria routine is provided.
4. For more information about contact status and its possible values, see Reviewing Results in POST1 in the *Contact Technology Guide*.

Menu Paths

Main Menu>General Postproc>List Results>Sorted Listing>Sort Nodes

Utility Menu>Parameters>Get Scalar Data

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NSTORE, *TINC*

Defines which time points are to be stored.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TINC

Store data associated with every *TINC* time (or frequency) point(s), within the previously defined range of *TMIN* to *TMAX* (**TIMERANGE (p. 2001)**). (Defaults to 1)

Command Default

Store every point.

Notes

Defines which time (or frequency) points within the range are to be stored.

Menu Paths

Main Menu>TimeHist Postpro>Settings>Data

NSUBST, *NSBSTP*, *NSBMX*, *NSBMN*, *Carry*

Specifies the number of substeps to be taken this load step.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSBSTP

Number of substeps to be used for this load step (that is, the time step size or frequency increment). If automatic time stepping is used (**AUTOTS (p. 207)**), *NSBSTP* defines the size of the first substep.

If contact elements (TARGE169, TARGE170, CONTA172, CONTA174, CONTA175, or CONTA177) are used, defaults to 1 or 20 substeps, depending on the physics of the model. If none of these contact elements are used, defaults to 1 substep.

NSBMX

Maximum number of substeps to be taken (that is, the minimum time step size) if automatic time stepping is used. The program automatically determines the default based on the physics of the model.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NSBMN

Minimum number of substeps to be taken (that is, the maximum time step size) if automatic time stepping is used. The program automatically determines the default based on the physics of the model.

Carry

Time step carryover key (program-determined default depending on the problem physics):

OFF

Use *NSBSTP* to define time step at start of each load step.

ON

Use final time step from previous load step as the starting time step (if automatic time stepping is used).

The program automatically determines the default based on the physics of the model.

Notes

See **DELTIM (p. 515)** for an alternative input. It is recommended that all fields of this command be specified for solution efficiency and robustness.

When the arc-length method is active (**ARCLEN (p. 175)** command), the *NSBMX* and *NSBMN* arguments are ignored.

Changing the number of substeps upon restarting an analysis during a load step is not recommended. You should only change the number of substeps between load steps.

For a harmonic balance method (HBM) analysis, use *NSBSTP* to specify the number of substeps when no continuation method is used (*CorrMeth* = OFF on **HBMOPT (p. 890)**,CONTSET). The first substep is at *FREQB* + (*FREQE* - *FREQB*)/*NSBSTP* as in other harmonic analyses, where *FREQB* and *FREQE* are the beginning and ending frequencies of a solution specified with the **HARFRQ (p. 885)** command. *NSBSTP* is the only argument used for HBM analyses.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NSVR, *ITYPE*, *NSTV*

Defines the number of variables for user-programmable element options.

PREP7 (p. 22): Element Type (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITYPE

Element type number as defined on the **ET (p. 686)** command.

NSTV

Number of extra state variables to save (must be no more than 840).

Command Default

No extra variables are saved.

Notes

Defines the number of extra variables that need to be saved for user-programmable (system-dependent) element options, for example, material laws through user subroutine USERPL. *ITYPE* must first be defined with the **ET (p. 686)** command.

Menu Paths

This command cannot be accessed from a menu.

NSYM, *Ncomp*, *INC*, *NODE1*, *NODE2*, *NINC*

Generates a reflected set of nodes.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ncomp

Symmetry key:

X

X (or R) symmetry (default).

Y

Y (or θ) symmetry.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Z

Z (or Φ) symmetry.

INC

Increment all nodes in the given pattern by *INC* to form the reflected node pattern.

NODE1*, *NODE2*, *NINC

Reflect nodes from pattern beginning with *NODE1* to *NODE2* (defaults to *NODE1*) in steps of *NINC* (defaults to 1). If *NODE1* = ALL, *NODE2* and *NINC* are ignored and pattern is all selected nodes (**NSEL (p. 1266)**). If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE1* (*NODE2* and *NINC* are ignored).

Notes

Generates nodes from a given node pattern by a symmetry reflection. Reflection is done in the active coordinate system by changing a particular coordinate sign. Nodes in the pattern may have been generated in any coordinate system. Nodal rotation angles are not reflected.

Symmetry reflection may be used with any node pattern, in any coordinate system, as many times as desired. Reflection is accomplished by a coordinate sign change (in the active coordinate system). For example, an X-reflection in a Cartesian coordinate system generates additional nodes from a given pattern, with a node increment added to each node number, and an X coordinate sign change. An R-reflection in a cylindrical coordinate system gives a reflected "radial" location by changing the "equivalent" Cartesian (that is, the Cartesian system with the same origin as the active cylindrical system) X and Y coordinate signs. An R-reflection in a spherical coordinate system gives a reflected "radial" location by changing the equivalent Cartesian X, Y, and Z coordinate location signs. Nodal coordinate system rotation angles are not reflected.

Menu Paths

Main Menu>Preprocessor>Modeling>Reflect>Nodes

/NUMBER, *NKEY*

Specifies whether numbers, colors, or both are used for displays.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NKEY

Numbering style:

0

Color (terminal dependent) the numbered items and show numbers.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Color the numbered items. Do not show the numbers.

2

Show the numbers. Do not color the items.

-1

Do not color the items or show the numbers. For contour plots, the resulting display will vary (see below).

Notes

Specifies whether numbers, colors, or both are used for numbering displays (**/PNUM (p. 1457)**) of nodes, elements, keypoints, lines, areas, and volumes.

Shading is also available for terminals configured with more than 4 color planes (**/SHOW (p. 1785)**). Color automatically appears for certain items and may be manually controlled (off or on) for other items.

When you suppress color (*NKEY* = -1) your contour plots will produce different results, depending on your graphics equipment. For non-3D devices (X11, Win32, etc.) your contour plot will be white (no color). For 3D devices, such as OpenGL, the resulting display will be in color.

The following items are automatically given discrete colors: Boundary condition symbols (**/PBC (p. 1356)**), curves on graph displays, and distorted geometry on postprocessing displays. Contour lines in postprocessing displays are automatically colored based upon a continuous, rather than a discrete, spectrum so that red is associated with the highest contour value. On terminals with raster capability (**/SHOW (p. 1785)**), the area between contour lines is filled with the color of the higher contour.

Explicit entity colors or the discrete color mapping may be changed with the **/COLOR (p. 400)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Numbering

NUMCMP, *Label*

Compresses the numbering of defined items.

PREP7 (p. 22): Database (p. 22)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Items to be compressed:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Coupled set numbers

SECN

Section numbers

CE

Constraint equation numbers

CSYS

Coordinate system numbers

ALL

All item numbers

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **NUMCMP (p. 1291)** command effectively compresses out unused item numbers by renumbering all the items, beginning with one and continuing throughout the model. The renumbering order follows the initial item numbering order (that is, compression lowers the maximum number by "sliding" numbers down to take advantage of unused or skipped numbers). All defined items are renumbered, regardless of whether or not they are actually used or selected. Applicable related items are also checked for re-numbering as described for the merge operation (**NUMMRG (p. 1295)**).

Compressing material numbers (**NUMCMP (p. 1291)**,ALL or **NUMCMP (p. 1291)**,MAT) does *not* update the material number referenced by either of the following:

- A temperature-dependent convection or surface-to-surface radiation load (**SF (p. 1733)**, **SFE (p. 1761)**, **SFL (p. 1774)**, **SFA (p. 1739)**)
- Real constants for multi-material elements

Compression is usually not required unless memory space is limited and there are large gaps in the numbering sequence.

Menu Paths

Main Menu>Preprocessor>Numbering Ctrls>Compress Numbers

NUMEXP, *NUM*, *BEGRNG*, *ENDRNG*, *Elcalc*

Specifies solutions to be expanded from mode-superposition analyses or substructure analyses.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NUM

The number of solutions to expand. This value is required.

Num

Number of solutions to expand.

ALL

Expand all substeps between *BEGRNG* and *ENDRNG* (provided that *ENDRNG* > 0). If *BEGRNG* and *ENDRNG* have no specified values, this option expands *all* substeps of *all* load steps.

BEGRNG, ENDRNG

Beginning and ending time (or frequency) range for expanded solutions. The default is 0 for both values.

Elcalc

The element-calculation key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

YES

Calculate element results, nodal loads, and reaction loads (default).

NO

Do not calculate these items.

Command Default

If this command is not issued, the default behavior is to calculate element results, nodal loads, and reaction loads (*Elcalc* = YES).

Notes

Issuing this command with no arguments is invalid. You must specify the number of solutions, or all solutions, to expand (*NUM*).

Specifies a range of solutions to be expanded from analyses that use mode-superposition methods (**ANTYPE (p. 162)**,HARMIC or TRANS) or substructuring (**ANTYPE (p. 162)**,SUBSTR).

For **ANTYPE (p. 162)**,TRANS, *NUM*, evenly spaced solutions are expanded between time *BEGRNG* and time *ENDRNG*.

For **ANTYPE (p. 162)**,HARMIC, *NUM*, evenly spaced solutions are expanded between frequency *BEGRNG* and frequency *ENDRNG*.

The first expansion in all cases is done at the first point beyond *BEGRNG* (that is, at *BEGRNG* + (*ENDRNG* - *BEGRNG*) / *NUM*)).

The resulting results file will maintain the same load step, substep, and time (or frequency) values as the use pass.

For a single expansion of a solution, or for multiple expansions when the solutions are not evenly spaced (such as in a mode-superposition harmonic analysis with the cluster option), Ansys, Inc. recommends issuing one or more **EXPSOL (p. 721)** commands.

NUMEXP (p. 1293) is invalid in these cases:

- In a substructing analysis (**ANTYPE (p. 162)**,*SUBST*) when a factorized matrix file (the .LN22 file generated by the sparse solver) does not exist, causing Mechanical APDL to use the full-resolve method.
- If the full-resolve option is selected (**SEOPT (p. 1715)**).

In both situations, issue **EXPSOL (p. 721)** to perform a single expansion for each solution desired.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Constraint equations

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

All items

TOLER

Range of coincidence. For *Label* = NODE and KP, defaults to 1.0E-4 (based on maximum Cartesian coordinate difference between nodes or keypoints). For *Label* = MAT, REAL, SECT, and CE, defaults to 1.0E-7 (based on difference of the values normalized by the values). Only items within range are merged. (For keypoints attached to lines, further restrictions apply. See the *GTOLER* field and *Merging Solid Model Entities* below.)

GTOLER

Global solid model tolerance -- used only when merging keypoints attached to lines. If specified, *GTOLER* will override the internal relative solid model tolerance. See *Merging Solid Model Entities* below.

Action

Specifies whether to merge or select coincident items.

SELE

Select coincident items but do not merge. *Action* = SELE is only valid for *Label* = NODE.

(Blank)

Merge the coincident items (default).

Switch

Specifies whether the lowest or highest numbered coincident item is retained after the merging operation. This option does not apply to keypoints; that is, for *Label* = KP, the lowest numbered keypoint is retained regardless of the *Switch* setting.

LOW

Retain the lowest numbered coincident item after the merging operation (default).

HIGH

Retain the highest numbered coincident item after the merging operation.

Notes

The **NUMMRG (p. 1295)** command does not change a model's geometry, only the topology.

After issuing the command, the area and volume sizes (**ASUM (p. 203)** and **VSUM (p. 2167)**) may give slightly different results. In order to obtain the same results as before, use **/FACET (p. 731)**, **/NORMAL (p. 1253)**, and **ASUM (p. 203)** / **VSUM (p. 2167)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The merge operation is useful for tying separate but coincident parts of a model together. If not all items are to be checked for merging, use the select commands (**NSEL (p. 1266)**, **ESEL (p. 661)**, etc.) to select items. Only selected items are included in the merge operation for nodes, keypoints, and elements.

By default, the merge operation retains the lowest numbered coincident item. Higher numbered coincident items are deleted. Set *Switch* to HIGH to retain the highest numbered coincident item after the merging operation. Applicable related items are also checked for deleted item numbers and if found, are replaced with the retained item number. For example, if nodes are merged, element connectivities (except superelements), mesh item range associativity, coupled degrees of freedom, constraint equations, master degrees of freedom, degree of freedom constraints, nodal-force loads, nodal surface loads, and nodal body force loads are checked. Merging material numbers (**NUMMRG (p. 1295)**,ALL or **NUMMRG (p. 1295)**,MAT) does *not* update the material number referenced:

- By temperature-dependent film coefficients as part of convection load or a temperature-dependent emissivity as part of a surface-to-surface radiation load (**SF (p. 1733)**, **SFE (p. 1761)**, **SFL (p. 1774)**, **SFA (p. 1739)**)
- By real constants for multi-material elements

When merging tapered beam or pipe sections, the program first uses the associated end sections for merging. If the merge is successful, the program replaces the tapered section database with the end section data.

If a unique load is defined among merged nodes, the value is kept and applied to the retained node. If loads are not unique (not recommended), only the value on the lowest node (or highest if *Switch* = HIGH) is kept (except for "force" loads for which the values are summed if they are not defined via tabular boundary conditions).

Note:

The unused nodes (not recommended) in elements, couplings, constraint equations, etc. may become active after the merge operation.

The *Action* field provides the option of visualizing the coincident items before the merging operation.

Caution:

When merging entities in a model that has already been meshed, the order in which you issue multiple **NUMMRG (p. 1295)** commands is significant. To merge two adjacent meshed regions having coincident nodes and keypoints, always merge nodes (**NUMMRG (p. 1295)**,NODE) *before* merging keypoints (**NUMMRG (p. 1295)**,KP); otherwise, some of the nodes may lose their association with the solid model (causing other operations to fail). To prevent mesh failure, avoid multiple merging and meshing operations .

After a **NUMMRG (p. 1295)**,NODE command executes, some nodes may be attached to more than one solid entity. As a result, subsequent attempts to transfer solid model loads to the elements may not be successful. Issue **NUMMRG (p. 1295)**,KP to correct this problem. Do *NOT* issue **VCLEAR (p. 2076)** before issuing **NUMMRG (p. 1295)**,KP.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For **NUMMRG (p. 1295)**,ELEM, elements must be identical in all aspects, including the direction of the element coordinate system.

For certain solid and shell elements, the program interprets coincident faces as internal and eliminate them. To prevent this from occurring, shrink the entities by a very small factor to delineate coincident items (**/SHRINK (p. 1794)**, 0.0001) and no internal nodes, lines, areas or elements will be eliminated.

When working with solid models, you may have better success with the gluing operations (**AGLUE (p. 108)**, **LGLUE (p. 1047)**, **VGLUE (p. 2130)**). Please read the following information when attempting to merge solid model entities.

Gluing Operations vs. Merging Operations

Adjacent, touching regions can be joined by gluing them (**AGLUE (p. 108)**, **LGLUE (p. 1047)**, **VGLUE (p. 2130)**) or by merging coincident keypoints (**NUMMRG (p. 1295)**,KP, which also causes merging of identical lines, areas, and volumes). In many situations, either approach will work just fine. Some factors, however, may lead to a preference for one method over the other.

Geometric Configuration

Gluing is possible regardless of the initial alignment or offset of the input entities. Keypoint merging is possible only if each keypoint on one side of the face to be joined is matched by a coincident keypoint on the other side. This is commonly the case after a symmetry reflection (**ARSYM (p. 184)** or **VSYMM (p. 2169)**) or a copy (**AGEN (p. 107)** or **VGEN (p. 2116)**), especially for a model built entirely in Mechanical APDL rather than imported from a CAD system. When the geometry is extremely precise, and the configuration is correct for keypoint merging, **NUMMRG (p. 1295)** is more efficient and robust than **AGLUE (p. 108)** or **VGLUE (p. 2130)**.

Model Accuracy

As with all boolean operations, gluing requires that the input entities meet the current boolean tolerance (BTOL). Otherwise, **AGLUE (p. 108)** or **VGLUE (p. 2130)** may fail. In such cases, relaxing the tolerance may allow the glue to complete. An advantage of gluing is that it is unlikely to degrade the accuracy of a geometric model. Keypoint merging can operate on almost any combination of entities (although you may have to override the default tolerances on **NUMMRG (p. 1295)**). However, it can also introduce or increase accuracy flaws, making later boolean operations less likely to succeed. If the input tolerances are too large, **NUMMRG (p. 1295)** can collapse out small lines, areas, or volumes you intended to keep, possibly rendering the model unusable.

Mesh Status

As with all boolean operations, gluing requires that the input entities be unmeshed. Keypoint merging is effective for meshed models under the right conditions. More information on keypoint merging follows.

Merging Solid Model Entities:

When merging solid model entities (*Label* = KP or ALL), keypoint locations are used as the basis for merging. Once keypoints are merged, any higher order solid model entities (lines, areas, and volumes), regardless of their select status or attachment to the merged keypoints, are considered for merging.

Keypoints that are attached to lines will be merged only if:

- ΔX, ΔY, and ΔZ are each less than *TOLER*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

where,

ΔX is the X component of the distance between keypoints,

ΔY is the Y component of the distance between keypoints, and

ΔZ is the Z component of the distance between keypoints;

and

- $\sqrt{\Delta X^2 + \Delta Y^2 + \Delta Z^2}$ is less than 1E-5 times the length of the longest line attached to those keypoints (internal relative solid model tolerance), or $\sqrt{\Delta X^2 + \Delta Y^2 + \Delta Z^2}$ is less than *GTOLER* (global solid model tolerance) if specified.

The *TOLER* field is a *consideration* tolerance. If a keypoint is within *TOLER* of another keypoint, then those two keypoints are *candidates* to be merged. If, when "moving" the higher numbered keypoint, the distance exceeds the internal relative solid model tolerance, or the global solid model tolerance (*GTOLER*) if specified, the keypoints will *not* be merged. Lines, areas, and volumes are considered for merging in a similar manner.

The internal relative solid model tolerance should be overridden by the global solid model tolerance (*GTOLER*) only when absolutely necessary. *GTOLER* is an *absolute* tolerance; if specified, relative lengths of lines in the model will no longer be considered in the merge operation. If *GTOLER* is too large, you can "merge-out" portions of your model accidently, effectively defeaturing the model. If using *GTOLER*, it is good practice so first save the database before issuing **NUMMRG (p. 1295)** (as undesired merges of solid model entities could occur).

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Circuit>Merge Nodes

Main Menu>Preprocessor>Modeling>Delete>Pre-tens Elemnts

Main Menu>Preprocessor>Numbering Ctrls>Merge Items

NUMOFF, *Label*, *VALUE*, *KREF*

Adds a number offset to defined items.

PREP7 (p. 22): Database (p. 22)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Apply offset number to one of the following sets of items:

NODE

Nodes

ELEM

Elements

KP

Keypoints

LINE

Lines

AREA

Areas

VOLU

Volumes

MAT

Materials

TYPE

Element types

REAL

Real constants

CP

Coupled sets

SECN

Section numbers

CE

Constraint equations

CSYS

Coordinate systems

VALUE

Offset number value (cannot be negative)

KREF

Attribute reference key:

0 – Add number offset to defined items only (default)

1 – Add number offset to *all* attribute references (includes undefined items)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Useful for offsetting current model data to prevent overlap if another model is read in. **CDWRITE (p. 293)** automatically writes the appropriate **NUMOFF (p. 1299)** commands followed by the model data to `File.cdb`. When the file is read, therefore, any model already existing in the database is offset before the model data on the file is read.

Offsetting material numbers with this command (**NUMOFF (p. 1299)**,MAT) does *not* update the material number referenced by either of the following:

- A temperature-dependent convection or surface-to-surface radiation load (**SF (p. 1733)**, **SFE (p. 1761)**, **SFL (p. 1774)**, **SFA (p. 1739)**)
- Real constants for multi-material elements

A mismatch may therefore exist between the material definitions and the material numbers referenced.

Menu Paths

Main Menu>Preprocessor>Numbering Ctrls>Add Num Offset

NUMSTR, *Label*, *VALUE*

Establishes starting numbers for automatically numbered items.

PREP7 (p. 22): Database (p. 22)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Apply starting number to one of the following sets of items:

NODE

Node numbers. *Value* defaults (and is continually reset) to 1 + maximum node number in model. Cannot be reset lower.

ELEM

Element numbers. *Value* defaults (and is continually reset) to 1 + maximum element number in model. Cannot be reset lower.

KP

Keypoint numbers. *Value* defaults to 1. Only undefined numbers are used. Existing keypoints are not overwritten.

LINE

Line numbers. *Value* defaults to 1. Only undefined numbers are used. Existing lines are not overwritten.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AREA

Area numbers. *Value* defaults to 1. Only undefined numbers are used. Existing areas are not overwritten.

VOLU

Volume numbers. *Value* defaults to 1. Only undefined numbers are used. Existing volumes are not overwritten.

DEFA

Default. Returns all starting numbers to their default values.

VALUE

Starting number value.

Notes

Establishes starting numbers for various items that may have numbers automatically assigned (such as element numbers with the **EGEN (p. 603)** command, and node and solid model entity numbers with the mesh like **AMESH (p. 121)**, **VMESH (p. 2140)**, etc.. Use **NUMSTR (p. 1301)**,STAT to display settings. Use **NUMSTR (p. 1301)**,DEFA to reset all specifications back to defaults. Defaults may be lowered by deleting and compressing items (that is, **NDELE (p. 1211)** and **NUMCMP (p. 1291)**,NODE for nodes, etc.).

Note:

A mesh clear operation (**VCLEAR (p. 2076)**, **ACLEAR (p. 93)**, **LCLEAR (p. 1024)**, and **KCLEAR (p. 975)**) automatically sets starting node and element numbers to the highest unused numbers. If a specific starting node or element number is desired, issue **NUMSTR (p. 1301)** after the clear operation.

Menu Paths

Main Menu>Preprocessor>Numbering Ctrls>Reset Start Num

Main Menu>Preprocessor>Numbering Ctrls>Set Start Number

Main Menu>Preprocessor>Numbering Ctrls>Start Num Status

NUMVAR, *NV*

Specifies the number of variables allowed in POST26.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV

Allow storage for *NV* variables. 200 maximum are allowed. Defaults to 10. TIME (variable 1) should also be included in this number.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Allow storage for 10 variables.

Notes

Specifies the number of variables allowed for data read from the results file and for data resulting from an operation (if any). For efficiency, *NV* should not be larger than necessary. *NV* cannot be changed after data storage begins.

Menu Paths

Main Menu>TimeHist Postpro>Settings>File

NUSORT

Restores original order for nodal data.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This command restores the nodal data to its original order (sorted in ascending node number sequence) after an **NSORT (p. 1283)** command. Changing the selected nodal set (**NSEL (p. 1266)**) also restores the original nodal order.

Menu Paths

Main Menu>General Postproc>List Results>Sorted Listing>Unsort Nodes

---

NWPAVE, *N1, N2, N3, N4, N5, N6, N7, N8, N9*

Moves the working plane origin to the average location of nodes.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

N1, N2, N3, . . . , N9

Nodes used in calculation of the average. At least one must be defined. If *N1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Notes

Averaging is based on the active coordinate system.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>WorkPlane>Offset WP to>Nodes

NWPLAN, *WN*, *NORIG*, *NXAX*, *NPLAN*

Defines the working plane using three nodes.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number whose viewing direction will be modified to be normal to the working plane (defaults to 1). If *WN* is a negative value, the viewing direction will not be modified. If fewer than three points are used, the viewing direction of window *WN* will be used instead to define the normal to the working plane.

NORIG

Node number defining the origin of the working plane coordinate system. If *NORIG* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NXAX

Node number defining the x-axis orientation (defaults to the x-axis being parallel to the global X-axis; or if the normal to the working plane is parallel to the global X-axis, then defaults to being parallel to the global Y-axis).

NPLAN

Node number defining the working plane (the normal defaults to the present display view (**/VIEW (p. 2131)**) of window *WN*).

Notes

Defines a working plane to assist in picking operations using three nodes as an alternate to the **WPLANE (p. 2180)** command. The three nodes also define the working plane coordinate system. A minimum of one node (at the working plane origin) is required. Immediate mode may also be active. See the **WPSTYL (p. 2182)** command to set the style of the working plane display.

This command is valid in any processor.

Menu Paths

Main Menu>General Postproc>Surface Operations>Create Surface>Sphere>At Node

Utility Menu>WorkPlane>Align WP with>Nodes

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NWRITE, *Fname*, *Ext*, --, *KAPPND*

Writes nodes to a file.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to NODE if *Fname* is blank.

--

Unused field.

KAPPND

Append key:

0

Rewind file before the write operation.

1

Append data to the end of the existing file.

Notes

Writes selected nodes (**NSEL (p. 1266)**]) to a file. The write operation is not necessary in a standard Mechanical APDL run but is provided as a convenience to those who want coded node file.

Data are written in a coded format. The format used is (I9, 6G21.13E3) to write out *NODE*,*X*,*Y*,*Z*,*THXY*,*THYZ*,*THZX*. If the last number is zero (*THZX* = 0), or the last set of numbers are zero, they are not written but are left blank. Therefore, use a formatted read to process this file.

Coordinate values are in the global Cartesian system.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Nodes>Write Node File

O Commands

OCDATA, *VAL1*, *VAL2*, *VAL3*, . . . , *VAL14*

Defines an ocean load using non-table data.

SOLUTION (p. 38): Ocean (p. 49)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAL1*, *VAL2*, *VAL3*, . . . , *VAL14

Values describing the basic ocean load or a wave condition.

Notes

The **OCDATA (p. 1307)** command specifies non-table data that defines the ocean load, such as the depth of the ocean to the mud line, the ratio of added mass over added mass for a circular cross section, or the wave type to apply. The terms *VAL1*, *VAL2*, etc. are specialized according to the input set required for the given ocean load.

The program interprets the data input via the **OCDATA (p. 1307)** command within the context of the most recently issued **OCTYPE (p. 1320)** command.

Input values in the order indicated.

This command is also valid in PREP7.

You can define the following ocean data types:

Ocean Data Type: Basic (OCTYPE,BASIC)

Ocean Data Type: Wave (OCTYPE,WAVE)

Ocean Zone Type: Component, Z-Level, or Pipe (OCZONE,COMP/ZLOC/PIP)

Ocean Data Type: Basic (OCTYPE (p. 1320),BASIC)

For a better understanding of how to set up a basic ocean type, see Figure 7: Basic Ocean Data Type Components (p. 1309).

VAL1

DEPTH -- The depth of the ocean (that is, the distance between the mean sea level and the mud line). The water surface is assumed to be level in the XY plane, with Z being positive upwards. This value is required and must be positive.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL2

MATOC -- The material number of the ocean. This value is required and is used to input the required density. It is also used to input the viscosity if the Reynolds number is used (**OCTABLE (p. 1316)**).

VAL3

KFLOOD -- The inside-outside fluid-interaction key:

0 -- The density and pressure of fluid inside and outside of the pipe element (PIPE288 or PIPE289) are independent of each other. This behavior is the default.

1 -- The density and pressure of fluid inside of the pipe element (PIPE288 or PIPE289) are set to equal the values outside of the pipe element.

For beam subtype CTUBE and HREC used with BEAM188 or BEAM189 and ocean loading, *KFLOOD* is always set to 1.

VAL4

Cay -- The ratio of added mass of the external fluid over the mass of the fluid displaced by the element cross section in the y direction (normal). The added mass represents the mass of the external fluid (ocean water) that moves with the pipe, beam, or link element when the element moves in the element y direction during a dynamic analysis.

If no value is specified, and the coefficient of inertia *CMy* is not specified (**OCTABLE (p. 1316)**), both values default to 0.0.

If no value is specified, but *CMy is* specified, this value defaults to *Cay* = *CMy* - 1.0.

If this value *should* be 0.0, enter 0.0.

VAL5

Caz -- The ratio of added mass of the external fluid over the mass of a cross section in the element z direction (normal). The added mass represents the mass of the external fluid (ocean water) that moves with the pipe, beam, or link element when the element moves in the element z direction during a dynamic analysis.

If no value is specified, and *Cay* is specified, this value defaults to *Cay*.

If no value is specified, and the coefficient of inertia *CMz* is not specified (**OCTABLE (p. 1316)**), both values default to 0.0.

If no value is specified, but *CMz is* specified, this value defaults to *Cay* = *CMz* - 1.0.

If this value *should* be 0.0, enter 0.0.

VAL6

Cb -- The ratio of buoyancy force used over buoyancy force based on the outside diameter and water density. Accept the default value in most cases. Adjust this option only when you must account for additional hardware (such as a control valve) attached to the pipe exterior. A non-default value

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

may lead to small non-physical inconsistencies; testing is therefore recommended for non-default values.

If no value is specified, this value defaults to 1.0.

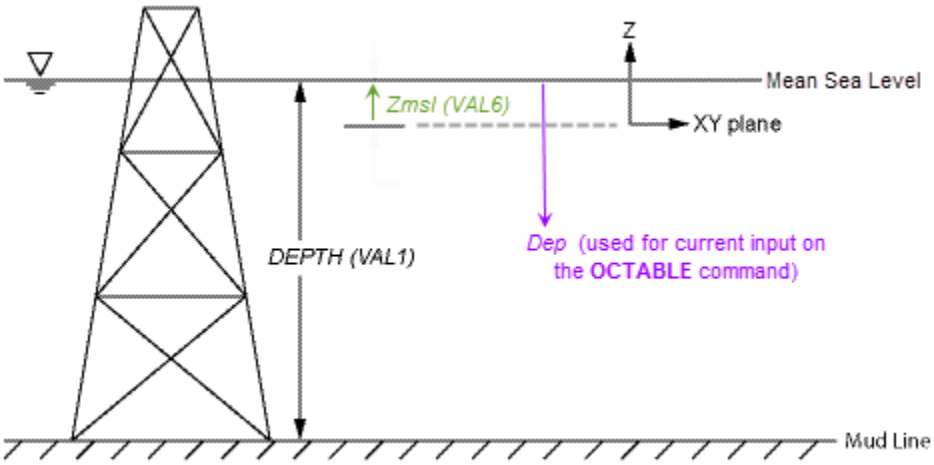
If this value should be 0.0 (useful when troubleshooting your input), enter 0.0.

VAL7

Zmsl -- A vertical offset from the global origin to the mean sea level. The default value is zero (meaning that the origin is located at the mean sea level).

Two example cases for *Zmsl* are:

- A structure with its origin on the sea floor (*Zmsl* = *DEPTH*).
- A tidal change (*tc*) above the mean sea level (*Zmsl* = *tc*, and *DEPTH* becomes *DEPTH* + *tc*)



VAL8

Ktable -- The dependency of *VAL1* on the **OCTABLE (p. 1316)** command:

Z (or 1) -- Values on the **OCTABLE (p. 1316)** command depend on the Z levels (default).

RE (or 2) -- Values on the **OCTABLE (p. 1316)** command depend on the Reynolds number.

Figure 7: Basic Ocean Data Type Components

Ocean Data Type: Wave (OCTYPE (p. 1320),WAVE)

VAL1

KWAVE -- The incident wave type:

0 *or* AIRY -- Small amplitude Airy wave without modifications (default).

1 *or* WHEELER -- Small amplitude wave with Wheeler empirical modification of depth decay function.

2 *or* STOKES-- Stokes fifth-order wave.

3 *or* STREAMFUNCTION -- Stream function wave.

5 *or* RANDOM -- Random (but repeatable) combination of linear Airy wave components.

6 *or* SHELLNEWWAVE -- Shell new wave.

7 *or* CONSTRAINED -- Constrained new wave.

8 *or* DIFFRACTED -- Diffracted wave (using imported hydrodynamic data)

101+ -- API for computing particle velocities and accelerations due to waves and current:

101 through 200 -- Data preprocessed (via *KWAVE* = 0 logic).

201+ -- Data not preprocessed.

For more information, see the description of the `userPartVelAcc` subroutine in the *Programmer's Reference*.

VAL2

THETA -- Angle of the wave direction θ from the global Cartesian X axis toward the global Cartesian Y axis (in degrees).

VAL3

WAVELOC (valid when *KWAVE* = 0 through 3, and 101+) -- The wave location type:

0 -- Waves act on elements at their actual locations (default).

1 -- Elements are assumed to be at wave peak.

2 -- Upward vertical wave velocity acts on elements.

3 -- Downward vertical wave velocity acts on elements.

4 -- Elements are assumed to be at wave trough.

SPECTRUM (valid when *KWAVE* = 5 through 7) -- The wave spectrum type:

0 -- Pierson-Moskowitz (default).

1 -- JONSWAP.

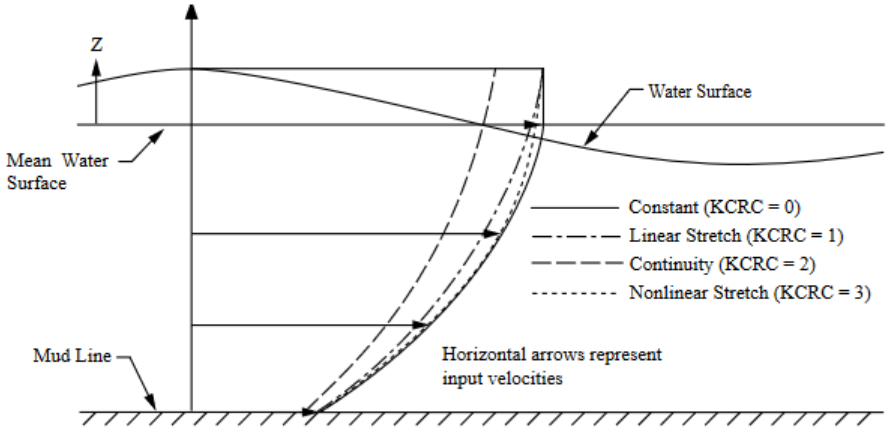
2 -- User-defined spectrum.

VAL4

KCRC -- The wave-current interaction key.

Adjustments to the current profile are available via the *KCRC* constant of the water motion table. Typically, these options are used only when the wave amplitude is large relative to the water depth, such that significant wave-current interaction exists.

0 -- Use the current profile (as input) for wave locations below the mean water level, and the top current profile value for wave locations above the mean water level (default).



1 -- Linearly stretch or compress the current profile from the mud line to the top of the wave.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2 -- Similar to *KCRC* = 1, but also adjusts the current profile horizontally such that total flow continuity is maintained with the input profile. All current directions *Th*(j) must be identical.

The following option is valid only when KWAVE = 5 through 7:

3 -- Nonlinear stretch or compress the current profile, as recommended in *API RP 2A Codes of Practice for Designing and Constructing Fixed Offshore Platforms*.

VAL5

KMF -- The MacCamy-Fuchs adjustment key, typically used only for larger-diameter pipes in relatively shallow water:

0 -- Do not apply the adjustment (default).

1 -- Apply the adjustment (valid only when *KWAVE* = 0 or 1).

VAL6

PRKEY -- The wavelength wave-printout key:

0 -- No extra printout (default).

1 -- Include the extra printout.

2 -- Print wave component details (valid only when *KWAVE* = 5 through 7).

The following input values are valid only when *KWAVE* = 5 through 7:

VAL7

APC -- Activate apparent period calculation when a wave is superimposed upon a current:

0 -- Not activated (default).

1 -- Activated.

VAL8

DSA -- Stretching depth factor:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Stretching is performed between a distance of *DSA* * *Hs* below the mean water level (MWL) and the water surface, where *Hs* is the significant wave height measured from the MWL. No stretching occurs outside this range, or if the wave surface is below the MWL. If *DSA* * *Hs* is negative, stretching is performed between that level above the MWL and the water surface. The default *DSA* value is 0.5.

VAL9

DELTA -- Delta stretching parameter (0.0 ≤ *DELTA* ≤ 1.0):

A value of 0.0 corresponds to Wheeler stretching under wave crests, 1.0 corresponds to linear extrapolation of kinematics at mean water level to crest. (Default = 0.3.) If zero is required, specify a small positive number (0.01 or less) instead.

VAL10

Wave kinematics factor or wave spreading angle:

KINE (*KWAVE* = 5 or 7) -- Wave kinematics factor (0.0 < *KINE* ≤ 1.0). The factor is used to account for wave spreading by modifying the horizontal wave velocities and accelerations. A value of 1.0 corresponds to uni-directional wave with no spreading. (Default = 1.0, no spreading.)

SPANGLE (*KWAVE* = 6) -- Wave spreading angle in degrees (0.0 ≤ *SPANGLE* ≤ 40.0). The angle is used to compute a wave spreading factor to modify the horizontal wave kinematics for nearly unidirectional seas. *SPANGLE* = 0.0 corresponds to no spreading. (Default = 0.0, no spreading.)

VAL11

Random seed value for phase angle generation, or wave crest amplitude value:

SEED (*KWAVE* = 5) -- Initial seed for random phase angle generation. (Default = 1.)

AMPMAX (*KWAVE* = 6) -- Maximum wave crest amplitude (distance between the mean water level and maximum wave crest).

AMPCONST (*KWAVE* = 7) -- Constrained wave crest amplitude (distance between the mean water level and wave crest).

The following input values are valid only when *KWAVE* = 6 or 7:

VAL12

TOFF -- Time offset at which the maximum wave crest will occur. (Default = 0.0.)

VAL13

ROFF -- Position offset along the wave direction where the maximum wave crest will occur. (Default = 0.0.)

VAL14

EVOLVING (*KWAVE* = 6) -- Activate evolving wave:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0 -- Not activated (default).

1 -- Activated.

SEED (*KWAVE* = 7) -- Initial seed for random phase angle generation. (Default = 1.)

Usage Hints for *KWAVE* = 5 Through 7

Recommendations given in *API RP 2A Codes of Practice for Designing and Constructing Fixed Offshore Platforms* can be enforced via the following settings (valid only when *KWAVE* = 5 through 7):

- Set *KCRC* = 3 (*VAL4*) to apply nonlinear current stretching.
- Set *APC* = 1 (*VAL7*) to enable automatic computation of apparent wave period when a wave is superimposed upon a current.
- If *KWAVE* = 5 or 7, specify wave kinematics factor *KINE* (*VAL10*) to modify the horizontal velocities and accelerations due to wave spreading. The factor can be estimated from measurement or hindcast directional spectral wave data as $\sqrt{(n+1)/(n+2)}$, where n is the exponent in the cosine wave spreading function at the spectral peak frequency.
- If *KWAVE* = 6, specify wave spreading angle *SPANGLE* (*VAL10*) to modify the horizontal velocities and accelerations due to wave spreading. This parameter differs from the wave kinematics factor indicated in the API codes, but the principle is similar nevertheless.

For *VAL11* (when *KWAVE* = 6 or 7), if no maximum or constrained wave crest amplitude (*AMPCONST* or *AMPMAX*) is defined, the value is calculated based on the significant wave height obtained from the spectrum data (**OCTABLE (p. 1316)**). For further information, see Hydrodynamic Loads in the *Mechanical APDL Theory Reference*.

For *VAL14*, the Shell new wave model (*KWAVE* = 6) is evolving (or *dispersive*) in that the crest height varies with time. By default, however, the wave is "frozen" so that it can be stepped through in a quasi-static manner.

When using waves in a superelement generation run (**ANTYPE (p. 162)**,SUBSTR), consider whether you should take the ocean level into account (*SeOcLvL* on the **SEOPT (p. 1715)** command).

Ocean Zone Type: Component, Z-Level, or Pipe (**OCZONE (p. 1322)**,COMP/ZLOC/PIP)

An ocean zone is a *local* space where you can override global ocean-loading parameters. The following arguments specifying the ocean zone values are described in more detail under "Ocean Data Type: Basic (OCTYPE,BASIC)" (p. 1307).

VAL1

KFLOOD -- The inside-outside fluid-interaction key.

VAL2

Cay -- The ratio of added mass of the external fluid over the mass of a cross section in the element y direction (normal).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL3

Caz -- The ratio of added mass of the external fluid over the mass of a cross section in the element z direction (normal).

VAL4

Cb -- The ratio of buoyancy force used over buoyancy force based on the outside diameter and water density.

Ocean Zone Type Usage Notes

Ocean zone values specified via the **OCDATA (p. 1307)** command override global ocean-loading parameters.

Arguments not specified default to the global values specified for the basic ocean type. Therefore, the relationship between *Ca* and *CM* values (*Ca* = *CM* - 1.0) is not applied to ocean zones.

For a pipe-type ocean zone (**OCZONE (p. 1322)**,PIP), *KFLOOD* is the only valid option.

Menu Paths

This command cannot be accessed from a menu.

OCDELETE,*DataType*,*ZoneName*

Deletes a previously defined ocean load.

SOLUTION (p. 38): Ocean (p. 49)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DataType

Ocean data type to delete. Valid values are BASIC, CURRENT, WAVE, ZONE, and ALL.

For *DataType* = ALL, *all* defined ocean loads are deleted.

ZoneName

The name of the ocean zone to delete. If no name is specified, *all* defined ocean zones are deleted. Valid only when *DataType* = ZONE.

Notes

The **OCDELETE (p. 1314)** command deletes previously specified ocean data from the database.

This command is also valid in PREP7.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OCLIST,*DataType*,*ZoneName*

Summarizes all currently defined ocean loads.

SOLUTION (p. 38): Ocean (p. 49)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DataType

Ocean data type to list. Valid values are BASIC, CURRENT, WAVE, ZONE, and ALL.

For *DataType* = ALL, *all* defined ocean loads are listed.

ZoneName

The name of an ocean zone to list. If no name is specified, *all* defined ocean zones are listed. Valid only when *DataType* = ZONE.

Notes

The **OCLIST (p. 1315)** command summarizes the ocean properties for all defined ocean loads in the current session.

When this command follows the **SOLVE (p. 1822)** command, certain waves types also list the calculated wave length.

This command is also valid in PREP7.

Menu Paths

This command cannot be accessed from a menu.

OCREAD,*Fname*,*Ext*,--,*Option*

Reads externally defined ocean data.

SOLUTION (p. 38): Ocean (p. 49)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

External ocean data file name (excluding the filename extension) and directory path containing the file. For more information, see the Notes (p. 1316) section.

Ext

Filename extension (limited to eight characters).

--

Reserved field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Option

Integer value passed to the `userOceanRead` subroutine (as *`iOption`*) for user-defined waves. This value does not apply to the diffracted wave type.

Notes

The **OCREAD (p. 1315)** command imports ocean data that has been defined externally (for example, via the Hydrodynamic Diffraction System (AQWA)).

The command operates on the ocean load ID specified via the most recently issued **OCTYPE (p. 1320)** command. Issue a separate **OCREAD (p. 1315)** command for each ocean load that you want to read into the program.

`Fname` is limited to 248 characters, including the directory path. If *`Fname`* does not include a directory path, the program searches for the specified file in the current working directory. An unspecified *`Fname`* defaults to `Jobname`.

For the diffracted wave type (*KWAVE* = 8 on the **OCDATA (p. 1307)** command), you must issue an **OCREAD (p. 1315)** command for the ocean wave ID in order to import the hydrodynamic data from the hydrodynamic analysis.

For more information, see Applying Ocean Loading from a Hydrodynamic Analysis in the *Advanced Analysis Guide*.

To learn more about creating user-defined waves, see Subroutine userPanelHydFor (Calculating Panel Loads Caused by Ocean Loading) in the *Programmer's Reference*.

This command is also valid in PREP7.

Menu Paths

This command cannot be accessed from a menu.

OCTABLE, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*, *VAL7*

Defines an ocean load using table data.

`SOLUTION` (p. 38): Ocean (p. 49)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAL1*, *VAL2*, *VAL3*, . . . , *VAL6

Values describing the basic ocean load, a current condition, or a wave condition.

Notes

The **OCTABLE (p. 1316)** specifies table data that defines the ocean load. The terms *VAL1*, *VAL2*, etc. are specialized according to the input set required for the given ocean load.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The program interprets the data input via the **OCTABLE (p. 1316)** command within the context of the most recently issued **OCTYPE (p. 1320)** command.

There is no limit to the number of data input.

Input values in the order indicated.

This command is also valid in PREP7.

You can define the following ocean data types:

Ocean Data Type: Basic (OCTYPE,BASIC)

Ocean Data Type: Current (OCTYPE,CURR)

Ocean Data Type: Wave (OCTYPE,WAVE)

Ocean Zone Type: Component or Z-Level (OCZONE,COMP/ZLOC)

Ocean Data Type: Basic (**OCTYPE (p. 1320)**,BASIC)

Basic ocean data to provide in the value fields:

IndVar, --, *CDy*, *CDz*, *CT*, *CMy*, *CMz*

where

IndVar = Independent variable for the table inputs. This value is dependent on the *Ktable* value specified via the **OCDATA (p. 1307)** command. If *Ktable* = Z, enter this value in *descending* order on each **OCTABLE (p. 1316)** command. If *Ktable* = RE, enter this value field in *ascending* order.

-- = Reserved.

CDy = Drag coefficient in the element y direction (normal).

CDz = Drag coefficient in the element z direction (normal). This value defaults to *CDy*.

CT = Drag coefficient in the element x direction (tangential).

CMy = Coefficient of inertia in the element y direction. If no value is specified, and *Cay* is specified, this value defaults to *Cay* + 1.0. If neither this value nor *Cay* is specified, both values default to 0.0.

CMz = Coefficent of inertia in the element z direction. If no value is specified, and *CMy* is specified on the same **OCTABLE (p. 1316)** command, this value defaults to *CMy*. If neither this value nor *CMy* is specified, and *Caz* is specified, this value defaults to *Caz* + 1.0. If neither this value nor *Caz* is specified, both values default to 0.0.

Ocean Data Type: Current (**OCTYPE (p. 1320)**,CURR)

Current data to provide in the value fields:

Dep, *W*, *Th*, *Te*

where

Dep = Depth of the drift current being input. Input these values in ascending order from one command to the next.

- If the current is constant, only one **OCTABLE (p. 1316)** command is necessary and *Dep* is not required.
- For waves (p. 1318), the current profile is stretched or compressed linearly up to 10 percent.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The first *Dep* value (representing the mean sea level) must be zero. The last *Dep* value (representing the mud line) must be equal to the *DEPTH* value input on the **OCDATA (p. 1307)** command.
- The Cartesian Z values used to locate nodes, etc. decrease as one moves from the ocean surface to the sea floor, but the *Dep* values increase. See Figure 7: Basic Ocean Data Type Components (p. 1309).
- *Dep* is not affected by changes to *Zmsl* on the **OCDATA (p. 1307)** command, as that value simply relocates the origin.

W = Velocity of the drift current at this location.

Th = Angle of the drift current from the global Cartesian X axis toward the global Cartesian Y axis (in degrees) at this location.

Te = Temperature at this location.

Ocean Data Type: Wave (OCTYPE (p. 1320),WAVE)

When specifying an ocean wave type, issue the **OCTABLE (p. 1316)** command to input either wave location data (p. 1318) or wave spectrum data (p. 1319).

Wave Location Input Data

Wave location data to provide in the value fields (valid only when *KWAVE* = 0 through 3, or 8, on the **OCDATA (p. 1307)** command):

H, *T*, *Ps*, *L*, *NORDER*, *KPRCO*

where

H = Wave height (peak-to-trough).

T = Wave period.

Ps = Phase shift (in degrees)

L = Wavelength. An optional value used only when *KWAVE* = 0 or 1 (and ignored for all other *KWAVE* types).

NORDER = Order used by stream function wave theory (*KWAVE* = 3). This value is optional.

KPRCO = Key for printing (1) or not printing (0 and default) the calculated dimensionless coefficients of the stream function wave theory (*KWAVE* = 3). This value is optional.

Hints for Wave Location Input:

- The **TIME (p. 2000)** command is not used, except perhaps to identify the load case.
- The phase shift (*Ps*) determines the wave position (that is, the point at which the load is to be applied).
- When using the Stokes fifth-order (*KWAVE* = 2) or stream function (*KWAVE* = 3) wave type, issue only one **OCTABLE (p. 1316)** command.
- The valid range of the order of the stream function (*NORDER*) is 3 through 50. If no value is specified, the program determines a value automatically.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- When using the diffracted wave type (*KWAVE* = 8), an **OCREAD (p. 1315)** command is also required to read in the hydrodynamic data from the hydrodynamic analysis.

Wave Spectrum Input Data

Wave spectrum data to provide in the value fields (valid only when *KWAVE* = 5 through 7 on the **OCDATA (p. 1307)** command):

***SPECTRUM* = 0** (Pierson-Moskowitz spectrum)

HS, *TP*, *NWC*

where

HS = Significant wave height of the spectrum.

TP = Peak period for the spectrum.

NWC = Number of wave components ($1 \le NWC \le 1000$) to model the spectrum. (Default = 50.)

***SPECTRUM* = 1** (JONSWAP spectrum)

HS, *TP*, *GAMMA*, *NWC*

where

HS = Significant wave height of the spectrum.

TP = Peak period for the spectrum.

GAMMA = Peak enhancement factor for the spectrum. (Default = 3.3.)

NWC = Number of wave components ($1 \le NWC \le 1000$) to model the spectrum. (Default = 50.)

***SPECTRUM* = 2** (User-defined spectrum)

w, *s*, *NWC*

w = Angular frequency (rad/s).

s = Spectral energy density (Length^2 / (rad/s))

NWC = Number of wave components ($1 \le NWC \le 1000$) to model the spectrum. (Default = 50.)

Hints for Wave Spectrum Input:

- When defining a Pierson-Moskowitz or JONSWAP spectrum (*SPECTRUM* = 0 or 1, respectively, on the **OCDATA (p. 1307)** command), issue only one **OCTABLE (p. 1316)** command.

- When defining a Pierson-Moskowitz or JONSWAP spectrum for Shell new wave (*KWAVE* = 6 on the **OCDATA (p. 1307)** command), *HS* is calculated from the maximum wave crest amplitude (*AMPMAX* on the **OCDATA (p. 1307)** command) if no value is specified. For further information, see Hydrodynamic Loads in the *Mechanical APDL Theory Reference*.

- For a user-defined spectrum (*SPECTRUM* = 2 on the **OCDATA (p. 1307)** command), issue an **OCTABLE (p. 1316)** command for *each* frequency data point defining the spectrum. Specify the frequency data in ascending order. The number of wave components (*NWC*) is required on the *first* **OCTABLE (p. 1316)** command only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ocean Zone Type: Component or Z-Level (OCZONE (p. 1322),COMP/ZLOC)

An ocean zone is a *local* space where you can override global ocean-loading parameters.

Ocean zone data to provide in the value fields:

Z, --, *CDy*, *CDz*, *CT*, *CMy*, *CMz*, *Mbio*, *Tbio*

where

Z = Z level for the coefficients specified on this command.

-- = Reserved.

CDy = Drag coefficient in the element y direction (normal).

CDz = Drag coefficient in the element z direction (normal). This value defaults to *CDy*.

CT = Drag coefficient in the element x direction (tangential).

CMy = Coefficient of inertia in the element y direction.

CMz = Coefficient of inertia in the element z direction. This value defaults to *CMy*.

Mbio = Material ID of biofouling.

Tbio = Thickness of biofouling.

Ocean Zone Type Usage Notes

Ocean zone values specified via the **OCTABLE (p. 1316)** command override global ocean-loading parameters.

Arguments not specified default to the global values specified for the basic ocean type (**OCTYPE (p. 1320)**,BASIC). Therefore, the relationship between *Ca* and *CM* values (*Ca* = *CM* - 1.0) is not applied to ocean zones.

The **OCTABLE (p. 1316)** command is not valid for a pipe-type ocean zone (**OCZONE (p. 1322)**,PIP).

Menu Paths

This command cannot be accessed from a menu.

OCTYPE,*DataType*,*Name*

Specifies the type of ocean load data to follow.

SOLUTION (p. 38): Ocean (p. 49)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DataType

The type of ocean data to be input following this command:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BASIC

The basic ocean load, required for any ocean loading.

CURR

An optional drift current.

WAVE

An optional ocean wave state.

Specify basic, current, or wave input data via the **OCDATA (p. 1307)** and **OCTABLE (p. 1316)** commands. The example input fragment listed in the Notes (p. 1701) section shows how to use the ocean load data types.

Name

An eight-character name for the ocean load. An ocean name can consist of letters and numbers, but cannot contain punctuation, special characters, or spaces.

Notes

The **OCTYPE (p. 1320)** command specifies the type of ocean load data to follow (basic, current, or wave). Issue this command *before* defining your ocean load data (**OCDATA (p. 1307)** and **OCTABLE (p. 1316)**).

Ocean loading applies only to current-technology pipe (PIPE288 and PIPE289), surface (SURF154), link (LINK180) and beam (BEAM188 and BEAM189) elements.

An ocean current or wave is accessible repeatedly. For example, it is not necessary to input an identical current table again just because the drag coefficients of the basic input table have changed.

The following example shows how you can use the basic (*DataType* = BASIC), current (*DataType* = CURR), and wave (*DataType* = WAVE) ocean data types within the context of a simple input file fragment:

```
Do=1.5                        ! outside diameter
th=0.1                        ! wall thickness
height=10                     ! wave height
CS=2                          ! surface current speed
Depth=100                     ! water depth
matwat=2                      ! material number id of the ocean
secpipe= 1                    ! section number of the pipe
!
sectype,secpipe,pipe,,pipetest
secdata,Do,th,16              ! 16 cells around circumference
!
octype,basic
ocdata,Depth,matwat,0,0,0,0   ! suppress added mass and buoyancy
octable,,,.5,.5,,2            ! CD = .5, CM = 2

octype,curr
octable,0.0,CS                ! input free surface current speed
octable,Depth,0.00            ! input ocean floor current speed of 0.0
!
octype,wave
ocdata,2                      ! request Stokes wave type
octable,height,8              ! wave period of 8 seconds

slist,all                     ! lists pipe section AND
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
!                                  mentions ocean loading
oclist,all                      ! lists details of ocean loading
```

Menu Paths

This command cannot be accessed from a menu.

OCZONE, *ZoneType*, *ZoneName*, *CompNameInt*, *CompNameExt*

Specifies the type of ocean zone data to follow.

SOLUTION (p. 38): Ocean (p. 49)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ZoneType

The type of ocean zone data to be input following this command:

COMP

Define by a component.

ZLOC

Define by Z levels.

PIP

Associate an internal pipe or pipes with an external pipe.

ZoneName

The ocean zone name. If no name is specified, the program assigns one.

CompNameInt

For *Zonetype* = COMP, the required name of a component.

For *Zonetype* = PIP, the required name of an internal pipe component.

CompNameExt

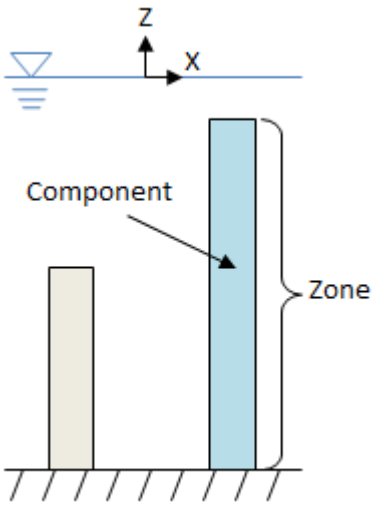
For *Zonetype* = PIP, the required name of an external pipe component.

Notes

The **OCZONE (p. 1322)** command specifies the type of ocean zone data to follow (component, Z-level, or internal pipes associated with an external pipe). An ocean zone is a *local* space where you can override global ocean-loading parameters.

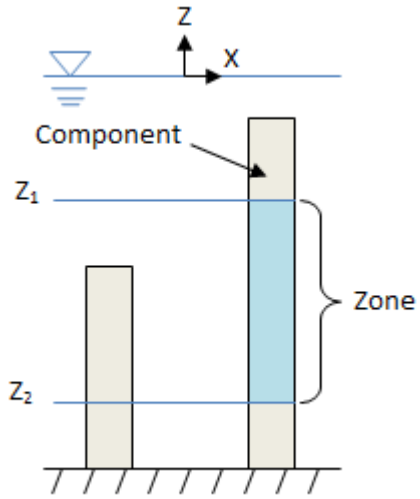
Names specified for *ZoneName*, *CompNameInt*, and *CompNameExt* can consist of up to 32 alphanumeric characters. The name cannot contain punctuation, special characters, or spaces.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



For *Zonetype* = COMP, the zone is defined by a component. Only the elements in the component are affected by the local parameters. A *partial* component can be defined as the zone via the Z input on the **OCTABLE (p. 1316)** command.

For *Zonetype* = ZLOC, the zone is defined by Z levels. Structural elements (such as BEAM188, BEAM189, PIPE288, PIPE289, and LINK180) in the Z levels are included in the zone.



For *Zonetype* = PIP, the zone is prepared for a special configuration of pipes. It associates an internal pipe or pipes with an external pipe to remove the hydrodynamic effect on the internal pipe. Only hydrostatic pressure is applied on the internal pipe.

This command is also valid in PREP7.

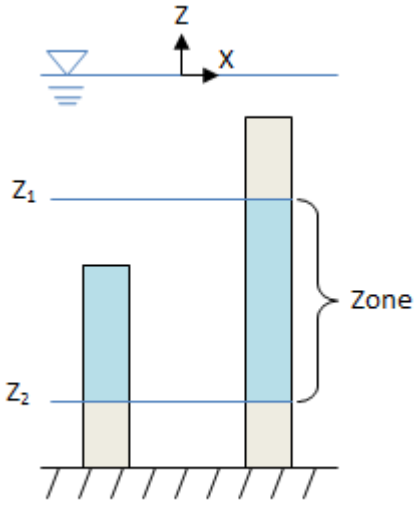


Figure 8: Ocean Zone Types (Specified via *ZoneType*)

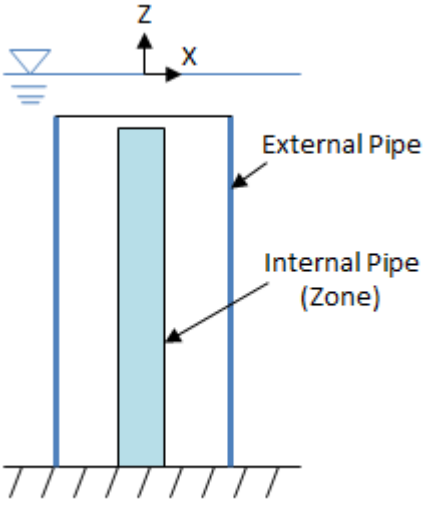

COMP

COMP with Z Inputs

ZLOC

PIP

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Issue this command before defining your ocean load data (**OCDATA (p. 1307)** or **OCTABLE (p. 1316)**). Define components before defining a component-type or a pipe-type zone (**OCZONE (p. 1322)**,COMP or **OCZONE (p. 1322)**,PIP, respectively).

Menu Paths

This command cannot be accessed from a menu.

OMEGA, *OMEGX*, *OMEGY*, *OMEGZ*

Specifies the rotational velocity of the structure.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

OMEGX*, *OMEGY*, *OMEGZ

Rotational velocity of the structure about the global Cartesian X, Y, and Z axes.

Notes

This command specifies the rotational velocity of the structure about each of the global Cartesian axes (right-hand rule). Rotational velocities may be defined in these analysis types:

- Static (**ANTYPE (p. 162)**,STATIC)
- Harmonic (**ANTYPE (p. 162)**,HARMIC) -- full, VT [1], Krylov [1], or mode-superposition [2]
- Transient (**ANTYPE (p. 162)**,TRANS) -- full or mode-superposition [2]
- Substructuring (**ANTYPE (p. 162)**,SUBSTR)
- Modal (**ANTYPE (p. 162)**,MODAL)

1. Loads for VT and Krylov methods are supported as long as they are not:
   - complex tabulated loads (constant or trapezoidal loads in tabulated form are supported)
   - used in conjunction with Rotordynamics (**CORIOLIS (p. 417)**,on).
2. In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

The command supports tabular boundary conditions (%*TABNAME_X*%, %*TABNAME_Y*%, and %*TABNAME_Z*%) for *OMEGA_X*, *OMEGA_Y*, and *OMEGA_Z* input values (***DIM (p. 530)**) for full transient and harmonic analyses.

Rotational velocities are combined with the element mass matrices to form a body-force load vector term. Units are radians/time. Related commands are **ACEL (p. 92)**, **CGLOC (p. 319)**, **CGOMGA (p. 320)**, **DCGOMG (p. 501)**, and **DOMEGA (p. 571)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

See Analysis Tools in the *Theory Reference* for more information.

If you have applied the Coriolis effect (**CORIOLIS (p. 417)**) using a stationary reference frame, this command takes the gyroscopic damping matrix into account for the elements listed in the **Stationary Reference Frame** heading in the notes section of the **CORIOLIS (p. 417)** command. The element axis must pass through the global Cartesian origin. The program verifies that the rotation vector axis is parallel to the axis of the element; if not, the gyroscopic effect is not applied. After issuing **OMEGA (p. 1324)** when the Coriolis or gyroscopic effect is present, a subsequently issued **CMOMEGA (p. 368)** command has no effect.

The load interpolation setting (**KBC (p. 970)**) applies to the rotational velocity, in particular the *OMG-SQRDKEY* option for quadratic interpolation.

This command is also valid in PREP7.

---

OPERATE

Specifies "Operation data" as the subsequent status topic.

POST26 (p. 58): Status (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

This command cannot be accessed from a menu.

OPNCONTROL, *Lab*, *VALUE*, *NUMSTEP*

Sets decision parameter for automatically increasing the time step interval in a pure thermal analysis.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

TEMP

Degree-of-freedom label used to base a decision for increasing the time step (substep) interval in a nonlinear or transient analysis. The only DOF label currently supported is TEMP.

OPENUPFACTOR

Key to set a multiplier for increasing the time step interval as specified in *VALUE* > 1.0 (up to 10.0). Valid only when **AUTOTS (p. 207)**,ON has been issued.

The multiplier is set by issuing **OPNCONTROL (p. 1326)**,OPENUPFACTOR,*VALUE* as follows:

- For a pure thermal analysis, if *VALUE* > 1.0, the OPENUPFACTOR is the minimum of 10.0,*VALUE*.

If the user does not specify the multiplier, the default is 3.0.

Generally, *VALUE* > 3.0 is not recommended. Note that in some rare cases this specification can be overwritten by internal heuristics in determining the new time step interval.

VALUE

A context sensitive value that depends on *Lab*:

- If *Lab* = TEMP, *VALUE* is used together with *NUMSTEP* in the algorithm for determining if the time step interval can be increased. The time step interval is increased if the maximum absolute value of the incremental solution is less than *VALUE* for the number of contiguous time steps specified by *NUMSTEP* (default *VALUE* = 0.1).
- If *Lab* = OPENUPFACTOR, *VALUE* is a multiplier (= 1.0 - 10.0) that can be specified for a pure thermal analysis as described above.

NUMSTEP

Valid only when *Lab* = TEMP. A value used together with *VALUE* in the algorithm for determining if the time step interval can be increased. The time step interval is increased if the maximum absolute value of the incremental solution at the specified TEMP label is less than *VALUE* for the number of contiguous time steps specified by *NUMSTEP* (default *NUMSTEP* = 3).

Notes

This command is available only for nonlinear static or full transient analyses. **OPNCONTROL (p. 1326)** enables an increase in the current time step size. It is analogous to the **CUTCONTROL (p. 445)** command, but with the opposite effect. **CUTCONTROL (p. 445)** reduces the step size for analyses experiencing

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

convergence difficulties while **OPNCONTROL (p. 1326)** increases the step size to speed up converging analyses.

The increase in the current time step size via **OPNCONTROL (p. 1326)** occurs when:

- a trigger mechanism is encountered and
- a multiplier (greater than 1.0) is set.

Different internal heuristics are used to automatically trigger the increase of the time step for different physics. However, for a pure thermal analysis, an additional trigger to increase the step size can be implemented by issuing **OPNCONTROL (p. 1326)**,TEMP.

The multiplier is set by issuing **OPNCONTROL (p. 1326)**,OPENUPFACTOR,*VALUE* (see details for different analysis types in the OPENUPFACTOR argument description above).

For linear full transient analysis, where the time step interval can be predominantly determined by the estimated modal frequency (number of solution points in a cycle in the dynamic system), the multiplier set via the OPENUPFACTOR argument may show no effect.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Nonlinear>Open Control

Main Menu>Solution>Load Step Opts>Nonlinear>Open Control

OSRESULT,*Item*,*Comp*,*Freq*,*Cname*

Controls the selected result data written to the database.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Item to output to the database. See Table 208: OSRESULT - Item and Component Labels (p. 1328).

Comp

Component of *Item* to output to the database. See Table 208: OSRESULT - Item and Component Labels (p. 1328).

Freq

Frequency to output to the database.

n

Writes every *n*th and last substep of each load step.

-n

Writes up to *n* equally spaced substeps of each load step.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Writes every substep.

LAST

Writes the last substep of each load step (default).

Cname

The name of an element component (**CM (p. 356)**) defining the set of elements for which this specification is active. If not specified, the set is *all* elements.

Notes

OSRESULT (p. 1327) controls output to the results database for the selected result defined by the item and component combination. The command activates output of the selected result for the specified substeps and elements. Multiple commands for the same result are cumulative. No selected results are written to the database unless specified via **OSRESULT (p. 1327)**.

The saved selected quantities are accessible via standard postprocessing commands (**ANSOL (p. 149)**, **ETABLE (p. 687)**, **ESOL (p. 672)**, **PLESOL (p. 1401)**, **PLNSOL (p. 1425)**, **PRESOL (p. 1481)**, and **PRNSOL (p. 1505)**).

OSRESULT (p. 1327),ERASE deletes the existing output specifications.

OSRESULT (p. 1327),STATUS lists the current set of selected result specifications.

The output of selected results is valid for static (**ANTYPE (p. 162)**,STATIC) and transient (**ANTYPE (p. 162)**,TRANS) analysis types.

To select other results to output to the database, see **OUTRES (p. 1336)**. (Element quantities specified via **OUTRES (p. 1336)** can be redundant to those specified via **OSRESULT (p. 1327)**. Avoid specifying redundant quantities, as they are stored and processed separately.)

All **OSRESULT (p. 1327)** results are in the solution coordinate system.

This command is also valid in PREP7.

Table 208: OSRESULT - Item and Component Labels

Component Name Method		
Item	**Comp**	**Description**
ERASE	--	Erases all selected result output specifications
STATUS	--	Lists the current set of selected result output specifications
SVAR	1,2,3, …, *N*	State variable number
FLD	UF01, UF02, ... , UF09	User-defined field variables
S	X, Y, Z, XY, YZ, XZ, 1, 2, 3, INT, EQV	Component and derived (principal, intensity, equivalent) stresses
EPEL	X, Y, Z, XY, YZ, XZ, 1, 2, 3, INT, EQV	Component and derived (principal, intensity, equivalent) elastic strains

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Component Name Method		
Item	**Comp**	**Description**
EPPL	X, Y, Z, XY, YZ, XZ, 1, 2, 3, INT, EQV	Component and derived (principal, intensity, equivalent) plastic strains
EPCR	X, Y, Z, XY, YZ, XZ, 1, 2, 3, INT, EQV	Component and derived (principal, intensity, equivalent) creep strains
EPTH	X, Y, Z, XY, YZ, XZ, 1, 2, 3, INT, EQV	Component and derived (principal, intensity, equivalent) thermal strains

Example 10: Specifying and Retrieving Selected Result Output

```
/SOLU
OUTRES,ALL,NONE        ! Here we want only selected results output,
                       !   so we suppress solution-result data written
                       !   to the database via OUTRES.

! Issue OSRESULT to specify selected results.
OSRESULT,S,Y,ALL       ! Item = S,    Comp = Y
OSRESULT,S,EQV,ALL     ! Item = S,    Comp = EQV
OSRESULT,EPPL,INT,ALL  ! Item = EPPL, Comp = INT
...

/POST1
! When issuing postprocessing commands to retrieve selected
!   results (SRES), specify ItemComp (Item + Comp combined)
!   from OSRESULT.
PRESOL,SRES,SY
PRESOL,SRES,SEQV
PRNSOL,SRES,EPPLINT
...
```

Menu Paths

This command cannot be accessed from a menu.

OUTAERO, *SENAME*, *TIMEB*, *DTIME*

Outputs the superelement matrices and load vectors to formatted files for aeroelastic analysis.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SENAME

Name of the superelement that models the wind turbine supporting structure. Defaults to the current Jobname.

TIMEB

First time at which the load vector is formed (defaults to be read from SENAME.sub).

DTIME

Time step size of the load vectors (defaults to be read from SENAME.sub).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Both TIMEB and DTIME must be blank if the time data is to be read from the SENAME.sub file.

The matrix file (SENAME.sub) must be available from the substructure generation run before issuing this command. This superelement that models the wind turbine supporting structure must contain only one master node with six freedoms per node: UX, UY, UZ, ROTX, ROTY, ROTZ. The master node represents the connection point between the turbine and the supporting structure.

This command will generate four files that are exported to the aeroelastic code for integrated wind turbine analysis. The four files are Jobname.GNK for the generalized stiffness matrix, Jobname.GNC for the generalized damping matrix, Jobname.GNM for the generalized mass matrix and Jobname.GNF for the generalized load vectors.

For detailed information on how to perform a wind coupling analysis, see Coupling to External Aeroelastic Analysis of Wind Turbines in the *Advanced Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

OUTGEOM, *Item*, *Freq*

Controls geometry-related data written to the results file.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Geometry data item for file write control:

MAT

Material Properties.

ERASE

Reset **OUTGEOM (p. 1330)** specifications to their default values.

STAT

List the current **OUTGEOM (p. 1330)** specifications.

Freq

Specifies how often to write the specified geometry data:

NONE

Suppress writing of the specified item for all substeps.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Write the data of the specified item for every substep.

Command Default

All geometry data (including material data) is written to the results file.

Notes

The **OUTGEOM (p. 1330)** command controls writing of the specified geometry *Item* to the results file. The geometry items correspond to the geometry records that are included in the results file (see the GEO records of the results file as described in Results File Format in the *Programmer's Reference*).

The command generates a specification for controlling data storage by either activating storage of the specified geometry item (*Freq* = ALL) or by suppressing storage of that item (*Freq* = NONE).

You can issue multiple **OUTGEOM (p. 1330)** commands in an analysis. After the initial command creates the storage specification, subsequent **OUTGEOM (p. 1330)** commands *modify* the specification set. The command processes your specifications in the order in which you input them. If you specify a given *Item* twice, output is based upon the *last* specification.

In addition to **OUTGEOM (p. 1330)**, **OUTPR (p. 1332)** and **OUTRES (p. 1336)** also control solution output. You can issue up to 50 of these output-control commands (any combination of the three) in an analysis.

OUTGEOM (p. 1330),ERASE erases the existing output specifications and resets the counted number of **OUTGEOM (p. 1330)** commands to zero.

Important:

When material property information is not written to the results file (**OUTGEOM (p. 1330)**,MAT,NONE), clearing the database via **/CLEAR (p. 350)** and reading in a set of data in the general postprocessor (**/POST1 (p. 1461)**) via the **SET (p. 1724)** command results in no material property data being stored in the database. In this case, the lack of material data prevents a successful solve from occurring with the modified database, and the results file is only applicable for carrying out post-processing.

The **OUTGEOM (p. 1330)** command is also valid in **/PREP7 (p. 1479)**.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OUTOPT

Specifies "Output options" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Output Options

OUTPR, *Item*, *Freq*, *Cname*

Controls the solution printout.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Item for print control:

BASIC

Basic quantities (nodal DOF solution, nodal reaction loads, and element solution) (default).

NSOL

Nodal DOF solution.

RSOL

Nodal reaction loads.

ESOL

Element solution.

NLOAD

Element nodal loads. When nonlinear stabilization is active, the stabilization force/moments are also printed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SFOR

Stabilization force/moment at the applicable nodes (valid only when nonlinear stabilization is active).

VENG

Element energies. When nonlinear stabilization is active, the energy dissipation due to stabilization is also printed.

RSFO

Result section force/moment output (valid only when a result section is defined). Result section output is always written to a file named `Jobname.secf`.

V

Nodal velocity (applicable to structural transient analysis only (**ANTYPE (p. 162)**,TRANS)).

A

Nodal acceleration (applicable to structural transient analysis only (**ANTYPE (p. 162)**,TRANS)).

ALL

All of the above solution items.

Freq

Print solution for this item every *Freq*th (and the last) substep of each load step. If -*n*, print up to *n* equally spaced solutions (only applies to static or full transient analyses when automatic time stepping is enabled). If NONE, suppress all printout for this item for this load step. If ALL, print solution for this item for every substep. If LAST, print solution for this item only for the last substep of each load step. For a modal analysis, use NONE or ALL.

Cname

Name of the component, created with the **CM (p. 356)** command, defining the selected set of nodes or elements for which this specification is active. If blank, the set is all entities.

Note:

The component named must be of the same type as the item, i.e. nodal or element. A component name is not allowed with the BASIC, RSFO, or ALL labels.

Command Default

No printout.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Controls the solution items to be printed, the frequency with which they are printed (in static, transient, or harmonic analyses), and the set of nodes or elements to which this specification applies (in static, full transient, or full harmonic analyses). An item is associated with either a node (**NSOL (p. 1281)**, **RFORCE (p. 1607)**, V, and A items) or an element (all of the remaining items). The specifications are processed in the order that they are input. Use **OUTPR (p. 1332)**,STAT to list the current specifications and use **OUTPR (p. 1332)**,ERASE to erase all the current specifications.

In addition to **OUTPR (p. 1332)**, **OUTRES (p. 1336)** and **OUTGEOM (p. 1330)** also control solution output. You can issue up to 50 of these output-control commands (any combination of the three) in an analysis.

As described above, **OUTPR (p. 1332)** writes some or all items (depending on analysis type) for all elements. To restrict the solution printout, use **OUTPR (p. 1332)** to selectively suppress (*Freq* = NONE) the writing of solution data, or first suppress the writing of all solution data (**OUTPR (p. 1332)**,ALL,NONE) and then selectively turn on the writing of solution data with subsequent **OUTPR (p. 1332)** commands.

If the generalized plane strain feature is active and **OUTPR (p. 1332)** is issued, the change of fiber length at the ending point during deformation and the rotation of the ending plane about X and Y during deformation will be printed if any displacement at the nodes is printed. The reaction forces at the ending point will be printed if any reaction force at the nodes is printed.

Nodal reaction loads (*Item* = RSOL) are processed according to the specifications listed for the **PRRSOL (p. 1518)** command.

Result printouts for interactive sessions are suppressed for models with more than 10 elements except when the printout is redirected to a file using the **/OUTPUT (p. 1334)** command.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Output Ctrls>Solu Printout

Main Menu>Solution>Load Step Opts>Output Ctrls>Solu Printout

/OUTPUT, *Fname*, *Ext*, --, *Loc*

Redirects text output to a file or to the screen.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

Filename and directory path (248 character maximum, including directory) to which text output will be redirected (defaults to Jobname if *Ext* is specified). For interactive runs, *Fname* = TERM (or blank) redirects output to the screen. For batch runs, *Fname* = blank (with all remaining command arguments blank) redirects output to the default system output file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ext

Filename extension (eight-character maximum).

--

Unused field.

Loc

Location within a file to which output will be written:

(blank)

Output is written starting at the top of the file (default).

APPEND

Output is appended to the existing file.

Command Default

Text output is written to the screen for interactive runs and to the system output file for batch runs (see the *Basic Analysis Guide*).

Notes

Text output includes responses to every command and GUI function, notes, warnings, errors, and other informational messages. Upon execution of **/OUTPUT (p. 1334)**,*Fname*, *Ext*, `...`, all subsequent text output is redirected to the file *Fname*`.`*Ext*. To redirect output back to the default location, issue **/OUTPUT (p. 1334)** (no arguments).

Note:

When using the GUI, output from list operations (**NLIST (p. 1239)**, **DLIST (p. 550)**, etc.) is always sent to a list window regardless of the **/OUTPUT (p. 1334)** setting. The output can then be saved on a file or copied to the **/OUTPUT (p. 1334)** location using the *File* menu in the list window.

This command is valid in any processor.

Menu Paths

Utility Menu>File>Switch Output to>File

Utility Menu>File>Switch Output to>Output Window

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OUTRES,*Item*,*Freq*,*Cname*,--,*NSVAR*,*DSUBres*

Controls the solution-result data written to the database.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Solution item for database and file-write control:

ALL

All solution items except LOCI, SVAR, and NAR (default).

BASIC

Write only NSOL, RSOL, NLOAD, STRS, FGRAD, and FFLUX records to the results file and database.

ERASE

Resets **OUTRES (p. 1336)** specifications to their default values.

STAT

Lists the current **OUTRES (p. 1336)** specifications.

NSOL

Nodal degree-of-freedom solution.

RSOL

Nodal reaction loads.

V

Nodal velocity (applicable to structural transient analysis only (**ANTYPE (p. 162)**,TRANS)).

A

Nodal acceleration (applicable to structural transient analysis only (**ANTYPE (p. 162)**,TRANS)).

CINT

All available results generated by **CINT (p. 334)**.

SVAR

State variables (used with supported subroutines that customize material behavior).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ESOL

Enables or disables *all* of the following element-solution items. (These items can also be individually enabled or disabled.)

NLOAD

Element nodal, input constraint, and force loads (also used with POST1 commands **PRRFOR (p. 1517)**, **NFORCE (p. 1216)**, and **FSUM (p. 780)** to calculate reaction loads).

STRS

Element nodal stresses.

EPEL

Element elastic strains.

EPTH

Element thermal, initial, and swelling strains.

EPPL

Element plastic strains.

EPCR

Element creep strains.

EPDI

Element diffusion strains.

FGRAD

Element nodal gradients.

FFLUX

Element nodal fluxes.

LOCI

Integration point locations.

VENG

Element energies.

MISC

Element miscellaneous data (**ETABLE (p. 687)** SMISC and NMISC items).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FMAG

Electromagnetic nodal forces.

CURD

Element source current density.

NLDAT

Element nonlinear data.

EHEAT

Element heat generation rate.

ETMP

Element temperatures.

SRFS

Element surface stresses.

CONT

Element contact data.

BKSTR

Element backstresses. Enabling this output also requires that you enable EPPL.

EANGL

Element Euler angles.

AESO

Enables or disables *all* of the following advanced element-solution output items. (These items *cannot* be individually enabled or disabled.)

BKS - Back-stress for kinematic hardening.

CDM - Damage variable for Mullins effect.

ESIG - BIOT's effective stress.

FFLX - Fluid flow flux in poromechanics.

FICT - Fictive temperature.

FSVAR - Fluence state variables.

MPLS - Microplane damage.

NS - Nominal strain.

PDMG - Progressive damage parameters.

PFC - Failure criteria based on the effective stresses in the damaged material.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PMSV - Permeability state variables.

SEND - Energy record.

TF - Thermal flux.

TG - Thermal gradient.

YSIDX - Yield status for geomechanical materials.

NAR

Enables or disables *all* of the following nodal-averaged solution items. (These items can also be individually enabled or disabled.)

NDST

Nodal-averaged stresses.

NDEL

Nodal-averaged elastic strains.

NDPL

Nodal-averaged plastic strains.

NDCR

Nodal-averaged creep strains.

NDTH

Nodal-averaged thermal and swelling strains.

DSUB

Enables `Jobname.dsub` file writing for all superelements if the nodal degree-of-freedom solution (*Item* = NSOL) file writing is disabled (see notes for details and an example).

Freq

Specifies how often (that is, at which substeps) to write the specified solution item.

LAST

Writes the specified solution item only for the last substep of each load step (default).

n

Writes the specified solution item every *n*th (and the last) substep of each load step.

-n

Writes up to *n* equally spaced solutions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The time range is divided into equally spaced time points. The first solution at or just past the time point is written. If the time steps span two time points, only one is written.

NONE

Suppresses writing of the specified solution item for all substeps.

ALL

Writes the solution of the specified solution item for every substep. This value is the default for a harmonic analysis (**ANTYPE (p. 162)**,HARMIC) and for any expansion pass (**EXPASS (p. 714)**,ON).

%*array*%

Where *array* is the name of an *n* x 1 x 1 dimensional array parameter defining *n* key times, the data for the specified solution item is written at those key times.

Key times in the array parameter must appear in ascending order. Values must be greater than or equal to the beginning values of the load step, and less than or equal to the ending time values of the load step.

For multiple-load-step problems, either change the parameter values to fall between the beginning and ending time values of the load step or erase the current settings and reissue the command with a new array parameter.

For more information about defining array parameters, see ***DIM (p. 530)**.

Cname

The name of the component (created via **CM (p. 356)**) defining the selected set of elements or nodes for which this specification is active. If not specified, the set is *all* entities. A component name is not allowed with the ALL, BASIC, or RSOL items.

--

Reserved.

NSVAR

The number of user-defined state variables (**TB (p. 1899)**,STATE) to be written to the results file. Valid only when *Item* = SVAR and user-defined state variables exist. The specified value cannot exceed the total number of state variables defined; if no value is specified, *all* user-defined state variables are written to the results file. This argument acts on all sets of user-defined state variables that exist for the model.

DSUBres

Specifies whether to write additional results in `Jobname.dsub` during a substructure or CMS use pass in a transient or harmonic analysis.

Blank

Write the nodal degree-of-freedom solution in `Jobname.dsub` (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

In addition to the nodal degree-of-freedom solution, also write necessary data to compute quantities using nodal velocity and nodal acceleration (damping force, inertial force, kinetic energy, etc.) in the subsequent expansion pass. For more information, see Step 3: Expansion Pass in the *Substructuring Analysis Guide*.

Command Default

Writes the specified solution item for every substep. Exceptions to the default behavior are as follows:

- For static (**ANTYPE (p. 162)**,STATIC) or transient (**ANTYPE (p. 162)**,TRANS) analyses, the default is to write the specified solution item for the last substep of each load step.
- For a harmonic analysis (**ANTYPE (p. 162)**,HARMIC) and any expansion pass, the default is to write the specified solution item for every substep.
- For a mode-superposition transient analysis, the default is to write the reduced displacements file for every fourth substep (as well as the last substep).

Notes

OUTRES (p. 1336) controls following output parameters:

- The solution item (*Item*) to write to the database (and to the reduced displacement and results files)
- The frequency (*Freq*) at which the solution item is written (applicable to static, transient, or full harmonic analyses)
- The set of elements or nodes (*Cname*) to which your specification applies.

The command generates a specification for controlling data storage for each substep, activating storage of the specified solution item for the specified substeps of the solution *and* suppressing storage of that item for *all other substeps*.

You can issue **OUTRES (p. 1336)** multiple times in an analysis. After the initial command creating the storage specification, subsequent **OUTRES (p. 1336)** commands *modify* the specification set for each substep. The command processes your specifications at each substep in the order in which you input them. If you specify a given solution item twice, output is based upon the *last* specification. Therefore, issue multiple **OUTRES (p. 1336)** commands carefully and in the proper sequence.

In addition to **OUTRES (p. 1336)**, these commands also control solution output: **OUTPR (p. 1332)**, **OUTGEOM (p. 1330)**, and **OSRESULT (p. 1327)**.

You can issue up to 50 output-control commands for **OUTRES (p. 1336)**, **OUTPR (p. 1332)**, **OUTGEOM (p. 1330)** in an analysis. There is no limit on the number of **OSRESULT (p. 1327)** commands.

OUTRES (p. 1336),ERASE erases the existing output specifications and resets the counted number of **OUTRES (p. 1336)** commands to zero. The ERASE argument works in a similar manner for **OUTPR (p. 1332)**, **OUTGEOM (p. 1330)**, and **OSRESULT (p. 1327)**.

A given **OUTRES (p. 1336)** command generally has no effect on solution items *not* specified. For example, an **OUTRES (p. 1336)**,ESOL,LAST command does not affect NSOL data; that is, it neither activates nor

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

suppresses NSOL data storage in any substep. An exception to this behavior involves the EANGL solution item.

OUTRES (p. 1336) controls element Euler angle (EANGL) data output as follows:

- When *Freq* = NONE, no element Euler angles are output at any substeps.

  Without Euler angles, element results postprocessing can occur in the element solution coordinate system only (that is, **RSYS (p. 1639)** has no effect on element results); therefore, nodal averaging of element solution items may not be applicable when element solution coordinate systems are not uniform.

- When *Freq* = any other value (including the command default), element Euler angles are output at substeps specified by *Freq*, *and* at any substeps where one or more tensorial element solution items (STRS, EPEL, EPTH, EPPL, EPCR, EPDI, FGRAD, FFLUX, and AESO) are output.

Additional results in the Jobname.dsub file (*DSUBres* = ALL) can only be requested in the first load step.

Important:

In the results-item hierarchy, certain items are subsets of other items. For example, element solution (ESOL) data is a subset of all (ALL) solution data. An **OUTRES (p. 1336)**,ALL command can therefore affect ESOL data. Likewise, an **OUTRES (p. 1336)** command that controls ESOL data can affect a *portion* of all data.

The example **OUTRES (p. 1336)** commands (p. 1343) illustrate the interrelationships between solution items and why it is necessary to issue **OUTRES (p. 1336)** thoughtfully.

To suppress all data at every substep, issue the **OUTRES (p. 1336)**,ALL,NONE command. (**OUTRES (p. 1336)**,ERASE *does not* suppress all data at every substep.)

The NSOL, RSOL, V, and A solution items are associated with nodes. The CINT solution item is associated with fracture. All remaining solution items are associated with elements.

Enabling nodal-averaged results (*Item* = NAR or any of the associated labels) generally reduces the results file size, provided the equivalent element-based results are concurrently disabled. When nodal-averaged results are enabled, element values for stress and strain are averaged and stored as nodal values. Some limitations apply when using nodal averaged results. For more information and an example, see Nodal-Averaged Results in the *Element Reference*.

The boundary conditions (constraints and force loads) are written to the results file only if either nodal or reaction loads (NLOAD or RSOL items) are also written.

Usage considerations when specifying *Freq*:

- The only valid labels for *Freq* are NONE or ALL for the following:
  - Modal analysis
  - Component mode synthesis (CMS) generation pass with *Elcalc* = YES on the **CMSOPT (p. 378)** command

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

– Any expansion pass (**EXPASS (p. 714)**,ON)

- When superelements exist in the model, the *Freq* specified for *Item* = NSOL controls the write frequency of the nodal degree-of-freedom solution to the Jobname.rst file and the superelements reduced nodal degree-of-freedom solution to the Jobname.dsub file. The program only considers a *Freq* specification for *Item* = DSUB if file writing for *Item* = NSOL is disabled.

  Example 11: To enable Jobname.dsub file writing (*Item* = DSUB at a specified *Freq*), first disable nodal DOF solution writing to the Jobname.rst file (*Item* = NSOL)

```
OUTRES,ERASE        !reset specifications to default values
OUTRES,ALL,NONE     !disable writing of all solution items, including NSOL
OUTRES,DSUB,ALL     !enable Jobname.dsub file writing at every substep
```

  After issuing the above commands, the nodal degree-of-freedom solutions are not written to Jobname.rst, but the reduced nodal degree-of-freedom solutions are written to Jobname.dsub for every substep.

For additive manufacturing analyses during the build step (**AMSTEP (p. 124)**,BUILD), *Freq* refers to the layer number (for example, output ALL layers, LAST layer, or every N^{th} layer).

To specify selected results to output to the database, see **OSRESULT (p. 1327)**.

OUTRES (p. 1336) is also valid in PREP7.

Example

When issuing an **OUTRES (p. 1336)** command, think of a matrix in which you set switches on and off. When a switch is on, a solution item is stored for the specified substep. When a switch is off, a solution item is suppressed for a specified substep.

Assuming a static (**ANTYPE (p. 162)**,STATIC) analysis, this example shows how the matrix looks after issuing each **OUTRES (p. 1336)** command in this six-substep solution.

```
NSUBST,6
OUTRES,ERASE
OUTRES,NSOL,2
OUTRES,ALL,3
OUTRES,ESOL,4
SOLVE
```

To simplify the example, only a subset of the available solution items appears in the matrix.

OUTRES (p. 1336),ERASE -- After issuing this command, the default output specifications are in effect, as shown:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Substep	Results Item Specification						
	ALL						
	BASIC						
	NSOL	RSOL	ESOL				
			NLOAD	STRS	FGRAD	EPEL	EPTH
1	off	off	off	off	off	off	off
2	off	off	off	off	off	off	off
3	off	off	off	off	off	off	off
4	off	off	off	off	off	off	off
5	off	off	off	off	off	off	off
6	**ON**	**ON**	**ON**	**ON**	**ON**	**ON**	**ON**

OUTRES (p. 1336),NSOL,2 -- This command modifies the initial specifications so that NSOL is enabled for substeps 2, 4 and 6, and disabled for substeps 1, 3 and 5, as shown:

Substep	Results Item Specification						
	ALL						
	BASIC						
	NSOL	RSOL	ESOL				
			NLOAD	STRS	FGRAD	EPEL	EPTH
1	off	off	off	off	off	off	off
2	**ON**	off	off	off	off	off	off
3	off	off	off	off	off	off	off
4	**ON**	off	off	off	off	off	off
5	off	off	off	off	off	off	off
6	ON	ON	ON	ON	ON	ON	ON

OUTRES (p. 1336),ALL,3 -- This command further modifies the specifications so that ALL is enabled for substeps 3 and 6, and disabled for substeps 1, 2, 4 and 5, as shown:

Substep	Results Item Specification						
	ALL						
	BASIC						
	NSOL	RSOL	ESOL				
			NLOAD	STRS	FGRAD	EPEL	EPTH
1	off	off	off	off	off	off	off
2	**off**	off	off	off	off	off	off
3	**ON**	**ON**	**ON**	**ON**	**ON**	**ON**	**ON**
4	**off**	off	off	off	off	off	off
5	off	off	off	off	off	off	off
6	ON	ON	ON	ON	ON	ON	ON

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OUTRES (p. 1336),ESOL,4 -- This command once again modifies the specifications so that ESOL is enabled for the fourth and last substeps, and disabled for substeps 1, 2, 3 and 5, as shown:

Substep	Results Item Specification						
	ALL						
	BASIC						
	NSOL	RSOL	ESOL				
			NLOAD	STRS	FGRAD	EPEL	EPTH
1	off	off	off	off	off	off	off
2	off	off	off	off	off	off	off
3	ON	ON	**off**	**off**	**off**	**off**	**off**
4	off	off	**ON**	**ON**	**ON**	**ON**	**ON**
5	off	off	off	off	off	off	off
6	ON	ON	ON	ON	ON	ON	ON

SOLVE (p. 1822)

When obtaining the solution, results data are stored as follows:

Substep	Results Items Stored
1	*No data*
2	*No data*
3	NSOL and RSOL data
4	ESOL data
5	*No data*
6	ALL data

P Commands

PADELE, *DELOPT*

Deletes a defined path.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DELOPT

Path delete option (one of the following):

ALL

Delete all defined paths.

NAME

Delete a specific path from the list of path definitions. (Substitute the actual path name for NAME.)

Command Default

Deletes the currently active path.

Notes

Paths are identified by individual path names. To review the current list of path names, issue the command **PATH (p. 1354)**,STATUS.

This command is valid in the general postprocessor.

Menu Paths

Main Menu>General Postproc>Path Operations>Archive Path>Retrieve>Path from array

Main Menu>General Postproc>Path Operations>Delete Path>All Paths

Main Menu>General Postproc>Path Operations>Delete Path>By Name

Main Menu>Preprocessor>Path Operations>Delete Path>All Paths

Main Menu>Preprocessor>Path Operations>Delete Path>By Name

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/PAGE, *ILINE*, *ICHAR*, *BLINE*, *BCHAR*, *COMMA*

Defines the printout and screen page size.

POST1 (p. 51): Listing (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ILINE

Number of lines (11 minimum) per "page" or screen. Defaults to 24. Applies to interactive non-GUI to the screen output only.

ICHAR

Number of characters (41 to 132) per line before wraparound. Defaults to 80. Applies to interactive non-GUI to the screen output only.

BLINE

Number of lines (11 minimum) per page. Defaults to 56. Applies to batch mode (**/BATCH (p. 217)**), diverted (**/OUTPUT (p. 1334)**), or interactive GUI (**/MENU (p. 1121)**) output. If negative, no page headers are output.

BCHAR

Number of characters (41 to 240 (system dependent)) per line before wraparound. Defaults to 140. Applies to batch mode (**/BATCH (p. 217)**), diverted (**/OUTPUT (p. 1334)**), or interactive GUI (**/MENU (p. 1121)**) output.

COMMA

Input 1 to specify comma-separated output for node (**NLIST (p. 1239)**) and element (**ELIST (p. 619)**) output.

Command Default

As defined by the items above.

Notes

Defines the printout page size for batch runs and the screen page size for interactive runs. Applies to the POST1 **PRNSOL (p. 1505)**, **PRESOL (p. 1481)**, **PRETAB (p. 1490)**, **PRRSOL (p. 1518)**, and **PRPATH (p. 1517)** commands. See the **/HEADER (p. 902)** command for additional controls (page ejects, headers, etc.) that affect the amount of printout. A blank (or out-of-range) value retains the previous setting. Issue **/PAGE (p. 1348)**,STAT to display the current settings. Issue **/PAGE (p. 1348)**,DEFA to reset the default specifications.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

PAGET, *PARRAY*, *P0PT*

Writes current path information into an array variable.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

PARRAY

The name of the array parameter that Mechanical APDL creates to store the path information. If the array parameter already exists, it will be replaced with the current path information.

P0PT

Determines how data will be stored in the parameter specified with *PARRAY*:

POINTS

Store the path points, the nodes (if any), and coordinate system. (For information on defining paths and path points, see the descriptions of the **PATH (p. 1354)** and **PPATH (p. 1463)** commands.)

TABLE

Store the path data items. (See the **PDEF (p. 1372)** command description for path data items.)

LABEL

Stores path data labels.

Notes

Use the **PAGET (p. 1349)** command with the **PAPUT (p. 1350)** command to store and retrieve path data in array variables for archiving purposes.

When retrieving path information, restore the path points (POINTS option) first, then the path data (TABLE option), and then the path labels (LABEL option).

Menu Paths

Main Menu>General Postproc>Path Operations>Archive Path>Store>Path in array

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PAPUT, *PARRAY*, *POPT*

Retrieves path information from an array variable.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

PARRAY

Name of the array variable containing the path information.

POPT

Specifies which path data to retrieve:

POINTS

Retrieve path point information (specified with the **PPATH (p. 1463)** command and stored with the **PAGET (p. 1349)**,POINTS command). The path data name will be assigned to the path points.

TABLE

Retrieve path data items (defined via the **PDEF (p. 1372)** command and stored with the **PAGET (p. 1349)**,,TABLE command).

LABEL

Retrieve path labels stored with the **PAGET (p. 1349)**,,LABEL command.

Notes

When retrieving path information, restore path points (POINTS option) first, then the path data (TABLE option), and then the path labels (LABEL option).

Menu Paths

Main Menu>General Postproc>Path Operations>Archive Path>Retrieve>Path from array

PARESU, *Lab*, *Fname*, *Ext*, - -

Restores previously saved paths from a file.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Read operation:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Read all paths from the selected file (default).

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to PATH if *Fname* is blank.

--

Unused field.

Notes

This command removes all paths from virtual memory and then reads path data from a file written with the **PASAVE (p. 1353)** command. All paths on the file will be restored. All paths currently in memory will be deleted.

Menu Paths

Main Menu>General Postproc>Path Operations>Archive Path>Retrieve>Paths from file

Main Menu>Preprocessor>Path Operations>Retrieve>Paths from file

---

PARRES, *Lab*, *Fname*, *Ext*, *--*

Reads parameters from a file.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Lab

Read operation:

NEW --

Replace current parameter set with these parameters (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CHANGE --

Extend current parameter set with these parameters, replacing any that already exist.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to `Jobname`.

Ext

Filename extension (eight-character maximum).

The extension defaults to PARM if *Fname* is blank.

--

Unused field.

Notes

Reads parameters from a coded file. The parameter file may have been written with the **PARSAV (p. 1352)** command. The parameters read may replace or change the current parameter set.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Restore Parameters

PARSAV, *Lab*, *Fname*, *Ext*, *--*

Writes parameters to a file.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Lab

Write operation:

SCALAR --

Write only scalar parameters (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL --

Write scalar and array parameters. Parameters may be numeric or alphanumeric.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to `Jobname`.

Ext

Filename extension (eight-character maximum).

The extension defaults to PARM if *Fname* is blank.

--

Unused field.

Notes

Writes the current parameters to a coded file. Previous parameters on this file, if any, will be overwritten. The parameter file may be read with the **PARRES (p. 1351)** command.

PARSAV (p. 1352)/**PARRES (p. 1351)** operations truncate some long decimal strings, and can cause differing values in your solution data when other operations are performed. A good practice is to limit the number of decimal places you will use before and after these operations.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Save Parameters

PASAVE, *Lab*, *Fname*, *Ext*, *--*

Saves selected paths to an external file.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Write operation:

S

Saves only selected paths.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Saves all paths (default).

Pname

Saves the named path (from the **PSEL (p. 1536)** command).

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to `Jobname`.

Ext

Filename extension (eight-character maximum).

The extension defaults to PATH if *Fname* is blank.

--

Unused field.

Notes

Saves the paths selected with the **PSEL (p. 1536)** command to an external file (default `Jobname.path`).

Previous paths on this file, if any, are overwritten. The path file can be read via **PARESU (p. 1350)**.

This command is valid in POST1.

Menu Paths

Main Menu>General Postproc>Path Operations>Archive Path>Store>Paths in file

Main Menu>Preprocessor>Path Operations>Store>Paths in file

PATH,*NAME*,*nPts*,*nSets*,*nDiv*

Defines a path name and establishes parameters for the path.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NAME

Name for this path (eight characters maximum. If *nPts* is blank, set the current path to the path with this name. If *nPts* is greater than zero, create a path of this name. If a path with this name already exists, replace it with a new path. If the *NAME* value is STATUS, display the status for path settings.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

nPts

The number of points used to define this path. The minimum number is two, and the maximum is 1000. Default is 2.

nSets

The number of sets of data which you can map to this path. You must specify at least four: X, Y, Z, and S. Default is 30.

nDiv

The number of divisions between adjacent points. Default is 20. There is no maximum number of divisions.

Notes

The **PATH (p. 1354)** command is used to define parameters for establishing a path. The path geometry is created by the **PPATH (p. 1463)** command. Multiple paths may be defined and named; however, only one path may be active for data interpolation (**PDEF (p. 1372)**) and data operations (**PCALC (p. 1362)**, etc.). Path geometry points and data are stored in memory while in POST1. If you leave POST1, the path information is erased. Path geometry and data may be saved in a file by archiving the data using the **PASAVE (p. 1353)** command. Path information may be restored by retrieving the data using the **PARESU (p. 1350)** command.

For overlapping nodes, the lowest numbered node is assigned to the path.

The number of divisions defined using *nDiv* does NOT affect the number of divisions used by **PLSECT (p. 1440)** and **PRSECT (p. 1520)**.

For information on displaying paths you have defined, see Mapping Results onto a Path in the *Basic Analysis Guide*.

PAUSE

Temporarily releases the current product license.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

The **PAUSE (p. 1356)** command temporarily releases (or pauses) the current product license so that another application can use it.

This application consumes a license as soon as you launch it, and retains that license until it is finished. If you launch the product interactively, the license is retained until you either close the application or issue a **PAUSE (p. 1356)** command via the command line.

No other operation (other than **SAVE (p. 1645)** or **/EXIT (p. 708)**) is possible in the current application while use of the product license is paused.

When the second application has finished and releases the license, issue an **UNPAUSE (p. 2056)** command via the command line to restore use of the license to the current application.

For more information, see the Ansys Licensing Guide.

Menu Paths

This command cannot be accessed from a menu.

/PBC, *Item*, --, *KEY*, *MIN*, *MAX*, *ABS*

Shows boundary condition (BC) symbols and values on displays.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Label identifying the item:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

U

Applied translational constraints (UX, UY, UZ).

ROT

Applied rotational constraints (ROTX, ROTY, ROTZ).

TEMP

Applied temperatures (TEMP, TBOT, TE2, TE3, . . ., TTOP).

PRES

Applied fluid pressures.

V

Applied flow velocities (VX, VY, VZ).

VOLT

Applied voltages.

MAG

Applied scalar magnetic potentials.

A

Applied vector magnetic potentials.

CONC

Concentration.

CHRG

Applied electric charge.

F or FORC

Applied structural forces (FX, FY, FZ).

M or MOME

Applied structural moments (MX, MY, MZ).

HEAT

Applied heat flows (HEAT, HBOT, HE2, HE3, . . ., HTOP).

FLOW

Applied fluid flow.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AMPS

Applied current flow.

FLUX

Applied magnetic flux.

CSG

Applied magnetic current segments.

RATE

Diffusion flow rate.

MAST

Master degrees of freedom.

CP

Coupled nodes.

CE

Nodes in constraint equations.

NFOR

POST1 nodal forces.

NMOM

POST1 nodal moments

RFOR

POST1 reaction forces.

RMOM

POST1 reaction moments (MX, MY, MZ).

PATH

Path geometry (undistorted) associated with the **PATH (p. 1354)** command after a **PDEF (p. 1372)** or **PVECT (p. 1556)** command has been issued.

ACEL

Global acceleration (ACELX, ACELY, ACELZ vector).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OMEG

Global angular velocity (OMEGX, OMEGY, OMEGZ vector) and acceleration (DOMEGX, DOMEGY, DOMEGZ vector).

ALL

Represents all appropriate labels.

- -

Unused field.

KEY

Symbol key:

0

Do not show symbol.

1

Show symbol.

2

Plot value next to symbol.

MIN

Minimum value in a range of values plotted on screen.

MAX

Maximum value in a range of values plotted on screen.

ABS

Absolute number. If *KEY* = 2 and *ABS* = 0, a number falling between the *MIN* and *MAX* is displayed. If *ABS* is not specified, it defaults to 0. If *KEY* = 2 and *ABS* = 1, an absolute value falling between the *MIN* and *MAX* is displayed. *ABS* = 1 lets you eliminate the display of numbers whose absolute values are less than a desired tolerance. For example, if *ABS* = 1, *MIN* = 10 and *MAX* = 1e8, values such as .83646 and -5.59737 are not displayed.

Command Default

No symbols displayed.

Notes

The **/PBC** command adds degree of freedom constraint, force load, and other symbols to displays.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Symbols are applied to the selected nodes only. All arrow and arrowhead symbols are oriented in the nodal coordinate system and lie in two perpendicular planes. Force arrows are scaled proportional to their magnitude. (If *KEY* = 1, use **/VSCALE (p. 2160)** to change arrow length.) For scalar quantities, the specific component direction (that is, x, y, or z) of the symbol has no meaning, but the positive or negative sense (for example, positive or negative x) represents a positive or negative scalar value, respectively.

The effects of the **/PBC** command are not cumulative (that is, the command does not modify an existing setting from a previously issued **/PBC** command). If you issue multiple **/PBC** commands during an analysis, only the setting specified by the most recent **/PBC (p. 1356)** command applies.

Use **/PSTATUS (p. 1550)** or **/PBC (p. 1356)**,STAT to display settings. Use **/PBC (p. 1356)**,DEFA to reset all specifications back to default. See the **/PSF (p. 1537)** and **/PBF (p. 1360)** commands for other display symbols.

In a cyclic symmetry analysis, the **/PBC (p. 1356)** command is deactivated when cyclic expansion is active (**/CYCEXPAND (p. 454)**,,ON). To view boundary conditions on the base sector, deactivate cyclic expansion (**/CYCEXPAND (p. 454)**,,OFF) and issue this command: **/PBC (p. 1356)**,ALL,,1

Issuing the command **/PBC (p. 1356)**,PATH, ,1 displays all defined paths.

The **/PBC (p. 1356)** command is valid in any processor.

/PBF,*Item*,--,*KEY*

Shows magnitude of body-force loads on displays.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Label identifying the item:

TEMP

Applied temperatures.

FLUE

Applied fluences.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HGEN

Applied heat generation rates.

JS

Applied current density magnitude.

JSX

X-component of current density.

JSY

Y-component of current density.

JSZ

Z-component of current density.

PHASE

Phase angle of applied load.

MVDI

Applied magnetic virtual displacements flag.

CHRGD

Applied electric charge density.

- -

Unused field.

KEY

Symbol key:

0

Do not show body-force load contours.

1

Show body-force load contours.

2

Show current density as a vector (not a contour).

Command Default

No body-force load contours displayed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Shows body-force loads as contours on displays for the selected elements.

The effects of the **/PBF** command are not cumulative (that is, the command does not modify an existing setting from a previously issued **/PBF** command). If you issue multiple **/PBF** commands during an analysis, only the setting specified by the most recent **/PBF (p. 1360)** command applies.

Use **/PSTATUS (p. 1550)** or **/PBF (p. 1360)**,STAT to display settings. Use **/PBF (p. 1360)**,DEFA to reset all specifications back to default. See also the **/PSF (p. 1537)** and **/PBC (p. 1356)** command for other display contours.

Portions of this command are not supported by PowerGraphics (**/GRAPHICS (p. 866)**,POWER).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Symbols

PCALC, *Oper*, *LabR*, *Lab1*, *Lab2*, *FACT1*, *FACT2*, *CONST*

Forms additional labeled path items by operating on existing path items.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Oper

Type of operation to be performed. See "Notes" (p. 1363) below for specific descriptions of each operation:

ADD

Adds two existing path items.

MULT

Multiplies two existing path items.

DIV

Divides two existing path items (a divide by zero results in a value of zero).

EXP

Exponentiates and adds existing path items.

DERI

Finds a derivative.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

INTG

Finds an integral.

SIN

Sine.

COS

Cosine.

ASIN

Arcsine.

ACOS

Arccosine.

LOG

Natural log.

LabR

Label assigned to the resulting path item.

Lab1

First labeled path item in operation.

Lab2

Second labeled path item in operation. *Lab2* must not be blank for the MULT, DIV, DERI, and INTG operations.

FACT1

Factor applied to *Lab1*. A (blank) or '0' entry defaults to 1.0.

FACT2

Factor applied to *Lab2*. A (blank) or '0' entry defaults to 1.0.

CONST

Constant value (defaults to 0.0).

Notes

If *Oper* = ADD, the command format is:

PCALC (p. 1362),ADD,*LabR*,*Lab1*,*Lab2*,*FACT1*,*FACT2*,*CONST*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This operation adds two existing path items according to the operation:

LabR = (*FACT1* x *Lab1*) + (*FACT2* x *Lab2*) + *CONST*

It may be used to scale the results for a single path item.

If *Oper* = MULT, the command format is:

PCALC (p. 1362),MULT,*LabR*,*Lab1*,*Lab2*,*FACT1*

Lab2 must not be blank. This operation multiplies two existing path items according to the operation:

LabR = *Lab1* x *Lab2* x *FACT1*

If *Oper* = DIV, the command format is:

PCALC (p. 1362),DIV,*LabR*,*Lab1*,*Lab2*,*FACT1*

Lab2 must not be blank. This operation divides two existing path items according to the operation:

LabR = (*Lab1*/*Lab2*) x *FACT1*

If *Oper* = EXP, the command format is:

PCALC (p. 1362),EXP,*LabR*,*Lab1*,*Lab2*,*FACT1*,*FACT2*

This operation exponentiates and adds existing path items according to the operation:

LabR = ($|Lab1|^{FACT1}$) + ($|Lab2|^{FACT2}|$)

If *Oper* = DERI, the command format is:

PCALC (p. 1362),DERI,*LabR*,*Lab1*,*Lab2*,*FACT1*

Lab2 must not be blank. This operation finds a derivative according to the operation:

LabR = *FACT1* x d(*Lab1*)/d(*Lab2*)

If *Oper* = INTG, the command format is:

PCALC (p. 1362),INTG,*LabR*,*Lab1*,*Lab2*,*FACT1*

Lab2 must not be blank. This operation finds an integral according to the operation:

$$LabR = FACT1 \times \int_S Lab1\, d(Lab2)$$

Use S for *Lab2* to integrate *Lab1* with respect to the path length. S, the distance along the path, is automatically calculated by the program when a path item is created with the **PDEF (p. 1372)** command.

If *Oper* = SIN, COS, ASIN, ACOS, or LOG, the command format is:

PCALC (p. 1362),Oper,*LabR*,*Lab1*,,*FACT1*,*CONST*

where the function (SIN, COS, ASIN, ACOS or LOG) is substituted for *Oper* and *Lab2* is blank.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The operation finds the resulting path item according to one of the following formulas:

$LabR$ = FACT2 x $sin(FACT1 \times Lab1) + CONST$

$LabR$ = FACT2 x $cos(FACT1 \times Lab1) + CONST$

$LabR$ = FACT2 x $sin^{-1}(FACT1 \times Lab1) + CONST$

$LabR$ = FACT2 x $cos^{-1}(FACT1 \times Lab1) + CONST$

$LabR$ = FACT2 x $log(FACT1 \times Lab1) + CONST$

PCGOPT,*Lev_Diff*,*Fallback*,*ReduceIO*,*StrmCk*,*Wrtfull*,*LM_Key*

Controls PCG solver options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lev_Diff

Indicates the level of difficulty of the analysis. Valid settings are AUTO or 0 (default), 1, 2, 3, 4, or 5. This option applies to both the PCG solver when used in a static, full transient, or full harmonic analyses and to the PCG Lanczos method in modal analyses.

Specify AUTO to allow Mechanical APDL to select the proper level of difficulty for the model.

Lower values (1 or 2) generally provide the best performance for well-conditioned problems.

Values of 3 or 4 generally provide the best performance for ill-conditioned problems; however, higher values may increase the solution time for well-conditioned problems. Higher level-of-difficulty values typically require more memory.

The highest value of 5 essentially performs a factorization of the global matrix (similar to the sparse solver) and may require a very large amount of memory. This level is generally recom-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

mended for small- to medium-sized problems when using the PCG Lanczos mode-extraction method. *Lev_Diff* = 5 is not supported for a full harmonic analysis.

For example, models containing elongated elements (that is, elements with high aspect ratios) and models containing contact elements can lead to ill-conditioned problems. To determine if your problem is ill-conditioned, view the Jobname.pcs file to see the number of PCG iterations needed to reach a converged solution. Generally, static, full transient, or full harmonic solutions that require more than 1500 iterations are considered to be ill-conditioned for the PCG solver.

Fallback

Controls whether Mechanical APDL switches to the sparse direct solver automatically (**EQSLV (p. 648)**,SPARSE) under certain conditions. (The criteria are listed below.) When Mechanical APDL switched the equation solver, the simulation attempts to continue without interruption.

AUTO

Automatically switch to the sparse solver when one of the following conditions apply (default):

- The assembled matrix is detected to be indefinite.
- The PCG solver requires more than 2000 iterations to reach convergence.
- The PCG solver fails to converge.

ON

More aggressive fallback criteria. Automatically switch to the sparse solver when one of the following conditions apply:

- The assembled matrix is detected to be indefinite.
- The PCG solver requires more than 1500 iterations to reach convergence.
- The PCG solver fails to converge.

OFF

Disables the fallback logic so that there is no automatic switching, and only the PCG solver is used to solve the equations for this simulation.

After switching to the sparse solver, the program reverts back to the PCG solver under certain conditions. See the Notes (p. ?) section for details and limitations.

ReduceIO

Controls whether the PCG solver will attempt to reduce I/O performed during equation solution:

AUTO

Automatically chooses whether to reduce I/O or not (default).

YES

Reduces I/O performed during equation solution in order to reduce total solver time.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NO

Does NOT reduce I/O performed during equation solution.

This option applies to both the PCG solver when used in static and full transient analyses and to the PCG Lanczos method in modal analyses.

StrmCk

Controls whether or not a Sturm sequence check is performed:

OFF

Does NOT perform Sturm sequence check (default).

ON

Performs Sturm sequence check

This option applies only when using the PCG Lanczos method in modal analyses. When using this option, a factorization must be performed and will require a very large amount of memory for extra computations. This option is generally recommended for small- to medium-sized problems. If the Sturm sequence check takes a large amount of computing time, use the `Jobname.ABT` file to abort the Sturm check, or press the **STOP** button if in interactive mode.

Wrtfull

Controls whether or not the `.full` file is written.

ON

Write `.full` file (default)

OFF

Do not write `.full` file.

This option applies only when using the PCG Lanczos method in modal analyses because the `.full` file is never written when using the PCG solver in static, full transient, or harmonic analyses.

If using **MSAVE (p. 1183)**,ON and conditions for the **MSAVE (p. 1183)** command are met, a complete `.full` file is never written regardless of this option.

If constraint equations are present in the model, a `.full` file is always written regardless of this option.

This option is useful in a distributed-memory parallel processing analysis because assembling the global stiffness and mass matrices on the head compute node before writing the `.full` file can take a considerable amount of memory. By setting *Wrtfull* = OFF, this assembly process is skipped on the head compute node, decreasing the amount of memory required to compute the modes and mode shapes. *Wrtfull* = OFF does not affect the results for the modes and mode shapes. However, without a `.full` file, the participation factor table computations do not occur.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To generate the `.full` file to be used in a downstream harmonic, transient mode-superposition, or spectrum analysis, rerun the modal analysis with *`Wrtfull`* = ON, or use the **WRFULL (p. 2184)** command.

`LM_Key`

Controls use of the PCG solver for MPC184 elements that involve the Lagrange multiplier method. This option applies only to the PCG solver when used in static analyses, full transient analyses, and modal analyses that use the PCG Lanczos mode-extraction method (**MODOPT (p. 1140)**,LANPCG).

ON

Allow use of the PCG solver with certain MPC184 element types that use the Lagrange multiplier method. (default)

OFF

Do not use the PCG solver with any MPC184 element types that use the Lagrange multiplier method.

The Lagrange multiplier method used by MPC184 elements transfers the Lagrange multipliers into multiple point constraints and, hence, can be solved by the PCG solver. The current MPC184 element types supported are: rigid beam, rigid link, slider, revolute joint, universal joint, translational joint, cylindrical joint, weld joint, spherical joint, and general joint. For all other MPC184 element types, the PCG solver cannot be used, and the equation solver automatically switches to the sparse solver regardless of the *`LM_Key`* setting on **PCGOPT (p. 1365)**.The **MSAVE (p. 1183)** command does not support the *`LM_Key`* = ON option.

Notes

`ReduceIO` works independently of the **MSAVE (p. 1183)** command in the PCG solver. Setting *`ReduceIO`* to YES can significantly increase the memory usage in the PCG solver.

To minimize the memory used by the PCG solver with respect to the *`Lev_Diff`* option only, set *`Lev_Diff`* = 1 if you do not have sufficient memory to run the PCG solver with *`Lev_Diff`* = AUTO.

For unsymmetric structural and harmonic analyses, the PCG solver supports a *`Lev_Diff`* equal to 2-4.

For symmetric and unsymmetric single degree-of-freedom analyses (thermal, etc.), the PCG solver only supports *`Lev_Diff`* = 1.

The **MSAVE (p. 1183)**,ON command is not valid in these circumstances:

- when *`Lev_Diff`* = 5; in this case, the *`Lev_Diff`* value will automatically be reset to 2.
- with the *`StrmCk`* option; in this case, *`StrmCk`* will be set to OFF.
- when the *`Fallback`* option is enabled (set to AUTO or ON); in this case, *`Fallback`* will automatically be reset to OFF.
- when the PCG solver is used for a full harmonic analysis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For Lagrange-formulation contact methods and mixed u-P formulations, the PCG solver cannot be used, and the sparse solver is required.

Fallback logic is automatically disabled (*Fallback* = OFF) in these circumstances:

- for analyses that include MPC184 elements using the Lagrange multiplier method to impose kinematic constraints
- for thermal analyses that use the quasi-static (**THOPT (p. 1997)**,QUASI) option.

Reverting to the PCG Solver After an Automatic Switch to the Sparse Solver

Linear Analysis (symmetric or unsymmetric): When fallback logic is enabled (*Fallback* = AUTO or ON) and the program switches to the sparse direct solver during a linear analysis, the sparse solver is used for the remainder of the simulation unless the solver choice is changed by issuing the **EQSLV (p. 648)** command between load steps.

Nonlinear Analysis (symmetric or unsymmetric): If the program switches to the sparse direct solver during a nonlinear analysis, the sparse solver is used for the remaining equilibrium iterations of the current substep. The program reverts back to the PCG solver at the end of the current substep unless one of the following conditions apply:

- The previous call to the sparse solver involved an indefinite or near-singular matrix.
- The last equilibrium iteration of the current substep using the sparse solver was faster than the last successful equilibrium iteration using the PCG solver.
- Three consecutive fallback switches between the sparse and the PCG solvers have occurred.

For both linear and nonlinear analyses, the solver choice can be changed using the **EQSLV (p. 648)** command between any subsequent load steps.

Full-Harmonic Analysis: If the program switches to the sparse direct solver during a full-harmonic analysis, the sparse solver is used for the current harmonic substep. The program reverts back to the PCG solver at the next continuing substep.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>Analysis Options

PCIRC, *RAD1*, *RAD2*, *THETA1*, *THETA2*

Creates a circular area centered about the working plane origin.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RAD1*, *RAD2

Inner and outer radii (either order) of the circle. A value of either zero or blank for either *RAD1* or *RAD2*, or the same value for both *RAD1* and *RAD2*, defines a solid circle.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

THETA1, THETA2

Starting and ending angles (either order) of the circular area. Used for creating a circular sector. The sector begins at the algebraically smaller angle, extends in a positive angular direction, and ends at the larger angle. The starting angle defaults to 0.0° and the ending angle defaults to 360.0°. See the *Modeling and Meshing Guide* for an illustration.

Notes

Defines a solid circular area or circular sector centered about the working plane origin. For a solid circle of 360°, the area will be defined with four keypoints and four lines. See the **CYL4 (p. 477)** and **CYL5 (p. 478)** commands for alternate ways to create circles.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Areas>Circle>By Dimensions

---

/PCIRCLE, *XCENTR, YCENTR, XLRAD*

Creates an annotation circle (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XCENTR

Circle X center location (-1.0 < X < 2.0).

YCENTR

Circle Y center location (-1.0 < Y < 1.0).

XLRAD

Circle radius length.

Notes

Creates an annotation circle to be written directly onto the display at a specified location. This is a command generated by the Graphical User Interface (GUI) and appears in the log file (`Jobname.log`) if annotation is used.

This command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with the **/INPUT (p. 948)** command).

All circles are shown on subsequent displays unless the annotation is turned off or deleted. Issue **/LSPEC (p. 1081)** and **/PSPEC (p. 1548)** to set the attributes of the circle.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

PCROSS, *LabXR*, *LabYR*, *LabZR*, *LabX1*, *LabY1*, *LabZ1*, *LabX2*, *LabY2*, *LabZ2*

Calculates the cross product of two path vectors along the current path.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabXR

Label assigned to X-component of resultant vector.

LabYR

Label assigned to Y-component of resultant vector.

LabZR

Label assigned to Z-component of resultant vector.

LabX1

X-component of first vector label (labeled path item).

LabY1

Y-component of first vector label.

LabZ1

Z-component of first vector label.

LabX2

X-component of second vector label (labeled path item).

LabY2

Y-component of second vector label.

LabZ2

Z-component of second vector label.

Menu Paths

Main Menu>General Postproc>Path Operations>Cross Product

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PDEF,*Lab*,*Item*,*Comp*,*Avglab*

Interpolates an item onto a path.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Label assigned to the resulting path item (8 characters maximum). This item may be used as input for other path operations.

Item

Label identifying the item for interpolation. Valid item labels are shown in Table 209: PDEF - Valid Item and Component Labels (p. 1373) below. Some items also require a component label.

Comp

Component of the item (if required). Valid component labels are shown in Table 209: PDEF - Valid Item and Component Labels (p. 1373) below.

Avglab

Option to average across element boundaries:

AVG

Average element results across elements (default).

NOAV

Do not average element results across elements. If the parameter *DISCON* = MAT on the **PMAP (p. 1449)** command, this option is automatically invoked.

Notes

Defines and interpolates a labeled path item along a predefined path (**PATH (p. 1354)**). Path item results are in the global Cartesian coordinate directions unless transformed (**RSYS (p. 1639)**). A path item must be defined before it can be used with other path operations. Additional path items may be defined from the **PVECT (p. 1556)**, **PCALC (p. 1362)**, **PDOT (p. 1375)**, and **PCROSS (p. 1371)** commands. Path items may be listed (**PRPATH (p. 1517)**) or displayed (**PLPATH (p. 1439)**, **PLPAGM (p. 1438)**). A maximum number of path items permitted is established by the *nSets* argument specified with the **PATH (p. 1354)** command.

When you create the first path item (**PDEF (p. 1372)** or **PVECT (p. 1556)**), the program automatically interpolates four path items which are used to describe the geometry of the path. These predefined items are the position of the interpolated path points (labels XG, YG, and ZG) in global Cartesian coordinates, and the path length (label S). For alternate methods of mapping the path geometry (to include, for example, material discontinuity) see the **PMAP (p. 1449)** command. These items may also be listed or displayed with the **PRPATH (p. 1517)**, **PLPATH (p. 1439)**, and **PLPAGM (p. 1438)** commands.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If specifying that load case operations act on principal/equivalent stresses (**SUMTYPE (p. 1880)**,PRIN), derived quantities (principal and equivalent stresses/strains) will be zero for path plots. A typical use for such a case involves mode combinations in a response spectrum analysis.

The number of interpolation points on the path is defined by the *nDiv* argument on the **PATH (p. 1354)** command. See Mapping Nodal and Element Data onto the Path in the *Mechanical APDL Theory Reference* for details. Use **PDEF (p. 1372)**,STAT to list the path item labels. Use **PDEF (p. 1372)**,CLEAR to erase all labeled path items, except the path geometry items (XG, YG, ZG, S).

See also Mapping Results onto a Path in the *Basic Analysis Guide*.

Table 209: PDEF - Valid Item and Component Labels

Item	Comp	Description
Valid item and component labels for nodal degree of freedom results are:		
U	X, Y, Z, SUM	X, Y, or Z structural displacement or vector sum.
ROT	X, Y, Z, SUM	X, Y, or Z structural rotation or vector sum.
TEMP[1]		Temperature.
PRES		Pressure.
VOLT		Electric potential.
MAG		Magnetic scalar potential.
V	X, Y, Z, SUM	X, Y, or Z fluid velocity or vector sum.
A	X, Y, Z, SUM	X, Y, or Z magnetic vector potential or vector sum.
CONC		Concentration.
CURR		Current.
EMF		Electromotive force drop.
Valid item and component labels for element results are:		
S	X, Y, Z, XY, YZ, XZ	Component stress.
"	1, 2, 3	Principal stress.
"	INT, EQV	Stress intensity or Equivalent stress.
EPTO	X, Y, Z, XY, YZ, XZ	Component total strain (EPEL + EPPL + EPCR).
"	1, 2, 3	Principal total strain.
"	INT, EQV	Total strain intensity or total equivalent strain.
EPEL	X, Y, Z, XY, YZ, XZ	Component elastic strain.
"	1, 2, 3	Principal elastic strain.
"	INT, EQV	Elastic strain intensity or elastic equivalent strain.
EPPL	X, Y, Z, XY, YZ, XZ	Component plastic strain.
"	1, 2, 3	Principal plastic strain.
"	INT, EQV	Plastic strain intensity or plastic equivalent strain.
EPCR	X, Y, Z, XY, YZ, XZ	Component creep strain.
"	1, 2, 3	Principal creep strain.
"	INT, EQV	Creep strain intensity or creep equivalent strain.
EPTH	X, Y, Z, XY, YZ, XZ	Component thermal strain.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item	Comp	Description
"	1, 2, 3	Principal thermal strain.
"	INT, EQV	Thermal strain intensity or thermal equivalent strain.
EPSW		Swelling strain.
NL	SEPL	Equivalent stress (from stress-strain curve).
"	SRAT	Stress state ratio.
"	HPRES	Hydrostatic pressure.
"	EPEQ	Accumulated equivalent plastic strain.
"	CREQ	Accumulated equivalent creep strain.
"	PSV	Plastic state variable.
"	PLWK	Plastic work/volume.
For contact results PowerGraphics is applicable for 3D models only.		
CONT	STAT2	Contact status.
"	PENE	Contact penetration.
"	PRES	Contact pressure.
"	SFRIC	Contact friction stress.
"	STOT	Contact total stress (pressure plus friction).
"	SLIDE	Contact sliding distance.
"	GAP	Contact gap distance.
"	FLUX	Total heat flux at contact surface.
TG	X, Y, Z, SUM	Component thermal gradient or vector sum.
TF	X, Y, Z, SUM	Component thermal flux or vector sum.
PG	X, Y, Z, SUM	Component pressure gradient or vector sum.
EF	X, Y, Z, SUM	Component electric field or vector sum.
D	X, Y, Z, SUM	Component electric flux density or vector sum.
JC	X, Y, Z, SUM	Component conduction current density or vector sum (for elements that support conduction current calculation)
H	X, Y, Z, SUM	Component magnetic field intensity or vector sum.
B	X, Y, Z, SUM	Component magnetic flux density or vector sum.
CG	X, Y, Z, SUM	Component concentration gradient or vector sum
DF	X, Y, Z, SUM	Component diffusion flux density or vector sum
FMAG	X, Y, Z, SUM	Component electromagnetic force or vector sum.
ETAB	Lab	Any user-defined element table label (see **ETABLE (p. 687)** command).
BFE	TEMP	Applied and calculated temperatures along a defined path.
SPL		Sound pressure level.
SPLA		A-weighted sound pressure level (dBA).

1. For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use the labels TBOT, TE2, TE3, ..., TTOP instead of TEMP.

PERBC2D, *LOC1*, *LOC2*, *LOCTOL*, *R1*, *R2*, *TOLR*, *OPT*, *PLNOPT*

Generates periodic constraints for 2D planar magnetic field analyses.

PREP7 (p. 22): Special Purpose (p. 37)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LOC1

Constant coordinate location of the first plane of nodes. For *PLNOPT* = 1 or 2, the constant coordinate location is the global Cartesian coordinate system (**CSYS (p. 441)**,0) location in the X or Y direction respectively. For *PLNOPT* = 0, the location is the angle in the global cylindrical coordinate system (**CSYS (p. 441)**,1).

LOC2

Constant coordinate location of the second plane of nodes. For *PLNOPT* = 1 or 2, the constant coordinate location is the global Cartesian coordinate system (**CSYS (p. 441)**,0) location in the X or Y direction respectively. For *PLNOPT* = 0, the location is the angle (in degrees) in the global cylindrical coordinate system (**CSYS (p. 441)**,1).

LOCTOL

Tolerance on the constant coordinate location for node selection. Defaults to .00001 for *PLNOPT* = 1 or 2 and .001 degrees for *PLNOPT* = 0.

R1

Minimum coordinate location along the second plane of nodes. For *PLNOPT* = 1 or 2, the coordinate location is the global Cartesian coordinate system location in the Y or X direction respectively. For *PLNOPT* = 0, the coordinate location is the radial coordinate value in the global cylindrical coordinate system. Periodic conditions are not applied to nodes at this location.

R2

Maximum coordinate location along the second plane of nodes. For *PLNOPT* = 1 or 2, the coordinate location is the global Cartesian coordinate system location in the Y or X direction respectively. For *PLNOPT* = 0, the coordinate location is the radial coordinate value in the global cylindrical coordinate system. Periodic conditions are not applied to nodes at this location.

TOLR

Tolerance dimension on node selection along the plane of nodes. Defaults to .00001.

OPT

Periodic option:

0

Odd symmetry (default). Apply constraint equations such that AZ(i) = -AZ(j).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Even symmetry. Apply node coupling such that AZ(i) = AZ(j).

PLNOPT

Symmetry plane option:

0

Planes of constant angle in the global cylindrical coordinate system (**CSYS (p. 441)**,1).

1

Planes parallel to the global Cartesian X axis (**CSYS (p. 441)**,0).

2

Planes parallel to the global Cartesian Y axis (**CSYS (p. 441)**,0).

Notes

PERBC2D (p. 1376) invokes a Mechanical APDL macro which generates periodic boundary condition constraints for 2D planar magnetic field analysis.

The macro is restricted to node pairs sharing common coordinate values along symmetry planes separated by a constant coordinate value. Planes (or lines) must lie at either constant angles (*PLNOPT* = 0), constant X values (*PLNOPT* = 1), or constant Y values (*PLNOPT* = 2).

The macro applies constraint equations (*OPT* = 0, odd symmetry) or node coupling (*OPT* = 1, even symmetry) to each node pair sharing a common coordinate value along the symmetry planes. By default, periodic conditions are not applied at the first and last node pairs on the symmetry planes unless the input location values, R1 and R2, are adjusted to be less than or greater than the actual node coordinate values.

Nodes are selected for application of constraints via **NSEL (p. 1266)**, with tolerances on the constant coordinate location (*LOCTOL*) and the coordinate location along the plane (RTOL).

PERTURB, *Type*, *MatKey*, *ContKey*, *LoadControl*

Sets linear perturbation analysis options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Type of linear perturbation analysis to be performed:

STATIC

Perform a linear perturbation static analysis.

MODAL

Perform a linear perturbation modal analysis.

BUCKLE

Perform a linear perturbation eigenvalue buckling analysis.

HARMONIC

Perform a linear perturbation full harmonic analysis.

SUBSTR

Perform a linear perturbation substructure generation pass.

OFF

Do not perform a linear perturbation analysis (default).

MatKey

Key for specifying how the linear perturbation analysis uses material properties, valid for all structural elements except contact elements. For more information, see Linear Perturbation Analysis in the *Mechanical APDL Theory Reference*.

AUTO

The program selects the material properties for the linear perturbation analysis automatically (default). The materials are handled in the following way:

- For pure linear elastic materials used in the base analysis, the same properties are used in the linear perturbation analysis.
- For hyperelastic materials used in the base analysis, the material properties are assumed to be linear elastic in the linear perturbation analysis. The material property data (or material Jacobian) is obtained based on the tangent of the hyperelastic material's constitutive law at the point where restart occurs.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- For hyperviscoelastic materials used in the base analysis, the program uses the harmonic material formulation in perturbed full harmonic solutions.
- For other nonlinear materials used in the base analysis, the material properties are assumed to be linear elastic in the linear perturbation analysis. The material data is the same as the linear portion of the nonlinear materials (that is, the parts defined via **MP (p. 1160)** commands).
- For COMBIN39, the stiffness is that of the first segment of the force-deflection curve.

TANGENT

Use the tangent (material Jacobian) on the material constitutive curve as the material property. The material property remains linear in the linear perturbation analysis and is obtained at the point of the base analysis where restart occurs. The materials are handled in the following way:

- For pure linear elastic materials used in the base analysis, the same properties are used in the linear perturbation analysis. Because the material constitutive curve is linear, the tangent is the same as the base analysis.
- For hyperelastic materials used in the base analysis, the program uses the same tangent as that used for *MatKey* = AUTO, and the results are therefore identical.
- For hyperviscoelastic materials used in the base analysis, the program uses the harmonic material formulation in perturbed full harmonic solutions.
- For other nonlinear materials used in the base analysis, the material properties are obtained via the material tangent on the material constitutive curve at the restart point of the base analysis.

  The materials and properties typically differ from *Matkey* = AUTO, but it is possible the results could be identical or very similar if a.) the material is elastoplastic rate-independent and is unloading (or has neutral loading) at the restart point, or b.) the material is rate-dependent, depending on the material properties and loading conditions.
- For COMBIN39, the stiffness is equal to the tangent of the current segment of the force-deflection curve.
- In a modal restart solution that follows a linear perturbation modal analysis, the TANGENT option is overridden by the AUTO option and linear material properties are used for stress calculations in the modal restart. See the discussion in the Notes (p. 1382) for more information.

SPOFF

Provide the same values as AUTO, but set the spin softening matrix to zero (ignoring the spin softening effect).

The spin softening effect is excluded in all the linear perturbation analysis types except for linear perturbation buckling. Note that although the spin softening effect is excluded in linear perturbation analysis, it is still included in the base static or full transient analysis if **NLGEOM (p. 1231)**,ON is issued in the base analysis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ContKey

Key that controls contact status for the linear perturbation analysis. This key controls all contact elements (TARGE169, TARGE170, CONTA172, CONTA174, CONTA175, CONTA177, and CONTA178) globally for all contact pairs. Alternatively, contact status can be controlled locally per contact pair by using the **CNKMOD (p. 392)** command. Note that the contact status from the base analysis solution is always adjusted by the local contact controls specified by **CNKMOD (p. 392)** first and then modified by the global sticking or bonded control (*ContKey* = STICKING or BONDED). The tables in the Notes (p. 1381) section show how the contact status is adjusted by **CNKMOD (p. 392)** and/or the *ContKey* setting.

CURRENT

Use the current contact status from the restart snapshot (default). If the previous run is nonlinear, then the nonlinear contact status at the point of restart is frozen and used throughout the linear perturbation analysis.

STICKING

For frictional contact pairs (MU > 0), use sticking contact (the tangential stiffness is calculated internally based on friction coefficient MU and the element shape) everywhere the contact state is closed (that is, status is sticking or sliding). This option only applies to contact pairs that are in contact and have a frictional coefficient MU greater than zero. Contact pairs without friction (MU = 0) and in a sliding state remain free to slide in the linear perturbation analysis.

BONDED

Any contact pairs that are in the closed (sticking or sliding) state are moved to bonded (for example, KN for both normal and tangential contact stiffness). Contact pairs that have a status of far-field or near-field remain open.

LoadControl

Key that controls how the load vector of $\{F_{perturbed}\}$ is calculated. This control is provided for convenience of load generation for linear perturbation analysis. In general, a new set of loads is required for a linear perturbation analysis. This key controls all mechanical loads; it does not affect non-mechanical loads. Non-mechanical loads (including thermal loads) are always kept (that is, not deleted).

ALLKEEP

Keep all the boundary conditions (loads and constraints) from the end of the load step of the current restart point. This option is convenient for further load application and is useful for a linear perturbation analysis restarted from a previous linear analysis. For this option, $\{F_{end}\}$ is the total load vector at the *end* of the load step at the restart point.

INERKEEP

Delete all loads and constraints from the restart step, except for displacement constraints and inertia loads (default). All displacement constraints (including coupling and constraint equations) and inertia loads are kept for convenience when performing the linear perturb-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ation analysis. Note that nonzero and tabular displacement constraints can be considered as external loads; however, they are not deleted when using this option.

PARKEEP

Delete all loads and constraints from the restart step, except for displacement constraints. All displacement constraints (including coupling and constraint equations) are kept for convenience when performing the linear perturbation analysis. Note that nonzero and tabular displacement constraints can be considered as external loads; however, they are not deleted when using this option.

DZEROKEEP

Behaves the same as the PARKEEP option, except that all nonzero displacement constraints (including any nonzero constant terms defined for any constraint equations) are set to zero upon the onset of linear perturbation.

NOKEEP

Delete all the loads and constraints, including all displacement constraints. This excludes coupling and constraint equations which remain defined, however, all nonzero constant equations are set to zero upon the onset of linear perturbation. For this option, $\{F_{end}\}$ is zero unless non-mechanical loads (for example, thermal loads) are present.

Command Default

Linear perturbation analysis is disabled (*Type* = OFF) by default. When the linear perturbation analysis is enabled, linear material property behavior is assumed for stress calculations; contact status for all contact pairs from the point of restart is used by default; and all loads and constraints from the restart step are deleted, except for displacement constraints and inertia loads, by default.

Notes

This command controls options relating to linear perturbation analyses. It must be issued in the first phase of a linear perturbation analysis.

This command is also valid in PREP7.

Linear Perturbation Overview

A linear perturbation analysis consists of two phases (two **SOLVE (p. 1822)** commands). The first phase is a restart from a base analysis. This base analysis must be a linear or nonlinear static analysis or full transient analysis. The first phase starts with the **ANTYPE (p. 162)**,,RESTART,,,PERTURB command and ends with the **SOLVE (p. 1822)**,ELFORM command. The purpose of the first phase is to re-establish a snapshot of the stiffness matrices at the specified restart point. The second phase, ending with the second **SOLVE (p. 1822)** command, is for the actual linear perturbation analysis.

The total perturbed loads are calculated as follows:

$$\{F_{perturbed}\} = \{F_{end}\} + \{F_{add}\}$$

where:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$\{F_{end}\}$ = total loads at the *end* of the load step of the current restart point (load applications are read from the `.ldhi` file). By default, all of the loads in $\{F_{end}\}$ are deleted except for displacement boundary conditions and inertia loads (see the description of *LoadControl* above).

$\{F_{add}\}$ = Additional (new) loads prescribed by the user in the second phase of the linear perturbation analysis (after the first **SOLVE (p. 1822)** command is invoked).

In the first phase of a linear perturbation analysis, the **ANTYPE (p. 162)**,,RESTART command resumes the `Jobname.rdb` database and reads in the `.ldhi` file to establish the $\{F_{end}\}$ load. New load application (adding to $\{F_{add}\}$) or load removal (changing $\{F_{end}\}$) can be done only in the second phase of the linear perturbation analysis (after the first **SOLVE (p. 1822)** command), allowing flexibility in controlling the final $\{F_{perturbed}\}$ to be used.

For *Type* = STATIC, $\{F_{perturbed}\}$ is the actual external load for the static analysis.

For *Type* = MODAL, $\{F_{perturbed}\}$ is calculated and stored in the `.full` and `.mode` files for a subsequent mode-superposition, PSD, or other type of modal-based linear dynamic analysis. Linear dynamic options such as multiple load generations (**MODCONT (p. 1132)**,ON), enforced motion (**MODCONT (p. 1132)**, ,ON), and residual vector methods (**RESVEC (p. 1603)**,ON) can be used in a linear perturbation analysis. For these methods, the **MODCONT (p. 1132)** or **RESVEC (p. 1603)** command must be invoked in the second phase (after the first **SOLVE (p. 1822)**) of the linear perturbation procedure. For the enforced motion method, the base identification number should be specified (**D (p. 483)** command) in the second phase of the linear perturbation analysis. This base identification number is used later in the downstream mode-superposition or other mode-superposition based analysis.

For *Type* = BUCKLE, $\{F_{perturbed}\}$ is the actual linear buckling load which is used to generate the linear stress stiffening matrix for the buckling analysis.

For *Type* = HARMONIC, $\{F_{perturbed}\}$ is the actual external load for the full harmonic analysis. In this case, $\{F_{perturbed}\}$ can be frequency dependent and can use complex input.

For *Type* = SUBSTR, $\{F_{perturbed}\}$ is used to generate the first reduced external load vector of the sub-structure.

Controlling Material Behavior

In most cases involving linear perturbation analysis, *Matkey* = AUTO is the best option for controlling material behavior. *Matkey* = TANGENT is often the better option, however, in special cases such as the following:

- A linear perturbation buckling analysis, to introduce preferred buckling modes into a subsequent post-buckling nonlinear analysis.
- A linear perturbation modal analysis, to introduce preferred modes into a subsequent bifurcation analysis.

If the TANGENT option is used in conjunction with a modal restart solution that follows a linear perturbation modal analysis, then the AUTO option is assumed and linear material properties are used for stress calculations in the modal restart solution. This occurs because the TANGENT material properties are not available during the modal restart phase due to a data architecture limitation. Furthermore, linear ma-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

terial properties are used for the stress calculation in any downstream analysis that uses the modal restart solution.

For more information about the automatic and tangent options, see Specifying Material Behavior in Linear Perturbation in the *Element Reference*.

Controlling Contact Status

You can control the contact status for the linear perturbation analysis by using the *ContKey* field on this command and/or the **CNKMOD (p. 392)** command. The first table shows the effects of using only the *ContKey* setting on the **PERTURB (p. 1378)** command. The second table shows the effects of using both the **CNKMOD (p. 392)** command and the *ContKey* setting on **PERTURB (p. 1378)**.

Table 210: Adjusted Contact Status when PERTURB Command Is Issued

Contact Status from the Base Analysis Solution at the Restart Point	***ContKey* Setting on PERTURB Command**	
	ContKey Value	Adjusted Contact Status
0 - far-field	any	0 - far-field
1 - near-field	any	1 - near-field
2 - sliding	CURRENT or STICKING (mu=0)	2 - sliding
	STICKING (mu>0) or BONDED	3 - sticking
3 - sticking	any	3 - sticking

Table 211: Adjusted Contact Status when Both CNKMOD and PERTURB Are Issued

Contact Status from the Base Analysis Solution at the Restart Point	**CNKMOD,*ITYPE*,12,*Value***		***ContKey* Setting on PERTURB Command**	
	KEYOPT(12) Value	Adjusted Contact Status	*ContKey* Value	Final Adjusted Contact Status
0 - far-field	any	0 - far-field	any	0 - far-field
1 - near-field	0, 1, 2, 3, 6	1 - near-field	any	1 - near-field
	4	1 - near-field (if outside of the adjusted pinball region)	any	1 - near-field
		2 - sliding (if inside of the adjusted pinball region)	CURRENT or STICKING (mu=0)	2 - sliding
			STICKING (mu>0) or BONDED	3 - sticking

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	5	1 - near-field (if outside of the adjusted pinball region)	any	1 - near-field
		3 - sticking (if inside of the adjusted pinball region)	any	3 - sticking
2 - sliding	0, 2, 4	2 - sliding	CURRENT or STICKING (mu=0)	2 - sliding
			STICKING (mu>0) or BONDED	3 - sticking
	1, 3, 5, 6	3 - sticking	any	3 - sticking
3 - sticking	any	3 - sticking	any	3 - sticking

When *ContKey* is set to CURRENT, all contact related parameters (such as normal stiffness and tangential stiffness) will remain unchanged throughout the linear perturbation analysis. However when *ContKey* is set to STICKING or BONDED, the program will re-evaluate the contact normal and tangential stiffness in order to perform the linear perturbation analysis based on the actual sticking behavior regardless of the friction coefficient value.

Note that the **CNKMOD (p. 392)** command allows you to take points in the base analysis that are near contact (within the pinball region) and modify them to be treated as "in contact" in the linear perturbation analysis; see the "1 - near-field" row in the above table with KEYOPT(12) values set to 4 or 5. **CNKMOD (p. 392)** also allows you to take points that are sliding in the base analysis and treat them as sticking in the linear perturbation analysis, irrespective of the MU value; see the "2 - sliding" row in the above table with KEYOPT(12) values set to 1,5, or 6.

If an open gap exists at the restart point of the base static/transient solution and the contact status is adjusted as sliding or sticking due to a “bonded” or “no separation” contact behavior definition, then the program will treat it as near-field contact when executing the **CNKMOD (p. 392)** command in a downstream linear perturbation analysis.

PFACT, *TBLNO*, *Excit*, *Parcor*

Calculates participation factors for the PSD or multi-point response spectrum table.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLNO

Input PSD (Power Spectral Density) table number for which participation factors are to be calculated.

Excit

Label defining the location of excitation:

BASE

Base excitation (default).

NODE

Nodal excitation.

Parcor

Label defining excitation type (applies only to **SPOPT (p. 1837)**,PSD analysis). Used only when partially correlated excitation is due to wave propagation or spatial correlation. Defaults to partially correlated excitation as defined by **COVAL (p. 420)** and **QDVAL (p. 1559)** commands.

WAVE

Excitation defined by **PSDWAV (p. 1534)** command.

SPAT

Excitation defined by **PSDSPL (p. 1532)** command.

Notes

Calculates the participation factors for a particular PSD or multi-point response spectrum table defined with the **PSDVAL (p. 1534)** or **SPVAL (p. 1842)** command. The `Jobname.db` file must contain modal solution data in order for this command to calculate the participation factor. There must be a **PFACT (p. 1385)** command for each excitation spectrum. You are limited to 300 excitations.

This command is also valid in PREP7.

PIVCHECK, *KEY*, *PRNTCNTRL*

Controls the behavior of an analysis when a negative or zero equation solver pivot value is encountered.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Determines whether to stop or continue an analysis when a negative or zero equation solver pivot value is encountered:

AUTO

Check for negative or zero pivot values for analyses performed with the sparse and PCG solvers. When one is encountered, an error or warning is issued, per various criteria relating to the type of analysis being solved. An error causes the analysis to stop; a warning allows the analysis to continue. A negative pivot value may be valid for some nonlinear and multiphysics analyses (for example, electromagnetic and thermal analyses); this key has no effect in these cases.

ERROR

Check for negative or zero pivot values for analyses performed with the sparse and PCG solvers. When one is encountered, an error is issued, stopping the analysis. A negative pivot value may be valid for some nonlinear and multiphysics analyses (for example, electromagnetic and thermal analyses); this key has no effect in these cases.

WARN

Check for negative or zero pivot values for analyses performed with the sparse and PCG solvers. When one is encountered, a warning is issued and the analysis continues. A negative pivot value may be valid for some nonlinear and multiphysics analyses (for example, electromagnetic and thermal analyses); this key has no effect in these cases.

OFF

Pivot values are not checked. This key causes the analysis to continue in spite of a negative or zero pivot value.

PRNTCNTRL

Provides print options. Print output with these options will be sent to the default output file, not to the files created by the nonlinear diagnostic tools (**NLDIAG (p. 1224)**).

ONCE

Print only the maximum and minimum pivot information on the first call to the sparse solver (which is the default solver). This is the default behavior.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EVERY

Print the maximum and minimum pivot information at every call to the sparse solver. This option is provided for nonlinear analysis diagnostics.

Command Default

The program checks for negative or zero pivot values (*Key* = AUTO). If any are found, the analysis may stop with an error or may proceed with only a warning, depending on various criteria pertaining to the type of analysis being solved.

Notes

This command is valid for all analyses. In a nonlinear analysis, a negative pivot may be valid. In some cases, rigid body motions in a nonlinear analysis will be trapped by error routines checking infinitely large displacements (DOF limit exceeded) or nonconvergence status. An under-constrained model may avoid the pivot check, but fail with a DOF limit exceeded error.

Machine precision may affect whether a small pivot triggers an error or bypasses this checking logic. You may wish to review the ratio of the maximum to absolute minimum pivot values. For ratios exceeding 12 to 14 orders of magnitude, the accuracy of the computed solution may be degraded by the severe ill-conditioning of the assembled matrix.

Note that negative pivots corresponding to Lagrange multiplier based mixed u-P elements are not checked or reported by this command. Negative pivots arising from the u-P element formulation and related analyses can occur and lead to correct solutions.

This command is also valid in PREP7.

PLAS, *Lab*, *LDSTEP*, *SUBSTEP*, *FREQB*, *FREQE*, *LogOpt*, *PlotType*, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*

Plots a specified acoustic quantity during postprocessing of an acoustic analysis.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

The acoustic quantity to calculate:

SIMP

Specific acoustic impedance on the selected surface.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AIMP

Acoustic impedance on the selected surface.

MIMP

Mechanical impedance on the selected surface.

PRES

Average pressure on the selected surface.

FORC

Force on the selected surface.

POWE

Acoustic power on the selected surface.

ERP

Equivalent radiated power on the selected structural surface (valid only for SHELL181, SOLID185, SOLID186, SOLID187, SOLSH190, SOLID225, SOLID226, SOLID227, and SHELL281).

ERPL

Equivalent radiated power level on the selected structural surface (valid only for SHELL181, SOLID185, SOLID186, SOLID187, SOLSH190, SOLID225, SOLID226, SOLID227, and SHELL281).

BSPL

Frequency-band sound pressure level on selected nodes.

BSPA

A-weighted frequency-band sound pressure level on selected nodes.

MENE

Acoustic potential energy on the selected elements.

KENE

Acoustic kinetic energy on the selected elements.

TENE

Acoustic total energy on the selected elements.

PL2V

Average square of the L2 norm of pressure on the selected elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LWIN

Input sound power level on defined port.

LWOUT

Output sound power level on defined driven port.

RL

Return loss on defined port.

ALPHA

Absorption coefficient on defined port.

TL

Transmission loss on defined ports.

DFSTL

Transmission loss of random acoustic analysis.

DFSPW

Radiated power in random acoustic analysis.

LDSTEP

Specified load step. Defaults to the load step number specified on the **SET (p. 1724)** command, or defaults to 1 if **SET (p. 1724)** has not been issued. This default applies to all *Lab* values except DFSTL and DFSPW.

n

Load step number.

ALL

All load steps.

AVG or 0

Average result of multiple samplings in a random acoustic analysis (see the **MSOLVE (p. 1193)** command). This option is used only for *Lab* = DFSTL and DFSPW, and it is the default for these labels.

SUBSTEP

Specified substep. Defaults to the substep number specified on the **SET (p. 1724)** command, or defaults to ALL (all substeps at the specified load step) if **SET (p. 1724)** has not been issued. For *Lab* = BSPL or BSPA, ALL is the only valid value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

n

Substep number.

ALL

All substeps.

FREQB

Frequency value representing one of the following:

- Beginning frequency of the frequency range (*FREQB* to *FREQE*) for the defined load step(s) and substeps (*SUBSTEP* = ALL). If a *SUBSTEP* value is specified, *FREQB* is invalid.
- Central frequency of octave bands, used when *LogOpt* = OB1, OB2, OB3, OB6, OB12, or OB24 and *FREQE* is blank.

FREQE

Ending frequency of the frequency range (*FREQB* to *FREQE*) for the defined load step(s) and substeps (*SUBSTEP* = ALL). If blank, *FREQE* is set to *FREQB*. If a *SUBSTEP* value is specified, *FREQE* is invalid.

LogOpt

Octave bands:

OB0

Narrow bands (default).

OB1

Octave bands.

OB2

1/2 octave bands.

OB3

1/3 octave bands.

OB6

1/6 octave bands.

OB12

1/12 octave bands.

OB24

1/24 octave bands.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PlotType

Type of plot:

LINE

Line plot (default).

BAR

Bar pattern plot, used only for *Lab* = BSPL or BSPA.

CONT

Waterfall diagram, used only for *Lab* = ERP or ERPL.

VAL1

Input port number for *Lab* = LWIN, LWOUT, RL, ALPHA, or TL.

VAL2

Output port number for *Lab* = TL.

VAL3

Reference power for *Lab* = LWIN, LWOUT, or EPRL (defaults to $1x10^{-12}$ W).

VAL4

Fluid mass density for *Lab* = ERP or ERPL (defaults to 1.2041 kg/m^3).

VAL5

Speed of sound in the fluid for *Lab* = ERP or ERPL (defaults to 343.25 m/s).

VAL6

Radiation efficiency for *Lab* = ERP or ERPL (defaults to 1).

Notes

The **PLAS (p. 1387)** command plots the specified acoustic quantity on the selected exterior surface, the energy on selected elements, or the sound pressure level over frequency bands. The calculation is based on the pressure and velocity solution or the frequency-band sound pressure level (SPL).

The total pressure and velocity are used if the selected surface is the excitation source surface. To calculate the incoming and outgoing acoustic power and other sound power parameters on the input and output surfaces, issue the **SF (p. 1733)**,,PORT command in the preprocessor to define port numbers.

The sound pressure level of the octave bands and general frequency band (defined via the **HARFRQ (p. 885)** command) is calculated at the selected nodes in the model.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

PLCAMP,*Option*,*SLOPE*,*UNIT*,*FREQB*,*Cname*,*STABVAL*,*KeyAllFreq*,*KeyNegFreq*

Plots Campbell diagram data for applications involving rotating structure dynamics.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Flag to activate or deactivate sorting of forward or backward whirl frequencies:

0 (OFF *or* NO)

No sorting.

1 (ON *or* YES)

Sort. This value is the default.

SLOPE

The slope of the line to be printed. This value must be positive.

SLOPE > 0

In the stationary reference frame (*RefFrame* = YES on the **CORIOLIS (p. 417)** command), the line represents the number of excitations per revolution of the rotor. For example, *SLOPE* = 1 represents one excitation per revolution, usually resulting from unbalance.

In the rotating reference frame (*RefFrame* = NO on the **CORIOLIS (p. 417)** command), the line represents the number of excitations per revolution of the rotor minus 1.

SLOPE = 0

The line represents the stability threshold for stability values or logarithmic decrements printout (*STABVAL* = 1, 2, or 3)

UNIT

Specifies the unit of measurement for rotational angular velocities:

RDS

Rotational angular velocities in radians per second (rad/s). This value is the default.

RPM

Rotational angular velocities in revolutions per minute (RPMs).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FREQB

The beginning, or lower end, of the frequency range of interest. The default is zero.

Cname

The rotating component name.

STABVAL

Flag to plot the stability values:

0 (OFF *or* NO)

Plot the frequencies (the imaginary parts of the eigenvalues in Hz). This value is the default.

1 (ON *or* YES)

Plot the stability values (the real parts of the eigenvalues in Hz).

2

Plot the inverse of the logarithmic decrements. A negative logarithmic decrement indicates stable motion.

3

Plot the logarithmic decrements. A positive logarithmic decrement indicates stable motion and is consistent with API (American Petroleum Institute) standards.

For more information about complex eigenmodes and corresponding logarithmic decrements, see Complex Eigensolutions in the *Mechanical APDL Theory Reference*.

KeyAllFreq

Key to specify if all frequencies above FREQB are plotted:

0 (OFF *or* NO)

A maximum of 10 frequencies are plotted. This value is the default.

1 (ON *or* YES)

All frequencies are plotted.

KeyNegFreq

Key to specify if the negative frequencies are plotted. It only applies to solutions obtained with the damped eigensolver (*Method* = DAMP on the **MODOPT (p. 1140)** command):

0 (OFF *or* NO)

Only positive frequencies are plotted. This value is the default.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1 (ON *or* YES)

Negative and positive frequencies are plotted.

Notes

The following items are required when generating a Campbell diagram:

- Activate the Coriolis effect (**CORIOLIS (p. 417)** command) in the solution phase (**/SOLU (p. 1821)**).
- Run a modal analysis using the QR damped (**MODOPT (p. 1140)**,QRDAMP) or damped (**MODOPT (p. 1140)**,DAMP) method. Complex eigenmodes are necessary (**MODOPT (p. 1140)**,QRDAMP,,,,*Cpxmod* = ON), and you must specify the number of modes to expand (**MXPAND (p. 1203)**).
- Define two or more load step results with an ascending order of rotational velocity (**OMEGA (p. 1324)** or **CMOMEGA (p. 368)**).

In some cases where modes are not in the same order from one load step to the other, sorting the frequencies (*Option* = 1) can help to obtain a correct plot. Sorting is based on the comparison between complex mode shapes calculated at two successive load steps.

At each load step, the application compares the mode shape to the loads at other load steps to determine whirl direction at the load step. If applicable, a label appears (in the plot legend) representing each whirl mode (BW for backward whirl and FW for forward whirl).

At each load step, the program checks for instability (based on the sign of the real part of the eigenvalue). The labels "stable" or "unstable" appear in the plot legend for each frequency curve.

The rotational velocities of a named component (*Cname*) are displayed on the X-axis.

For information on plotting a Campbell diagram for a prestressed structure, see Solving for a Subsequent Campbell Analysis of a Prestressed Structure Using the Linear Perturbation Procedure in the *Rotordynamic Analysis Guide*.

For a usage example of the **PLCAMP (p. 1392)** command, see Campbell Diagram in the *Rotordynamic Analysis Guide*.

Damped modal cyclic symmetry (**CYCLIC (p. 462)**) analyses do not support the **PLCAMP (p. 1392)** command.

Menu Paths

Main Menu>General Postproc>Rotor Dynamics>Plot Campbell

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PLCFREQ,*SPEC*,*SECTbeg*,*SECTend*

Plots the frequency response for the given CYCSPEC (p. 475) specification.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SPEC

CYCSPEC (p. 475) specification number (ordered 1 to N in the order input; use **CYCSPEC (p. 475)**,LIST to view the current list order). Defaults to 1.

SECTbeg

Beginning sector number to plot. Defaults to 1.

SECTend

Ending sector number to plot. Defaults to the total number of sectors expanded (**/CYCEXPAND (p. 454)**).

Notes

Following a cyclic mode-superposition harmonic analysis, this command plots the result item given by a **CYCSPEC (p. 475)** specification versus the harmonic frequency, one curve for each of the specified sectors. A **CYCCALC (p. 453)** command must have been issued prior to this command.

Menu Paths

This command cannot be accessed from a menu.

PLCHIST,*SPEC*,*FREQpt*

Plots a histogram of the frequency response of each sector for the given CYCSPEC (p. 475) specification.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SPEC

CYCSPEC (p. 475) specification number (ordered 1 to N in the order input; use **CYCSPEC (p. 475)**,LIST to view the current list order). Defaults to 1.

FREQpt

Harmonic frequency point to plot (the data set number NSET or CUMULATIVE on **SET (p. 1724)**,LIST). Defaults to the current **SET (p. 1724)** frequency.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Following a cyclic mode-superposition harmonic analysis, this command creates a histogram plot of the result item given by a **CYCSPEC (p. 475)** specification versus the sector number. A **CYCCALC (p. 453)** command must have been issued prior to this command.

Menu Paths

This command cannot be accessed from a menu.

PLCINT,*ACTION*,*ID*,*Node*,*Cont*,*Dtype*

Plots the fracture parameter (CINT (p. 334)) result data.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

PATH

Plots **CINT (p. 334)** quantities according to path number (default).

FRONT

Plots **CINT (p. 334)** quantities distribution along the crack front.

ID

Crack ID number.

Node

Crack tip node number (default = ALL).

Use only for *ACTION* = PATH. Plots **CINT (p. 334)** contour for an individual crack tip node.

Cont

Contour number (Default = ALL).

Use only for *ACTION* = FRONT. Plots **CINT (p. 334)** distribution along the crack for a given path.

Dtype

Data type to output:

JINT

J-integral (default)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IIN1

Interaction integral 1

IIN2

Interaction integral 2

IIN3

Interaction integral 3

K1

Mode 1 stress-intensity factor

K2

Mode 2 stress-intensity factor

K3

Mode 3 stress-intensity factor

G1

Mode 1 energy release rate

G2

Mode 2 energy release rate

G3

Mode 3 energy release rate

GT

Total energy release rate

MFTX

Total material force X

MFTY

Total material force Y

MFTZ

Total material force Z

TSTRESS

T-stress

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CEXT

Crack extension

CSTAR

C*-integral

DLTA

Incremental crack extension in a fatigue/static crack-growth analysis

DLTN

Number of incremental cycles in a fatigue crack-growth analysis

DLTK

Equivalent stress-intensity factor range in a fatigue crack-growth analysis

KEQV

Equivalent stress-intensity factor in a fatigue/static crack-growth analysis

KANG

Kink angle (degree) in a fatigue/static crack-growth analysis

R

Stress (load) ratio in a fatigue crack-growth analysis

UFAC

U-factor (crack closure) in a fatigue crack-growth analysis

Notes

The **PLCINT (p. 1396)** command is not available for XFEM-based crack-growth analyses results processing.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PLCKSURF, *MODELDISPLAY*

Plots the $\Phi = 0$ level set surface in an XFEM-based crack analysis

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MODELDISPLAY

Solid model display behavior:

0

No display of the solid model (default).

1

Solid model displayed with translucency and edges disabled.

Notes

The **PLCKSURF (p. 1399)** command is available only for XFEM-based crack analysis during results processing.

Menu Paths

This command cannot be accessed from a menu.

PLCPLX, *KEY*

Specifies the part of a complex variable to display.

POST26 (p. 58): Display (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Complex variable part:

0

Amplitude.

1

Phase angle.

2

Real part.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3

Imaginary part.

Notes

Used only with harmonic analyses (**ANTYPE (p. 162)**,HARMIC).

All results data are stored in the form of real and imaginary components and converted to amplitude and/or phase angle as specified via the **PLCPLX (p. 1399)** command. The conversion is not valid for derived results (such as principal stress/strain, equivalent stress/strain and USUM).

Menu Paths

Main Menu>TimeHist Postpro>Settings>Graph

PLDISP, *KUND*

Displays the displaced structure.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KUND

Undisplaced shape key:

0

Display only displaced structure.

1

Overlay displaced display with similar undisplaced display (appearance is system-dependent).

2

Same as 1 except overlay with undisplaced edge display (appearance is system-dependent).

Notes

Displays the displaced structure for the selected elements.

For information on true scale plots, refer to the description of the **/DSCALE (p. 575)** command (**/DSCALE (p. 575)**,,1.0).

Menu Paths

Main Menu>General Postproc>Plot Results>Deformed Shape

Utility Menu>Plot>Results>Deformed Shape

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Utility Menu>PlotCtrls>Animate>Deformed Shape

PLESOL, *Item*, *Comp*, *KUND*, *Fact*, *AVG*

Displays solution results as discontinuous element contours.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Label identifying the item. Valid item labels are shown in the table below. Some items also require a component label. For selected result output, specify SRES and see Table 213: PLESOL - Selected Result (SRES) Component Labels (p. 1411).

Comp

Component of the item (if required). Valid component labels are shown in the table below.

KUND

Undisplaced shape key:

0

Do not overlay undeformed structure display.

1

Overlay displaced contour plot with undeformed display (appearance is system-dependent).

2

Overlay displaced contour plot with undeformed edge display (appearance is system-dependent).

Fact

Scale factor for 2D display of contact items. Default = 1. To invert the display, specify a negative scaling factor.

AVG

Specifies whether results of reinforcing members within the same reinforcing element are smoothed:

0

Disable smoothing.

1

Enable smoothing (default), displaying constant results of reinforcing members if the base elements are low-order, and linear results when the base elements are high-order.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

PLESOL (p. 1401) displays the solution results as element contours discontinuous across element boundaries for the selected elements.

For example, **PLESOL (p. 1401)**,S,X displays the X component of stress S (that is, the SX stress component). Various element results depend on the calculation method and the selected results location (**AVPRIN (p. 210)**, **RSYS (p. 1639)**, and **ESEL (p. 661)**).

Contours are determined by linear interpolation within each element, unaffected by the surrounding elements; that is, no nodal averaging occurs. The discontinuity between contours of adjacent elements is an indication of the gradient across elements. Component results are displayed in the active results coordinate system (**RSYS (p. 1639)** [default is global Cartesian]).

To display items not available via **PLESOL (p. 1401)** (such as line element results), see **ETABLE (p. 687)** and **PLETAB (p. 1411)**.

For PowerGraphics displays (**/GRAPHICS (p. 866)**,POWER), results are plotted only for the model exterior surface. Items not supported by PowerGraphics are noted in Table 212: PLESOL - General Result Item and Component Labels (p. 1402).

The results displayed by **PLESOL (p. 1401)** are unaffected by any requested nodal-averaged results (**OUTRES (p. 1336)**,NAR). For more information, see Nodal-Averaged Results in the *Element Reference*.

For *Item* = SRES, selected result (**OSRESULT (p. 1327)**) values are output. See Table 213: PLESOL - Selected Result (SRES) Component Labels (p. 1411).

Table 212: PLESOL - General Result Item and Component Labels

General Item and Component Labels PLESOL (p. 1401), *Item, Comp*		
Item	**Comp**	**Description**
S	X, Y, Z, XY, YZ, XZ	Component stress.
	1, 2, 3	Principal stress.
	INT	Stress intensity.
	EQV	Equivalent stress.
EPEL	X, Y, Z, XY, YZ, XZ	Component elastic strain.
	1, 2, 3	Principal elastic strain.
	INT	Elastic strain intensity.
	EQV	Elastic equivalent strain.
EPDI	X, Y, Z, XY, YZ, XZ	Component diffusion strain.[a]
	1, 2, 3	Principal diffusion strain.
	EQV	Diffusion equivalent strain.
	INT	Diffusion strain intensity.
EPPL	X, Y, Z, XY, YZ, XZ	Component plastic strain.
	1, 2, 3	Principal plastic strain.
	INT	Plastic strain intensity.
	EQV	Plastic equivalent strain.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLESOL (p. 1401), *Item, Comp*		
Item	**Comp**	**Description**
EPCR	X, Y, Z, XY, YZ, XZ	Component creep strain.
	1, 2, 3	Principal creep strain.
	INT	Creep strain intensity.
	EQV	Creep equivalent strain.
EPTH	X, Y, Z, XY, YZ, XZ	Component thermal strain.
	1, 2, 3	Principal thermal strain.
	INT	Thermal strain intensity.
	EQV	Thermal equivalent strain.
EPSW		Swelling strain.
EPTO	X, Y, Z, XY, YZ, XZ	Component total mechanical strain (EPEL + EPPL + EPCR).
	1, 2, 3	Principal total mechanical strain.
	INT	Total mechanical strain intensity.
	EQV	Total mechanical equivalent strain.
EPTT	X, Y, Z, XY, YZ, XZ	Total mechanical, thermal, diffusion, and swelling strain (EPEL + EPPL + EPCR + EPTH + EPDI + EPSW).
	1, 2, 3	Principal total mechanical, thermal, diffusion, and swelling strain.
	INT	Total mechanical, thermal, diffusion, and swelling strain intensity.
	EQV	Total mechanical, thermal, diffusion, and swelling equivalent strain.
NL	SEPL	Equivalent stress (from stress-strain curve).
	SRAT	Stress state ratio.
	HPRES	Hydrostatic pressure.
	EPEQ	Accumulated equivalent plastic strain.
	CREQ	Accumulated equivalent creep strain.
	PSV	Plastic state variable.
	PLWK	Plastic work/volume.
SEND	ELASTIC[b]	Elastic strain energy density. (For viscoelastic and sintering materials, the stored energy.)
	PLASTIC	Plastic strain energy density.
	CREEP	Creep strain energy density.
	DAMAGE	Damage strain energy density.
	VDAM[b]	Viscoelastic dissipation energy density.
	VREG	Visco-regularization strain energy density.
	DISS	Structural-thermal dissipation.
	ENTO	Total strain energy density (sum of ELASTIC, PLASTIC, and CREEP strain energy densities).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLESOL (p. 1401), *Item, Comp*		
Item	**Comp**	**Description**
CDM	DMG	Damage variable.
	LM	Maximum previous strain energy for virgin material.
FAIL	MAX	Maximum of all active failure criteria defined at the current location.[a][c]
	EMAX	Maximum Strain Failure Criterion.[a][c]
	SMAX	Maximum Stress Failure Criterion.[a][c]
	TWSI	Tsai-Wu Strength Index Failure Criterion.[a][c]
	TWSR	Inverse of Tsai-Wu Strength Ratio Index Failure Criterion[a][c]
	HFIB	Hashin Fiber Failure Criterion.[a][c][d]
	HMAT	Hashin Matrix Failure Criterion.[a][c][d]
	PFIB	Puck Fiber Failure Criterion.[a][c][d]
	PMAT	Puck Matrix Failure Criterion.[a][c][d]
	L3FB	LaRc03 Fiber Failure Criterion.[a][c][d]
	L3MT	LaRc03 Matrix Failure Criterion.[c][d]
	L4FB	LaRc04 Fiber Failure Criterion.[a][c][d]
	L4MT	LaRc04 Matrix Failure Criterion.[a][c][d]
	USR1, USR2, ..., USR9	User-defined failure criteria.[a][c][d][e]
PFC	MAX[f]	Maximum of all failure criteria defined at current location.
	FT[f]	Fiber tensile failure criteria.
	FC[f]	Fiber compressive failure criteria.
	MT[f]	Matrix tensile failure criteria.
	MC[f]	Matrix compressive failure criteria.
PDMG	STAT	Damage status (0 = undamaged, 1 = damaged, 2 = completely damaged).
	FT	Fiber tensile damage variable.
	FC	Fiber compressive damage variable.
	MT	Matrix tensile damage variable.
	MC	Matrix compressive damage variable.
	S	Shear damage variable (S).
	SED	Energy dissipated per unit volume.
	SEDV	Energy per unit volume due to viscous damping.
FCMX	LAY	Layer number where the maximum of all active failure criteria over the entire element occurs.[a][c]
	FC	Number of the maximum-failure criterion over the entire element:[a][c] 1 = EMAX 2 = SMAX

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLESOL (p. 1401), *Item, Comp*		
Item	**Comp**	**Description**
		3 = TWSI 4 = TWSR 5 = PFIB 6 = PMAT 7 = HFIB 8 = HMAT 9 = L3FB 10 = L3MT 11 = L4FB 12 = L4MT 13~21 = USR1~USR9
	VAL	Value of the maximum failure criterion over the entire element:[a][c]
SVAR	1, 2, 3, ... N	State variable.[a]
GKS	X, XY, XZ	Gasket component stress.
GKD	X, XY, XZ	Gasket component total closure.
GKDI	X, XY, XZ	Gasket component total inelastic closure.
GKTH	X, XY, XZ	Gasket component thermal closure.
SS	X, XY, XZ	Interface traction (stress).
SD	X, XY, XZ	Interface separation.
CONT	STAT	Contact status:[g] 3 = closed and sticking 2 = closed and sliding 1 = open but near contact 0 = open and not near contact
	PENE	Contact penetration.
	PRES	Contact pressure.
	SFRIC	Contact friction stress.
	STOT	Contact total stress (pressure plus friction).
	SLIDE	Contact sliding distance.
	GAP	Contact gap distance.
	FLUX	Total heat flux at contact surface.
	CNOS	Total number of contact status changes during substep.
	FPRS	Fluid penetration pressure.
TG[h]	X, Y, Z, SUM	Component thermal gradient or vector sum.
TF[h]	X, Y, Z, SUM	Component thermal flux or vector sum.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLESOL (p. 1401), *Item, Comp*		
Item	**Comp**	**Description**
PG	X, Y, Z, SUM	Component or vector sum of velocity or energy density flux (room acoustics).
EF	X, Y, Z, SUM	Component electric field or vector sum.
D	X, Y, Z, SUM	Component electric flux density or vector sum.
H	X, Y, Z, SUM	Component magnetic field intensity or vector sum.
B	X, Y, Z, SUM	Component magnetic flux density or vector sum.
CG	X, Y, Z, SUM	Component concentration gradient or vector sum.[a]
DF	X, Y, Z, SUM	Component diffusion flux density or vector sum.[a]
FMAG	X, Y, Z, SUM	Component electromagnetic force or vector sum.[a]
P	X, Y, Z, SUM	Poynting vector component or sum.[a]
SERR[i]		Structural error energy.[a]
SDSG[i]		Absolute value of the maximum variation of any nodal stress component.[a]
TERR[i]		Thermal error energy.[a]
TDSG[i]		Absolute value of the maximum variation of any nodal thermal gradient component.[a]
F	X, Y, Z	X, Y, or Z structural force.[a][j]
M	X, Y, Z	X, Y, or Z structural moment.[a]
HEAT		Heat flow.[a]
FLOW		Fluid flow.[a]
AMPS		Current flow.[a] Use **FORCE (p. 772)** for type.
CHRG		Charge.[a] Use **FORCE (p. 772)** for type.
FLUX		Magnetic flux.[a]
CSG	X, Y, Z	X, Y, or Z magnetic current segment component.[a]
RATE		Diffusion flow rate.
SENE		"Stiffness" energy or thermal heat dissipation.[a] Same as TENE.
STEN		Elemental energy dissipation due to stabilization.[a]
TENE		Thermal heat dissipation or "stiffness" energy.[a] Same as SENE.
KENE		Kinetic energy.[a]
ASENE		Amplitude "stiffness" energy.[a]
PSENE		Peak "stiffness" energy.[a]
AKENE		Amplitude kinetic energy.[a]
PKENE		Peak kinetic energy.[a]
DENE		Damping energy.[a]
WEXT[k]		Work due to external load.[a]

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLESOL (p. 1401), *Item, Comp*		
Item	**Comp**	**Description**
AENE		Artificial energy due to hourglass control/drill stiffness or due to contact stabilization.[a]
JHEAT		Element Joule heat generation.[a]
JS	X, Y, Z, SUM	Source current density for low-frequency magnetic analyses. Total current density (sum of conduction and displacement current densities) in low frequency electric analyses. Components (X, Y, Z) and vector sum (SUM).[a]
JT	X, Y, Z, SUM	Total measureable current density in low-frequency electromagnetic analyses. (Conduction current density in a low-frequency electric analysis.) Components (X, Y, Z) and vector sum (SUM).[a]
JC	X, Y, Z, SUM	Conduction current density for elements that support conduction current calculation. Components (X, Y, Z) and vector sum (SUM).[a]
MRE		Magnetic Reynolds number.[a]
VOLU		Volume of volume element.[a]
CENT	X, Y, Z	Centroid X, Y, or Z location (based on shape function) in the active coordinate system.[a]
BFE	TEMP[l]	Body temperatures (calculated from applied temperatures) as used in solution (area and volume elements only).[m]
SMISC	*snum*	Element summable miscellaneous data value at sequence number *snum* (shown in the Output Data section of each element description.
NMISC	*snum*	Element non-summable miscellaneous data value at sequence number *snum* (shown in the Output Data section of each element description.
CAP	C0,X0,K0,ZONE, DPLS,VPLS	Material cap plasticity model only: Cohesion; hydrostatic compaction yielding stress; I1 at the transition point at which the shear and compaction envelopes intersect; zone = 0: elastic state, zone = 1: compaction zone, zone = 2: shear zone, zone = 3: expansion zone; effective deviatoric plastic strain; volume plastic strain.
EDPC	CSIG,CSTR	Material EDP creep model only (not including the cap model): Equivalent creep stress; equivalent creep strain.
FICT	TEMP	Fictive temperature.
ESIG	X,Y,Z,XY,YZ,ZX	Components of Biot's effective stress.
	1, 2, 3	Principal stresses of Biot's effective stress.
	INT	Stress intensity of Biot's effective stress.
	EQV	Equivalent stress of Biot's effective stress.
DPAR	TPOR	Total porosity (Gurson material model).
	GPOR	Porosity due to void growth.
	NPOR	Porosity due to void nucleation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLESOL (p. 1401), *Item, Comp*		
Item	**Comp**	**Description**
FFLX	X,Y,Z	Fluid flow flux in poromechanics.
FGRA	X,Y,Z	Fluid pore-pressure gradient in poromechanics.
MENE		Acoustic potential energy.[a]
PMSV	VRAT, PPRE, DSAT, RPER	Void volume ratio, pore pressure, degree of saturation, and relative permeability for coupled pore-pressure-thermal elements.
YSIDX	TENS,SHEA	Yield surface activity status for Mohr-Coulomb, soil, concrete, and joint rock material models: 1 = yielded, 0 = not yielded.
FPIDX	TF01,SF01, TF02,SF02, TF03,SF03, TF04,SF04	Failure plane surface activity status for concrete and joint rock material models: 1 = yielded, 0 = not yielded. Tension and shear failure status are available for all four sets of failure planes.
NS	X, Y, Z, XY, YZ, XZ	Nominal strain for hyperelastic material, reported in the current configuration (unaffected by **RSYS (p. 1639)**).
MPLA	DMAC, DMAX	Microplane damage, macroscopic and maximum values.
MPDP	TOTA, TENS, COMP, RW	Microplane homogenized total, tension, and compression damages (TOTA, TENS, COMP), and split weight factor (RW).
DAMAGE	1,2,3,MAX	Damage in directions 1, 2, 3 (1, 2, 3) and the maximum damage (MAX).
GDMG		Damage
IDIS		Structural-thermal dissipation rate
BKS	X, Y, Z, XY, YZ, XZ	Total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements.
BKS1, . . . ,BKS5	X, Y, Z, XY, YZ, XZ	Superimposed components of the total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements when more than one superimposed back-stress component is defined.
EPFR		Free strain in porous media
SNDI	X, Y, Z, SUM	Component sound intensity or vector sum.[a]
FC1S	1,2,3,4,5,6	First set of six components of FCC crystal slip. Available for 3D elements only.
FC2S	1,2,3,4,5,6	Second set of six components of FCC crystal slip. Available for 3D elements only.
HC1S	1,2,3,4,5,6	Six components of HCP crystal slip on basal and prismatic systems. Available for 3D elements only.
HC2S	1,2,3,4,5,6	Six components of HCP crystal slip on pyramidal system. Available for 3D elements only.
HC3S	1,2,3,4,5,6	First set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLESOL (p. 1401), *Item, Comp*		
Item	**Comp**	**Description**
HC4S	1,2,3,4,5,6	Second set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC5S	1,2,3,4,5,6	Six components of HCP crystal slip on the second-order pyramidal system. Available for 3D elements only.
BC1S	1,2,3,4,5,6	First set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC2S	1,2,3,4,5,6	Second set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC3S	1,2,3,4,5,6	First set of six components of BCC slip on 112 plane. Available for 3D elements only.
BC4S	1,2,3,4,5,6	Second set of six components of BCC slip on 112 plane. Available for 3D elements only.
BC5S	1,2,3,4,5,6	First set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC6S	1,2,3,4,5,6	Second set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC7S	1,2,3,4,5,6	Third set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC8S	1,2,3,4,5,6	Fourth set of six components of BCC slip on 123 plane. Available for 3D elements only.
FC1H	1,2,3,4,5,6	First set of six components of FCC crystal hardness. Available for 3D elements only.
FC2H	1,2,3,4,5,6	Second set of six components of FCC crystal hardness. Available for 3D elements only.
HC1H	1,2,3,4,5,6	Sixcomponents of HCP crystal hardness on basal and prismatic systems. Available for 3D elements.
HC2H	1,2,3,4,5,6	Six components of HCP crystal hardness on pyramidal system. Available for 3D elements only.
HC3H	1,2,3,4,5,6	First set of six components of HCP crystal hardness on the first-order pyramidal system. Available for 3D elements only.
HC4H	1,2,3,4,5,6	Second set of six components of HCP crystal hardness on the first-order pyramidal system. Available for 3D elements only.
HC5H	1,2,3,4,5,6	Six components of HCP crystal hardness on the second-order pyramidal system. Available for 3D elements only.
BC1H	1,2,3,4,5,6	First set of six components of BCC hardness on 111 plane. Available for 3D elements only.
BC2H	1,2,3,4,5,6	Second set of six components of BCC hardness on 111 plane. Available for 3D elements only.
BC3H	1,2,3,4,5,6	First set of six components of BCC hardness on 112 plane. Available for 3D elements only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLESOL (p. 1401), *Item, Comp*		
Item	**Comp**	**Description**
BC4H	1,2,3,4,5,6	Second set of six components of BCC hardness on 112 plane. Available for 3D elements only.
BC5H	1,2,3,4,5,6	First set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC6H	1,2,3,4,5,6	Second set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC7H	1,2,3,4,5,6	Third set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC8H	1,2,3,4,5,6	Fourth set of six components of BCC hardness on 123 plane. Available for 3D elements only.
XELG	1,2,3,45,6,EQV	Crystal Lagrangian strain in 11, 22, 33, 12, 23,13 directions and its equivalent. Available for 3D elements only.
SINT	RHO, ETA, SSTR, GRAIN	Sintering relative density, viscosity, sintering stress, and average grain size values.

[a] Not supported by PowerGraphics.

[b] The results for this postprocessing SEND component are invalid for ELBOW290 if that element is used with viscoelastic or viscohyperelastic materials.

[c] Works only if failure criteria are provided (**FC (p. 732)** and **TB (p. 1899)**).

[d] Must first be added (**FCTYP (p. 740)**.

[e] USR1 through USR9 require a failure-criteria routine.

[f] Failure criteria are based on the effective stresses in the damaged material.

[g] For MPC-based contact definitions, the value of STAT can be negative, indicating that one or more contact constraints were intentionally removed to prevent overconstraint. STAT = -3 is used for MPC bonded contact; STAT = -2 is used for MPC no-separation contact.

[h] *Comp* = SUM is not supported for coupled pore-pressure-thermal (CPT*nnn*) elements.

[i] Some element- and material-type limitations apply. (See **PRERR (p. 1480)**.)

[j] Do not use **PLESOL (p. 1401)** to obtain contact force values for contact elements. (The force values reported may not be accurate for these elements.) Use **ETABLE (p. 687)** instead.

[k] WEXT is calculated for element-based loading only (and not for nodal-force loading). WEXT is stored on elements to which loading has been applied; if surface elements are added on top of other elements, for example, and pressure loading is applied to the surface elements, WEXT is available for the surface elements only.

[l] For reinforcing elements REINF264 and REINF265, issue **PLESOL (p. 1401)**,BFE,TEMP to plot the corner-point temperature of each member. You can also plot intersection-point temperature gradients (**PLESOL (p. 1401)**,TG) and intersection-point heat flux (**PLESOL (p. 1401)**,TF). For higher-order reinforcing members (generated when using higher-order base elements), the midpoint values are not available for the reinforcing members.

[m] For SOLID278 and SOLID279 with KEYOPT(3) = 2, use **PLESOL (p. 1401)**,BFE,TEMP to plot the temperature distribution through the thickness of the element. When other thermal elements

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

are included in the model, they should be unselected to avoid plotting undefined information.

Table 213: PLESOL - Selected Result (SRES) Component Labels

PLESOL (p. 1401),SRES,*Comp*	
Comp	**Description**
SVAR*n*	The *n*th state variable.
FLDUF0*n*	The *n*th user-defined field variable.
ItemComp (concatenated *Item* + *Comp* label) from Table 208: OSRESULT - Item and Component Labels (p. 1328)[a]	See the table (p. 1328) for the combined item and component description.

[a] See Example 10: Specifying and Retrieving Selected Result Output (p. 1329).

Menu Paths

Main Menu>General Postproc>Plot Results>Contour Plot>Element Solu

Utility Menu>Plot>Results>Contour Plot>Elem Solution

PLETAB,*Itlab*,*Avglab*

Displays element table items.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Itlab

User-defined label, as specified with the **ETABLE (p. 687)** command, of item to be displayed.

Avglab

Averaging operation:

NOAV

Do not average element items at common nodes (default).

AVG

Average the element items at common nodes.

Notes

Displays items stored in the table defined with the **ETABLE (p. 687)** command for the selected elements. For display purposes, items are assumed to be constant over the element and assigned to each of its nodes. Contour display lines (lines of constant value) are determined by linear interpolation within each element from the nodal values. These nodal values have the option of being averaged (values are averaged at a node whenever two or more elements connect to the same node) or not averaged (discon-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

tinuous). The discontinuity between contour lines of adjacent elements is an indication of the gradient across elements.

For reinforcing elements, this command displays the results of reinforcing member (individual reinforcing) selected via the **LAYER (p. 1015)**,*N* command (where *N* is a given reinforcing member). **LAYER (p. 1015)**,0 (default) or **LAYER (p. 1015)**,1 selects the first reinforcing member.

Portions of this command are not supported by PowerGraphics (**/GRAPHICS (p. 866)**,POWER).

PLFAR, *Lab*, *Option*, *VAR1B*, *VAR1E*, *NVAR1*, *VAR2B*, *VAR2E*, *NVAR2*, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *LDSTEP*, *SUBSTEP*, *FREQB*, *FREQE*, *PlotType*, *LogOpt*

Plots pressure far fields and far-field parameters.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Parameters to plot :

PRES

Acoustic parameters

PROT

Acoustic parameters with the y-axis rotated extrusion (not valid for 2D elements)

PLAT

Acoustic parameters radiated by a vibrating structural panel (not valid for 2D elements)

Option

Plot option, based on the specified plot parameter type:

Lab	*Option*
PRES, PROT, *or* PLAT	SUMC -- Maximum pressure in Cartesian coordinate system plot (default) SUMP -- Maximum pressure in polar coordinate system plot

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Lab	Option
	PHSC -- Pressure phase angle in Cartesian coordinate system plot PHSP -- Pressure phase angle in polar coordinate system plot SPLC -- Sound pressure level in Cartesian coordinate system plot SPLP -- Sound pressure level in polar coordinate system plot SPAC – A-weighted sound pressure level in Cartesian coordinate system plot (dBA) SPAP – A-weighted sound pressure level in polar coordinate system plot (dBA) DGCT -- Acoustic directivity in Cartesian coordinate system plot DGPL -- Acoustic directivity in polar coordinate system plot PSCT -- Maximum scattered pressure in Cartesian coordinate system plot PSPL -- Maximum scattered pressure in polar coordinate system plot TSCT -- Target strength in Cartesian coordinate system plot TSPL -- Target strength in polar coordinate system plot PWL -- Sound power level

The arguments *VAR1B*, *VAR1E*, *NVAR1*, *VAR2B*, *VAR2E*, *NVAR2*, and *VAL1* are used when *Option* = SUMC, SUMP, PHSC, PHSP, SPLC, SPLP, SPAC, SPAP, DGCT, DGPL, PSCT, PSPL, TSCT, or TSPL:

VAR1B, VAR1E

Starting and ending values for the first variable associated with *PlotType* as described below.

When *PlotType* = blank (default) or SPHR: Starting and ending phi (ϕ) angles (in degrees) in the spherical coordinate system. Defaults to 0.

When *PlotType* = PLXY: Starting and ending x value in the Cartesian coordinate system. Defaults to 0.

When *PlotType* = PLYZ: Starting and ending y value in the Cartesian coordinate system. Defaults to 0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When *PlotType* = PLXZ: Starting and ending x value in the Cartesian coordinate system. Defaults to 0.

NVAR1

Number of divisions between the starting and ending *VAR1* values for data computations. Defaults to 0.

VAR2B, VAR2E

Starting and ending values for the second variable associated with *PlotType* as described below.

When *PlotType* = blank (default) or SPHR: Starting and ending theta (θ) angles (in degrees) in the spherical coordinate system. Defaults to 0 for a 3D model and 90 for a 2D extrusion model.

When *PlotType* = PLXY: Starting and ending y value in the Cartesian coordinate system. Defaults to 0.

When *PlotType* = PLYZ: Starting and ending z value in the Cartesian coordinate system. Defaults to 0.

When *PlotType* = PLXZ: Starting and ending z value in the Cartesian coordinate system. Defaults to 0.

NVAR2

Number of divisions between the starting and ending *VAR2* values for data computations. Defaults to 0.

VAL1

VAL1 is additional input. Its meaning depends on the *PlotType* argument as described below.

When *PlotType* = blank (default) or SPHR: Radius of the sphere surface.

When *PlotType* = PLXY: Fixed z value for an X-Y plane in the Cartesian coordinate system. Defaults to 0.

When *PlotType* = PLYZ: Fixed x value for a Y-Z plane in the Cartesian coordinate system. Defaults to 0.

When *PlotType* = PLXZ: Fixed y value for an X-Z plane in the Cartesian coordinate system, Defaults to 0.

The arguments *VAL2* through *VAL5* are additional input used with certain *Lab* and *Option* settings as described below.

VAL2

When *Option* = SPLC, SPLP, SPAC, or SPAP: Reference rms sound pressure. Defaults to $2x10^{-5}$ Pa.

When *Option* = PWL: Reference sound power. Defaults to $1x10^{-12}$ watts.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL3

When *Lab* = PRES: Thickness of 2D model extrusion in the z direction (no default).

When *Lab* = PROT: Angle of the y-axis rotated extrusion model (no default).

VAL4

When *Lab* = PLAT: Mass density of acoustic fluid.

VAL5

When *Lab* = PLAT: Sound speed in acoustic fluid.

LDSTEP

Specified load step. Defaults to the load step number specified on the **SET (p. 1724)** command, or defaults to 1 if **SET (p. 1724)** has not been issued.

n

Load step number.

ALL

All load steps.

SUBSTEP

Specified substep. Defaults to the substep number specified on the **SET (p. 1724)** command, or defaults to ALL (all substeps at the specified load step) if **SET (p. 1724)** has not been issued.

n

Substep number.

ALL

All substeps.

FREQB

Frequency value representing one of the following:

- Beginning frequency of the frequency range (*FREQB* to *FREQE*) for the defined load step(s) and substeps (*SUBSTEP* = ALL). If a *SUBSTEP* value is specified, *FREQB* is invalid.
- Central frequency of octave bands, used when *LogOpt* = OB1, OB2, OB3, OB6, OB12, or OB24 and *FREQE* is blank.

FREQE

Ending frequency of the frequency range (*FREQB* to *FREQE*) for the defined load step(s) and substeps (*SUBSTEP* = ALL). If blank, *FREQE* is set to *FREQB*. If a *SUBSTEP* value is specified, *FREQE* is invalid.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PlotType

Type of plot:

ANGX

x-y chart with angle as the x-axis variable (default).

FRQX

x-y chart with frequency as the x-axis variable.

CONT

Waterfall diagram of a field parameter with variables (frequency, angle).

MRPM

Waterfall diagram of a field parameter with variables (frequency, RPM).

PLXY

Contour plot on an X-Y plane.

PLYZ

Contour plot on a Y-Z plane.

PLXZ

Contour plot on an X-Z plane.

SPHR

Contour plot on a sphere surface.

LogOpt

Octave bands (used only when Option = SPLC, SPLP, SPAC, SPAP, or PWL):

OB0

Narrow bands (default).

OB1

Octave bands.

OB2

1/2 octave bands.

OB3

1/3 octave bands.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OB6

1/6 octave bands.

OB12

1/12 octave bands.

OB24

1/24 octave bands.

Notes

The **PLFAR (p. 1412)** command plots pressure far fields and far-field parameters as determined by the equivalent source principle. Use this command to plot pressure and acoustic parameters. See the **HFSYM (p. 905)** command for the model symmetry and the **HFANG (p. 904)** command for spatial radiation angles.

Plotting acoustic parameters radiated by a vibrating structural panel (*Lab* = PLAT) is supported by elements SOLID185, SOLID186, SOLID187, SHELL181, SHELL281, and SOLSH190. The vibration surface of the panel must be flagged by the **SF (p. 1733)**,,MXWF command.

A maximum of ten curves can be plotted on a 2D chart.

The waterfall diagram is plotted only in Cartesian coordinates.

Menu Paths

This command cannot be accessed from a menu.

PLF2D,*NCONT*,*OLAY*,*ANUM*,*WIN*

Generates a contour line plot of equipotentials.

POST1 (p. 51): Magnetics Calculations (p. 55)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NCONT

Number of contour lines to display. Issue in multiples of 9 (that is, 9, 18, 27, etc.). Default is 27 contour lines.

OLAY

Overlay:

0

Overlay edge outlines by material number.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Overlay edge outlines by real constant number.

ANUM

Highest material or real constant attribute number. Command will cycle through *ANUM* element display overlays. Defaults to 10.

WIN

Window number to which command applies. Defaults to 1.

Notes

PLF2D (p. 1417) invokes a Mechanical APDL macro which plots equipotentials of the degree of freedom AZ. The equipotential lines are parallel to flux lines and thus give a good representation of flux patterns.

In the axisymmetric case, the display is actually r * AZ where r is the node radius.

The macro overlays (*OLAY*) edge outlines by material number or real constant number (*ANUM*) and enables you to control the number of contour lines to display (*NCONT*).

Menu Paths

Main Menu>General Postproc>Plot Results>Contour Plot>2D Flux Lines

Utility Menu>Plot>Results>Flux Lines

PLGEOM, *Item*, *NODEkey*

Plots target and source geometries.

/MAP (p. 63): Pressure Mapping (p. 63)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Items to plot:

BOTH

Plot both target and source geometries (default).

TARGET

Plot only the target geometry.

SOURCE

Plot only the source geometry.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NODEkey

If the source data contains faces (that is, surface elements were created upon the **READ (p. 1578)** command), set *NODEkey* = 1 to plot only the source nodes rather than both the nodes and the elements.

Notes

Target faces are displayed in gray and source points in yellow. If the source data contains faces (that is, surface elements were created upon the **READ (p. 1578)** command), the source faces are also displayed in blue (unless *NODEkey* = 1), and both surfaces are made translucent.

Menu Paths

This command cannot be accessed from a menu.

PLLS,*LabI*,*LabJ*,*Fact*,*KUND*,*ViewUP*

Displays element table items as contoured areas along elements.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabI

Label of element table item (**ETABLE (p. 687)**) for node I magnitude.

LabJ

Label of element table item for node J magnitude.

Fact

Scale factor for display (defaults to 1). A negative scaling factor may be used to invert the display.

KUND

Undisplaced shape key:

0

Display selected items on undeformed shape.

1

Display selected items on deformed shape.

ViewUP

View Up key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Ignore the view-up (**/VUP (p. 2173)**) vector when calculating trapezoid orientation (default).

1

Use the view-up (**/VUP (p. 2173)**) vector to calculate trapezoid orientation.

Notes

Displays selected items (such as shears and moments) as a contoured area (trapezoid) display along line elements and 2D axisymmetric shell elements (such as shear and moment diagrams). Three sides of the trapezoid are formed by the element (one side) and lines at nodes I and J of length proportional to the item magnitude and displayed normal to the element and the viewing direction (the two parallel sides).

When *ViewUP* = 1, the trapezoid is oriented within the plane created by the element and the global Cartesian coordinate system reference orientation (/VUP or view up) vector. In this case, the program does not perform the calculation involving the element and view direction.

Portions of this command are not supported by PowerGraphics (**/GRAPHICS (p. 866)**,POWER).

Menu Paths

Main Menu>General Postproc>Plot Results>Contour Plot>Line Elem Res

---

PLMAP,*Item*,--,*NODEkey*,*ImagKey*

Plots target and source pressures.

/MAP (p. 63): Pressure Mapping (p. 63)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Items to plot:

BOTH

Plot both target and source pressures (default).

TARGET

Plot only the target pressures.

SOURCE

Plot only the source pressures.

--

Unused field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NODEkey

If the source data contains faces (that is, surface elements were created upon the **READ (p. 1578)** command), set *NODEkey* = 1 to plot only the source nodes rather than both the nodes and the elements.

ImagKey

0

Plot the real pressures (default).

1

Plot the imaginary pressures.

Notes

Pressures on the target faces are displayed as a color contour plot using the command **/PSF (p. 1537)**,PRES,,3. If the source data contains faces (that is, surface elements were created upon the **READ (p. 1578)** command), the source faces are also displayed using a color contour plot by default. If *NODEkey* = 1 or no source faces are available, the source pressures are displayed as colored node symbols (**/PSYMB (p. 1552)**,DOT,1 command).

Menu Paths

This command cannot be accessed from a menu.

PLMC, *LSTEP*, *SBSTEP*, *TIMFRQ*, *KIMG*, *HIbeg*, *HIend*

Plots the modal coordinates from a mode-superposition solution.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LSTEP, SBSTEP

Plot the solution identified as load step *LSTEP* and substep *SBSTEP*

TIMFRQ

As an alternative to *LSTEP* and *SBSTEP*, plot the solution at the time value *TIMFRQ* (for **ANTYPE (p. 162)**,TRANS) or frequency value *TIMFRQ* (for **ANTYPE (p. 162)**,HARMIC). *LSTEP* and *SBSTEP* should be left blank.

KIMG

Key for plotting real or imaginary solution. Valid only for **ANTYPE (p. 162)**,HARMIC.

0 (or blank)

Plot the real solution (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Plot the imaginary solution.

2

Plot the amplitude.

HIbeg, HIend

For cyclic symmetry solutions, plot the solutions in the harmonic index solution range *HIbeg* to *HIend*. Defaults to all harmonic indices (all modes).

Notes

PLMC (p. 1421) plots a histogram of the modal coordinates (the factors which modes may be multiplied by to obtain their contribution to the response) at a certain time point (transient analyses) or frequency point (harmonic analyses). The absolute values of the modal coordinates are plotted. Use **/XRANGE (p. 2199)** to plot only modes in a certain range, if desired.

For transient analyses, a `.rdsp` file must be available. For harmonic analyses, a `.rfrq` file must be available. The content of these files depends on the **OUTRES (p. 1336)** command settings. Note that the default for mode-superposition transient analysis is to write the reduced displacement file every 4th substep. For more information, see Command Default (p. 1341) in the **OUTRES (p. 1336)** command description.

For a cyclic harmonic mode-superposition analysis, use the **CYCFILES (p. 457)** command to identify the `.rfrq` and modal `.rst` file. For other analyses, use the **FILE (p. 752)** command to specify the `.rdsp` or `.rfrq` file.

You may limit the plot to display only those modes in a certain harmonic index range. The modes having the same harmonic index are each plotted in a unique color. If there are less than 10 harmonic indices, they are identified in the graphics legend.

This is a graphical representation of the optional `Jobname.mcf` text file (see the **TRNOPT (p. 2017)** and **HROPT (p. 912)** commands). To print the modal coordinates, use the **PRMC (p. 1499)** command. For more information on modal coordinates, see Mode-Superposition Method in the *Mechanical APDL Theory Reference*.

Example Usage

Example Mode-Superposition Harmonic Cyclic Symmetry Analysis with Mistuning

Example: Forced Response with Mistuning and Aero Coupling

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PLNEAR, *Lab*, *Opt*, *KCN*, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*, *VAL7*, *VAL8*, *VAL9*

Plots the pressure in the near zone exterior to the equivalent source surface.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Plot the maximum pressure or sound pressure level:

SPHERE

on the spherical structure

PATH

along the path

Opt

PSUM

Maximum complex pressure for acoustics.

PHAS

Phase angle of complex pressure for acoustics.

SPL

Sound pressure level for acoustics.

SPLA

A-weighted sound pressure level for acoustics (dBA).

KCN

KCN is the coordinate system reference number. It may be 0 (Cartesian) or any previously defined local coordinate system number (>10). Defaults to 0.

VAL1, VAL2, VAL3, . . . , VAL9

For *LAB* = SPHERE:

VAL1

Radius of spherical surface in spherical coordinate system.

VAL2

Starting ϕ angle (degree) in the spherical coordinate system. Defaults to 0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL3

Ending ϕ angle (degree) in the spherical coordinate system. Defaults to 0.

VAL4

Number of divisions between the starting and ending ϕ angles for data computations. Defaults to 0.

VAL5

Starting θ angle (degrees) in the spherical coordinate system. Defaults to 0 in 3D and 90 in 2D extension.

VAL6

Ending θ angle (degrees) in the spherical coordinate system. Defaults to 0 in 3D and 90 in 2D extension.

VAL7

Number of divisions between the starting and ending θ angles for data computations. Defaults to 0.

VAL8

Reference rms sound pressure. Defaults to $2x10^{-5}$ Pa.

VAL9

Thickness of 2D model extension in z direction (defaults to 0).

For *Lab* = **PATH (p. 1354)**, **PLNEAR (p. 1423)** computes the electric field or pressure for the path data points for the path currently defined by the **PATH (p. 1354)** and **PPATH (p. 1463)** commands.

Notes

PLNEAR (p. 1423) uses the equivalent source principle to calculate the pressure in the near zone exterior to the equivalent source surface (flagged with the Maxwell surface flag in the preprocessor) for one of the following locations:

- A spherical surface in the KCN coordinate system
- A path defined by the **PATH (p. 1354)** and **PPATH (p. 1463)** commands

To plot the pressure results for a path, use the **PLPAGM (p. 1438)** or **PLPATH (p. 1439)** commands. See the **HFSYM (p. 905)** command for the model symmetry.

To retrieve saved equivalent source data, issue the **SET (p. 1724)**,*Lstep*,*Sbstep*,,REAL command.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PLNSOL, *Item*, *Comp*, *KUND*, *Fact*, *FileID*, *Avg*, *DataKey*

Displays solution results as continuous element contours.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Label identifying the item. Valid item labels are shown in the table below. Some items also require a component label. For selected result output, specify SRES and see Table 215: PLNSOL - Selected Result (SRES) Component Labels (p. 1434).

Comp

Component of the item (if required). Valid component labels are shown in the table below.

KUND

Undisplaced shape key:

0

Do not overlay undeformed structure display.

1

Overlay displaced contour plot with undeformed display (appearance is system-dependent).

2

Overlay displaced contour plot with undeformed edge display (appearance is system-dependent).

Fact

Scale factor for 2D display for contact items. Default value is 1. A negative scaling factor inverts the display.

FileID

The file index number (obtained via **NLDIAG (p. 1224)**,NRRE,ON). Valid only for *Item* = NRRE.

Avg

Specifies whether random acoustic results are averaged. Valid only for *Item* = U and PRES.

(blank)

No averaging (default).

AVG

Display averaged results for random acoustics.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DataKey

Key to specify which data is plotted:

AUTO

Nodal-averaged results are used, if available; otherwise, the element-based data is used, if available. (Default.)

ESOL

Only element-based results are used. If they are not available, the command is ignored.

NAR

Only nodal-averaged results are used. If they are not available, the command is ignored.

Notes

PLNSOL (p. 1425) displays the solution results as continuous contours across element boundaries for the selected nodes and elements.

For example, **PLNSOL (p. 1425)**,S,X displays the X component of stress S (that is, the SX stress component). Various element results depend upon the recalculation method and the selected results location (**AVPRIN (p. 210)**, **RSYS (p. 1639)**, **LAYER (p. 1015)**, **SHELL (p. 1784)**, and **NSEL (p. 1266)**).

Contours are determined by linear interpolation within each element from the nodal values, averaged at a node whenever two or more elements connect to the same node. (The exception is FMAG, which is summed at the node.)

For reinforcing elements (REINF*nnn*), contours are determined by interpolation within each reinforcing member of reinforcing elements from the results of the base elements. Element results of members within the same reinforcing element are smoothed based on the order of its base element. **PLNSOL (p. 1425)** displays constant results for a reinforcing element if the base elements are low-order, and linear results when the base elements are high-order.

For PowerGraphics displays (**/GRAPHICS (p. 866)**,POWER), results are plotted for the model exterior surface only. Items not supported by PowerGraphics are noted in Table 214: PLNSOL - Valid Item and Component Labels (p. 1427).

To plot midside nodes, first issue **/EFACET (p. 602)**,2.

If nodal-averaged results (**OUTRES (p. 1336)**,NAR or another nodal-averaged label) are in the database, then **PLNSOL (p. 1425)** uses the nodal-averaged data for the applicable items (S, EPEL, EPPL, EPCR, EPTH, EPSW) by default. You can change this behavior via the *DataKey* argument. Keep these points in mind when using nodal-averaged results:

- The **LAYER (p. 1015)** and **RSYS (p. 1639)**,SOLU commands are not valid with nodal-averaged results. If these commands are used, the element solution is plotted instead if applicable.
- Issuing **ESEL (p. 661)** before plotting nodal-averaged results has no effect on the output.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- PowerGraphics is supported. The output is equivalent to the full model graphics output, but only the appropriate surface nodes are plotted. See Postprocessing Nodal-Averaged Results in the *Element Reference*.)

For *Item* = SRES, selected result (**OSRESULT (p. 1327)**) values are output. See Table 215: PLNSOL - Selected Result (SRES) Component Labels (p. 1434).

Table 214: PLNSOL - Valid Item and Component Labels

General Item and Component Labels PLNSOL (p. 1425), *Item, Comp*		
Item	**Comp**	**Description**
Valid item and component labels for nodal degree of freedom results are:		
U	X, Y, Z, SUM	X, Y, or Z structural displacement or vector sum.
ROT	X, Y, Z, SUM	X, Y, or Z structural rotation or vector sum.
TEMP[a]		Temperature.
PRES		Pressure.
GFV1, GFV2, GFV3		Nonlocal field values 1, 2, and 3.
VOLT		Electric potential.
MAG		Magnetic scalar potential.
CONC		Concentration. [b]
V	X, Y, Z, SUM	X, Y, or Z fluid velocity or vector sum in a fluid analysis.
A	X, Y, Z, SUM	X, Y, or Z magnetic vector potential or vector sum in an electromagnetic analysis.
VEL	X, Y, Z, SUM	X, Y, or Z velocity or vector sum in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
ACC	X, Y, Z, SUM	X, Y, or Z acceleration or vector sum in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
OMG	X, Y, Z, SUM	X, Y, or Z rotational velocity or vector sum in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
DMG	X, Y, Z, SUM	X, Y, or Z rotational acceleration or vector sum in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
WARP		Warping.
NRRE	FX, FY, FZ, FNRM, MX, MY, MZ, MNRM	Plot the Newton-Raphson residuals from the file you obtained via the **NLDIAG (p. 1224)**,NRRE,ON command. The FNRM and MNRM labels are computed as the square root of the sum of the squares of the residual component forces or moments (FX,FY,FZ, MX, MY, MZ).[c]
		When KUND = 0, use the absolute value of the residual from the files (default).
SPL		Sound pressure level.
SPLA		A-weighted sound pressure level (dBA).
VNS		Normal velocity on the structural surface.[d]

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLNSOL (p. 1425), *Item, Comp*		
Item	**Comp**	**Description**
ENKE		Acoustic diffusion energy density
Valid item and component labels for element results are:		
S	X, Y, Z, XY, YZ, XZ	Component stress.[e]
	1, 2, 3	Principal stress.[e]
	INT	Stress intensity.[e]
	EQV	Equivalent stress.[e]
EPEL	X, Y, Z, XY, YZ, XZ	Component elastic strain.[e]
	1, 2, 3	Principal elastic strain.[e]
	INT	Elastic strain intensity.[e]
	EQV	Elastic equivalent strain.[e]
EPTH	X, Y, Z, XY, YZ, XZ	Component thermal strain.[e]
	1, 2, 3	Principal thermal strain.[e]
	INT	Thermal strain intensity.[e]
	EQV	Thermal equivalent strain.[e]
EPDI	X, Y, Z, XY, YZ, XZ	Component diffusion strain.[b]
	1, 2, 3	Principal diffusion strain.
	INT	Diffusion strain intensity.
	EQV	Diffusion equivalent strain.
EPPL	X, Y, Z, XY, YZ, XZ	Component plastic strain.[e]
	1, 2, 3	Principal plastic strain.[e]
	INT	Plastic strain intensity.[e]
	EQV	Plastic equivalent strain.[e]
EPCR	X, Y, Z, XY, YZ, XZ	Component creep strain.[e]
	1, 2, 3	Principal creep strain.[e]
	INT	Creep strain intensity.[e]
	EQV	Creep equivalent strain.[e]
EPSW		Swelling strain.[e]
EPTO	X, Y, Z, XY, YZ, XZ	Component total mechanical strain (EPEL + EPPL + EPCR).
	1, 2, 3	Principal total mechanical strain.
	INT	Total mechanical strain intensity.
	EQV	Total mechanical equivalent strain.
EPTT	X, Y, Z, XY, YZ, XZ	Component total mechanical, thermal, diffusion, and swelling strain (EPEL + EPPL + EPCR + EPTH + EPDI + EPSW).
	1, 2, 3	Principal total, mechanical, thermal, diffusion, and swelling strain.
	INT	Total mechanical, thermal, diffusion, and swelling strain intensity.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLNSOL (p. 1425), *Item, Comp*		
Item	**Comp**	**Description**
	EQV	Total mechanical, thermal, diffusion, and swelling equivalent strain.
ESIG	X,Y,Z,XY,YZ,ZX	Components of Biot's effective stress.
	1, 2, 3	Principal stresses of Biot's effective stress.
	INT	Stress intensity of Biot's effective stress.
	EQV	Equivalent stress of Biot's effective stress.
DPAR	TPOR	Total porosity (Gurson material model).
	GPOR	Porosity due to void growth.
	NPOR	Porosity due to void nucleation.
NL	SEPL	Equivalent stress (from stress-strain curve).
	SRAT	Stress state ratio.
	HPRES	Hydrostatic pressure.
	EPEQ	Accumulated equivalent plastic strain.
	CREQ	Accumulated equivalent creep strain.
	PSV	Plastic state variable.
	PLWK	Plastic work/volume.
SEND	ELASTIC[f]	Elastic strain energy density. (For viscoelastic and sintering materials, the stored energy.)
	PLASTIC	Plastic strain energy density.
	CREEP	Creep strain energy density.
	DAMAGE	Damage strain energy density.
	VDAM[f]	Viscoelastic dissipation energy density.
	VREG	Visco-regularization strain energy density.
	DISS	Structural-thermal dissipation.
	ENTO	Total strain energy density (sum of ELASTIC, PLASTIC, and CREEP strain energy densities).
CDM	DMG	Damage variable.
	LM	Maximum previous strain energy for virgin material.
FAIL	MAX	Maximum of all active failure criteria defined at the current location. (See **FCTYP (p. 740)**.)[b][g]
	EMAX	Maximum Strain Failure Criterion.[b][g]
	SMAX	Maximum Stress Failure Criterion.[b][g]
	TWSI	Tsai-Wu Strength Index Failure Criterion.[b][g]
	TWSR	Inverse of Tsai-Wu Strength Ratio Index Failure Criterion.[b][g]
	HFIB	Hashin Fiber Failure Criterion.[b][g][h]
	HMAT	Hashin Matrix Failure Criterion.[b][g][h]
	PFIB	Puck Fiber Failure Criterion.[b][g][h]
	PMAT	Puck Matrix Failure Criterion.[b][g][h]

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLNSOL (p. 1425), *Item, Comp*		
Item	**Comp**	**Description**
	L3FB	LaRc03 Fiber Failure Criterion.[b][g][h]
	L3MT	LaRc03 Matrix Failure Criterion.[b][g][h]
	L4FB	LaRc04 Fiber Failure Criterion.[b][g][h]
	L4MT	LaRc04 Matrix Failure Criterion.[b][g][h]
	USR1, USR2, ..., USR9	User-defined failure criteria.[b][g][h][i]
PFC	MAX[j]	Maximum of all failure criteria defined at current location.
	FT[j]	Fiber tensile failure criteria.
	FC[j]	Fiber compressive failure criteria.
	MT[j]	Matrix tensile failure criteria.
	MC[j]	Matrix compressive failure criteria.
PDMG	STAT	Damage status (0 = undamaged, 1 = damaged, 2 = completely damaged).
	FT	Fiber tensile damage variable.
	FC	Fiber compressive damage variable.
	MT	Matrix tensile damage variable.
	MC	Matrix compressive damage variable.
	S	Shear damage variable (S).
	SED	Energy dissipated per unit volume.
	SEDV	Energy per unit volume due to viscous damping.
SVAR	1, 2, 3, ... N	State variable.[b]
GKS	X, XY, XZ	Gasket component stress.
GKD	X, XY, XZ	Gasket component total closure.
GKDI	X, XY, XZ	Gasket component total inelastic closure.
GKTH	X, XY, XZ	Gasket component thermal closure.
SS	X, XY, XZ	Interface traction (stress).
SD	X, XY, XZ	Interface separation.
FICT	TEMP	Fictive temperature.
CONT[k][l]	STAT	Contact status[m]: 3 = closed and sticking 2 = closed and sliding 1 = open but near contact 0 = open and not near contact
	PENE	Contact penetration.
	PRES	Contact pressure.
	SFRIC	Contact friction stress.
	STOT	Contact total stress (pressure plus friction).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLNSOL (p. 1425), *Item, Comp*		
Item	**Comp**	**Description**
	SLIDE	Contact sliding distance.
	GAP	Contact gap distance.
	FLUX	Total heat flux at contact surface.
	CNOS	Total number of contact status changes during substep.
	FPRS	Fluid penetration pressure.
TG[n]	X, Y, Z, SUM	Component thermal gradient or vector sum.
TF[n]	X, Y, Z, SUM	Component thermal flux or vector sum.
PG	X, Y, Z, SUM	Component or vector sum of velocity or energy density flux (room acoustics).
EF	X, Y, Z, SUM	Component electric field or vector sum.
D	X, Y, Z, SUM	Component electric flux density or vector sum.
H	X, Y, Z, SUM	Component magnetic field intensity or vector sum.
B	X, Y, Z, SUM	Component magnetic flux density or vector sum.
CG	X, Y, Z, SUM	Component concentration gradient or vector sum.[b]
DF	X, Y, Z, SUM	Component diffusion flux density or vector sum.[b]
CAP	C0,X0,K0,ZONE, DPLS,VPLS	Material cap plasticity model only: Cohesion; hydrostatic compaction yielding stress; I1 at the transition point at which the shear and compaction envelopes intersect; zone = 0: elastic state, zone = 1: compaction zone, zone = 2: shear zone, zone = 3: expansion zone; effective deviatoric plastic strain; volume plastic strain.
EDPC	CSIG,CSTR	Material EDP creep model only (not including the cap model): Equivalent creep stress; equivalent creep strain.
FFLX	X,Y,Z	Fluid flow flux in poromechanics.
FGRA	X,Y,Z	Fluid pore-pressure gradient in poromechanics.
FMAG	X, Y, Z, SUM	Component electromagnetic force or vector sum.[b]
JC	X, Y, Z, SUM	Conduction current density for elements that support conduction current calculation. Components (X, Y, Z) and vector sum (SUM).[b]
BFE	TEMP	Body temperatures (calculated from applied temperatures) as used in solution (area and volume elements only).
PMSV	VRAT, PPRE, DSAT, RPER	Void volume ratio, pore pressure, degree of saturation, and relative permeability for coupled pore-pressure-thermal elements.
NS	X, Y, Z, XY, YZ, XZ	Nominal strain for hyperelastic material, reported in the current configuration (unaffected by **RSYS (p. 1639)**).
MPLA	DMAC, DMAX	Microplane damage, macroscopic and maximum values.
MPDP	TOTA, TENS, COMP, RW	Microplane homogenized total, tension, and compression damages (TOTA, TENS, COMP), and split weight factor (RW).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLNSOL (p. 1425), *Item, Comp*		
Item	**Comp**	**Description**
DAMAGE	1,2,3,MAX	Damage in directions 1, 2, 3 (1, 2, 3) and the maximum damage (MAX).
GDMG		Damage
IDIS		Structural-thermal dissipation rate
BKS	X, Y, Z, XY, YZ, XZ	Total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements.
BKS1, . . . ,BKS5	X, Y, Z, XY, YZ, XZ	Superimposed components of the total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements when more than one superimposed back-stress component is defined.
EPFR		Free strain in porous media
SNDI	X, Y, Z, SUM	Component sound intensity or vector sum.[b]
FC1S	1,2,3,4,5,6	First set of six components of FCC crystal slip. Available for 3D elements only.
FC2S	1,2,3,4,5,6	Second set of six components of FCC crystal slip. Available for 3D elements only.
HC1S	1,2,3,4,5,6	Six components of HCP crystal slip on basal and prismatic systems. Available for 3D elements only.
HC2S	1,2,3,4,5,6	Six components of HCP crystal slip on pyramidal system. Available for 3D elements only.
HC3S	1,2,3,4,5,6	First set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC4S	1,2,3,4,5,6	Second set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC5S	1,2,3,4,5,6	Six components of HCP crystal slip on the second-order pyramidal system. Available for 3D elements only.
BC1S	1,2,3,4,5,6	First set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC2S	1,2,3,4,5,6	Second set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC3S	1,2,3,4,5,6	First set of six components of BCC slip on 112 plane. Available for 3D elements only.
BC4S	1,2,3,4,5,6	Second set of six components of BCC slip on 112 plane. Available for 3D elements only.
BC5S	1,2,3,4,5,6	First set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC6S	1,2,3,4,5,6	Second set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC7S	1,2,3,4,5,6	Third set of six components of BCC slip on 123 plane. Available for 3D elements only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PLNSOL (p. 1425), *Item, Comp*		
Item	**Comp**	**Description**
BC8S	1,2,3,4,5,6	Fourth set of six components of BCC slip on 123 plane. Available for 3D elements only.
FC1H	1,2,3,4,5,6	First set of six components of FCC crystal hardness. Available for 3D elements only.
FC2H	1,2,3,4,5,6	Second set of six components of FCC crystal hardness. Available for 3D elements only.
HC1H	1,2,3,4,5,6	Sixcomponents of HCP crystal hardness on basal and prismatic systems. Available for 3D elements.
HC2H	1,2,3,4,5,6	Six components of HCP crystal hardness on pyramidal system. Available for 3D elements only.
HC3H	1,2,3,4,5,6	First set of six components of HCP crystal hardness on the first-order pyramidal system. Available for 3D elements only.
HC4H	1,2,3,4,5,6	Second set of six components of HCP crystal hardness on the first-order pyramidal system. Available for 3D elements only.
HC5H	1,2,3,4,5,6	Six components of HCP crystal hardness on the second-order pyramidal system. Available for 3D elements only.
BC1H	1,2,3,4,5,6	First set of six components of BCC hardness on 111 plane. Available for 3D elements only.
BC2H	1,2,3,4,5,6	Second set of six components of BCC hardness on 111 plane. Available for 3D elements only.
BC3H	1,2,3,4,5,6	First set of six components of BCC hardness on 112 plane. Available for 3D elements only.
BC4H	1,2,3,4,5,6	Second set of six components of BCC hardness on 112 plane. Available for 3D elements only.
BC5H	1,2,3,4,5,6	First set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC6H	1,2,3,4,5,6	Second set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC7H	1,2,3,4,5,6	Third set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC8H	1,2,3,4,5,6	Fourth set of six components of BCC hardness on 123 plane. Available for 3D elements only.
XELG	1,2,3,45,6,EQV	Crystal Lagrangian strain in 11, 22, 33, 12, 23,13 directions and its equivalent. Available for 3D elements only.
SINT	RHO, ETA, SSTR, GRAIN	Sintering relative density, viscosity, sintering stress, and average grain size values.

[a] For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use the labels TBOT, TE2, TE3, . . ., TTOP instead of TEMP to view the individual temperature degree of freedom. When other thermal elements are included in the model, deselect them to avoid plotting undefined information. To view all temperatures in the same plot, set **/ESHAPE (p. 665)**,1 and **/GRAPHICS (p. 866)**,POWER and issue **PLNSOL (p. 1425)**,TEMP.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

[b] Not supported by PowerGraphics.

[c] When plotting Newton-Raphson residual items (*Item* = NRRE) from a file on the deformed geometry, the displacements are based on the current set of results in the database. These displacements may not correspond to the loadstep and substep in the .nr*xxxxx* file. (For more information about .nr*xxxxx* files and nonlinear diagnostics postprocessing, see the description of the **NLDPOST (p. 1229)** command and Performing Nonlinear Diagnostics.)

[d] Valid only for SHELL181, SOLID185, SOLID186, SOLID187, SOLSH190, and SHELL281.

[e] This item plots the solution using nodal-averaged results if they are available on the results file.

[f] The results for this postprocessing SEND component are invalid for ELBOW290 if that element is used with viscoelastic or viscohyperelastic materials.

[g] Works only if failure criteria are provided (**FC (p. 732)** and **TB (p. 1899)**).

[h] Must first be added (**FCTYP (p. 740)**).

[i] USR1 through USR9 require a failure-criteria routine.

[j] Failure criteria are based on the effective stresses in the damaged material.

[k] For contact results, PowerGraphics is supported for 3D models only.

[l] For the CONT items for elements CONTA172, CONTA174, CONTA175, and CONTA177, the reported data is averaged across the element. To obtain a more meaningful STAT value, use **PLESOL (p. 1401)**.

[m] For MPC-based contact definitions, the value of STAT can be negative, indicating that one or more contact constraints were intentionally removed to prevent overconstraint. STAT = -3 is used for MPC bonded contact; STAT = -2 is used for MPC no-separation contact.

[n] *Comp* = SUM is not supported for coupled pore-pressure-thermal (CPT*nnn*) elements.

Table 215: PLNSOL - Selected Result (SRES) Component Labels

PLNSOL (p. 1425),SRES,*Comp*	
Comp	**Description**
SVAR*n*	The *n*th state variable.
FLDUF0*n*	The *n*th user-defined field variable.
ItemComp (concatenated *Item* + *Comp* label) from Table 208: OSRESULT - Item and Component Labels (p. 1328)[a]	See the table (p. 1328) for the combined item and component description.

[a] See Example 10: Specifying and Retrieving Selected Result Output (p. 1329).

/PLOPTS, *Label*, *KEY*

Controls graphics options on subsequent displays.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Apply display items as selected from the following labels:

INFO

Controls the display of the legend (ON or OFF) and allows the choice of preset or Multi-legend placement. Control is provided by the *KEY* values. (Defaults to *KEY*=3 when the GUI is on. Defaults to *KEY*= 2 otherwise.)

LEG1

Header portion of legend column (defaults to ON).

LEG2

View portion of legend column (defaults to ON (except off with contour displays)).

LEG3

View the contour section of the legend column (defaults to ON).

FRAME

Frame border lines around windows (defaults to ON).

TITLE

Title (bottom left text) (defaults to ON).

MINM

Min-Max symbols on contour displays (defaults to ON).

LOGO

Ansys logo (defaults to OFF (displayed as text at top of legend column)). If *KEY* = ON, the text is removed from legend column but the logo symbol is displayed in whichever active window is either in the uppermost right corner and on top, or if there is no window in that location, then in the window to the furthest right of the screen. Version information remains in the legend column.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

WINS

Controls whether graphics windows automatically stretch or shrink to adjust to screen size as the legend column is turned off or on (**/PLOPTS (p. 1435)**,INFO) (defaults to ON). If WINS is on and the legend column is changed from off to on, all windows are shrunk regardless of what their correct size is.

WP

Working plane (defaults to OFF). The working plane is drawn as part of the display (*not* just an overlaid image as in **WPSTYL (p. 2182)**). This option is best used in combination with a hidden-line technique (**/TYPE (p. 2034)**).

DATE

Controls the display of the date and time in your legend. Subsequent *KEY* values control the display as follows:

0 – No date or time displays are included in your legend.

1 – Only the date is shown.

2 – Both the date and time are shown (default).

FILE

Controls the display of the Mechanical APDL jobname in your legend. Subsequent *KEY* values control the display as follows:

0 – The Mechanical APDL jobname is *not* included in your legend (default).

1 – The Mechanical APDL jobname is included in your legend.

KEY

Switch:

OFF or 0

Do not apply this display item. For *Label* = DATE, no time or date are displayed.

ON or 1

Apply this display item. For *Label* = DATE, show only the date.

AUTO or 2

For *Label* = INFO, initiate Auto-legend mode. If the display has contours, the legend is ON; if the display has no contours, the legend is OFF. For *Label* = DATE, display both the date and time.

3

For *Label* = INFO , switch to Multi-legend mode. See the **/UDOC (p. 2038)** command for the available legend configurations.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

See individual label defaults.

The Multi-legend mode (**/PLOPTS (p. 1435)**,INFO,3) is the default for contour legend displays.

Notes

Use **/PLOPTS (p. 1435)**,STAT to display settings. Use **/PLOPTS (p. 1435)**,DEFA to reset all specifications back to their defaults.

When you perform multiple results displays, contours on the legend column may be truncated. To avoid this, specify **/PLOPTS (p. 1435)**,LEG1,0.

The Multi-legend mode provides a number of legend data item priority and placement options. These options are accessed via the GUI at **Utility Menu> PlotCtrls> Window Controls> Window Options**. The **/UDOC (p. 2038)** command provides command line options for this capability.

This command is valid in any processor.

This command is not available for Academic Research or Teaching level products

Menu Paths

Utility Menu>PlotCtrls>Window Controls>Reset Window Options

Utility Menu>PlotCtrls>Window Controls>Window Options

PLORB

Displays the orbital motion of a rotating structure

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

When a structure is rotating and the Coriolis or gyroscopic effect is taken into account (**CORIOLIS (p. 417)**), nodes lying on the rotation axis generally exhibit an elliptical orbital motion. The **PLORB (p. 1437)** command displays the orbit of each rotating node as well as the deformed shape at time $t = 0$ (the real part of the solution).

To *print* the characteristics of the orbital path traversed by each node, issue the **PRORB (p. 1515)** command.

The **PLORB (p. 1437)** command is valid for line elements (such as BEAM188, BEAM189, PIPE288, and PIPE289). **PLORB (p. 1437)** is not supported for beam elements with the warping degree of freedom activated.

Your model must also involve a rotational velocity (**OMEGA (p. 1324)** or **CMOMEGA (p. 368)**) with Coriolis enabled (**CORIOLIS (p. 417)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Because orbit data is written in the database, a **SET (p. 1724)** command must be issued after the **PLORB (p. 1437)** command to ensure proper output for subsequent postprocessing commands.

The coordinate system for displaying nodal results must be global Cartesian (**RSYS (p. 1639)**,*KCN* = 0). **PLORB (p. 1437)** is not supported if nodes are rotated in a cylindrical coordinate system.

Menu Paths

Main Menu>General Postproc>Rotor Dynamics>Plot orbit

PLOTTING

Specifies "Plotting settings" as the subsequent status topic.

POST26 (p. 58): Status (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>TimeHist Postproc>Plot

PLPAGM, *Item*, *Gscale*, *Nopt*

Displays path items along the path geometry.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

The path data item to be displayed on the currently active path (defined by the **PATH (p. 1354)** command). Valid path items are those defined with the **PDEF (p. 1372)** or **PLNEAR (p. 1423)** commands.

Gscale

Scale factor for the offset from the path for the path data item displays. Defaults to 1.0.

Nopt

Determines how data is displayed:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(blank)

Do not display nodes, and scale the display based on the currently selected node set (default).

NODE

Display path item data along with the currently selected set of nodes. The display geometry is scaled to the selected node set.

Notes

You can use the *Gscale* argument to scale the contour display offset from the path for clarity. You need to type all six characters to issue this command.

Fore more information, see Mapping Results onto a Path in the *Basic Analysis Guide*.

Main Menu>General Postproc>Path Operations>Plot Path Item>On Geometry

Main Menu>General Postproc>Plot Results>Plot Path Item>On Geometry

---

PLPATH, *Lab1*, *Lab2*, *Lab3*, *Lab4*, *Lab5*, *Lab6*

Displays path items on a graph.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab1*, *Lab2*, *Lab3*, . . . , *Lab6

Labels identifying the path items to be displayed. Up to six items may be drawn per frame. Predefined path geometry items XG, YG, ZG, and S (**PDEF (p. 1372)**) may also be displayed.

Notes

The path must have been defined by the **PATH (p. 1354)** and **PPATH (p. 1463)** commands. Path items and their labels must have been defined with the **PDEF (p. 1372)**, **PVECT (p. 1556)**, **PCALC (p. 1362)**, **PDOT (p. 1375)**, **PCROSS (p. 1371)**, or **PLNEAR (p. 1423)** commands. Path items may also be printed with the **PRPATH (p. 1517)** command. Graph scaling may be controlled with the **/XRANGE (p. 2199)**, **/YRANGE (p. 2201)**, and **PRANGE (p. 1464)** commands. You need to type all six characters to issue this command.

Fore more information, see Mapping Results onto a Path in the *Basic Analysis Guide*.

Utility Menu>Plot>Results>Path Plot

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PLSECT, *Item*, *Comp*, *RHO*, *KBR*, *KBR3D*

Displays membrane and membrane-plus-bending linearized stresses.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Label identifying the item to be processed. Valid item labels are shown in Table 216: PLSECT - Valid Item and Component Labels (p. 1441) below. Items also require a component label.

Comp

Component of the item. Valid component labels are shown in Table 216: PLSECT - Valid Item and Component Labels (p. 1441) below.

RHO

In-plane (X-Y) average radius of curvature of the inside and outside surfaces of an axisymmetric section. If zero (or blank), a plane or 3D structure is assumed. If nonzero, an axisymmetric structure is assumed. Use a very large number (or -1) for an axisymmetric straight section.

KBR

Through-thickness bending stresses key for an axisymmetric analysis (*RHO* $\neq$ 0):

0

Include the thickness-direction bending stresses.

1

Ignore the thickness-direction bending stresses.

2

Include the thickness-direction bending stress using the same formula as the Y (axial direction) bending stress. Also use the same formula for the shear stress.

KBR3D

Through-thickness bending stresses key for 3D geometry (*RHO* = 0):

0

Include the thickness-direction bending stresses.

1

Ignore the following thickness-direction bending stresses: SX, SXY, SXZ

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Calculates and displays the membrane and membrane-plus-bending linearized stresses (as described for the **PRSECT (p. 1520)** command) along a path section (**PATH (p. 1354)**) as a graph. The path section is defined by two points specified with the **PPATH (p. 1463)** command. For linearized stress calculations, the path must be defined with nodes. The path must be entirely within the selected elements (that is, there must not be any element gaps along the path). The total stress (equivalent to the **PLPATH (p. 1439)** display) is also displayed. This command always uses 48 divisions along the path, regardless of the number of divisions defined by **PATH (p. 1354)**.

In analyses of 3D models with *RH0* = 0, ignoring the calculated out-of-plane bending stresses is recommended in some scenarios when determining the linearized bending stresses. If *KBR3D* = 0, all calculated stresses are included in the linearized bending-stress calculations. If *KBR3D* = 1, these calculated out-of-plane bending stresses are ignored in the linearized bending-stress calculations: SX, SXY, SXZ. (The principal bending-stress calculation for S1, S2, S3, SINT, and SEQV is performed with these zeroed components.)

Portions of this command are not supported by PowerGraphics (**/GRAPHICS (p. 866)**,POWER).

Table 216: PLSECT - Valid Item and Component Labels

Item	Comp	Description
	Valid item and component labels for element results are:	
S	X, Y, Z, XY, YZ, XZ	Component stress.
"	1, 2, 3	Principal stress.
"	INT, EQV	Stress intensity or equivalent stress.

Menu Paths

Main Menu>General Postproc>Path Operations>Linearized Strs

Main Menu>General Postproc>Plot Results>Plot Path Item>Lineariz Strs

---

PLTIME, *TMIN*, *TMAX*

Defines the time range for which data are to be displayed.

POST26 (p. 58): Display (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TMIN

Minimum time (defaults to the first point stored).

TMAX

Maximum time (defaults to the last point stored).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Use the previously defined range (**TIMERANGE (p. 2001)**).

Notes

Defines the time (or frequency) range (within the range stored) for which data are to be displayed. Time is always displayed in the Z-axis direction for 3D graph displays. If XVAR = 1, time is also displayed in the X-axis direction and this control also sets the abscissa scale range.

Menu Paths

Main Menu>TimeHist Postpro>Settings>Graph

PLTRAC,*Analopt*,*Item*,*Comp*,*TRPNum*,*Name*,*MXLOOP*,*TOLER*,*--*,*ESCL*,*MSCL*

Displays a charged particle trace on an element display.

POST1 (p. 51): Trace Points (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Analopt

Analysis option

ELEC

Particle trace in electric field

MAGN

Particle trace in magnetic field

EMAG

Particle trace in presence of both electric and magnetic fields (default)

Item

Label identifying the item to be contoured. Valid item labels are shown in Table 217: PLTRAC - Valid Item and Component Labels (p. 1444) below. Some items also require a component label. If *Item* is blank, display only the path trajectory.

Comp

Component of the item (if required). Valid component labels are shown in Table 217: PLTRAC - Valid Item and Component Labels (p. 1444) below.

TRPNum

Trace point number for storing trajectory data for use with **PATH (p. 1354)** logic. Defaults to 0 (no trajectory path data is stored for further processing with **PATH (p. 1354)** logic).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name

Name of prefix of array variable. Defaults to TRAC. *Name*POIN stores trajectory path points for trace point number *TRPNum*. If *Analopt* = ELEC, MAGN, or EMAG, two additional array parameters, *Name*DATA and *Name*LABL, store trajectory path data and labels for the same *TRPNum*.

MXLOOP

Maximum number of loops traced by a particle. Defaults to 1000.

TOLER

Length tolerance used for particle trajectory geometry calculation. Valid for *Analopt* = ELEC, MAGN, or EMAG. If particle trace appears to terminate inside an element, adjusting the length tolerance may be necessary. Defaults to 1.0 x 10^{-8}.

--

Unused field.

ESCL

Electric field scale factor. Setting this scale factor affects only the tracing, not the field solution results. A negative factor corresponds to the opposite vector direction. Valid only for *Analopt* = ELEC or EMAG. Defaults to 1.

MSCL

Magnetic field scale factor. Setting this scale factor affects only the tracing, not the field solution results. A negative factor corresponds to the opposite vector direction. Valid only for *Analopt* = MAGN or EMAG. Defaults to 1.

Notes

For a specified item, the variation of the item is displayed along the particle trace as a color-contoured ribbon. The **TRPOIN (p. 2021)** command must be used to define a point on the trajectory path. Multiple traces may be displayed simultaneously by defining multiple trace points. Issue the **TRPLIS (p. 2020)** command to list the current tracing points. Issue the **TRPDEL (p. 2020)** command to delete tracing points defined earlier. Use the **PAPUT (p. 1350)** command with the POIN option to retrieve the particle trajectory points as path points.

The model must be 3D for the ELEC, MAGN, and EMAG analysis options.

Three array parameters are created at the time of the particle trace: TRACPOIN, TRACDATA and TRACLABL. These array parameters can be used to put the particle velocity and the elapsed time into path form. The procedure to put the arrays into a path named PATHNAME is as follows:

```
*get,npts,PARM,TRACPOIN,DIM,x
PATH,PATHNAME,npts,9,1
PAPUT,TRACPOIN,POINTS
PAPUT,TRACDATA,TABLES
PAPUT,TRACLABL,LABELS
PRPATH,S,T_TRACE,VX_TRACE,VY_TRACE,VZ_TRACE,VS_TRACE
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If working in the GUI, use the "All information" option to retrieve information from all three arrays at once.

Table 217: PLTRAC - Valid Item and Component Labels

Item	Comp	Description
Valid item labels for *Analopt* = ELEC nodal results are:		
VOLT		Electric potential.
Valid item labels for *Analopt* = MAGN or EMAG nodal results are:		
None		Color contour displayed.

See the *Basic Analysis Guide* for more information on charged particle traces. See Animation in the *Basic Analysis Guide* for information on particle trace animation.

Menu Paths

Main Menu>General Postproc>Plot Results>Particle Trace

Utility Menu>PlotCtrls>Animate>Particle Flow

PLVAR, *NVAR1*, *NVAR2*, *NVAR3*, *NVAR4*, *NVAR5*, *NVAR6*, *NVAR7*, *NVAR8*, *NVAR9*, *NVAR10*

Displays up to ten variables in the form of a graph.

POST26 (p. 58): Display (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR1, NVAR2, NVAR3, . . . , NVAR10

Variables to be displayed, defined either by the reference number or a unique thirty-two character name. If duplicate names are used the command will plot the data for the lowest-numbered variable with that name.

Notes

Variables are displayed vs. variable *N* on the **XVAR (p. 2199)** command. The string value will be a pre-defined, unique name. For complex variables, the amplitude is displayed by default (**PLCPLX (p. 1399)**). Each **PLVAR (p. 1444)** command produces a new frame. See the **/GRTYP (p. 874)** command for displaying multiple variables in a single frame with separate Y-axes.

Menu Paths

Main Menu>TimeHist Postpro>Graph Variables

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PLVECT, *Item*, *Lab2*, *Lab3*, *LabP*, *Mode*, *Loc*, *Edge*, *KUND*

Displays results as vectors.

POST1 (p. 51): Results (p. 51)
POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Predefined vector item (from Table 218: PLVECT - Valid Item Labels (p. 1447) below) or a label identifying the i-component of a user-defined vector.

Lab2

Label identifying the j-component of a user-defined vector. In most cases, this value must be blank if *Item* is selected from Table 218: PLVECT - Valid Item Labels (p. 1447). Individual principal stresses (*Item* = S) or principal strains (*Item* = EP*xx*) may be plotted by specifying the value as 1, 2, or 3.

Lab3

Label identifying the k-component of a user-defined vector. Must be blank if *Item* is selected from list below or for 2D user defined vector.

LabP

Label assigned to resultant vector for display labeling (defaults to *Item*).

Mode

Vector or raster mode override key:

(blank)

Use the setting of *KEY* on the **/DEVICE (p. 523)** command.

RAST

Use raster mode for **PLVECT (p. 1445)** displays.

VECT

Use vector mode for **PLVECT (p. 1445)** displays.

Loc

Vector location for display of field element results:

ELEM

Display at element centroid (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NODE

Display at element nodes.

Nodal results quantities will only be displayed at nodes, not at element centroids.

Edge

Edge display override key:

(blank)

Use the setting of Key on the **/EDGE (p. 594)** command.

OFF

Deactivate the edge display.

ON

Activate the edge display.

KUND

Undisplaced shape key:

0

Display vectors on undeformed mesh or geometry.

1

Display vectors on deformed mesh or geometry.

Notes

Displays various solution results as vectors (arrows) for the selected nodes and/or elements (elements must contain at least three nodes that are not colinear). For example, **PLVECT (p. 1445)**,U displays the displacement vector for all selected nodes. For section displays (**/TYPE (p. 2034)**), the vectors are shown only on the section face (that is, cutting plane). The **PLVECT (p. 1445)** display of principal strains and stresses (*Item* = S, EPTO, EPEL, EPPL, EPCR, or EPTH) on a "cut" of the model (**/TYPE (p. 2034)**,,1 ,5,7,8, or 9) is not supported. The resulting plot displays the vectors on *all* selected elements, not on just the sliced surface. See the **/VSCALE (p. 2160)** command to scale vector lengths. Vector magnitudes may be shown as a contour display with the **PLNSOL (p. 1425)** command. Various results also depend upon the recalculation method and the selected results location (**LAYER (p. 1015)**, **SHELL (p. 1784)**, and **NSEL (p. 1266)**).

Items may be selected from a set of recognized vector labels (*Item*) or a vector may be defined from up to three scalar labels (*Item*,*Lab2*,*Lab3*). Scalar labels may be user-defined with the **ETABLE (p. 687)** command. The vectors appear on an element display as arrows showing the relative magnitude of the vector and its direction. The predefined items will be shown either at the node or at the element centroid, depending on what item is being displayed and depending on the *Loc* setting. User defined **ETABLE (p. 687)** items will be shown at the element centroid, regardless of the *Loc* setting. Stress vectors appear as arrows at the element centroid, with the arrowheads pointing away from each other for tension and toward each other for compression.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For PowerGraphics, vector arrow displays are generated in Global Cartesian (**RSYS (p. 1639)** = 0). All subsequent displays will revert to your original coordinate system.

When vector mode is active (*Mode* = VECT), use the Z-buffered display type (**/TYPE (p. 2034)**,,6) to maximize speed of **PLVECT (p. 1445)** plots (other hidden display types may make plotting slow). For PowerGraphics (**/GRAPHICS (p. 866)**,POWER), the items marked with [1] are not supported by PowerGraphics.

It is possible to plot principal stresses (*Item* = S) or principal strains (*Item* = EP*xx*) individually. To do so, specify a *Lab2* value of 1, 2, or 3. For example, the following are valid commands:

PLVECT (p. 1445),S,1,,,VECT,ELEM,ON,0

PLVECT (p. 1445),EPEL,3,,,VECT,NODE,ON,0

Table 218: PLVECT - Valid Item Labels

Item	Description
Valid item labels for nodal degree of freedom vector results are:	
U	Structural displacement vector.
ROT	Structural rotation vector.
V	Velocity vector.
A	Magnetic vector potential vector.
FFLX	Fluid flux in poromechanics.
Valid item labels for structural element results are:	
S	Principal stresses [1].
EPTO	Principal total strain (EPEL + EPPL + EPCR) [1].
EPEL	Principal elastic strains [1].
EPPL	Principal plastic strains [1].
EPCR	Principal creep strains [1].
EPTH	Principal thermal strains [1].
EPDI	Principal diffusion strains [1].
Valid item labels for field element results are:	
TG	Thermal gradient vector.
TF	Thermal flux vector.
PG	Velocity vector or energy density flux vector (room acoustics).
EF	Electric field vector.
D	Electric flux density vector.
H	Magnetic field intensity vector. If Lab2 is blank, Item is interpreted as one of the predefined labels; otherwise, Item is interpreted as a user-defined **ET (p. 686)** label and the program requests a nonblank Lab2 / Lab3 according to the dimension of the problem.
B	Magnetic flux density vector.
CG	Concentration gradient vector.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item	Description
DF	Diffusion flux density vector.
FMAG	Electromagnetic force vector.
P	Poynting vector.
JS	Source current density vector for low-frequency magnetic analyses. Total current density vector (sum of conduction and displacement current densities) in low frequency electric analyses.
JT	Total measureable current density vector in low-frequency electromagnetic analyses. (Conduction current density vector in a low-frequency electric analysis.)
JC	Conduction current density vector for elements that support conduction current calculation.
SNDI	Sound intensity vector [1].

1. Not supported by PowerGraphics

Utility Menu>PlotCtrls>Animate>Q-Slice Vectors

PLZZ,*RotVel*,*DeltaRotVel*

Plots the interference diagram from a cyclic modal analysis.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RotVel

Rotational speed in revolutions per minute (RPM) used to define the speed line. If blank, use the rotational speed (from **OMEGA (p. 1324)**) specified in the prestressing step of the linear perturbation analysis. If explicitly input as 0, or if the linear perturbation was not used, no speed lines are plotted.

DeltaRotVel

Adds speed lines about the *RotVel* speed line corresponding to *RotVel* ± *DeltaRotVel*. Only plotted if *RotVel* is known.

Notes

PLZZ (p. 1448) plots the cyclic modal frequencies as points on a frequency vs. harmonic index (nodal diameter) graph. If rotational speed (*RotVel*) is provided, the speed line is also plotted, leading to the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

interference diagram (also known as the SAFE or ZZENF diagram). If *DeltaRotVel* is also provided, two additional speed lines are plotted, enveloping the safe speed line itself.

For more information, see Postprocessing a Modal Cyclic Symmetry Analysis in the *Cyclic Symmetry Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

/PMACRO

Specifies that macro contents be written to the session log file.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This command forces the contents of a macro or other input file to be written to `Jobname.log`. It is valid only within a macro or input file, and should be placed at the top of the file. **/PMACRO (p. 1449)** should be included in any macro or input file that calls GUI functions.

Menu Paths

This command cannot be accessed from a menu.

PMAP, *FORM*, *DISCON*

Creates mapping of the path geometry by defining path interpolation division points.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FORM

Defines the mapping method:

UNIFORM

Maps uniform divisions (specified on the *nDiv* argument of the **PATH (p. 1354)** command) between specified points. This is the default.

ACCURATE

Map geometry using a small division at the beginning and end of each segment. This gives you accurate derivatives, integrals, tangents, and normals for curves which do not have continuous slopes at the specified points. To create nonuniform divisions, the *nDiv* argument of the **PATH (p. 1354)** command must be greater than 2.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DISCON

Sets mapping for discontinuities in the field. The divisions are modified to put a point just before and just after the discontinuity. The valid label is MAT, for a material discontinuity. No discontinuity is the default. Discontinuity mapping involves the NOAV option on the **PDEF (p. 1372)** command.

Main Menu>Preprocessor>Path Operations>Define Path>Path Options

---

PMGTRAN, *Fname*, *FREQ*, *Fcnam1*, *Fcnam2*, *Pcnam1*, *Pcnam2*, *Ecnam1*, *Ccnam1*

Summarizes electromagnetic results from a transient analysis.

POST26 (p. 58): Special Purpose (p. 60)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name (8 characters maximum) to which tabular data and plot files will be written. Must be enclosed in single quotes when the command is manually typed in. Defaults to MG_TRNS. The data file extension is .OUT and the plot file extension is .PLT.

FREQ

Frequency of solution output. Defaults to 1. Every *FREQ*th solution on the results file is output.

Fcnam1, Fcnam2

Names of element components for force calculation. Must be enclosed in single quotes when the command is manually typed in.

Pcnam1, Pcnam2

Names of element components for power loss calculation. Must be enclosed in single quotes when the command is manually typed in.

Ecnam1, Ccnam1

Names of element components for energy and total current calculations, respectively. Must be enclosed in single quotes when the command is manually typed in.

Notes

PMGTRAN (p. 1450) invokes a Mechanical APDL macro which calculates and summarizes electromagnetic results from a transient analysis. The results are summarized by element components and listed on the screen as well as written to a file (*Fname*.OUT).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can select two components for the summary of electromagnetic forces, two for power loss, and one each for stored energy (see **SENERGY (p. 1714)**) and total current (see **CURR2D (p. 444)**). See the referenced commands for other restrictions.

PMGTRAN (p. 1450) is restricted to MKSA units.

Menu Paths

Main Menu>TimeHist Postpro>Elec&Mag>Magnetics

PMLOPT,*PSYS*,*Lab*,*Xminus*,*Xplus*,*Yminus*,*Yplus*,*Zminus*,*Zplus*,*WOptXm*,*WOptXp*,*WOptYm*,*WOptYp*,*WOptZm*,*WOptZp*

Defines perfectly matched layers (PMLs) or irregular perfectly matched layers (IPML).

PREP7 (p. 22): Artificially Matched Layers (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

PSYS

PML element coordinate system number. *PSYS* may be 0 (global Cartesian) or any previously defined local Cartesian coordinate system number (>10). Defaults to 0. (Not used for IPML.)

Lab

Label defining the number of dimensions (not used for IPML):

ONE

A one-dimensional PML region.

THREE

A three-dimensional PML region (default).

Xminus

For PML, normal reflection coefficient (harmonic analysis) or attenuation factor (static structural analysis) in negative X direction of *PSYS*. Defaults to 1.E−3 (equivalent to -60 dB) for *WOptXm* = PROP or HYBR, 30 for *WOptXm* = EVAN, and 40 for *WOptXm* = MAXP.

Xplus

Normal reflection coefficient (harmonic analysis) or attenuation factor (static structural analysis) in positive X direction of *PSYS*. Defaults to 1.E−3 (equivalent to -60 dB) for *WOptXp* = PROP or HYBR, 30 for *WOptXp* = EVAN, and 40 for *WOptXp* = MAXP. (Not used for IPML.)

Yminus

Normal reflection coefficient (harmonic analysis) or attenuation factor (static structural analysis) in negative Y direction of *PSYS*. Defaults to 1.E−3 (equivalent to -60 dB) for *WOptYm* = PROP or HYBR, 30 for *WOptYm* = EVAN, and 40 for *WOptYm* = MAXP. (Not used for IPML.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Yplus

Normal reflection coefficient (harmonic analysis) or attenuation factor (static structural analysis) in positive Y direction of *PSYS*. Defaults to 1.E−3 (equivalent to -60 dB) for *WOptYp* = PROP or HYBR, 30 for *WOptYp* = EVAN, and 40 for *WOptYp* = MAXP. (Not used for IPML.)

Zminus

Normal reflection coefficient (harmonic analysis) or attenuation factor (static structural analysis) in negative Z direction of *PSYS*. Defaults to 1.E−3 (equivalent to -60 dB) for *WOptZm* = PROP or HYBR, 30 for *WOptZm* = EVAN, and 40 for *WOptZm* = MAXP. (Not used for IPML.)

Zplus

Normal reflection coefficient (harmonic analysis) or attenuation factor (static structural analysis) in positive Z direction of *PSYS*. Defaults to 1.E−3 (equivalent to -60 dB) for *WOptZp* = PROP or HYBR, 30 for *WOptZp* = EVAN, and 40 for *WOptZp* = MAXP. (Not used for IPML.)

WOptXm*, *WOptXp*, *WOptYm*, *WOptYp*, *WOptZm*, *WOptZp

Type of attenuated wave in the PML region in each direction:

PROP

Only the propagating wave is attenuated. The PML parameter is set to $s = 1–j\beta$ in harmonic analyses and acoustic transient analyses.

EVAN

Only the evanescent field is attenuated. The PML parameter is set to $s = \alpha$ ($\alpha > 1$) in static analyses.

HYBR

Both the propagating wave and the evanescent wave are attenuated (default). The PML parameter is set to $s = \alpha–j\beta$ ($\alpha > 1$). The program sets the coefficient α values in terms of the normal reflection coefficients in harmonic analyses.

MAXP

The maximum attenuation coefficient for frequency-independent PML parameter in harmonic analyses, acoustic modal analyses, and acoustic transient analyses.

Notes

The **PMLOPT (p. 1451)** command can be used to define perfectly matched layers (PML). The following element types support perfectly matched layers:

- Acoustic elements: FLUID30, FLUID220, and FLUID221 (KEYOPT(4) > 0) in a modal, harmonic, or transient acoustic analysis.
- Piezoelectric coupled-field elements: PLANE222, PLANE223, SOLID225, SOLID226, and SOLID227 (KEYOPT(15) = 1) in a harmonic piezoelectric analysis. For the lower order elements (PLANE222 and SOLID225), PML is only supported with the B-bar method.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Structural elements: PLANE182, PLANE183, SOLID185, SOLID186, and SOLID187 (KEYOPT(15) = 1) in a linear static or harmonic structural analysis. For the lower order elements (PLANE182 and SOLID185), PML is only supported with the B-bar method.

Each PML region must have a uniquely defined PML element coordinate system (**PSYS (p. 1554)**). Normal reflection coefficient values for a harmonic analysis must be less than 1.

The **PMLOPT (p. 1451)** command can also be used to define irregular perfectly matched layers (IPML) for acoustic analyses. Normal reflection coefficient values for a harmonic analysis must be less than 1.

Issue **PMLOPT (p. 1451)**,STAT to list the current normal reflection coefficient or attenuation factor settings for a PML or IPML region. Issue **PMLOPT (p. 1451)**,CLEAR to clear all normal reflection coefficient settings and restore them to the defaults.

Issue **PMLOPT (p. 1451)**,PSYS,CLEAR to clear all normal reflection coefficient settings for the specified PML element coordinate system and restore them to the defaults.

For modal analysis, use one buffer element between the PML and the resonant structure to avoid the spurious modes. The mode patterns should be evaluated graphically.

See Artificially Matched Layers in the *Acoustic Analysis Guide* for more information about using perfectly matched layers (PML) and irregular perfectly matched layers (IPML).

Menu Paths

This command cannot be accessed from a menu.

PMLSIZE, *FREQB*, *FREQE*, *DMIN*, *DMAX*, *THICK*, *ANGLE*, *WAVESPEED*

Determines number of PML or IPML layers.

PREP7 (p. 22): Artificially Matched Layers (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FREQB

Minimum operating frequency (no default).

FREQE

Maximum operating frequency (defaults to *FREQB*).

DMIN

Minimum distance from the radiation source to the PML or IPML interface (no default).

DMAX

Maximum distance from the radiation source to the PML or IPML interface (defaults to *DMIN*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

THICK

Thickness of the PML or IPML region (defaults to 0).

ANGLE

Incident angle of wave to the PML or IPML interface (defaults to 0).

WAVESPEED

Wave speed in PML or IPML medium (defaults to 343.24 m/s).

Notes

PMLSIZE (p. 1453) determines the number of PML or IPML layers for acceptable numerical accuracy.

PMLSIZE (p. 1453) must be issued before any meshing commands. If the thickness of the PML or IPML region is known, it determines an element edge length (h) and issues **ESIZE (p. 668)**,h. If the thickness of the PML or IPML region is unknown, it determines the number of layers (n) and issues **ESIZE (p. 668)**,,n.

See Artificially Matched Layers in the *Acoustic Analysis Guide* for more information about using perfectly matched layers (PML) and irregular perfectly matched layers (IPML).

Menu Paths

This command cannot be accessed from a menu.

/PMORE, - -, *X5*, *Y5*, *X6*, *Y6*, *X7*, *Y7*, *X8*, *Y8*

Creates an annotation polygon (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

- -

Unused field.

X5

X location for vertex 5 of polygon (-1.0 < X < 2.0).

Y5

Y location for vertex 5 of polygon (-1.0 < Y < 1.0).

X6

X location for vertex 6 of polygon (-1.0 < X < 2.0).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Y6

Y location for vertex 6 of polygon (-1.0 < Y < 1.0).

X7

X location for vertex 7 of polygon (-1.0 < X < 2.0).

Y7

Y location for vertex 7 of polygon (-1.0 < Y < 1.0).

X8

X location for vertex 8 of polygon (-1.0 < X < 2.0).

Y8

Y location for vertex 8 of polygon (-1.0 < Y < 1.0).

Notes

Defines the 5th through 8th vertices of an annotation polygon (**/POLYGON (p. 1460)**). This is a command generated by the Graphical User Interface (GUI) and appears in the log file (`Jobname.log`) if annotation is used.

The command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with the **/INPUT (p. 948)** command).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

PNGR,*Keyword*,*OPT*,*VAL*

Provides PNG file export for Mechanical APDL displays.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Keyword

Specifies various PNG file export options.

COMP

If *Keyword* = COMP, then *OPT* is either ON or OFF (blank is interpreted as OFF). This option allows you to turn PNG file compression ON or OFF. If OPT = ON, then The VAL field is read to determine the degree of compression. See the VALUE argument for acceptable compression values.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ORIENT

If *Keyword* = ORIENT, then *OPT* will determine the orientation of the entire plot. *OPT* can be either Horizontal (default) or Vertical.

COLOR

If *Keyword* = COLOR, then *OPT* will determine the color depth of the saved file. *OPT* can be 0, 1, or 2, corresponding to Black and White, Grayscale, and Color (default), respectively.

TMOD

If *Keyword* = TMOD, then *OPT* will determine the text method. *OPT* can be either 1 or 0, corresponding to bitmap text (default) or line stroke text, respectively.

DEFAULT

If *Keyword* = DEFAULT, then all of the default values, for all of the Keyword parameters listed above, are active.

STAT

Shows the current status of PNG file export.

OPT

OPT can have the following names or values, depending on the value for *Keyword* (see above).

ON, OFF

If *Keyword* = COMP, the values On and Off control the use of compression. The degree of compression is determined by VAL

Horizontal, Vertical

If *Keyword* = ORIENT, the terms Horizontal or Vertical determine the orientation of the plot.

0, 1, 2

If *Keyword* = COLOR, the numbers 0, 1, and 2 correspond to Black and White, Grayscale and Color, respectively.

1, 0

If *Keyword* = TMOD, the values 1 and 0 determine whether bitmap (1) or stroke text (0) fonts will be used

VAL

VAL is active only when *Keyword* = COMP, and determines the degree of compression applied to the exported file (see above).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

-1

Apply the default, optimum value for compression. This value represents the best combination of speed and compression. It varies according to the release level of the ZLIB compression package.

1-9

Use this value to specify a specific compression level. 1 is the lowest compression level (fastest) and 9 is the highest compression level (slowest).

Menu Paths

Utility Menu>PlotCtrls>Redirect Plots

Utility Menu>PlotCtrls>Hard Copy

/PNUM, *Label*, *KEY*

Controls entity numbering/coloring on plots.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Type of numbering/coloring:

NODE

Node numbers on node and element plots.

ELEM

Element numbers and colors on element plots.

SEC

Section numbers and colors on element and solid model plots (see "Notes" (p. 1459)).

MAT

Material set numbers and colors on element and solid model plots (see "Notes" (p. 1459)).

TYPE

Element type reference numbers and colors on element and solid model plots (see "Notes" (p. 1459)).

REAL

Real constant set numbers and colors on element and solid model plots (see "Notes" (p. 1459)).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ESYS

Element coordinate system numbers on element and solid model plots (see "Notes" (p. 1459)).

LOC

Location numbers/colors of the element in matrix assembly order on element plots.

Note:

LOC and ELEM numbers will be the same unless the model has been reordered.

KP

Keypoint numbers on solid model plots.

LINE

Line numbers on solid model plots (both numbers and colors on line plots).

AREA

Area numbers on solid model plots (both numbers and colors on area plots).

VOLU

Volume numbers on solid model plots (both numbers and colors on volume plots).

SVAL

Stress (or any contour) values on postprocessing plots, and surface load values and colors on model plots when surface load symbols are on (**/PSF (p. 1537)**). For tabular boundary conditions, the table-evaluated values will be displayed on node, element, or contour displays in POST1 when load symbols (**/PBF (p. 1360)**, **/PSF (p. 1537)**, **/PBC (p. 1356)**) are on and TABNAM is OFF.

TABNAM

Table names for tabular boundary conditions. If this label is turned on, the table name appears next to the appropriate symbol, arrow, face outline, or contour as dictated by the **/PSF (p. 1537)**, **/PBC (p. 1356)**, and **/PBF (p. 1360)** commands.

STAT

Shows current settings for **/PNUM (p. 1457)**.

DEFA

Resets all **/PNUM (p. 1457)** specifications back to default.

KEY

Switch:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Turns OFF numbers/colors for specified label.

1

Turns ON numbers/colors for specified label.

Notes

This command specifies entity numbering and coloring for subsequent plots.

The MAT, TYPE, REAL, and ESYS labels activate both the numbering and coloring of the corresponding attributes for **EPLOT (p. 648)**, **KPLOT (p. 988)**, **LPLOT (p. 1061)**, **APLOT (p. 169)**, and **VPLOT (p. 2147)**. The ELEM, MAT, TYPE, REAL, ESYS, and LOC labels are mutually exclusive, that is, only one can be specified at a time. Also, turning on a LINE, AREA, or VOLU label will turn off the MAT, TYPE, and REAL labels.

PowerGraphics (**/GRAPHICS (p. 866)**,POWER) displays for**/PNUM (p. 1457)** can be problematic. **/PNUM (p. 1457)**,ELEM will display erratically depending on other display command specifications, while **/PNUM (p. 1457)**,LOC and **/PNUM (p. 1457)**,ESYS are not supported.

Element and volume numbers are not visible for 3D elements and volumes when Z-buffering is turned on (**/TYPE (p. 2034)**,,[6,7, or 8]).

Use **/PSTATUS (p. 1550)** or **/PNUM (p. 1457)**,STAT to show settings. Use **/PNUM (p. 1457)**,DEFA to reset all specifications back to default. Use the **/NUMBER (p. 1290)** command to control whether numbers and colors are displayed together.

This command is valid in any processor

Menu Paths

Utility Menu>PlotCtrls>Numbering

POINT

Specifies "Point flow tracing settings" as the subsequent status topic.

POST1 (p. 51): Status (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>List>Status>General Postproc>Trace Points

POLY

Creates a polygonal area based on working plane coordinate pairs.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Defines a polygonal area on the working plane. The area will be defined with NPT keypoints and NPT lines, where NPT (must be at least 3) is the number of coordinate pairs defined with the **PTXY (p. 1556)** command. See the **RPOLY (p. 1616)** and **RPR4 (p. 1617)** commands for other ways to create polygons.

Menu Paths

This command cannot be accessed from a menu.

/POLYGON, *NVERT*, *X1*, *Y1*, *X2*, *Y2*, *X3*, *Y3*, *X4*, *Y4*

Creates annotation polygons (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVERT

Number of vertices of polygon (3 ≤ *NVERT* ≤ 8). Use **/PMORE (p. 1454)** for polygons with more than 4 vertices.

X1

X location for vertex 1 of polygon (-1.0 < X < 2.0).

Y1

Y location for vertex 1 of polygon (-1.0 < Y < 1.0).

X2

X location for vertex 2 of polygon (-1.0 < X < 2.0).

Y2

Y location for vertex 2 of polygon (-1.0 < Y < 1.0).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X3

X location for vertex 3 of polygon (-1.0 < X < 2.0).

Y3

Y location for vertex 3 of polygon (-1.0 < Y < 1.0).

X4

X location for vertex 4 of polygon (-1.0 < X < 2.0).

Y4

Y location for vertex 4 of polygon (-1.0 < Y < 1.0).

Notes

Creates annotation polygons to be written directly onto the display at a specified location. This is a command generated by the Graphical User Interface (GUI) and will appear in the log file (`Jobname.log`) if annotation is used.

The command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with **/INPUT (p. 948)**).

All polygons are shown on subsequent displays unless the annotation is turned off or deleted. Issue **/LSPEC (p. 1081)** and **/PSPEC (p. 1548)** to set the attributes of the polygon. Issue **/PMORE (p. 1454)** to define the 5th through 8th vertices of the polygon.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

/POST1

Enters the database results postprocessor.

SESSION (p. 11): Processor Entry (p. 12)
POST1 (p. 51): Set Up (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Enters the general database results postprocessor (POST1). All load symbols (**/PBC (p. 1356)**, **/PSF (p. 1537)**, or **/PBF (p. 1360)**) are automatically turned off with this command.

This command is valid only at the Begin Level.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Enters the time-history results postprocessor (POST26).

This command is valid only at the Begin Level.

Menu Paths

Main Menu>TimeHist Postpro

POWERH

Calculates the rms power loss in a conductor or lossy dielectric.

POST1 (p. 51): Magnetics Calculations (p. 55)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

POWERH (p. 1462) invokes a Mechanical APDL macro which calculates the time-averaged (rms) power loss in a conductor or lossy dielectric material from a harmonic analysis. The power loss is stored in the parameter PAVG.

Conductor losses include solid conductors and surface conductors approximated by impedance or shielding boundary conditions. The power-loss density for solid conductors or dielectrics is stored in the element table with the label PLOSSD and may be listed (**PRETAB (p. 1490)**) or displayed (**PLETAB (p. 1411)**). PLOSSD does not include surface losses.

The elements of the conducting region must be selected before this command is issued.

POWERH (p. 1462) is valid for 2D and 3D analyses.

Menu Paths

Main Menu>General Postproc>Elec&Mag Calc>Element Based>Power Loss

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PPATH, *POINT*, *NODE*, *X*, *Y*, *Z*, *CS*

Defines a path by picking or defining nodes, or locations on the currently active working plane, or by entering specific coordinate locations.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

POINT

The point number. It must be greater than zero and less than or equal to the *nPts* value specified on the **PATH (p. 1354)** command if graphical picking is not being used.

NODE

The node number defining this point. If blank, use the X, Y, Z coordinates to define the point. A valid node number will override *X*, *Y*, *Z* coordinate arguments.

X, Y, Z

The location of the point in the global Cartesian coordinate system. Use these arguments only if you omit the *NODE* argument.

CS

The coordinate system for interpolation of the path between the previous point and this point. Omit this argument if you wish to use the currently active (**CSYS (p. 441)**) coordinate system. If the coordinate system of two adjacent points is different, the *CS* value of the latter point will be used.

Notes

For linearized stress calculations, the path must be defined with nodes.

This command is designed and works best in interactive (GUI) mode, using the menu paths listed below. For command line operations, issue **PPATH (p. 1463)**,P to define your path by picking nodes.

For information on displaying paths you have defined, see Mapping Results onto a Path in the *Basic Analysis Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PRANGE, *LINC*, *VMIN*, *VMAX*, *XVAR*

Determines the path range.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LINC*, *VMIN*, *VMAX

Set the range for listing or displaying the table locations between a minimum value (*VMIN*) and a maximum value (*VMAX*) of the path distance with a location increment of *LINC* (defaults to 1). The first location begins at *VMIN*.

XVAR

Path variable item to be used as the x-axis plot variable. Any valid path variable may be used (**PDEF (p. 1372)** command). Default variable is the path distance, S.

Command Default

Include every interpolation point and entire path distance.

Notes

Determines the path distance range for use with the **PRPATH (p. 1517)** and **PLPATH (p. 1439)** commands.

Menu Paths

Main Menu>General Postproc>Path Operations>Plot Path Item>Path Range

PRAS, *Lab*, *LDSTEP*, *SUBSTEP*, *FREQB*, *FREQE*, *LogOpt*, - -, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*

Prints a specified acoustic quantity during postprocessing of an acoustic analysis.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

The acoustic quantity to calculate:

SIMP

Specific acoustic impedance on the selected surface.

AIMP

Acoustic impedance on the selected surface.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MIMP

Mechanical impedance on the selected surface.

PRES

Average pressure on the selected surface.

FORC

Force on the selected surface.

POWE

Acoustic power on the selected surface.

ERP

Equivalent radiated power on the selected structural surface (valid only for SHELL181, SOLID185, SOLID186, SOLID187, SOLSH190, SOLID225, SOLID226, SOLID227, and SHELL281).

ERPL

Equivalent radiated power level on the selected structural surface (valid only for SHELL181, SOLID185, SOLID186, SOLID187, SOLSH190, SOLID225, SOLID226, SOLID227, and SHELL281).

BSPL

Frequency-band sound pressure level on selected nodes.

BSPA

A-weighted frequency-band sound pressure level on selected nodes.

MENE

Acoustic potential energy on the selected elements.

KENE

Acoustic kinetic energy on the selected elements.

TENE

Acoustic total energy on the selected elements.

PL2V

Average square of the L2 norm of pressure on the selected elements.

LWIN

Input sound power level on defined port.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LWOUT

Output sound power level on defined driven port.

RL

Return loss on defined port.

ALPHA

Absorption coefficient on defined port.

TL

Transmission loss on defined ports.

PALL

All port-related parameters (LWIN, LWOUT, RL, ALPHA, TL).

DFSTL

Transmission loss of random acoustic analysis.

DFSPW

Radiated power in random acoustic analysis.

DALL

All random acoustic related parameters (DFSTL, DFSPW).

LDSTEP

Specified load step. Defaults to the load step number specified on the **SET (p. 1724)** command, or defaults to 1 if **SET (p. 1724)** has not been issued. This default applies to all *Lab* values except DFSTL, DFSPW, and DALL.

n

Load step number.

ALL

All load steps.

AVG or 0

Average result of multiple samplings in a random acoustic analysis (see the **MSOLVE (p. 1193)** command). This option is used only for *Lab* = DFSTL, DFSPW, and DALL, and it is the default for these labels.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SUBSTEP

Specified substep. Defaults to the substep number specified on the **SET (p. 1724)** command, or defaults to ALL (all substeps at the specified load step) if **SET (p. 1724)** has not been issued. For *Lab* = BSPL or BSPA, ALL is the only valid value.

n

Substep number.

ALL

All substeps.

FREQB

Frequency value representing one of the following:

- Beginning frequency of the frequency range (*FREQB* to *FREQE*) for the defined load step(s) and substeps (*SUBSTEP* = ALL). If a *SUBSTEP* value is specified, *FREQB* is invalid.
- Central frequency of octave bands, used when *LogOpt* = OB1, OB2, OB3, OB6, OB12, or OB24 and *FREQE* is blank.

FREQE

Ending frequency of the frequency range (*FREQB* to *FREQE*) for the defined load step(s) and substeps (*SUBSTEP* = ALL). If blank, *FREQE* is set to *FREQB*. If a *SUBSTEP* value is specified, *FREQE* is invalid.

LogOpt

Octave bands:

OB0

Narrow bands (default).

OB1

Octave bands.

OB2

1/2 octave bands.

OB3

1/3 octave bands.

OB6

1/6 octave bands.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OB12

1/12 octave bands.

OB24

1/24 octave bands.

- -

Unused field.

VAL1

Input port number for *Lab* = LWIN, LWOUT, RL, ALPHA, TL, or PALL.

VAL2

Output port number for *Lab* = TL or PALL.

VAL3

Reference power for *Lab* = LWIN, LWOUT, PALL or EPRL (defaults to $1x10^{-12}$ W).

VAL4

Fluid mass density for *Lab* = ERP or ERPL (defaults to 1.2041 kg/m^3).

VAL5

Speed of sound in the fluid for *Lab* = ERP or ERPL (defaults to 343.25 m/s).

VAL6

Radiation efficiency for *Lab* = ERP or ERPL (defaults to 1).

Notes

The **PRAS (p. 1464)** command lists the specified acoustic quantity on the selected exterior surface, the energy on selected elements, or the sound pressure level over frequency bands. The calculation is based on the pressure and velocity solution or the frequency-band sound pressure level (SPL).

The total pressure and velocity are used if the selected surface is the excitation source surface. To calculate the incoming and outgoing acoustic power and other sound power parameters on the input and output surfaces, issue the **SF (p. 1733)**,,PORT command in the preprocessor to define port numbers.

The sound pressure level of the octave bands and general frequency band (defined via the **HARFRQ (p. 885)** command) is calculated at the selected nodes in the model.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PRCAMP,*Option*,*SLOPE*,*UNIT*,*FREQB*,*Cname*,*STABVAL*,*KeyALLFreq*,*KeyNegFreq*,*KeyWhirl*

Prints Campbell diagram data for applications involving rotating structure dynamics.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Flag to activate or deactivate sorting of forward or backward whirl frequencies:

0 (OFF *or* NO)

No sorting.

1 (ON *or* YES)

Sort. This value is the default.

SLOPE

The slope of the line to be printed. This value must be positive.

SLOPE > 0

In the stationary reference frame (*RefFrame* = YES on the **CORIOLIS (p. 417)** command), the line represents the number of excitations per revolution of the rotor. For example, *SLOPE* = 1 represents one excitation per revolution, usually resulting from unbalance.

In the rotating reference frame (*RefFrame* = NO on the **CORIOLIS (p. 417)** command), the line represents the number of excitations per revolution of the rotor minus 1.

SLOPE = 0

The line represents the stability threshold for stability values or logarithmic decrements printout (*STABVAL* = 1, 2, or 3)

UNIT

Specifies the unit of measurement for rotational angular velocities:

RDS

Rotational angular velocities in radians per second (rad/s). This value is the default.

RPM

Rotational angular velocities in revolutions per minute (RPMs).

FREQB

The beginning, or lower end, of the frequency range of interest. The default is zero.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cname

The rotating component name.

STABVAL

Flag to print the stability values:

0 (OFF *or* NO)

Print the frequencies (the imaginary parts of the eigenvalues in Hz). This value is the default.

1 (ON *or* YES)

Print the stability values (the real parts of the eigenvalues in Hz).

2

Print the inverse of the logarithmic decrements. A negative logarithmic decrement indicates stable motion.

3

Print the logarithmic decrements. A positive logarithmic decrement indicates stable motion and is consistent with API (American Petroleum Institute) standards.

For more information about complex eigenmodes and corresponding logarithmic decrements, see Complex Eigensolutions in the *Mechanical APDL Theory Reference*.

KeyALLFreq

Key to specify if all frequencies above FREQB are printed out:

0 (OFF *or* NO)

A maximum of 10 frequencies are printed out. They correspond to the frequencies displayed via the **PLCAMP (p. 1392)** command. This value is the default.

1 (ON *or* YES)

All frequencies are printed out.

KeyNegFreq

Key to specify if the negative frequencies are printed out. It only applies to solutions obtained with the damped eigensolver (*Method*=DAMP on the **MODOPT (p. 1140)** command):

0 (OFF *or* NO)

Only positive frequencies are printed out. This value is the default.

1 (ON *or* YES)

Negative and positive frequencies are printed out.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KeyWhirl

Flag to print the whirl and instability keys for each load step:

0 (OFF *or* NO)

Print the whirl for the last load step. This value is the default.

1 (ON *or* YES)

Print the whirl and instability keys for each load step.

Notes

The following items are required when generating a Campbell diagram:

- Activate the Coriolis effect (**CORIOLIS (p. 417)** command) in the solution phase (**/SOLU (p. 1821)**).
- Run a modal analysis using the QR damped (**MODOPT (p. 1140)**,QRDAMP) or damped (**MODOPT (p. 1140)**,DAMP) method. Complex eigenmodes are necessary (**MODOPT (p. 1140)**,QRDAMP,,,,*Cpxmod* = ON), and you must specify the number of modes to expand (**MXPAND (p. 1203)**).
- Define two or more load step results with an ascending order of rotational velocity (**OMEGA (p. 1324)** or **CMOMEGA (p. 368)**).

In some cases where modes are not in the same order from one load step to the other, sorting the frequencies (*Option* = 1) can help to obtain a correct printout. Sorting is based on the comparison between complex mode shapes calculated at two successive load steps.

At each load step, the application compares the mode shape to the loads to determine the whirl direction. If applicable, a label appears (on the rows of output data) representing the whirl mode (BW for backward whirl and FW for forward whirl).

If you specify a non-zero slope (*SLOPE* > 0), the command prints the critical speeds corresponding to the intersection points of the frequency curves and the added line. In the case of a named component (*Cname*), critical speeds relate to the rotational velocity of the component. Critical speeds are available only if the frequencies are printed (*STABVAL* = OFF).

If you specify a zero slope (*SLOPE* = 0), the command prints the stability threshold corresponding to the sign change of the stability values (or logarithmic decrements). In the case of a named component (*Cname*), stability thresholds relate to the rotational velocity of the component. Stability thresholds are available only if the stability values or logarithmic decrements are printed (*STABVAL* = 1, 2, or 3).

At each load step, the program checks for instability (based on the sign of the real part of the eigenvalue and a damping ratio with absolute value greater than 0.1%). The label "U" appears on the printout for each unstable frequency.

If specified, the rotational velocities of the named component (*Cname*) are printed out along with the natural frequencies.

For information on printing a Campbell diagram for a prestressed structure, see Solving for a Subsequent Campbell Analysis of a Prestressed Structure Using the Linear Perturbation Procedure in the *Rotordynamic Analysis Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For a usage example of the companion command **PLCAMP (p. 1392)** (used for *plotting* a Campbell diagram), see Example: Campbell Diagram Analysis of a Simply Supported Beam in the *Rotordynamic Analysis Guide*.

For more information on Campbell diagram generation, see Campbell Diagram in the *Rotordynamic Analysis Guide*.

Damped modal cyclic symmetry (**CYCLIC (p. 462)**) analyses do not support the **PRCAMP (p. 1469)** command.

PRCINT, *ID*, *Node*, *Dtype*

Lists fracture parameter (CINT (p. 334)) results data.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ID

Crack ID number.

Node

Crack tip node number. Default = ALL. Valid only for 3D analysis.

Dtype

Data type to output:

JINT

J-integral

IIN1

Interaction integral 1

IIN2

Interaction integral 2

IIN3

Interaction integral 3

K1

Mode 1 stress-intensity factor

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

K2

Mode 2 stress-intensity factor

K3

Mode 3 stress-intensity factor

G1

Mode 1 energy release rate

G2

Mode 2 energy release rate

G3

Mode 3 energy release rate

GT

Total energy release rate

MFTX

Total material force X

MFTY

Total material force Y

MFTZ

Total material force Z

TSTRESS

T-stress

CEXT

Crack extension

CSTAR

C*-integral

STTMAX

Maximum circumferential stress

PSMAX

Maximum circumferential stress when $\sigma_{r\theta}$=0

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DLTA

Incremental crack extension in a fatigue/static crack-growth analysis

DLTN

Number of incremental cycles in a fatigue/static crack-growth analysis

DLTK

Equivalent stress-intensity factor range in a fatigue/static crack-growth analysis

KEQV

Equivalent stress-intensity factor in a fatigue/static crack-growth analysis

KANG

Kink angle (degree) in a fatigue/static crack-growth analysis

R

Stress (load) ratio in a fatigue/static crack-growth analysis

UFAC

U-factor (crack closure) in a fatigue/static crack-growth analysis

CRDX

X coordinate of the crack tip

CRDY

Y coordinate of the crack tip

CRDZ

Z coordinate of the crack tip

APOS

Position attribute of the crack-tip node:

Positive integer –

The subcrack[1] ID number to which this tip belongs. For a crack with only a single subcrack, this value is 1.

Negative integer –

The absolute value of the negative integer is the subcrack ID number to which this tip belongs.

[1] Subcracks typically appear in SMART crack-growth analyses and are uncommon in other types of fracture analyses.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The negative sign indicates that this crack tip is the end of this subcrack, and that this subcrack is a closed polygon. It must be connected to the first tip of this subcrack when the crack front is plotted.

For more information, see "Examples: APOS Usage" (p. 1475).

Examples: APOS Usage

The following examples show how APOS values[2] are applied in several cases for fracture analysis.

The most common situation is that an open crack exists in *N* crack tips, and all tips are connected into a single subcrack. The APOS values for each tip are:

Tip Index	1	2	3	… …	N-1	N
APOS	1	1	1	1… …1	1	1

For a closed crack without extra subcracks, the APOS values are:

Tip Index	1	2	3	… …	N-1	N[a]
APOS	1	1	1	1… …1	1	**-1**

[a] The value for the N^{th} tip is -1, meaning that the crack front should be plotted as a closed loop.

The following crack has two subcracks, the first open and the second closed. Assuming *M* tips on the first subcrack and *N* tips on the second, the APOS values are:

Tip Index	1	… …	M	M+1	… …	M+N
APOS	1	1	1	2	2	**-2**

Notes

When a crack tip node is defined, the values associated with the specified node are listed.

Dtype = STTMAX or PSMAX are valid for phantom-node-based XFEM analyses only.

Dtype = CRDX, CRDY, CRDZ, and APOS are valid only in a fatigue/static crack-growth analysis using SMART or singularity-based XFEM.

Dtype = DLTA, DLTN, DLTK, R are valid in a fatigue crack-growth analysis using SMART or singularity-based XFEM. DLTA is also valid for static crack-growth analysis using SMART.

Dtype = UFAC is valid only in a fatigue crack-growth analysis using SMART.

Dtype = KEQV and KANG are valid only in a fatigue/static crack-growth analysis using SMART.

[2] Issuing ***GET (p. 797)** is an effective way to obtain APOS values.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

PRCPLX, *KEY*

Defines the output form for complex variables.

POST26 (p. 58): Listing (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Output form key:

0

Real and imaginary parts.

1

Amplitude and phase angle. Stored real and imaginary data are converted to amplitude and phase angle upon output. Data remain stored as real and imaginary parts.

Notes

Defines the output form for complex variables. Used only with harmonic analyses (**ANTYPE (p. 162)**,HARMIC).

All results data are stored in the form of real and imaginary components and converted to amplitude and/or phase angle as specified via the **PRCPLX (p. 1476)** command. The conversion is not valid for derived results (such as principal stress/strain, equivalent stress/strain and USUM).

Menu Paths

Main Menu>TimeHist Postpro>Settings>List

PRED, *Sskey*, - -, *Lskey*

Activates a predictor in a nonlinear analysis.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Sskey

Substep predictor key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AUTO

The program uses a predictor but, within certain exceptions, automatically switches prediction off. This behavior is the default; see "Command Default" (p. 1477) for details.

OFF

No prediction occurs.

LINEAR (or ON)

Use the linear predictor on all substeps after the first.

QUADRATIC

Use the quadratic predictor on all substeps after the second.

- -

Unused field.

Lskey

Load step predictor:

OFF

No prediction across load steps occurs. This is the default behavior.

ON

Use a predictor also on the first substep of the load step. (*Sskey* = ON is required.)

Command Default

The default command behavior is to use prediction (*Sskey* = AUTO). The AUTO option chooses to either use the linear predictor or to turn the predictor OFF. However, prediction does not occur if one or more of these conditions exist:

- Over prediction occurs due to a large residual force or excessive element distortion.
- You are mapping (**MAPSOLVE (p. 1108)**) variables to a new mesh during rezoning. (Prediction does not occur for any **MAPSOLVE (p. 1108)** substeps, nor for the first substep afterwards.)
- You have steady-state analysis defined (**SSTATE (p. 1855)**), and contact elements exist in the model.

Notes

Activates a predictor in a nonlinear analysis on the degree-of-freedom solution for the first equilibrium iteration of each substep.

When using the arc-length method (**ARCLEN (p. 175)**, **ARCTRM (p. 177)**), you cannot issue the DOF solution predictor command (**PRED (p. 1476)**), the automatic time stepping command (**AUTOTS (p. 207)**), or the line search command (**LNSRCH (p. 1057)**). If you activate the arc-length method *after* you set

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PRED (p. 1476), **AUTOTS (p. 207)**, or **LNSRCH (p. 1057)**, a warning message appears. If you elect to proceed with the arc-length method, the program disables your DOF predictor, automatic time stepping, and line search settings, and the time step size is controlled by the arc-length method internally.

When using step-applied loads, such as **TUNIF (p. 2027)**, **BFUNIF (p. 259)**, etc., or other types of non-monotonic loads, the predictor may adversely affect the convergence. If the solution is discontinuous, the predictor may need to be turned off.

When performing a nonlinear analysis involving large rotations, the predictor may require using smaller substeps. If the model has rotational degrees-of-freedom, the quadratic predictor could work more efficiently than the linear predictor.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Sol'n Controls>Nonlinear

Main Menu>Preprocessor>Loads>Load Step Opts>Nonlinear>Predictor

Main Menu>Solution>Analysis Type>Sol'n Controls>Nonlinear

Main Menu>Solution>Load Step Opts>Nonlinear>Predictor

PRENERGY,*EnergyType*,*Cname1*,*Cname2*,*Cname3*,*Cname4*,*Cname5*,*Cname6*

Prints the total energies of a model or the energies of the specified components.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

EnergyType

Type of energies to be printed:

ALL

All energies are printed: potential, kinetic, artificial hourglass/drill stiffness, contact stabilization energy, and artificial stabilization energy when applicable. This is the default.

SENE

Potential energy (stiffness energy).

KENE

Kinetic energy.

DENE

Damping energy.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

WEXT

Work done by external loads.

Cname1, Cname2, Cname3,...

Component names for energies of the components printout.

If *Cname1* is blank, the total energies are listed.

If *Cname1* = ALL, the energies are listed for all selected components.

If *Cname1* is neither blank nor ALL, it is the name of an existing component. The energies are listed for up to 6 selected components named in *Cname1* to *Cname6*.

Notes

The **PRENERGY (p. 1478)** command prints out either the total energies of the entire model or the energies of the components depending on the *Cname1* specification.

Only existing components based on elements (defined with the **CM (p. 356)** command) are supported when component energies are listed.

Damping energy (DENE) and work done by external loads (WEXT) are available only if the following were set prior to the analysis solution: *EngCalc* = YES on the **TRNOPT (p. 2017)**, **HROUT (p. 918)** or **MXPAND (p. 1203)** command; and *Item* = VENG, ESOL, or ALL on the **OUTRES (p. 1336)** command.

If *EngCalc* = YES on the **HROUT (p. 918)** or **MXPAND (p. 1203)** command, average, amplitude, and peak values are returned for potential (SENE) and kinetic (KENE) energies.

The energy values can be retrieved using the ***GET (p. 797)** command with *Entity* = PRENERGY.

This command applies to structural elements only.

Menu Paths

This command cannot be accessed from a menu.

/PREP7

Enters the model creation preprocessor.

SESSION (p. 11): Processor Entry (p. 12)
PREP7 (p. 22): Database (p. 22)

Notes

Enters the general input data preprocessor (PREP7).

This command is valid only at the Begin Level.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor

PRERR

Prints SEPC and TEPC.

POST1 (p. 51): Listing (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Prints the percent error in structural energy norm (SEPC) and the thermal energy norm percent error (TEPC). Approximations of mesh discretization error associated with a solution are calculated for analyses having structural or thermal degrees of freedom.

The structural approximation is based on the energy error (which is similar in concept to the strain energy) and represents the error associated with the discrepancy between the calculated stress field and the globally continuous stress field (see POST1 - Error Approximation Technique in the *Mechanical APDL Theory Reference*). This discrepancy is due to the assumption in the elements that only the displacements are continuous at the nodes. The stress field is calculated from the displacements and should also be continuous, but generally is not.

Thermal analyses may use any solid and shell thermal element having only temperature degrees of freedom. The thermal approximation is based on the total heat flow dissipation and represents the error associated with the discrepancy between the calculated nodal thermal flux within an element and a continuous global thermal flux. This continuous thermal flux is calculated with the normal nodal averaging procedure.

The volume (result label VOLU) is used to calculate the energy error per element (result label SERR for the structural energy error and TERR for the thermal energy error). These energy errors, along with the appropriate energy, are then used to calculate the percent error in energy norm (SEPC for structural and TEPC for thermal). These percentages can be listed by the **PRERR (p. 1480)** command, retrieved by the ***GET (p. 797)** command (with labels SEPC and TEPC) for further calculations, and shown on the displacement display (**PLDISP (p. 1400)**), as applicable.

For structural analyses, the maximum absolute value of nodal stress variation of any stress component for any node of an element (result item SDSG) is also calculated. Similarly, for thermal gradient components, TDSG is calculated. Minimum and maximum result bounds considering the possible effect of discretization error will be shown on contour displays (**PLNSOL (p. 1425)**). For shell elements, the top surface location is used to produce a meaningful percentage value. SERR, TERR, SEPC, TEPC, SDSG, and TDSG will be updated whenever the nodal stresses or fluxes are recalculated.

If the energy error is a significant portion of the total energy, then the analysis should be repeated using a finer mesh to obtain a more accurate solution. The energy error is relative from problem to problem but will converge to a zero energy error as the mesh is refined.

The following element- and material-type limitations apply:

- Valid with most 2D solid, 3D solid, axisymmetric solid, or 3D shell elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The model should have only structural or thermal degrees of freedom.
- The analysis must be linear (for both material and geometry).
- Multi-material (for example, composite) elements are not valid.
- Transition regions from one material to another are not valid (that is, the entire model should consist of one material).
- Anisotropic materials (**TB (p. 1899)**,ANEL) are not considered.

Menu Paths

Main Menu>General Postproc>List Results>Percent Error

Utility Menu>List>Results>Percent Error

PRESOL, *Item*, *Comp*

Prints the solution results for elements.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Label identifying the item. Valid item labels are shown in the table below. Some items also require a component label. For selected result output, specify SRES and see Table 220: PRESOL - Selected Result (SRES) Component Labels (p. 1489).

Comp

Component of the item (if required). Valid component labels are shown in the table below.

Notes

PRESOL (p. 1481) prints the solution results for the selected elements in the sorted sequence.

For example, **PRESOL (p. 1481)**,S prints the stress items SX, SY, SZ, SXY, SYZ, and SXZ for the node locations of the element. Various element results depend on the calculation method (**AVPRIN (p. 210)**).

Component results are in the global Cartesian coordinate directions unless transformed (**RSYS (p. 1639)**).

Shell elements print values at the top, then bottom of the element (or layer). If KEYOPT(8) = 2 (for SHELL181, SHELL208, SHELL209, SHELL281, or ELBOW290), the results are printed in the order TOP, BOT and then MID of each element, (or layer). The MID value is the actual value to the results file.

Items are listed as columns of a table versus element number. An exception occurs for item ELEM, which uses an element format (where all applicable line element results are listed per element) instead of a tabular format. An exception also occurs for the section results of beam- and pipe-based elements, which use a different fixed format and do not change with the **/FORMAT (p. 774)** specifications of the command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can issue **FORCE (p. 772)** to define which component of the nodal load is to be used (static, damping, inertia, or total).

To print items not available via **PRESOL (p. 1481)** (such as line element results), see **ETABLE (p. 687)** and **PRETAB (p. 1490)**.

For PowerGraphics (**/GRAPHICS (p. 866)**,POWER), results are listed only for the element surface. Items not supported by PowerGraphics are noted in Table 219: PRESOL - General Result Item and Component Labels (p. 1482).

The results printed by **PRESOL (p. 1481)** are unaffected by any requested nodal-averaged results (**OUTRES (p. 1336)**,NAR). For more information, see Nodal-Averaged Results in the *Element Reference*.

For *Item* = SRES, selected result components (**OSRESULT (p. 1327)**) are output. See Table 220: PRESOL - Selected Result (SRES) Component Labels (p. 1489).

Table 219: PRESOL - General Result Item and Component Labels

General Item and Component Labels PRESOL (p. 1481), *Item, Comp*		
Item	**Comp**	**Description**
S	COMP or blank	Component (X, Y, Z, XY, YZ, XZ) stresses.
	PRIN	Principal stresses (1, 2, 3), stress intensity (INT), and equivalent stress (EQV).
EPEL	COMP or blank	Component (X, Y, Z, XY, YZ, XZ) elastic strains.
	PRIN	Principal elastic strains (1, 2, 3), strain intensity (INT), and equivalent strain (EQV).
EPTH	COMP or blank	Component (X, Y, Z, XY, YZ, XZ) thermal strains.
	PRIN	Principal thermal strains (1, 2, 3), strain intensity (INT), and equivalent strain (EQV).
EPDI	COMP or blank	Component (X, Y, Z, XY, YZ, XZ) diffusion strains.
	PRIN	Principal diffusion strains (1, 2, 3), strain intensity (INT), and equivalent strain (EQV).
EPPL	COMP or blank	Component (X, Y, Z, XY, YZ, XZ) plastic strains.
	PRIN	Principal plastic strains (1, 2, 3), strain intensity (INT), and equivalent strain (EQV).
EPCR	COMP or blank	Component (X, Y, Z, XY, YZ, XZ) creep strains.
	PRIN	Principal creep strains (1, 2, 3), strain intensity (INT), and equivalent strain (EQV).
EPSW		Swelling strain.
EPTO	COMP or blank	Component (X, Y, Z, XY, YZ, XZ) total mechanical strains (EPEL + EPPL + EPCR).
	PRIN	Principal total mechanical strains (1, 2, 3), strain intensity (INT), and equivalent strain (EQV).
EPTT	COMP or blank	Component (X, Y, Z, XY, YZ, XZ) total mechanical, thermal, diffusion, and swelling strains (EPEL + EPPL + EPCR + EPTH + EPDI + EPSW).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PRESOL (p. 1481), *Item, Comp*		
Item	**Comp**	**Description**
	PRIN	Principal total mechanical, diffusion, thermal, and swelling strains (1, 2, 3), strain intensity (INT), and equivalent strain (EQV).
NL		Nonlinear items (SEPL, SRAT, HPRES, EPEQ, CREQ, PSV, PLWK).
SEND	ELASTIC[a]	Elastic strain energy density. (For viscoelastic and sintering materials, the stored energy.)
	PLASTIC	Plastic strain energy density.
	CREEP	Creep strain energy density.
	DAMAGE	Damage strain energy density.
	VDAM[a]	Viscoelastic dissipation energy density.
	VREG	Visco-regularization strain energy density.
	DISS	Structural-thermal dissipation.
	ENTO	Total strain energy density (sum of ELASTIC, PLASTIC, and CREEP strain energy densities).
CDM	DMG	Damage variable.
	LM	Maximum previous strain energy for virgin material.
FAIL		Failure criteria for virgin material.[b][c] **Default components:** Maximum of all failure criteria defined at current location (MAX), maximum strain (EMAX), maximum stress (SMAX), Tsai-Wu Strength Index (TWSI), inverse of Tsai-Wu Strength Ratio Index (TWSR). **Other available components:** Hashin Fiber Failure (HFIB), Hashin Matrix Failure (HMAT), Puck Fiber Failure (PFIB), Puck Matrix Failure (PMAT), LaRc03 Fiber Failure (L3FB), LaRc03 Matrix Failure (L3MT), LaRc04 Fiber Failure (L4FB), LaRc04 Matrix Failure (L4MT), and any user-defined failure criteria (USR1 through USR9).[d] Issue **FCTYP (p. 740)** to activate or remove failure criteria.
PFC		Failure criteria based on the effective stresses in the damaged material. **Components:** Maximum of all failure criteria defined at current location (MAX), fiber tensile failure (FT), fiber compressive failure (FC), matrix tensile failure (MT), and matrix compressive (MC).
PDMG		Progressive damage parameters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PRESOL (p. 1481), *Item, Comp*		
Item	**Comp**	**Description**
		Components: Damage status (STAT, 0 = undamaged, 1 = damaged, 2 = complete damage), fiber tensile damage variable (FT), fiber compressive damage variable (FC), matrix tensile damage variable (MT), matrix compressive damage variable (MC), shear damage variable (S), energy dissipated per unit volume (SED), energy per unit volume due to viscous damping (SEDV).
FCMX		Maximum failure criterion over the entire element.[b][c] **Components:** Layer number where the maximum occurs (LAY), name of the maximum failure criterion (FC), and value of the maximum failure criterion (VAL).
SVAR	1,2,3, ... N	State variable.
GKS		Gasket component (X, XY, XZ) stress.
GKD		Gasket component (X, XY, XZ) total closure.
GKDI		Gasket component (X, XY, XZ) total inelastic closure.
GKTH		Gasket component (X, XY, XZ) thermal closure.
CONT		Contact items (STAT, PENE, PRES, SFRIC, STOT, SLIDE, GAP, FLUX, CNOS, FPRS). See component descriptions in **PLESOL (p. 1401)**.
TG		Component (X, Y, Z) thermal gradients and vector sum (SUM).[e]
TF		Component (X, Y, Z) thermal fluxes and vector sum (SUM).[e]
PG		Component (X, Y, Z) and vector sum (SUM) for velocity or energy density flux (room acoustics).
EF		Component (X, Y, Z) electric fields and vector sum (SUM).
D		Component (X, Y, Z) electric flux densities and vector sum (SUM).
H		Component (X, Y, Z) magnetic field intensities and vector sum (SUM).
B		Component (X, Y, Z) magnetic flux densities and vector sum (SUM).
CG		Component concentration gradient or vector sum.
DF		Component diffusion flux density or vector sum.
FMAG		Component (X, Y, Z) electromagnetic forces and vector sum (SUM).[b]
P		Poynting vector components (X, Y, Z) and sum (SUM).[b]
CG		Concentration gradient.
F		Component (X, Y, Z) structural forces.[b][f][g]
M		Component (X, Y, Z) structural moments.[f][b]

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PRESOL (p. 1481), *Item, Comp*		
Item	**Comp**	**Description**
HEAT		Heat flow.[f][b]
FLOW		Fluid flow.[f]
AMPS		Current flow.[f][b]
CHRG		Charge.[f][b]
FLUX		Magnetic flux.[f][b]
CSG		Component (X, Y, Z) magnetic current segments.[f][b]
FORC		All available force items (F to CSG above). (10 maximum).[b]
RATE		Diffusion flow rate.
BFE	TEMP[h]	Body temperatures (calculated from applied temperatures) as used in solution (area and volume elements only).
ELEM		All applicable element results (available only for LINK180 and previous-generation structural line elements).[b]
SERR[i]		Structural error energy.[b]
SDSG[i]		Absolute value of the maximum variation of any nodal stress component.[b]
TERR[i]		Thermal error energy.[b]
TDSG[i]		Absolute value of the maximum variation of any nodal thermal gradient component.[b]
SENE		"Stiffness" energy or thermal heat dissipation. Same as TENE.[b]
STEN		Elemental energy dissipation due to stabilization.
TENE		Thermal heat dissipation or "stiffness" energy. Same as SENE.[b]
KENE		Kinetic energy.[b]
ASENE		Amplitude "stiffness" energy.[b]
PSENE		Peak "stiffness" energy.[b]
AKENE		Amplitude kinetic energy.[b]
PKENE		Peak kinetic energy.[b]
DENE		Damping energy.[b]
WEXT[j]		Work due to external load.[b]
AENE		Artificial energy due to hourglass control/drill stiffness or due to contact stabilization.[b]
JHEAT		Element Joule heat generation (coupled-field calculation).[b]
JS		Source current density for low-frequency magnetic analyses. Total current density (sum of conduction and displacement current densities) in low frequency electric analyses. Components (X, Y, Z) and vector sum (SUM).[b]
JT		Total measureable current density in low-frequency electromagnetic analyses. (Conduction current density in

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PRESOL (p. 1481), *Item, Comp*		
Item	**Comp**	**Description**
		a low-frequency electric analysis.) Components (X, Y, Z) and vector sum (SUM).[b]
JC		Conduction current density for elements that support conduction current calculation. Components (X, Y, Z) and vector sum (SUM).[b]
MRE		Magnetic Reynolds number.[b]
VOLU		Volume of volume element.[b]
CENT		Centroid X, Y, or Z location (based on shape function) in the active coordinate system.[b]
LOCI		Integration point location.
SMISC	*snum*	Element summable miscellaneous data value at sequence number *snum* (shown in the Output Data section of each element description).[b]
NMISC	*snum*	Element nonsummable miscellaneous data value at sequence number *snum* (shown in the Output Data section of each element description).[b]
CAP		Material cap plasticity model only: Cohesion (C0); hydrostatic compaction yielding stress (X0); I1 at the transition point at which the shear and compaction envelopes intersect (K0); ZONE = 0: elastic state, ZONE = 1: compaction zone, ZONE = 2: shear zone, ZONE = 3: expansion zone; effective deviatoric plastic strain (DPLS); volume plastic strain (VPLS).
EDPC		Material EDP creep model only (not including the cap model): Equivalent creep stress (CSIG); equivalent creep strain (CSTR).
FICT	TEMP	Fictive temperature.
ESIG	COMP or blank	Components of Biot's effective stress.
	PRIN	Principal stresses of Biot's effective stress.
	INT	Stress intensity of Biot's effective stress.
	EQV	Equivalent stress of Biot's effective stress.
DPAR	TPOR	Total porosity (Gurson material model).
	GPOR	Porosity due to void growth.
	NPOR	Porosity due to void nucleation.
FFLX	COMP	Fluid flow flux components in poromechanics.
FGRA	COMP	Fluid pore-pressure gradient components in poromechanics.
MENE		Acoustic potential energy.[b]
PMSV	COMP	Void volume ratio, pore pressure, degree of saturation, and relative permeability for coupled pore-pressure CPT elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PRESOL (p. 1481), *Item, Comp*		
Item	**Comp**	**Description**
FPIDX	TF01,SF01, TF02,SF02, TF03,SF03, TF04,SF04	Failure plane surface activity status for concrete and joint rock material models: 1 = yielded, 0 = not yielded. Tension and shear failure status are available for all four sets of failure planes.
YSIDX	TENS,SHEA	Yield surface activity status for Mohr-Coulomb, soil, concrete, and joint rock material models: 1 = yielded, 0 = not yielded.
NS	COMP	Nominal strain for hyperelastic material, reported in the current configuration (unaffected by **RSYS (p. 1639)**).
MPLA	DMAC,DMAX	Microplane damage, macroscopic and maximum values.
MPDP		Microplane homogenized total, tension, and compression damages (TOTA, TENS, COMP), and split weight factor (RW).
DAMAGE		Damage in directions 1, 2, 3 (1, 2, 3) and the maximum damage (MAX).
GDMG		Damage
IDIS		Structural-thermal dissipation rate
BKS	X, Y, Z, XY, YZ, XZ	Total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements.
BKS1, . . . ,BKS5	X, Y, Z, XY, YZ, XZ	Superimposed components of the total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements when more than one superimposed back-stress component is defined.
EPFR		Free strain in porous media
SNDI		Component (X, Y, Z) sound intensity and vector sum (SUM).[b]
FC1S	1,2,3,4,5,6	First set of six components of FCC crystal slip. Available for 3D elements only.
FC2S	1,2,3,4,5,6	Second set of six components of FCC crystal slip. Available for 3D elements only.
HC1S	1,2,3,4,5,6	Six components of HCP crystal slip on basal and prismatic systems. Available for 3D elements only.
HC2S	1,2,3,4,5,6	Six components of HCP crystal slip on pyramidal system. Available for 3D elements only.
HC3S	1,2,3,4,5,6	First set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC4S	1,2,3,4,5,6	Second set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC5S	1,2,3,4,5,6	Six components of HCP crystal slip on the second-order pyramidal system. Available for 3D elements only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PRESOL (p. 1481), *Item, Comp*		
Item	**Comp**	**Description**
BC1S	1,2,3,4,5,6	First set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC2S	1,2,3,4,5,6	Second set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC3S	1,2,3,4,5,6	First set of six components of BCC slip on 112 plane. Available for 3D elements only.
BC4S	1,2,3,4,5,6	Second set of six components of BCC slip on 112 plane. Available for 3D elements only.
BC5S	1,2,3,4,5,6	First set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC6S	1,2,3,4,5,6	Second set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC7S	1,2,3,4,5,6	Third set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC8S	1,2,3,4,5,6	Fourth set of six components of BCC slip on 123 plane. Available for 3D elements only.
FC1H	1,2,3,4,5,6	First set of six components of FCC crystal hardness. Available for 3D elements only.
FC2H	1,2,3,4,5,6	Second set of six components of FCC crystal hardness. Available for 3D elements only.
HC1H	1,2,3,4,5,6	Sixcomponents of HCP crystal hardness on basal and prismatic systems. Available for 3D elements.
HC2H	1,2,3,4,5,6	Six components of HCP crystal hardness on pyramidal system. Available for 3D elements only.
HC3H	1,2,3,4,5,6	First set of six components of HCP crystal hardness on the first-order pyramidal system. Available for 3D elements only.
HC4H	1,2,3,4,5,6	Second set of six components of HCP crystal hardness on the first-order pyramidal system. Available for 3D elements only.
HC5H	1,2,3,4,5,6	Six components of HCP crystal hardness on the second-order pyramidal system. Available for 3D elements only.
BC1H	1,2,3,4,5,6	First set of six components of BCC hardness on 111 plane. Available for 3D elements only.
BC2H	1,2,3,4,5,6	Second set of six components of BCC hardness on 111 plane. Available for 3D elements only.
BC3H	1,2,3,4,5,6	First set of six components of BCC hardness on 112 plane. Available for 3D elements only.
BC4H	1,2,3,4,5,6	Second set of six components of BCC hardness on 112 plane. Available for 3D elements only.
BC5H	1,2,3,4,5,6	First set of six components of BCC hardness on 123 plane. Available for 3D elements only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PRESOL (p. 1481), *Item, Comp*		
Item	**Comp**	**Description**
BC6H	1,2,3,4,5,6	Second set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC7H	1,2,3,4,5,6	Third set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC8H	1,2,3,4,5,6	Fourth set of six components of BCC hardness on 123 plane. Available for 3D elements only.
XELG	1,2,3,45,6,EQV	Crystal Lagrangian strain in 11, 22, 33, 12, 23,13 directions and its equivalent. Available for 3D elements only.
SINT	RHO, ETA, SSTR, GRAIN	Sintering relative density, viscosity, sintering stress, and average grain size values.

[a] The results for this postprocessing SEND component are invalid for ELBOW290 if that element is used with viscoelastic or viscohyperelastic materials.

[b] Not supported by PowerGraphics.

[c] Works only if failure criteria are provided (**FC (p. 732)** and **TB (p. 1899)**).

[d] USR1 through USR9 require a failure-criteria routine.

[e] No vector sum is calculated for coupled pore-pressure-thermal (CPT*nnn*) elements.

[f] Use **FORCE (p. 772)** for type.

[g] Do not use **PRESOL (p. 1481)** to obtain contact forces for contact elements, as the force values reported may not be accurate for these elements. Use **ETABLE (p. 687)** instead.

[h] For reinforcing elements REINF264 and REINF265, issue **PRESOL (p. 1481)**,BFE,TEMP to print the intersection-point temperature of each member. You can also print intersection-point temperature gradients (**PRESOL (p. 1481)**,TG) and intersection-point heat flux (**PLESOL (p. 1401)**,TF). For higher-order reinforcing members (generated when using higher-order base elements), the midpoint values are not available for the reinforcing members.

[i] Some element- and material-type limitations apply. See **PRERR (p. 1480)**.

[j] WEXT is calculated for element-based loading only (and not for nodal-force loading). WEXT is stored on elements to which loading has been applied; if surface elements are added on top of other elements, for example, and pressure loading is applied to the surface elements, WEXT is available for the surface elements only.

Table 220: PRESOL - Selected Result (SRES) Component Labels

PRESOL (p. 1481),SRES,*Comp*	
Comp	**Description**
SVAR*n*	The *n*th state variable.
FLDUF0*n*	The *n*th user-defined field variable.
ItemComp (concatenated *Item* + *Comp* label) from Table 208: OSRESULT - Item and Component Labels (p. 1328)[a]	See the table (p. 1328) for the combined item and component description.

[a] See Example 10: Specifying and Retrieving Selected Result Output (p. 1329).

PRETAB, *Lab1*, *Lab2*, *Lab3*, *Lab4*, *Lab5*, *Lab6*, *Lab7*, *Lab8*, *Lab9*

Prints the element table items.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab1*, *Lab2*, *Lab3*, . . . , *Lab9

Print selected items. Valid labels are (blank) or any label as specified with the **ETABLE (p. 687)** command. Convenience labels may be used for *Lab1* to select groups of labels (10 labels maximum): GRP1 for first 10 stored items; GRP2 for items 11 to 20; GRP3 for items 21 to 30; GRP4 for items 31 to 40; GRP5 for items 41 to 50. Enter **ETABLE (p. 687)**,STAT command to list stored item order. If all labels are blank, print first 10 stored items (GRP1).

Notes

Prints the items stored in the table defined with the **ETABLE (p. 687)** command. Item values will be listed for the selected elements in the sorted sequence (**ESORT (p. 680)**). The **FORCE (p. 772)** command can be used to define which component of the nodal load is to be used (static, damping, inertia, or total).

Portions of this command are not supported by PowerGraphics (**/GRAPHICS (p. 866)**,POWER).

PRFAR, *Lab*, *Option*, *VAR1B*, *VAR1E*, *NVAR1*, *VAR2B*, *VAR2E*, *NVAR2*, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *LDSTEP*, *SUBSTEP*, *FREQB*, *FREQE*, *PrintType*, *LogOpt*

Prints acoustic far field parameters.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Parameters to print:

PRES

Acoustic parameters

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PROT

Acoustic parameters with the y-axis rotated extrusion (not valid for 2D elements)

PLAT

Acoustic parameters radiated by a vibrating structural panel (not valid for 2D elements)

Option

Print option, based on the specified print parameter type:

Lab	*Option*
PRES, PROT, *or* PLAT	SUMC -- Maximum pressure (default) PHSC -- Pressure phase angle SPLC -- Sound pressure level SPAC – A-weighted sound pressure level (dBA) DGCT -- Acoustic directivity PSCT -- Maximum scattered pressure TSCT -- Target strength PWL -- Sound power level

The arguments *VAR1B*, *VAR1E*, *NVAR1*, *VAR2B*, *VAR2E*, *NVAR2*, and *VAL1* are used when *Option* = SUMC, PHSC, SPLC, SPAC, DGCT, PSCT, or TSCT:

VAR1B, VAR1E

Starting and ending values for the first variable associated with *PrintType* as described below.

When *PrintType* = blank (default) or SPHR: Starting and ending phi (ϕ) angles (in degrees) in the spherical coordinate system. Defaults to 0.

When *PrintType* = PLXY: Starting and ending x value in the Cartesian coordinate system. Defaults to 0.

When *PrintType* = PLYZ: Starting and ending y value in the Cartesian coordinate system. Defaults to 0.

When *PrintType* = PLXZ: Starting and ending x value in the Cartesian coordinate system. Defaults to 0.

NVAR1

Number of divisions between the starting and ending *VAR1* values for data computations. Defaults to 0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAR2B, VAR2E

Starting and ending values for the second variable associated with *PrintType* as described below.

When *PrintType* = blank (default) or SPHR: Starting and ending theta (θ) angles (in degrees) in the spherical coordinate system. Defaults to 0 for a 3D model and 90 for a 2D extrusion model.

When *PrintType* = PLXY: Starting and ending y value in the Cartesian coordinate system. Defaults to 0.

When *PrintType* = PLYZ: Starting and ending z value in the Cartesian coordinate system. Defaults to 0.

When *PrintType* = PLXZ: Starting and ending z value in the Cartesian coordinate system. Defaults to 0.

NVAR2

Number of divisions between the starting and ending *VAR2* values for data computations. Defaults to 0.

VAL1

VAL1 is additional input. Its meaning depends on the *PrintType* argument as described below.

When *PrintType* = blank (default) or SPHR: Radius of the sphere surface.

When *PrintType* = PLXY: Fixed z value for an X-Y plane in the Cartesian coordinate system. Defaults to 0.

When *PrintType* = PLYZ: Fixed x value for a Y-Z plane in the Cartesian coordinate system. Defaults to 0.

When *PrintType* = PLXZ: Fixed y value for an X-Z plane in the Cartesian coordinate system, Defaults to 0.

The arguments *VAL2* through *VAL5* are additional input used with certain *Lab* and *Option* settings as described below.

VAL2

When *Option* = SPLC or SPAC: Reference rms sound pressure. Defaults to $2x10^{-5}$ Pa.

When *Option* = PWL: Reference sound power. Defaults to $1x10^{-12}$ watts.

VAL3

When *Lab* = PRES: Thickness of 2D model extrusion in the z direction (no default).

When *Lab* = PROT: Angle of the y-axis rotated extrusion model (no default)

VAL4

When *Lab* = PLAT: Mass density of acoustic fluid.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL5

When *Lab* = PLAT: Sound speed in acoustic fluid.

LDSTEP

Specified load step. Defaults to the load step number specified on the **SET (p. 1724)** command, or defaults to 1 if **SET (p. 1724)** has not been issued.

n

Load step number.

ALL

All load steps.

SUBSTEP

Specified substep. Defaults to the substep number specified on the **SET (p. 1724)** command, or defaults to ALL (all substeps at the specified load step) if **SET (p. 1724)** has not been issued.

n

Substep number.

ALL

All substeps.

FREQB

Frequency value representing one of the following:

- Beginning frequency of the frequency range (*FREQB* to *FREQE*) for the defined load step(s) and substeps (*SUBSTEP* = ALL). If a *SUBSTEP* value is specified, *FREQB* is invalid.
- Central frequency of octave bands, used when *LogOpt* = OB1, OB2, OB3, OB6, OB12, or OB24 and *FREQE* is blank.

FREQE

Ending frequency of the frequency range (*FREQB* to *FREQE*) for the defined load step(s) and substeps (*SUBSTEP* = ALL). If blank, *FREQE* is set to *FREQB*. If a *SUBSTEP* value is specified, *FREQE* is invalid.

PrintType

Print out far-field parameters on a plane or sphere (used when *Option* = SUMC, PHSC, SPLC, SPAC, DGCT, PSCT, or TSCT). No default.

PLXY

On an X-Y plane.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PLYZ

On a Y-Z plane.

PLXZ

On an X-Z plane.

SPHR

On a sphere surface.

LogOpt

Octave bands (used only when Option = SPLC, SPAC, or PWL):

OB0

Narrow bands (default).

OB1

Octave bands.

OB2

1/2 octave bands.

OB3

1/3 octave bands.

OB6

1/6 octave bands.

OB12

1/12 octave bands.

OB24

1/24 octave bands.

Notes

The **PRFAR (p. 1490)** command prints pressure far fields and far field parameters as determined by the equivalent source principle. Use this command to print pressure and acoustic parameters. See the **HFSYM (p. 905)** command for the model symmetry and the **HFANG (p. 904)** command for spatial radiation angles.

Printing acoustic parameters radiated by a vibrating structural panel (*Lab* = PLAT) is supported by elements SOLID185, SOLID186, SOLID187, SHELL181, SHELL281, and SOLSH190. The vibration surface of the panel must be flagged by the **SF (p. 1733)**,MXWF command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

PRI2, *P51X*, *Z1*, *Z2*

Creates a polygonal area or a prism volume by vertices (GUI).

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Creates a polygonal area or a prism volume using the vertices as input. This is a command generated by the Graphical User Interface (GUI) and appears in the log file (`Jobname.log`) if graphical picking is used.

This command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with **/INPUT (p. 948)**).

For polygons, **PRI2 (p. 1495)** appears in the log file as **PRI2 (p. 1495)**,*P51X*,0.0,0.0, preceded by **FITEM (p. 758)** commands defining the vertices (in global Cartesian coordinates).

For prisms, **PRI2 (p. 1495)** appears in the log file as **PRI2 (p. 1495)**,*P51X*, preceded by **FITEM (p. 758)** commands defining the vertices and the Z-end of the prism.

See **RPOLY (p. 1616)**, **POLY (p. 1460)**, **RPRISM (p. 1618)**, **PRISM (p. 1497)**, and **RPR4 (p. 1617)** for other ways to create polygons and prisms.

Main Menu>Preprocessor>Modeling>Create>Volumes>Prism>By Vertices

---

PRIM

Specifies "Solid model primitives" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.LOG`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Solid Model

PRINT

Specifies "Print settings" as the subsequent status topic.

POST1 (p. 51): Status (p. 58)
POST26 (p. 58): Status (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

---

*PRINT,*Matrix*,*Fname*

Prints the matrix values to a file.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Matrix

Name of matrix or vector to print. Must be specified.

Fname

File name (case-sensitive, 32-character maximum). If blank, matrix is written to the output file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The matrix may be a dense matrix (***DMAT (p. 551)**), a sparse matrix (***SMAT (p. 1801)**), or a vector (***VEC (p. 2085)**). Only the non-zero entries of the matrix are printed.

Menu Paths

This command cannot be accessed from a menu.

PRISM, *Z1*, *Z2*

Creates a prism volume based on working plane coordinate pairs.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Z1, Z2

Working plane Z coordinates of the top and bottom of the prism.

Notes

Defines a prism volume based on the working plane. The top and bottom areas will each be defined with NPT keypoints and NPT lines, where NPT (must be at least 3) is the number of coordinate pairs defined with **PTXY (p. 1556)** command. Also, a line will be defined between each point pair on the top and bottom face. See the **RPRISM (p. 1618)** and **RPR4 (p. 1617)** commands for other ways to create prisms.

Menu Paths

This command cannot be accessed from a menu.

PRITER

Prints solution summary data.

POST1 (p. 51): Listing (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Prints solution summary data (such as time step size, number of equilibrium iterations, convergence values, etc.) from a static or full transient analysis. All other analyses print zeros for the data.

Menu Paths

Main Menu>General Postproc>List Results>Iteration Summry

Utility Menu>List>Results>Iteration Summry

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PRJSOL, *Item*, *Comp*

Prints joint element output.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Label identifying the item. Some items also require a component label.

DISP

Relative displacements.

ROT

Relative rotations.

VEL

Relative linear velocities.

OMG

Relative angular velocities.

ACC

Relative linear accelerations.

DMG

Relative angular accelerations.

SMISC

Summable miscellaneous quantities.

Comp

Component of the item (if required). For *Item* = DISP, ROT, VEL, OMG, ACC, and DMG, enter the direction label, X, Y, or Z. For *Item* = SMISC, enter a valid number.

Notes

Prints element output for the MPC184 joint element. The joint element quantities printed are the values for the free or unconstrained relative degrees of freedom.

Only **PRJSOL (p. 1498)**,SMISC is available in linear, modal, and linear perturbation analyses.

Only **PRJSOL (p. 1498)**,SMISC is available for penalty-based joint elements.

This command is valid in POST1 only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

PRMC, *LSTEP*, *SBSTEP*, *TIMFRQ*, *KIMG*, *HIbeg*, *HIend*, *Matrix*

Prints the modal coordinates from a mode-superposition solution.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LSTEP, SBSTEP

Print the solution identified as load step *LSTEP* and substep *SBSTEP*.

TIMFRQ

As an alternative to *LSTEP* and *SBSTEP*, print the solution at the time value *TIMFRQ* (for **ANTYPE (p. 162)**,TRANS) or frequency value *TIMFRQ* (for **ANTYPE (p. 162)**,HARMIC). *LSTEP* and *SBSTEP* should be left blank.

KIMG

Key for printing real or imaginary solution. Valid only for **ANTYPE (p. 162)**,HARMIC.

0 (or blank)

Print the real solution (default).

1

Print the imaginary solution.

2

Print the amplitude.

HIbeg, HIend

For cyclic symmetry solutions, print the solutions in the harmonic index solution range *HIbeg* to *HIend*. Defaults to all harmonic indices (all modes).

Matrix

Create an APDL Math dense matrix with the name entered on this field (up to 32 characters; for nomenclature guidelines see Guidelines for Parameter Names in the *Ansys Parametric Design Language Guide*). The matrix contains the modal coordinates. By default (*Matrix* = blank), no APDL Math matrix is created.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

PRMC (p. 1499) prints the modal coordinates (the factors which modes may be multiplied by to obtain their contribution to the response) at a certain time point (transient analyses) or frequency point (harmonic analyses).

The printout contains four columns: the mode number (labelled MODE), the modal frequency (labelled FREQ), the modal coordinate or mode multiplier (labelled MULT), and the normalized modal coordinate (labelled NORM). The normalized modal coordinate is the ratio of absolute value of the mode multiplier divided by the sum of the absolute values of all multipliers listed (at a solution time/frequency and harmonic index). It may be useful for identifying the dominant modes. Maximum values of each column are also listed at the end of each report.

By default, the real part of the modal coordinate values are printed even if the modal coordinates are complex.

When *Matrix* is specified, an APDL Math dense matrix similar to the one created with the ***DMAT (p. 551)** command is created. If **PRMC (p. 1499)** is issued multiple times with the same name entered on *Matrix* or if a matrix with the specified name already exists, the matrix is overwritten. This matrix contains four to five columns depending on the analysis. The first four columns are the ones printed by **PRMC (p. 1499)**. The fifth column contains the harmonic index for cyclic analysis only. This matrix can then be used in APDL Math data processing and file handling (See APDL Math in the *Ansys Parametric Design Language Guide*). For instance, ***EXPORT (p. 716)** can be issued to export the **PRMC (p. 1499)** data to a `.csv` file.

For transient analyses, a `.rdsp` file must be available. For harmonic analyses, a `.rfrq` file must be available. The content of these files depends on the **OUTRES (p. 1336)** command settings. Note that the default for mode-superposition transient analysis is to write the reduced displacement file every 4th substep. For more information, see Command Default (p. 1341) in the **OUTRES (p. 1336)** command description.

For a cyclic harmonic mode-superposition analysis, use the **CYCFILES (p. 457)** command to identify the `.rfrq` and modal `.rst` files. For other analyses, use the **FILE (p. 752)** command to specify the `.rdsp` or `.rfrq` file.

This information can also be obtained from the optional `Jobname.mcf` text file (see the **TRNOPT (p. 2017)** and **HROPT (p. 912)** commands), and it can be plotted using the **PLMC (p. 1421)** command. For more information on modal coordinates, see Mode-Superposition Method in the *Mechanical APDL Theory Reference*

Example Usage

```
/POST1
FILE,,rdsp                    ! Specify Jobname.rdsp file from a previous MSUP transient analysis
! Print modal coordinates from the second loadstep and fourth substep
PRMC,2,4,,,,,MAT              ! also create an APDL Math matrix called MAT
*EXPORT,MAT,CSV,PRMCFILE.CSV  ! Export MAT to a .csv file
```

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PRNEAR, *Lab*, *Opt*, *KCN*, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*, *VAL7*, *VAL8*, *VAL9*

Prints the pressure in the near zone exterior to the equivalent source surface.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Print the maximum pressure or sound pressure level:

POINT

at the point (x,y,z)

SPHERE

on the spherical structure

PATH

along the path

Opt

PSUM

Maximum complex pressure for acoustics.

PHAS

Phase angle of complex pressure for acoustics.

SPL

Sound pressure level for acoustics.

SPLA

A-weighted sound pressure level for acoustics (dBA).

KCN

KCN is the coordinate system reference number. It may be 0 (Cartesian) or any previously defined local coordinate system number (>10). Defaults to 0.

VAL1, VAL2, VAL3, . . . , VAL9

For *Lab* = POINT:

VAL1

x coordinate value

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL2

y coordinate value

VAL3

z coordinate value

VAL4 - VAL8

not used

VAL9

Thickness of model in z direction (defaults to 0).

For *LAB* = SPHERE:

VAL1

Radius of spherical surface in spherical coordinate system.

VAL2

Starting ϕ angle (degree) in the spherical coordinate system. Defaults to 0.

VAL3

Ending ϕ angle (degree) in the spherical coordinate system. Defaults to 0.

VAL4

Number of divisions between the starting and ending ϕ angles for data computations. Defaults to 0.

VAL5

Starting θ angle (degrees) in the spherical coordinate system. Defaults to 0 in 3D and 90 in 2D extension.

VAL6

Ending θ angle (degrees) in the spherical coordinate system. Defaults to 0 in 3D and 90 in 2D extension.

VAL7

Number of divisions between the starting and ending θ angles for data computations. Defaults to 0.

VAL8

Reference rms sound pressure. Defaults to $2x10^{-5}$ Pa.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL9

Thickness of 2D model extension in z direction (defaults to 0).

For *Lab* = **PATH (p. 1354)**, **PRNEAR (p. 1501)** computes the pressure for the path data points for the path currently defined by the **PATH (p. 1354)** and **PPATH (p. 1463)** commands.

Notes

The command uses the equivalent source principle to calculate the pressure in the near zone exterior to the equivalent source surface (flagged with the Maxwell surface flag in the preprocessor) for one of the following locations:

- A point X, Y, Z in the KCN coordinate system
- A spherical surface in the KCN coordinate system
- A path defined by the **PATH (p. 1354)** and **PPATH (p. 1463)** commands

To list the pressure results for a path, use the **PRPATH (p. 1517)** command. See **HFSYM (p. 905)** command for the model symmetry.

To retrieve saved equivalent source data, issue the **SET (p. 1724)**,*Lstep*,*Sbstep*,,REAL command.

Menu Paths

This command cannot be accessed from a menu.

PRNLD,*Lab*,*TOL*,*Item*

Prints the summed element nodal loads.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Nodal reaction load type. If blank, use the first ten of all available labels. Valid labels are:

Structural force labels: FX, FY or FZ (forces); F (FX, FY and FZ); MX, MY or MZ (moments); M (MX, MY and MZ).

Thermal force labels: HEAT, HBOT, HE2, HE3, . . ., HTOP (heat flow).

Fluid force labels: FLOW (fluid flow); VFX, VFY and VFZ (fluid "forces"); VF (VFX, VFY and VFZ).

Electric force labels: AMPS (current flow); CHRG (charge); CURT (current); VLTG (voltage drop).

Magnetic force labels: FLUX (magnetic flux); CSGZ (magnetic current segment).

Diffusion label: RATE (diffusion flow rate).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TOL

Tolerance value about zero within which loads are not printed, as follows:

> 0

Relative tolerance about zero within which loads are not printed. In this case, the tolerance is *TOL* * *Load*, where *Load* is the absolute value of the maximum load on the selected nodes.

0

Print *all* nodal loads.

> 0

Absolute tolerance about zero within which loads are not printed.
Defaults to 1.0E-9 times the absolute value of the maximum load on the selected nodes.

ITEM

Selected set of nodes.

(blank)

Prints the summed element nodal loads for all selected nodes (default), excluding contact elements.

CONT

Prints the summed element nodal loads for contact nodes only.

BOTH

Prints the summed element nodal loads for all selected nodes, including contact nodes.

Notes

Prints the summed element nodal loads (forces, moments, heat flows, flux, etc.) for the selected nodes in the sorted sequence. Results are in the global Cartesian coordinate directions unless transformed (**RSYS (p. 1639)**). Zero values (within a tolerance range) are not printed. Loads applied to a constrained degree of freedom are not included. The **FORCE (p. 772)** command can be used to define which component of the nodal load is to be used (static, damping, inertia, or total).

By default, **PRNLD (p. 1503)** excludes elements TARGE169 - CONTA177. Setting *ITEM* = CONT will only account for nodal forces on selected contact elements (CONTA172, CONTA174, CONTA175, and CONTA177). Setting *ITEM* = BOTH will account for nodal forces on all selected nodes, including contact nodes.

Using PRNLD (p. 1503) in a Spectrum or PSD Analysis (ANTYPE (p. 162), SPECTR)

When using **PRNLD (p. 1503)** in a spectrum analysis (after the combination file has been input through **/INPUT (p. 948)**,,MCOM and when **SPOPT (p. 1837)** has not been issued with *Elcalc* = YES during the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

spectrum analysis), or in a PSD analysis when postprocessing 1-sigma results (loadstep 3, 4, or 5), the following message will display in the printout header:

```
(Spectrum analysis summation is used)
```

This message means that the summation of the element nodal forces is performed prior to the combination of those forces. In this case, **RSYS (p. 1639)** does not apply. The forces are in the nodal coordinate systems, and the vector sum is always printed in the global coordinate system.

The spectrum analysis summation is available when the element results are written to the mode file, `Jobname.mode` (*MSUPkey* = Yes on the **MXPAND (p. 1203)** command).

Because modal displacements cannot be used to calculate contact element nodal forces, *ITEM* does not apply to spectrum and PSD analyses.

Menu Paths

Main Menu>General Postproc>List Results>Nodal Loads

Utility Menu>List>Results>Nodal Loads

PRNSOL, *Item*, *Comp*, --, --, --, *Avg*, *DataKey*

Prints nodal solution results.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Label identifying the item. Valid item labels are shown in the table below. Some items also require a component label. For selected result output, specify SRES and see Table 222: PRNSOL - Selected Result (SRES) Component Labels (p. 1514).

Comp

Component of the item (if required). Valid component labels are shown in the table below. Default = COMP.

--, --, --

Unused fields.

Avg

Specifies whether random acoustic results are averaged. Valid only for *Item* = U and PRES.

(blank)

No averaging (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AVG

Print averaged results for random acoustics.

DataKey

Key to specify which data is printed:

AUTO

Nodal-averaged results are used if available; otherwise, the element-based data is used, if available. (Default.)

ESOL

Only element-based results are used. If they are not available, the command is ignored.

NAR

Only nodal-averaged results are used. If they are not available, the command is ignored.

Notes

Prints the nodal solution results for the selected nodes in the sorted sequence. For reinforcing elements (REINF*nnn*), results are printed at intersection points of reinforcing elements and base elements.

For example, **PRNSOL (p. 1505)**,U,X prints the X component of displacement vector U (that is, the UX degree of freedom).

Component results are in the global Cartesian coordinate directions unless transformed (**RSYS (p. 1639)**).

Various element results also depend upon the recalculation method and the selected results location (**AVPRIN (p. 210)**, **RSYS (p. 1639)**, **LAYER (p. 1015)**, **SHELL (p. 1784)**, and **NSEL (p. 1266)**).

If **LAYER (p. 1015)** is issued, the resulting output is listed in full graphics mode (**/GRAPHICS (p. 866)**,FULL).

You can define which component of the nodal load (static, damping, inertia, or total) should be used (**FORCE (p. 772)**).

PowerGraphics can affect your nodal solution listings. For PowerGraphics (**/GRAPHICS (p. 866)**,POWER), results are listed for the model exterior surfaces only.

When shell element types are present, results are output on a surface-by-surface basis. For shell elements (such as SHELL181 or SHELL281), and for ELBOW290, printed output is for both the top and bottom surfaces. For solid elements such as SOLID185, the output is averaged for each surface and printed as follows:

- **Node at a vertex:** Three lines are output (one printed line for each surface).
- **Node on an edge:** Two lines are output (one printed line for each surface).
- **Nodes on a face:** One value is output.
- **Nodes interior to the volume:** No printed values are output.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If a node is common to more than one element, or if a geometric discontinuity exists, several conflicting listings may result. For example, a corner node incorporating results from solid elements and shell elements could yield as many as nine different results; the printed output would be averages at the top and bottom for the three shell surfaces plus averages at the three surfaces for the solid, for a total of nine lines of output. The program does not average result listings across geometric discontinuities when shell element types are present. It is important to analyze the listings at discontinuities to ascertain the significance of each set of data.

When only reinforcing elements (REINF*nnn*) are selected, results are listed for intersection points of reinforcing elements and base elements. Prints include coordinates of intersection points in global Cartesian coordinate system and results. Results are interpolated from the results of base elements. If a point is common to more than one reinforcing element, or reinforcing member within one reinforcing element, averaged results are printed. Prints also include minimum and maximum values.

The printed output for full graphics (**/GRAPHICS (p. 866)**,FULL) averages results at the node. For shell elements, the default for display is TOP so that the results for the top of the shell are averaged with the other elements attached to that node.

If **NSORT (p. 1283)**, **ESORT (p. 680)** or **/ESHAPE (p. 665)** is issued with PowerGraphics enabled (**/GRAPHICS (p. 866)**,POWER), **PRNSOL (p. 1505)** behaves as though full graphics mode is enabled (**/GRAPHICS (p. 866)**,FULL).

Items not supported by PowerGraphics are noted in Table 221: PRNSOL - General Result Item and Component Labels (p. 1507).

For *Item* = SRES, selected result component (**OSRESULT (p. 1327)**) values are output. See Table 222: PRNSOL - Selected Result (SRES) Component Labels (p. 1514).

To print midside nodes, first issue **/EFACET (p. 602)**,2.

To learn more about the specific behaviors of **PRNSOL (p. 1505)** in a cyclic symmetry analysis and printing results for nodes at cyclic edges, see Using the /CYCEXPAND Command in the *Cyclic Symmetry Analysis Guide*.

If nodal-averaged results (**OUTRES (p. 1336)**,NAR or another nodal-averaged label) are in the database, then **PRNSOL (p. 1505)** uses the nodal-averaged data for the applicable items (S, EPEL, EPPL, EPCR, EPTH, EPSW) by default. You can change this behavior via the *DataKey* argument. Keep these points in mind when using nodal-averaged results:

- The **LAYER (p. 1015)** and **RSYS (p. 1639)**,SOLU commands are not valid with nodal-averaged results. If these commands are used, the element solution is printed instead if applicable.
- Issuing **ESEL (p. 661)** before printing nodal-averaged results has no effect on the output.
- PowerGraphics is supported. The output is equivalent to the full model graphics output, but only the appropriate surface nodes are printed. See Postprocessing Nodal-Averaged Results in the *Element Reference* for details.

Table 221: PRNSOL - General Result Item and Component Labels

General Item and Component Labels **PRNSOL (p. 1505)**, *Item*, *Comp*		
Item	**Comp**	**Description**
Valid item and component labels for nodal degree of freedom results are:		

General Item and Component Labels PRNSOL (p. 1505), *Item, Comp*		
Item	**Comp**	**Description**
U	X, Y, Z	X, Y, or Z structural displacement.
	COMP	X, Y, and Z structural displacements and vector sum.
ROT	X, Y, Z	X, Y, or Z structural rotation.
	COMP	X, Y, and Z structural rotations and vector sum.
TEMP[a]		Temperature.
PRES		Pressure.
VOLT		Electric potential.
GFV1, GFV2, GFV3		Nonlocal field values 1, 2, and 3.
MAG		Magnetic scalar potential.
CONC		Concentration.[b]
V	X, Y, Z	X, Y, or Z fluid velocity in a fluid analysis.
	COMP	X, Y, and Z fluid velocity and vector sum in a fluid analysis.
A	X, Y, Z	X, Y, or Z magnetic vector potential in an electromagnetic analysis.
	COMP	X, Y, and Z magnetic vector potential and vector sum in an electromagnetic analysis.
VEL	X, Y, Z	X, Y, or Z velocity in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
	COMP	X, Y, and Z velocity and vector sum in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
ACC	X, Y, Z	X, Y, or Z acceleration in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
	COMP	X, Y, and Z acceleration and vector sum in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
OMG	X, Y, Z	X, Y, or Z rotational velocity in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
	COMP	X, Y, and Z rotational velocity and vector sum in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
DMG	X, Y, Z	X, Y, or Z rotational acceleration in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
	COMP	X, Y, and Z rotational acceleration and vector sum in a structural transient dynamic analysis (**ANTYPE (p. 162)**,TRANS).
CURR		Current.
EMF		Electromotive force drop.
DOF		All available degree of freedom labels (10 maximum).
FICT	TEMP	Fictive temperature.
SPL		Sound pressure level.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PRNSOL (p. 1505), *Item, Comp*		
Item	**Comp**	**Description**
SPLA		A-weighted sound pressure level (dBA).
VNS		Normal velocity on the structural surface.[c]
ENKE		Acoustic diffusion energy density
Valid item and component labels for element results are:		
S	COMP	X, Y, Z, XY, YZ, and XZ component stresses.[d]
	PRIN	S1, S2, S3 principal stresses, SINT stress intensity, and SEQV equivalent stress.[d]
EPEL	COMP	Component elastic strains.[d]
	PRIN	Principal elastic strains, strain intensity, and equivalent strain.[d]
	FAIL	Maximum Strain Failure Criteria.[b][e]
EPTH	COMP	Component thermal strains.[d]
	PRIN	Principal thermal strains, strain intensity, and equivalent strain.[d]
EPDI	COMP	Component diffusion strains.
	PRIN	Principal diffusion strains, strain intensity, and equivalent strain.
EPPL	COMP	Component plastic strains.[d]
	PRIN	Principal plastic strains, strain intensity, and equivalent strain.[d]
EPCR	COMP	Component creep strains.[d]
	PRIN	Principal creep strains, strain intensity, and equivalent strain.[d]
EPSW		Swelling strain.[d]
EPTO	COMP	Component total mechanical strains (EPEL + EPPL + EPCR).
	PRIN	Principal total mechanical strains, strain intensity, and equivalent strain.
EPTT	COMP	Component total mechanical, thermal, diffusion, and swelling strains (EPEL + EPPL + EPCR + EPTH + EPDI + EPSW).
	PRIN	Principal total mechanical, thermal, diffusion, and swelling strains, strain intensity, and equivalent strain.
NL		Nonlinear items (SEPL, SRAT, HPRES, EPEQ, CREQ, PSV, PLWK).
SEND	ELASTIC[f]	Elastic strain energy density. (For viscoelastic and sintering materials, the stored energy.)
	PLASTIC	Plastic strain energy density.
	CREEP	Creep strain energy density.
	DAMAGE	Damage strain energy density.
	VDAM[f]	Viscoelastic dissipation energy density.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PRNSOL (p. 1505), *Item, Comp*		
Item	**Comp**	**Description**
	VREG	Visco-regularization strain energy density.
	DISS	Structural-thermal dissipation.
	ENTO	Total strain energy density (sum of ELASTIC, PLASTIC, and CREEP strain energy densities).
CDM	DMG	Damage variable.
	LM	Maximum previous strain energy for virgin material.
FAIL		Failure criteria.[b][e] **Default components:** Maximum of all failure criteria defined at current location (MAX), maximum strain (EMAX), maximum stress (SMAX), Tsai-Wu Strength Index (TWSI), inverse of Tsai-Wu Strength Ratio Index (TWSR). **Other available components:** Other available components: Hashin Fiber Failure (HFIB), Hashin Matrix Failure (HMAT), Puck Fiber Failure (PFIB), Puck Matrix Failure (PMAT), LaRc03 Fiber Failure (L3FB), LaRc03 Matrix Failure (L3MT), LaRc04 Fiber Failure (L4FB), LaRc04 Matrix Failure (L4MT), and any user-defined failure criteria (USR1 through USR9).[g] Issue **FCTYP (p. 740)** to activate or remove failure criteria.
PFC		Failure criteria based on the effective stresses in the damaged material. **Components:** Maximum of all failure criteria defined at current location (MAX), fiber tensile failure (FT), fiber compressive failure (FC), matrix tensile failure (MT), and matrix compressive (MC).
PDMG		Progressive damage parameters. **Components:** Damage status (STAT, 0 = undamaged, 1 = damaged, 2 = complete damage), fiber tensile damage variable (FT), fiber compressive damage variable (FC), matrix tensile damage variable (MT), matrix compressive damage variable (MC), shear damage variable (S), energy dissipated per unit volume (SED), energy per unit volume due to viscous damping (SEDV).
SVAR[h]	1, 2, 3, ... N	State variable.
GKS	COMP	X, XY, XZ component gasket stress.
GKD	COMP	X, XY, XZ component gasket total closure.
GKDI	COMP	X, XY, XZ component gasket total inelastic closure.

General Item and Component Labels PRNSOL (p. 1505), *Item, Comp*		
Item	**Comp**	**Description**
GKTH	COMP	X, XY, XZ component thermal closure.
SS	X, XY, XZ	Interface traction (stress).
SD	X, XY, XZ	Interface separation.
CONT		Contact items (STAT[i], PENE, PRES, SFRIC, STOT, SLIDE, GAP, FLUX, CNOS, FPRS). See component descriptions in PLNSOL (p. 1425).
TG	COMP	Component thermal gradients and vector sum.[j]
TF	COMP	Component thermal fluxes and vector sum.[j]
PG	COMP	Components and vector sum for velocity or energy density flux (room acoustics).
EF	COMP	Component electric fields and vector sum.
D	COMP	Component electric flux densities and vector sum.
H	COMP	Component magnetic field intensities and vector sum.
B	COMP	Component magnetic flux densities and vector sum.
CG	COMP	Component concentration gradient or vector sum.
DF	COMP	Component diffusion flux density or vector sum.
FMAG	COMP	Component electromagnetic forces and vector sum.[b]
JC	COMP	Conduction current density for elements that support conduction current calculation. Components (X, Y, Z) and vector sum (SUM).[b]
BFE		Body temperatures (calculated from applied temperatures) as used in solution (area and volume elements only).
CAP		Material cap plasticity model only: Cohesion (C0); hydrostatic compaction yielding stress (X0); I1 at the transition point at which the shear and compaction envelopes intersect (K0); ZONE = 0: elastic state, ZONE = 1: compaction zone, ZONE = 2: shear zone, ZONE = 3: expansion zone; effective deviatoric plastic strain (DPLS); volume plastic strain (VPLS).
EDPC		Material EDP creep model only (not including the cap model): Equivalent creep stress (CSIG); equivalent creep strain (CSTR).
ESIG	COMP or blank	Components of Biot's effective stress.
	PRIN	Principal stresses of Biot's effective stress.
	INT	Stress intensity of Biot's effective stress.
	EQV	Equivalent stress of Biot's effective stress.
DPAR	TPOR	Total porosity (Gurson material model).
	GPOR	Porosity due to void growth.
	NPOR	Porosity due to void nucleation.
FFLX	COMP	Fluid flow flux in poromechanics.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels PRNSOL (p. 1505), *Item, Comp*		
Item	**Comp**	**Description**
FGRA	COMP	Fluid pore pressure gradient components in poromechanics.
PMSV	COMP	Void volume ratio, pore pressure, degree of saturation, and relative permeability for coupled pore-pressure CPT elements.
NS	COMP	Nominal strain for hyperelastic material, reported in the current configuration (unaffected by **RSYS (p. 1639)**).
MPLA	DMAC, DMAX	Microplane damage, macroscopic and maximum values.
MPDP		Microplane homogenized total, tension, and compression damages (TOTA, TENS, COMP), and split weight factor (RW).
DAMAGE		Damage in directions 1, 2, 3 (1, 2, 3) and the maximum damage (MAX).
GDMG		Damage
IDIS		Structural-thermal dissipation rate
BKS	X, Y, Z, XY, YZ, XZ	Total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements.
BKS1, . . . ,BKS5	X, Y, Z, XY, YZ, XZ	Superimposed components of the total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements when more than one superimposed back-stress component is defined.
EPFR		Free strain in porous media
SNDI	COMP	Component sound intensity and vector sum.[b]
FC1S	1,2,3,4,5,6	First set of six components of FCC crystal slip. Available for 3D elements only.
FC2S	1,2,3,4,5,6	Second set of six components of FCC crystal slip. Available for 3D elements only.
HC1S	1,2,3,4,5,6	Six components of HCP crystal slip on basal and prismatic systems. Available for 3D elements only.
HC2S	1,2,3,4,5,6	Six components of HCP crystal slip on pyramidal system. Available for 3D elements only.
HC3S	1,2,3,4,5,6	First set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC4S	1,2,3,4,5,6	Second set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC5S	1,2,3,4,5,6	Six components of HCP crystal slip on the second-order pyramidal system. Available for 3D elements only.
BC1S	1,2,3,4,5,6	First set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC2S	1,2,3,4,5,6	Second set of six components of BCC slip on 111 plane. Available for 3D elements only.

General Item and Component Labels PRNSOL (p. 1505), *Item*, *Comp*		
Item	**Comp**	**Description**
BC8H	1,2,3,4,5,6	Fourth set of six components of BCC hardness on 123 plane. Available for 3D elements only.
XELG	1,2,3,45,6,EQV	Crystal Lagrangian strain in 11, 22, 33, 12, 23,13 directions and its equivalent. Available for 3D elements only.
SINT	RHO, ETA, SSTR, GRAIN	Sintering relative density, viscosity, sintering stress, and average grain size values.

[a] For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use the labels TBOT, TE2, TE3, . . ., TTOP instead of TEMP.

[b] Not supported by PowerGraphics.

[c] Valid only for SHELL181, SOLID185, SOLID186, SOLID187, SOLSH190, and SHELL281.

[d] This item outputs nodal-averaged results if they are available on the results file.

[e] Works only if failure criteria are provided (**FC (p. 732)** and **TB (p. 1899)**).

[f] The results for this postprocessing SEND component are invalid for ELBOW290 if that element is used with viscoelastic or viscohyperelastic materials.

[g] USR1 through USR9 require a failure-criteria routine.

[h] Not supported by PowerGraphics.

[i] For contact elements CONTA172, CONTA174, CONTA175, and CONTA177, the reported data are averaged across the element. To obtain a more meaningful STAT value, use **PRESOL (p. 1481)**.

[j] No vector sum is calculated for coupled pore-pressure-thermal (CPT*nnn*) elements.

Table 222: PRNSOL - Selected Result (SRES) Component Labels

PRNSOL (p. 1505),SRES,*Comp*	
Comp	**Description**
SVAR*n*	The *n*th state variable.
FLDUF0*n*	The *n*th user-defined field variable.
ItemComp (concatenated *Item* + *Comp* label) from Table 208: OSRESULT - Item and Component Labels (p. 1328)[a]	See the table (p. 1328) for the combined item and component description.

PROD, *IR*, *IA*, *IB*, *IC*, *Name*, - -, - -, *FACTA*, *FACTB*, *FACTC*

Multiplies variables.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA, IB, IC

Reference numbers of the three variables to be operated on. If only two leave *IC* blank. If only one, leave *IB* blank also.

Name

Thirty-two character name identifying the variable on printouts and displays. Embedded blanks are compressed for output.

--, --

Unused fields

FACTA, FACTB, FACTC

Scaling factors (positive or negative) applied to the corresponding variables (default to 1.0).

Notes

Multiplies variables (up to three at once) according to the operation:

IR = (*FACTA* x *IA*) x (*FACTB* x *IB*) x (*FACTC* x *IC*)

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Multiply

PRORB, *WhrlNodKey*

Prints the orbital motion characteristics of a rotating structure

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WhrlNodKey

Flag to print the whirl for each node:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1 (ON or YES)

Print the whirl for each node.

0 (OFF or NO)

No printout. This value is the default.

Notes

When a structure is rotating and the Coriolis or gyroscopic effect is taken into account (**CORIOLIS (p. 417)**), nodes lying on the rotation axis generally exhibit an elliptical orbital motion. The **PRORB (p. 1515)** command prints out the orbit characteristics A, B, PSI, PHI, YMAX, ZMAX, and Whirl of each rotating node, where

A is the semi-major axis.

B is the semi-minor axis.

PSI is the angle between local y axis and major axis.

PHI is the angle between initial position (t = 0) and major axis.

YMAX is the maximum displacement along local y axis.

ZMAX is the maximum displacement along local z axis.

Whirl is the direction of an orbital motion (BW for backward whirl and FW for forward whirl).

Angles PSI and PHI are in degrees and within the range of -180 through +180.

To *display* the characteristics of the orbital path traversed by each node, issue the **PLORB (p. 1437)** command.

The **PRORB (p. 1515)** command is valid for line elements (such as BEAM188, BEAM189, PIPE288, and PIPE289). **PRORB (p. 1515)** is not supported for beam elements with the warping degree of freedom activated.

Your model must also involve a rotational velocity (**OMEGA (p. 1324)** or **CMOMEGA (p. 368)**) with Coriolis enabled (**CORIOLIS (p. 417)**).

Because orbit data is written in the database, a **SET (p. 1724)** command must be issued after the **PRORB (p. 1515)** command to ensure proper output for subsequent postprocessing commands.

The coordinate system for displaying nodal results must be global Cartesian (**RSYS (p. 1639)**,*KCN* = 0). **PRORB (p. 1515)** is not supported if nodes are rotated in a cylindrical coordinate system.

PRPATH, *Lab1*, *Lab2*, *Lab3*, *Lab4*, *Lab5*, *Lab6*

Prints path items along a geometry path.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab1*, *Lab2*, *Lab3*, . . . , *Lab6

Labels identifying the path items to be printed. Up to six items may be printed at a time. Predefined path geometry items XG, YZ, ZG, and S (**PDEF (p. 1372)**) may also be printed.

Notes

Prints path items with respect to a geometry path (as defined by the **PATH (p. 1354)** and **PPATH (p. 1463)** commands). Path items and their labels must have been defined with the **PDEF (p. 1372)**, **PVECT (p. 1556)**, **PCALC (p. 1362)**, **PDOT (p. 1375)**, **PCROSS (p. 1371)**, or **PRNEAR (p. 1501)** commands. Path items may also be displayed with the **PLPATH (p. 1439)** and **PLPAGM (p. 1438)** commands. See the **PRANGE (p. 1464)** command for range control of the path.

Fore more information, see Mapping Results onto a Path in the *Basic Analysis Guide*.

PRRFOR, *Lab*

Prints the constrained node reaction solution. Used with the FORCE (p. 772) command.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Nodal reaction load type. If blank, use the first ten of all available labels. Valid labels are:

Structural force labels: FX, FY or FZ (forces); F (FX, FY and FZ); MX, MY or MZ (moments); M (MX, MY and MZ).

Thermal force labels: HEAT, HBOT, HE2, HE3, . . ., HTOP (heat flow).

Fluid force labels: FLOW (fluid flow); VFX, VFY and VFZ (fluid forces); VF (VFX, VFY and VFZ).

Electric force labels: AMPS (current flow); CHRG (charge); CURT (current); VLTG (voltage drop).

Magnetic force labels: FLUX (magnetic flux); CSGZ (magnetic current segment); CURT (current), VLTG (voltage drop).

Diffusion labels: RATE (diffusion flow rate).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

PRRFOR (p. 1517) has the same functionality as the **PRRSOL (p. 1518)** command; use **PRRFOR (p. 1517)** instead of **PRRSOL (p. 1518)** when a **FORCE (p. 772)** command has been issued.

In a non-spectrum analysis, if either contact or pretension elements exist in the model, **PRRFOR (p. 1517)** uses the **PRRSOL (p. 1518)** command internally and the **FORCE (p. 772)** setting is ignored.

Because modal displacements cannot be used to calculate contact element nodal forces, those forces are not included in the spectrum and PSD analyses reaction solution. As a consequence, the **PRRFOR (p. 1517)** command is not supported when constraints on contact element pilot nodes are present.

PRRFOR (p. 1517) is not valid when using the amplitude or phase results set (*KIMG* = AMPL or PHAS on the **SET (p. 1724)** command). Use **PRRSOL (p. 1518)** instead.

Using PRRFOR (p. 1517) in a Spectrum or PSD Analysis (ANTYPE (p. 162),SPECTR)

When using **PRRFOR (p. 1517)** in a spectrum analysis (after the combination file has been input through **/INPUT (p. 948)**,,MCOM and when **SPOPT (p. 1837)** has not been issued with *Elcalc* = YES during the spectrum analysis), or in a PSD analysis when postprocessing 1-sigma results (loadstep 3, 4, or 5), the following message will display in the printout header:

```
(Spectrum analysis summation is used)
```

This message means that the summation of the element nodal forces is performed prior to the combination of those forces. In this case, **RSYS (p. 1639)** does not apply, and the reaction forces are in the nodal coordinate systems. Unlike **PRRSOL (p. 1518)**, which retrieves the forces from the database, the **PRRFOR (p. 1517)** command calculates the forces in the postprocessor.

The spectrum analysis summation is available when the element results are written to the mode file, `Jobname.mode` (*MSUPkey* = Yes on **MXPAND (p. 1203)**).

The spectrum analysis summation is not available after reading a load case (**LCWRITE (p. 1031)**, **LCZERO (p. 1032)**, **LCASE (p. 1019)**).

Menu Paths

This command cannot be accessed from a menu.

PRRSOL, *Lab*

Prints the constrained node reaction solution.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Nodal reaction load type. If blank, use the first ten of all available labels. Valid labels are:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Structural force labels: FX, FY or FZ (forces); F (FX, FY and FZ); MX, MY or MZ (moments); M (MX, MY and MZ); BMOM (bimoments).

Thermal force labels: HEAT, HBOT, HE2, HE3, . . ., HTOP (heat flow).

Fluid force labels: FLOW (fluid flow); VFX, VFY and VFZ (fluid forces); VF (VFX, VFY and VFZ).

Electric force labels: AMPS (current flow); CHRG (charge); CURT (current); VLTG (voltage drop).

Magnetic force labels: FLUX (magnetic flux); CSGZ (magnetic current segment); CURT (current), VLTG (voltage drop).

Diffusion labels: RATE (diffusion flow rate).

Notes

Prints the constrained node reaction solution for the selected nodes in the sorted sequence. For coupled nodes and nodes in constraint equations, the sum of all reactions in the coupled or constraint equation set appears at the primary node of the set. Results are in the global Cartesian coordinate directions unless transformed (**RSYS (p. 1639)**).

PRRSOL (p. 1518) is not valid if any load is applied to a constrained node in the direction of the constraint and any of the following is true:

- **LCOPER (p. 1026)** has been used.
- **LCASE (p. 1019)** has been used to read from a load case file.
- The applied loads and constraints in the database are not the ones used to create the results data being processed.

PRRSOL (p. 1518) provides the total reaction solution (static, plus damping, plus inertial, as appropriate based on the analysis type); however, modal reactions include only the static contribution.

Use **PRRFOR (p. 1517)** instead of **PRRSOL (p. 1518)** with the **FORCE (p. 772)** command to obtain only the static, damping, or inertial components.

When using distributed-memory parallel processing, in a spectrum analysis or a PSD analysis performed with *Elcalc* = YES on the **SPOPT (p. 1837)** command, use **PRRFOR (p. 1517)** instead of **PRRSOL (p. 1518)** to print the maximum reaction forces (spectrum analysis) or reaction forces variances of 1-σ solutions, as **PRRSOL (p. 1518)** may lead to more conservative results.

PRSCONTROL, *Key*

Specifies whether to include pressure load stiffness in the element stiffness formation.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Pressure load stiffness key. In general, use the default setting. Use a non-default setting only if you encounter convergence difficulties. Pressure load stiffness is automatically included when using eigenvalue buckling analyses (**ANTYPE (p. 162)**,BUCKLE), equivalent to *Key* = INCP. For all other types of analyses, valid arguments for *Key* are:

NOPL

Pressure load stiffness not included for any elements.

(blank) (default)

Include pressure load stiffness for elements SURF153, SURF154, SURF156, SURF159, SHELL181, PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, SOLSH190, BEAM188, BEAM189, FOLLW201, SHELL208, SHELL209, SOLID272, SOLID273, SHELL281, SOLID285, PIPE288, PIPE289, and ELBOW290.

Notes

This command is rarely needed. The default settings are recommended for most analyses.

Menu Paths

This command cannot be accessed from a menu.

PRSECT, *RH0*, *KBR*, *KBR3D*

Calculates and prints linearized stresses along a section path.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RH0

In-plane (X-Y) average radius of curvature of the inside and outside surfaces of an axisymmetric section. If zero (or blank), a plane or 3D structure is assumed. If nonzero, an axisymmetric structure is assumed. Use any large number (or -1) for an axisymmetric straight section.

KBR

Through-thickness bending stresses key for an axisymmetric analysis (*RH0* $\neq$ 0):

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Include the thickness-direction bending stresses.

1

Ignore the thickness-direction bending stresses.

2

Include the thickness-direction bending stress using the same formula as the Y (axial direction) bending stress. Also use the same formula for the shear stress.

KBR3D

Through-thickness bending stresses key for 3D geometry (*RH0* = 0):

0

Include the thickness-direction bending stresses.

1

Ignore the following thickness-direction bending stresses: SX, SXY, SXZ

Notes

You may want to linearize the stresses through a section and separate them into categories for various code calculations. **PRSECT (p. 1520)** calculates and reports linearized stresses along a section path. The linearized stresses are also separated into membrane, bending, membrane plus bending, peak, and total stress categories.

Define your section path (**PATH (p. 1354)** and **PPATH (p. 1463)** with the NODE option). Your path must lie entirely within the selected set of elements (that is, no element gaps may exist along the path). **PATH (p. 1354)** and **PPATH (p. 1463)** only retrieve the two end nodes; the path data is not retained. The section path is defined by the two end nodes, and by 47 intermediate points that are automatically determined by linear interpolation in the active display coordinate system (**DSYS (p. 582)**). The number and location of the intermediate points are not affected by the number of divisions set by **PATH (p. 1354)**,,,,*nDiv*.

Your linearized component stress values are obtained by interpolating each element's average corner nodal values along the section path points within each path element. **PRSECT (p. 1520)** reports the linearized component and principal stresses for each stress category at the beginning, mid-length, and end of the section path. **PRPATH (p. 1517)** can be used to report the total stresses at the intermediate points.

Section paths can be through any set of solid (2D plane, 2D axisymmetric or 3D) elements; however, section paths are usually defined to be through the thickness of the structure and normal to the inner and outer structure surfaces. Section paths (in-plane only) can also be defined for shell element structures.

If the *RH0* option is set to indicate the axisymmetric option (non-zero), **PRSECT (p. 1520)** reports the linearized stresses in the section coordinates (SX – along the path, SY – normal to the path, and SZ – hoop direction). If the *RH0* option is set to indicate the 2D planar or 3D option (zero or blank), **PRSECT (p. 1520)**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

reports the linearized stresses in the active results coordinate system (**RSYS (p. 1639)**]. If the *RH0* option is zero or blank and either **RSYS (p. 1639)**, SOLU or **RSYS (p. 1639)**, -1 are active, the linearized stresses are calculated and reported in the global Cartesian coordinate system.

Linearized stress calculations should be performed in a rectangular coordinate system. Principal stresses are recalculated from the component stresses and are invariant with the coordinate system as long as SX is in the same direction at all points along the defined path. The **PLSECT (p. 1440)** command displays the linearized stresses in the same coordinate system as reported by **PRSECT (p. 1520)**.

Stress components through the section are linearized by a line integral method and separated into constant membrane stresses, bending stresses varying linearly between end points, and peak stresses (defined as the difference between the actual (total) stress and the membrane plus bending combination).

For nonaxisymmetric structures, the bending stresses are calculated such that the neutral axis is at the midpoint of the path. Axisymmetric results include the effects of both the radius of revolution (automatically determined from the node locations) and the in-plane average radius of curvature of the section surfaces (user input).

For axisymmetric cases, Mechanical APDL calculates the linearized bending stress in the through-thickness direction as the difference between the total outer fiber stress and the membrane stress if *KBR* = 0. The calculation method may be conservative for locations with a highly nonlinear variation of stress in the through-thickness direction. Alternatively, you can specify *KBR* = 2 to calculate the bending stress using the same method and formula as the Y (axial direction) bending stress. For more information, see the discussion of axisymmetric cases (specifically Equation 17.38) in the *Mechanical APDL Theory Reference*.

In analyses of 3D models with *RH0* = 0, ignoring the calculated out-of-plane bending stresses is recommended in some scenarios when determining the linearized bending stresses. If *KBR3D* = 0, all calculated stresses are included in the linearized bending-stress calculations. If *KBR3D* = 1, these calculated out-of-plane bending stresses are ignored in the linearized bending-stress calculations: SX, SXY, SXZ. (The principal bending-stress calculation for S1, S2, S3, SINT, and SEQV is performed with these zeroed components.)

Portions of this command are not supported by PowerGraphics (**/GRAPHICS (p. 866)**,POWER].

Menu Paths

Main Menu>General Postproc>Path Operations>List Linearized

Utility Menu>List>Results>Linearized Stresses

PRTIME, *TMIN*, *TMAX*

Defines the time range for which data are to be listed.

POST26 (p. 58): Listing (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TMIN

Minimum time (defaults to the first point stored).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TMAX

Maximum time (defaults to the last point stored).

Command Default

Use the previously defined range (**TIMERANGE (p. 2001)**).

Notes

Defines the time (or frequency) range (within the range stored) for which data are to be listed.

Menu Paths

Main Menu>TimeHist Postpro>Settings>List

PRVAR, *NVAR1*, *NVAR2*, *NVAR3*, *NVAR4*, *NVAR5*, *NVAR6*

Lists variables vs. time (or frequency).

POST26 (p. 58): Listing (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR1, NVAR2, NVAR3, . . . , NVAR6

Variables to be displayed, defined either by the reference number or a unique thirty-two character name. If duplicate names are used the command will print the data for the lowest-numbered variable with that name.

Notes

Lists variables vs. time (or frequency). Up to six variables may be listed across the line. Time column output format can be changed using the **/FORMAT (p. 774)** command arguments *Ftype*, *NWIDTH*, and *DSIGNF*.

Menu Paths

Main Menu>TimeHist Postpro>List Variables

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PRVECT,*Item*,*Lab2*,*Lab3*,*LabP*

Prints results as vector magnitude and direction cosines.

POST1 (p. 51): Results (p. 51)
POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Predefined vector item (from Table 223: PRVECT - Valid Item and Component Labels (p. 1524) below) or a label identifying the i-component of a user-defined vector.

Lab2

Label identifying the j-component of a user-defined vector. In most cases, this value must be blank if *Item* is selected from Table 223: PRVECT - Valid Item and Component Labels (p. 1524). Individual principal stresses (*Item* = S) or principal strains (*Item* = EP*xx*) may be printed by specifying the value as 1, 2, or 3.

Lab3

Label identifying the k-component of a user-defined vector. Must be blank if *Item* is selected from list below or for 2D user defined vector.

LabP

Label assigned to resultant vector for printout labeling (defaults to *Item*).

Notes

Prints various solution results as vector magnitude and direction cosines for the selected nodes and/or elements. For example, **PRVECT (p. 1524)**,U prints the displacement magnitude and its direction cosines for all selected nodes. For nodal degree of freedom vector results, direction cosines are with respect to the results coordinate system RSYS. For element results, direction cosines are with respect to the global Cartesian system. Item components may be printed with the **PRNSOL (p. 1505)** command. Various results also depend upon the recalculation method and the selected results location (**LAYER (p. 1015)**, **SHELL (p. 1784)**, **NSEL (p. 1266)**, and **ESEL (p. 661)**). Items may be selected from a set of recognized vector labels (*Item*) or a vector may be defined from up to three scalar labels (*Item*,*Lab2*,*Lab3*). Scalar labels may be user-defined with the **ETABLE (p. 687)** command.

Portions of this command are not supported by PowerGraphics (**/GRAPHICS (p. 866)**,POWER).

Table 223: PRVECT - Valid Item and Component Labels

Item	Comp	Description
Valid item labels for nodal degree of freedom vector results are:		
U		Structural displacement vector magnitude and direction cosines.
ROT		Structural rotation vector magnitude and direction cosines.
V		Velocity vector magnitude and direction cosines.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item	Comp	Description
A		Magnetic vector potential vector magnitude and direction cosines.
	Valid item labels for element results are:	
S		Principal stresses and direction cosines.
EPTO		Principal total strains (EPEL + EPPL + EPCR) and direction cosines.
EPEL		Principal elastic strains and direction cosines.
EPPL		Principal plastic strains and direction cosines.
EPCR		Principal creep strains and direction cosines.
EPTH		Principal thermal strains and direction cosines.
EPDI		Principal diffusion strains and direction cosines.
TG		Thermal gradient vector sum and direction cosines.
TF		Thermal flux vector sum and direction cosines.
PG		Velocity or energy density flux (room acoustics) vector sum and direction cosines.
EF		Electric field vector sum and direction cosines.
D		Electric flux density vector sum and direction cosines.
H		Magnetic field intensity vector sum and direction cosines. If *Lab2* is blank, Item is interpreted as one of the predefined labels; otherwise, Item is interpreted as a user-defined **ET (p. 686)** label and the program requests a non-blank *Lab2*/*Lab3* according to the dimension of the problem.
B		Magnetic flux density vector sum and direction cosines.
CG		Concentration gradient vector sum and direction cosines.
DF		Diffusion flux density vector sum and direction cosines.
FMAG		Electromagnetic force vector sum and direction cosines.
P		Poynting vector sum and direction cosines.
JS		Source current density vector sum and direction cosines for low-frequency magnetic analyses. Total current density vector sum and direction cosines (sum of conduction and displacement current densities) in low frequency electric analyses.
JT		Total measurable current density vector sum and direction cosines in low-frequency electromagnetic analyses. (Conduction current density vector sum and direction cosines in a low-frequency electric analysis.)
JC		Conduction current density vector sum and direction cosines for elements that support conduction current calculation.
SNDI		Sound intensity vector sum and direction cosines.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>General Postproc>List Results>Vector Data

Utility Menu>List>Results>Vector Data

PSCONTROL, *Option*, *Key*

Enables or disables shared-memory parallel operations.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Specify the operations for which you intend to enable/disable parallel behavior:

ALL

Enable/disable parallel for all areas (default).

PREP

Enable/disable parallel during preprocessing (**/PREP7 (p. 1479)**).

SOLU

Enable/disable parallel during solution (**/SOLU (p. 1821)**).

FORM

Enable/disable parallel during element matrix generation.

SOLV

Enable/disable parallel during equation solver.

RESU

Enable/disable parallel during element results calculation.

POST

Enable/disable parallel during postprocessing (**/POST1 (p. 1461)** and **/POST26 (p. 1462)**).

STAT

List parallel operations that are enabled/disabled.

Key

Option control key. Used for all *Option* values except STAT.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON

Enable parallel operation.

OFF

Disable parallel operation.

Command Default

None. The command is ignored if issued with no arguments.

Notes

Use this command in shared-memory parallel operations.

This command is useful when you encounter minor discrepancies in a nonlinear solution when using different numbers of processors. A parallel operation applied to the element matrix generation can produce a different nonlinear solution with a different number of processors. Although the nonlinear solution converges to the same nonlinear tolerance, the minor discrepancy created may not be desirable for consistency.

Enabling/disabling parallel behavior for the solution (*Option* = SOLU) supersedes the activation/deactivation of parallel behavior for element matrix generation (FORM), equation solver (SOLV), and element results calculation (RESU).

The SOLV option supports only the sparse direct and PCG solvers (**EQSLV (p. 648)**,SPARSE *or* PCG). No other solvers are supported.

This command applies only to shared-memory architecture. It does not apply to distributed-memory parallel processing.

Menu Paths

This command cannot be accessed from a menu.

PSDCOM,*SIGNIF*,*COMODE*,,*ForceType*

Specifies the power spectral density mode combination method.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SIGNIF

Combine only those modes whose significance level exceeds the*SIGNIF* threshold. For PSD response (**SPOPT (p. 1837)**,PSD), the significance level is defined as the modal covariance matrix term, divided by the maximum modal covariance matrix term. Any term whose significance level is less than *SIGNIF* is considered insignificant and is not contributed to the mode combinations. The higher the *SIGNIF* threshold, the fewer the number of terms used. *SIGNIF* defaults to 0.0001. If *SIGNIF* is specified as 0.0, it is taken as 0.0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

COMODE

First *COMODE* number of modes to be actually combined. *COMODE* must always be less than or equal to *NMODE* (input quantity *NMODE* on the **SPOPT (p. 1837)** command). *COMODE* defaults to *NMODE*. *COMODE* performs a second level of control for the first sequential *COMODE* number of modes to be combined. It uses the significance level threshold indicated by *SIGNIF* and operates only on the significant modes.

ForceType

Label identifying the forces to be combined:

STATIC

Combine the modal static forces (default).

TOTAL

Combine the modal static plus inertial forces.

Notes

This command is also valid for PREP7. This command is valid only for **SPOPT (p. 1837)**,PSD.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>PSD>Mode Combine

Main Menu>Solution>Load Step Opts>Spectrum>PSD>Mode Combine

PSDFRQ, *TBLNO1*, *TBLNO2*, *FREQ1*, *FREQ2*, *FREQ3*, *FREQ4*, *FREQ5*, *FREQ6*, *FREQ7*

Defines the frequency points for the input spectrum tables PSDVAL vs. PSDFRQ for PSD analysis.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLNO1

Input table number. When used with the **COVAL (p. 420)** or the **QDVAL (p. 1559)** command, *TBLNO1* represents the row number of this table. Up to 200 tables may be defined.

TBLNO2

Input table number. *TBLNO2* is used only for the **COVAL (p. 420)** or the **QDVAL (p. 1559)** commands and represents the column number of this table.

FREQ1, FREQ2, FREQ3, . . . , FREQ7

Frequency points (cycles/time) for spectrum vs. frequency tables. *FREQ1* should be greater than zero, and values must be in ascending order. Log-log interpolation will be used between frequency points.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The spectrum values may be input with the **PSDVAL (p. 1534)**, **COVAL (p. 420)**, or **QDVAL (p. 1559)** commands. A separate **PSDFRQ (p. 1528)** command must be used for each table and cross table defined. Frequencies must be in ascending order.

Repeat **PSDFRQ (p. 1528)** command for additional frequency points. Values are added after the last nonzero frequency. If all fields after **PSDFRQ (p. 1528)** are blank, all input vs. frequency tables are erased. If *TBLNO1* is nonblank, all corresponding **PSDVAL (p. 1534)** tables are erased. If both *TBLNO1* and *TBLNO2* are nonblank, all corresponding **COVAL (p. 420)** and **QDVAL (p. 1559)** tables are erased.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>PSD>Correlation>Cospectral

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>PSD>Correlation>Erase Co & Quad

Main Menu>Solution>Load Step Opts>Spectrum>PSD>PSD vs Freq

PSDGRAPH, *TBLNO1*, *TBLNO2*, *DisplayKey*

Displays input PSD curves.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLNO1

PSD table number to display.

TBLNO2

Second PSD table number to display. *TBLNO2* is used only in conjunction with the **COVAL (p. 420)** or the **QDVAL (p. 1559)** commands.

DisplayKey

Key to display the points markers and numbering:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Display points markers and numbering (default).

1

Display points numbering only.

2

Display points markers only.

3

No points markers or numbering.

Notes

The input PSD tables are displayed in log-log format as dotted lines. The best-fit curves, used to perform the closed-form integration, are displayed as solid lines. If there is a significant discrepancy between the two, then you should add one or more intermediate points to the table to obtain a better fit.

If *TBLN02* is zero, blank, or equal to *TBLN01*, then the autospectra (**PSDVAL (p. 1534)**) are displayed for *TBLN01*. If *TBLN02* is also specified, then the autospectra for *TBLN01* and *TBLN02* are displayed, along with the corresponding cospectra (**COVAL (p. 420)**) and quadspectra (**QDVAL (p. 1559)**), if they are defined.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Loads>Spectrum>Graph PSD Tab

Main Menu>Solution>Spectrum>Graph PSD Tab

PSDRES, *Lab*, *RelKey*

Controls solution output written to the results file from a PSD analysis.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Label identifying the solution output:

DISP

Displacement solution (default). One-sigma displacements, stresses, forces, etc. Written as load step 3 on `File.rst`.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VELO

Velocity solution. One-sigma velocities, "stress velocities," "force velocities," etc. Written as load step 4 of `File.rst`.

ACEL

Acceleration solution. One-sigma accelerations, "stress accelerations," "force accelerations," etc. Written as load step 5 on `File.rst`.

RelKey

Key defining relative or absolute calculations:

REL

Calculations are relative to the base excitation (default).

ABS

Calculations are absolute.

OFF

No calculation of solution output identified by *Lab*.

Command Default

Relative displacement solution, no velocity or acceleration solution for 1 σ results.

Notes

Controls the amount and form of solution output written to the results file from a PSD analysis. One-sigma values of the relative or absolute displacement solution, relative or absolute velocity solution, relative or absolute acceleration solution, or any combination may be included on the results file.

This command is also valid in PREP7.

Menu Paths

Main Menu>Solution>Load Step Opts>Spectrum>PSD>Calc Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PSDSPL, *TBLNO*, *RMIN*, *RMAX*

Defines a partially correlated excitation in a PSD analysis.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLNO

Input PSD table number defined with **PSDVAL (p. 1534)** command.

RMIN

Minimum distance between excitation points which are partially correlated. Excited nodes closer than *RMIN* will be fully correlated.

RMAX

Maximum distance between excitation points which are partially correlated. Excited nodes farther apart than *RMAX* will be uncorrelated.

Notes

Defines a partially correlated excitation in terms of a sphere of influence relating excitation point geometry (in a PSD analysis). If the distance between any two excitation points is less than *RMIN*, then the excitation is fully correlated. If the distance is greater than *RMAX*, then the excitation is uncorrelated. If the distance lies between *RMIN* and *RMAX*, then the excitation is partially correlated with the degree of correlation dependent on the separation distance between the points. This command is not available for a pressure PSD analysis.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>PSD>Correlation>Spatial Correlat

Main Menu>Solution>Load Step Opts>Spectrum>PSD>Correlation>Spatial Correlat

PSDUNIT, *TBLNO*, *Type*, *GVALUE*

Defines the type of input PSD.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLNO

Input table number.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Type

Label identifying the type of spectrum:

DISP

Displacement spectrum (in terms of displacement^2/Hz).

VELO

Velocity spectrum (in terms of velocity^2/Hz).

ACEL

Acceleration spectrum (in terms of acceleration^2/Hz).

ACCG

Acceleration spectrum (in terms of g^2/Hz).

FORC

Force spectrum (in terms of force^2/Hz).

PRES

Pressure spectrum (in terms of pressure^2/Hz).

GVALUE

Value of acceleration due to gravity in any arbitrary units for Type=ACCG. Default is 386.4 in/sec^2.

Command Default

Acceleration (ACEL) spectrum (acceleration^2/Hz).

Notes

Defines the type of PSD defined by the **PSDVAL (p. 1534)**, **COVAL (p. 420)**, and **QDVAL (p. 1559)** commands.

Force (FORC) and pressure (PRES) type spectra can be used only as a nodal excitation.

GVALUE is valid only when type ACCG is specified. A zero or negative value cannot be used. A parameter substitution can also be performed.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>PSD>Settings

Main Menu>Solution>Load Step Opts>Spectrum>PSD>Settings

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PSDVAL, *TBLN0*, *SV1*, *SV2*, *SV3*, *SV4*, *SV5*, *SV6*, *SV7*

Defines PSD values.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLN0

Input table number being defined.

SV1, SV2, SV3, . . . , SV7

Spectral values corresponding to the frequency points (**PSDFRQ (p. 1528)**). Values are interpreted as defined with the **PSDUNIT (p. 1532)** command.

Notes

Defines PSD values to be associated with the previously defined frequency points.

Repeat **PSDVAL (p. 1534)** command for additional values, up to the number of frequency points (**PSDFRQ (p. 1528)**). Values are added after the last nonzero value.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>PSD>PSD vs Freq

Main Menu>Solution>Load Step Opts>Spectrum>PSD>PSD vs Freq

PSDWAV, *TBLN0*, *VX*, *VY*, *VZ*

Defines a wave propagation excitation in a PSD analysis.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLN0

Input PSD table number defined with **PSDVAL (p. 1534)** command.

VX

Global Cartesian X-velocity of traveling wave.

VY

Global Cartesian Y-velocity of traveling wave.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VZ

Global Cartesian Z-velocity of traveling wave.

Notes

Defines a traveling wave in a PSD analysis. This command is not available for a pressure PSD analysis.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>PSD>Correlation>Traveling Wave
Main Menu>Solution>Load Step Opts>Spectrum>PSD>Correlation>Traveling Wave

---

/PSEARCH, *Pname*

Specifies a directory to be searched for "unknown command" macro files.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Pname

Path name (64 characters maximum, and must include the final delimiter) of the middle directory to be searched. Defaults to the user home directory. If *Pname* = OFF, search only the program and current working directories. If *Pname* = STAT, list the current middle directory and show the **ANSYS_MACROLIB** setting.

Command Default

The middle directory searched is the user home directory.

Notes

Specifies the pathname of a directory for file searches when reading unknown-command macro files.

The search for the files is typically from the program directory, then from the user home directory, and then from the current working directory. The command allows the middle directory searched to be other than the user home directory.

This command is valid only at the Begin level.

Menu Paths

Utility Menu>Macro>Macro Search Path

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PSEL, *Type*, *Pname1*, *Pname2*, *Pname3*, *Pname4*, *Pname5*, *Pname6*, *Pname7*, *Pname8*, *Pname9*, *Pname10*

Selects a path or paths.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Select a new path.

R

Reselect a path from the current set of paths.

A

Additionally select a path and extend the current set of paths.

U

Unselect a path from the current set of paths.

ALL

Restore the full set of paths.

NONE

Unselect the full set of paths.

INV

Invert the current set of paths (selected becomes unselected and vice versa).

Pname1, Pname2, Pname3, . . . , Pname10

Name of existing path(s).

Notes

Selects a path or multiple paths, up to ten. Data are flagged as selected and unselected; no data are actually deleted from the database. There is no default for this command; you must specify a type and pathname.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>General Postproc>Path Operations>Archive Path>Store>Paths in file

Main Menu>Preprocessor>Path Operations>Store>Paths in file

/**PSF**,*Item*,*Comp*,*KEY*,*KSHELL*,*Color*

Shows surface load symbols on model displays.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item*,*Comp

Labels identifying the surface load to be shown; see Table 224: /PSF - Valid Item and Component Labels (p. 1539).

KEY

Key to turn surface load symbols on or off:

0

Off (default).

1

On, shown as face outlines. Line surface loads (**SFL (p. 1774)**) on solid model plots are shown as arrows.

2

On, shown as arrows.

3

On, shown as color filled surfaces. Line and area surface loads (**SFL (p. 1774)** and **SFA (p. 1739)**) on solid model plots are shown as arrows.

KSHELL

Visibility key for shell elements.

0

Off (default), surface load symbols are displayed only on visible load faces.

1

On, surface load symbols are displayed even if load face is not visible.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Color

Visibility key for contour legend.

ON

The symbols (arrows or face outlines) will show up in color with the legend showing the corresponding color labels (default).

OFF

The contour legend will not be displayed. The symbols (arrows or face outlines) will show up in grey. The size of the arrows will be proportional to the applied load.

Command Default

No surface load symbols are displayed.

Notes

/PSF (p. 1537) determines whether and how to show surface loads on subsequent model displays.

If surface loads are applied to solid model entities, only solid model plots show the load symbols; node and element plots do not show them unless the loads are transferred (**SFTRAN (p. 1782)** or **SBCTRAN (p. 1647)**). Similarly, solid model plots do not show the load symbols if surface loads are applied to nodes and elements. For node and element plots of shell element models, the surface load symbols are shown only if the load face is visible from the current viewing direction.

The effects of the **/PSF** command are not cumulative (that is, the command does not modify an existing setting from a previously issued **/PSF (p. 1537)** command). Only the setting specified via the most recent **/PSF (p. 1537)** command applies.

If you issue a postprocessing (POST1) (p. 51) plot command that produces result contours (such as **PLNSOL (p. 1425)**), **/PSF (p. 1537)** has no effect. This behavior prevents conflicting contours in the graphics window.

When using the radiosity method (*Item* = RDSF and *Comp* = ENCL) with *Key* = 2, the radiation arrows point outward from any element face.

/PSF (p. 1537),STAT displays current **/PSF (p. 1537)** settings, and **/PSF (p. 1537)**,DEFA resets them back to default.

Other useful commands are **/PNUM (p. 1457)**,SVAL,1 to show the values of the surface loads, **/VSCALE (p. 2160)** to change arrow lengths, and **/PBC (p. 1356)** and **/PBF (p. 1360)** to activate other load symbols.

For beam elements, only the colors representing shear (GREEN) and normal (RED) pressures are displayed for the arrows. The color of these arrows does not correspond to the magnitudes in the contour legend. The length of these arrows does, however, correlate to the relative magnitude of the pressures.

For elements SURF159, SOLID272, SOLID273, PIPE288 and PIPE289, **/PSF (p. 1537)** is not available when displaying elements with shapes determined from the real constants or section definition (**/ESHAPE (p. 665)**). For PIPE288 and PIPE289, only external loads applied via **SFBEAM (p. 1746)** are displayed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is valid in any processor.

Table 224: /PSF - Valid Item and Component Labels

Item	Comp	Description	Comments
PRES [1]	NORM (or blank)	Applied pressure normal to the face (real component only).	For element types *other than* SURF153, SURF154 and SURF156.
	NORM	Applied pressure normal to the face (real component).	For element types SURF153, SURF154 and SURF156 with KEYOPT(2) = 0. For supported structural elements (p. 1751) with *KCSYS* = 0. [2]
	TANX	Applied pressure in the element tangential x direction (real component).	
	TANY	Applied pressure in the element tangential-y direction (real component).	
	INRM	Applied pressure normal to the face (imaginary component).	
	ITNX	Applied pressure in the element tangential x direction (imaginary component).	
	ITNY	Applied pressure in the element tangential y direction (imaginary component).	
	LOCX	Applied pressure in the local x direction (real component).	For element types SURF153, SURF154 and SURF156 with KEYOPT(2) = 1. For supported structural elements (p. 1751) with *KCSYS* = 1. [2]
	LOCY	Applied pressure in the local y direction (real component).	
	LOCZ	Applied pressure in the local z direction (real component).	
	ILCX	Applied pressure in the local x direction (imaginary component).	
	ILCY	Applied pressure in the local y direction (imaginary component).	
	ILCZ	Applied pressure in the local z direction (imaginary component).	
	RVEC	Applied pressure in the user-defined direction (real component).	For supported structural elements (p. 1751) with *KCSYS* = 2. [2]
	IVEC	Applied pressure in the user-defined direction (imaginary component).	
CONV	HCOEF	Applied convection (film coefficient).	
	TBULK	Applied convection (bulk temperature).	
RAD	EMIS	Applied radiation (emissivity).	
	TAMB	Applied radiation (ambient temperature).	
RDSF	EMSS	Radiation emissivity.	
	ENCL	Enclosure number.	
FSIN		Fluid-solid interface number.	

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item	Comp	Description	Comments
HFLUX		Applied heat flux.	
FSI		Acoustic fluid-structure interface flag.	
IMPD		Applied acoustic impedance.	
SHLD	COND	Applied conductivity.	
	MUR	Applied relative permeability.	
MXWF		Maxwell force flag.	
INF		Exterior surface flag.	
CHRGS		Applied electric surface charge density.	
BLI		Boundary layer impedance flag.	

1. Pressure loads apply to the element coordinate system (KEYOPT(2) = 0). Adjust appropriately for a local coordinate system (KEYOPT(2) = 1). See Figure : Pressures, Figure : Pressures, and Figure : Pressures in the Element Reference.

2. *KCSYS* is specified when issuing **SFCONTROL (p. 1748)**.

Menu Paths

Utility Menu>PlotCtrls>Symbols

PSMAT,*Fname*,*Ext*,*Matrix*,*Color*

Writes an assembled global matrix to a postscript format that graphically displays nonzero matrix values.

AUX2 (p. 61): Binary File Manipulation (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

This file name is used for the postscript file name. It defaults to the current Jobname if left blank.

Ext

Filename extension (eight-character maximum).

Defaults to `.ps` if left blank.

Matrix

Specify which matrix to write to the output postscript file:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

STIFF

Write stiffness matrix to output postscript file. Valid for all types of analyses that write a `.full` file.

MASS

Write mass matrix to output postscript file. Valid for buckling, substructure, and modal analyses. If the `.full` file was generated in a buckling analysis, then this label will write the stress stiffening matrix to the output postscript file.

DAMP

Write damping matrix to output postscript file. Only valid for damped modal analyses.

Color

Specifies whether to display the grid in black and white or in color:

BLACK

Each nonzero coefficient is symbolized by a black square (default).

COLOR

Each nonzero coefficient is symbolized by a colored square. The color depends on the module of the coefficient; the range is from blue for the smallest values to red for the largest values. The color map is:

Notes

This command is used to copy a matrix from the assembled global matrix file (`.full` file) as specified on the **FILE (p. 752)** command and write it in a postscript format to a new file named *Fname.Ext* (defaults to `Jobname.ps`). The matrix is symbolized by a grid in which the black or colored squares represent the nonzero coefficients of the matrix. The `.full` file must be available for this command to work properly.

If the matrix is large, it may be difficult to display the postscript file. In this case, use *Color* = BLACK to reduce the postscript file size.

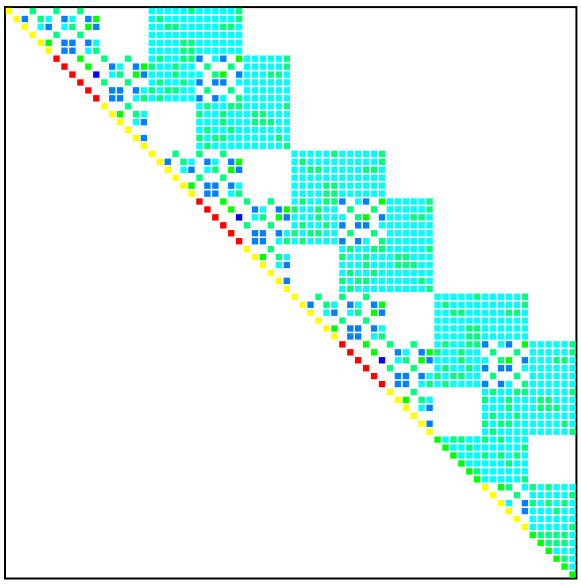
The assembled global matrix file is created during solution depending on the analysis type, equation solver, and other solution options. By default, the assembled global matrix file is never deleted at the end of solution. For most analysis types, the Sparse direct solver and the ICCG solver write a `.full` file. All mode extraction methods used for buckling and modal analyses write a properly formatted `.full` file to be used with the **PSMAT (p. 1540)** command.

When copying the stiffness matrix for transient and harmonic analyses, be aware that the element mass matrix values (and possibly element damping matrix values) are incorporated into the globally assembled stiffness matrix. Thus, the globally assembled stiffness matrix represents more than the stiffness of the model for these analysis types. Please refer to the *Mechanical APDL Theory Reference* for more details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **PSMAT (p. 1540)** command is not able to display a lumped mass matrix from a `.full` file generated by a harmonic analysis.

When copying a `.full` file, the rows and columns corresponding to specified constraints (for example, **D (p. 483)** commands) are eliminated from the system of equations and therefore are not written to the `.ps` file. In addition, rows and columns corresponding to eliminated (dependent) degrees of freedom from coupling and/or constraint equations (for example, **CE (p. 297)**, **CP (p. 421)** commands) are eliminated from the system of equations and are not written to the `.ps` file. The DOFs that are eliminated from any coupling and/or constraint equations are determined internally by the solution code and may not match what you specified via the **CE (p. 297)**/**CP (p. 421)** (or similar) commands.



When copying a `.full` file, only the upper triangular part of the matrix will be written to the `.ps` file if the matrix is symmetric; the full matrix is written if the matrix is unsymmetric. Only matrix coefficients that are greater than zero will be written.

The **WRFULL (p. 2184)** command, in conjunction with the **SOLVE (p. 1822)** command, can be used to generate the assembled global matrix file and eliminate the equation solution process and results output process.

The following command sequence shows typical usage of this command.

```
/BATCH,LIST
/AUX2   ! Enter AUX2 processor
FILE,job1,full  ! FULL file containing stiffness matrix is job1.full
PSMAT,job1KColor,ps,STIFF,COLOR ! Create file job1KColor.ps in color
!                               postscript format for stiffness matrix
PSMAT,job1MBlack,,STIFF,BLACK ! Create file job1MBalck.ps in black/white
!                               postscript format for stiffness matrix
FINISH
```

Below is an example of an export of the stiffness matrix to a postscript format using the COLOR option.

K Matrix

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PSMESH,*SECID*,*Name*,*P0*,*Egroup*,*NUM*,*KCN*,*KDIR*,*VALUE*,*NDPLANE*,*PSTOL*,*PSTYPE*,*ECOMP*,*NCOMP*

Creates and meshes a pretension section (PRETS179) or a preload section (MPC184).

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SECID

Unique section number. This number must not already be assigned to a section.

Name

Unique eight character descriptive name, if desired.

P0

Pretension node number (for a pretension section using PRETS179) or joint element number (for a preload section using MPC184).

For a pretension element, the node is defined if it doesn't exist, and the number defaults to the highest node number plus one.

For a joint element, a unique element number is assigned by default.

Egroup*, *NUM

Element group on which **PSMESH (p. 1543)** will operate. If *Egroup* = P, graphical picking is enabled and *NUM* is ignored (valid only in the GUI).

L (or LINE)

PSMESH (p. 1543) operates on all elements in the line specified by *NUM*. New pretension nodes are associated with *NUM* or entities below it. Any subsequent **LCLEAR (p. 1024)** operation of *NUM* deletes the pretension elements and nodes created by **PSMESH (p. 1543)**. (MPC184 joint elements and associated contact pairs of a preload section are not deleted by **LCLEAR (p. 1024)**.)

A (or AREA)

PSMESH (p. 1543) operates on all elements in the area specified by *NUM*. New pretension nodes are associated with *NUM* or entities below it. Any subsequent **ACLEAR (p. 93)** of *NUM* deletes the pretension elements and nodes created by **PSMESH (p. 1543)**. (MPC184 joint elements and associated contact pairs of a preload section are not deleted by **ACLEAR (p. 93)**.)

V (or VOLU)

PSMESH (p. 1543) operates on all elements in the volume specified by *NUM*. New pretension nodes are associated with *NUM* or entities below it. Any subsequent **VCLEAR (p. 2076)** of *NUM* deletes the pretension elements and nodes created by **PSMESH (p. 1543)**. (MPC184 joint elements and associated contact pairs of a preload section are not deleted by **VCLEAR (p. 2076)**.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

P

PSMESH (p. 1543) operates on elements selected through the subsequent picking operations, and *NUM* is ignored

ALL

The command operates on all selected elements, and *NUM* is ignored.

KCN

Coordinate system number for the separation surface and normal direction.

KDIR

Direction (x, y, or z) normal to separation surface in the *KCN* coordinate system.

If *KCN* is Cartesian, the pretension section normal will be parallel to the *KDIR* axis regardless of the position of the pretension node.

If *KCN* is non-Cartesian, the pretension section normal will be aligned with the *KDIR* direction of system *KCN* at the position of the pretension node.

For an MPC184 joint element defined as part of a preload section, *KDIR* is used to define the normal of the separation surface and does not affect the axis direction of the joint element.

VALUE

Point along the *KDIR* axis at which to locate the separation surface. Ignored if *NDPLANE* is supplied.

NDPLANE

Existing node that **PSMESH (p. 1543)** will use to locate the separation surface. If *NDPLANE* is supplied, the location of the separation surface is defined by the *KDIR* coordinate of *NDPLANE*.

PSTOL

Optional tolerance below *VALUE*. Allows nodes occurring precisely at or slightly below the separation to be identified properly as above the plane. Has the effect of shifting the plane down by *PSTOL*. The following expression represents the default value:

$$\frac{\sqrt{\Delta X^2+\Delta Y^2+\Delta Z^2}}{1000}$$

where ΔX, ΔY, and ΔZ are the dimensions of the locally selected region of the model based on nodal locations (that is, $\Delta X = X_{max} - X_{min}$).

PSTYPE

Type of pretension or preload section to be generated.

If a positive value is specified (or if this argument is left blank), a pretension section that includes PRETS179 elements is generated. The value entered is the element type number for PRETS179. If no number is specified, the program defines the element type number.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If TORQUE is specified, a preload section that includes a cylindrical joint element (MPC184) is generated as follows:

- **For a 2D model**: An x-axis cylindrical joint element is generated along with two force-distributed surface-based constraints. A local Cartesian coordinate system is created at the first node of the joint element such that the local x- axis is the axis of that element (KEYOPT(4) = 0 for the MPC184 element).
- **For a 3D model**: A z-axis cylindrical joint element is generated along with two force-distributed surface-based constraints. A local Cartesian coordinate system is created at the first node of the joint element such that the local z- axis is the axis of that element (KEYOPT(4) = 1 for the MPC184 element).
- **For a 3D model that contains beam elements**: A z-axis cylindrical joint element is generated between the endpoints of two beam elements. (No force-distributed surface-based constraints are needed.) A local Cartesian coordinate system is created at the first node of the joint element such that the local z- axis is the axis of that element (KEYOPT(4) = 1 for the MPC184 element).

If a negative value is specified, a preload section that includes a screw joint element (MPC184) is created with the absolute value of *PSTYPE* used as the pitch value for the joint. This option is only valid for 3D models. Two force-distributed surface-based constraints are generated at the cutting surfaces, except for the case of a beam model which does not need the force-distributed constraints. A local Cartesian coordinate system is created at the first node of the joint element such that the local z- axis is the axis of that element.

ECOMP

If specified, the name of a component to be composed of new pretension elements and existing elements modified by the **PSMESH (p. 1543)** command. This argument is not used with the MPC184 joint element.

NCOMP

Name of a component to be composed of nodes on new pretension elements. This argument is not used with the MPC184 joint element.

Notes

PSMESH (p. 1543) generates a pretension section (PRETS179) or a preload section (MPC184) for modeling bolt fastener preloads. The type of section is specified by the *PSTYPE* argument.

The **PSMESH (p. 1543)** command is valid for structural analyses only.

Pretension Section (PRETS179)

When *PSTYPE* is a positive value or blank, the **PSMESH (p. 1543)** command creates a pretension section normal to the pretension load direction by cutting the mesh along existing element boundaries at the point defined by *VALUE* or *NDPLANE* and inserting PRETS179 elements. The **PSMESH (p. 1543)** command verifies that *PSTYPE* is a PRETS179 element type; if it is not, the command finds the lowest available *ITYPE* (**ET (p. 686)**) that is PRETS179, or it creates a new one if necessary.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When it is necessary to define the pretension node, the program uses node *NDPLANE*. If the *NDPLANE* value is not specified, the program defines the pretension node at:

- The centroid of geometric entity *NUM*, if *Egroup* = LINE, AREA, or VOLU; or
- The centroid location of all selected elements, if *Egroup* = ALL or if graphical picking is used.

If the elements to which the pretension load is to be applied have already been meshed in two groups, **PSMESH (p. 1543)** cannot be used to insert the pretension elements. The **EINTF (p. 614)** command must be used to insert the PRETS179 elements between the two meshed groups.

The **PSMESH (p. 1543)** operation copies any nodal temperatures you have defined on the split surface of the original mesh from the original nodes to the newly created coincident duplicate nodes. However, displacements, forces, and other boundary conditions are not copied.

By mathematical definition, the pretension surface must always be a flat plane. In a non-Cartesian coordinate system, the **PSMESH (p. 1543)** command creates that plane at the indicated position, oriented with respect to the specified direction of the active system (in the same manner that the **NROTAT (p. 1264)** command orients a nodal system with respect to a curved system). For example, assuming X = 1 and Y = 45 in a cylindrical coordinate system with Z as the axis of rotation (*KCN* = 1), a pretension surface normal to X tilts 45 degrees away from the global X axis.

A pretension section can be defined for fastener models made up of any 2D or 3D structural solid, beam, shell, pipe, or link element type. The elements can be low- or high-order.

The pretension section is also supported for general axisymmetric elements (SOLID272 and SOLID273). **PSMESH (p. 1543)** cuts the model and generates PRETS179 elements between all Fourier nodes in the circumferential direction.

For more information, see Defining Pretension in a Joint Fastener in the *Basic Analysis Guide*.

Preload Section (MPC184)

When *PSTYPE* is a negative value or set to TORQUE, the **PSMESH (p. 1543)** command defines an MPC184 joint element for applying a preload to a bolt undergoing large rotation or large deformation. **PSMESH (p. 1543)** cuts the mesh in two parts along existing element boundaries at the point defined by *VALUE* or *NDPLANE*. It generates force-distributed surface-based constraints (remote points) on the cutting surfaces, inserts an MPC184 joint element that connects the two pilot nodes, and creates a local Cartesian coordinate system at the first node of the joint element to define the normal direction. If the joint is between beam elements, no force-distributed constraints are generated. For more information, see Defining Preload in a Joint Fastener Undergoing Large Rotation in the *Basic Analysis Guide*.

The preload section based on MPC184 is not supported for general axisymmetric elements (SOLID272 and SOLID273).

PSTRES, *Key*

Specifies whether prestress effects are calculated or included.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Prestress key:

OFF

Do not calculate (or include) prestress effects (default).

ON

Calculate (or include) prestress effects.

Notes

The **PSTRES (p. 1551)** command specifies whether or not prestress effects are to be calculated or included. The command should be issued *after* the **ANTYPE (p. 162)** command.

Prestress effects are calculated in a static or transient analysis for inclusion in a buckling, modal, harmonic (Method = FULL), or substructure generation analysis. If used in the solution processor (**/SOLU (p. 1821)**), this command is valid only within the first load step.

If you apply thermal body forces during a static analysis to calculate prestress effects, do not delete the forces during any subsequent full harmonic analyses. If you delete the thermal body forces, the thermal prestress effects will not be included in the harmonic analysis. Temperature loads used to define the thermal prestress will also be used in the full harmonic analysis as sinusoidally time-varying temperature loads.

A prestress effect applied with non-follower loads resists rigid body rotation of the model. For example, an unsupported beam with axial tensile forces applied to both ends will have two nonzero rotational rigid body modes.

If tabular loading (***DIM (p. 530)**,,TABLE (p. 533)) was used in the prestress static analysis step, the corresponding value of **TIME (p. 2000)** will be used for tabular evaluations in the modal analysis.

This command is also valid in PREP7.

/PSYMB, *Label*, *KEY*

Shows various symbols on displays.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Show symbols as selected from the following labels:

CS

Local coordinate systems.

NDIR

Nodal coordinate systems (on rotated nodes only).

ESYS

Element coordinate systems (element displays only).

LDIR

Line directions (line displays only).

LDIV

Controls the display of element divisions on lines.

ADIR

Area direction symbol (for keypoint, line, area and volume plots).

LAYR

Layer orientations (relative to the projected element x-axis) or fiber orientations in smeared reinforcing elements. Used only within an element display. Use *KEY* to specify the layer number.

ECON

Element mesh symbols on keypoints and lines.

DOT

Larger symbols displayed for node and keypoint locations. When *Label* = DOT, *KEY* = 1 by default.

XNOD

Extra node of surface or circuit elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FBCS

Force boundary condition scaling. Subsequent *KEY* value determines whether or not to scale the applied and derived forces/moments to the same maximum value.

DEFA

Resets the symbol keys so that Mechanical APDL displays none of the symbols controlled by the **/PSYMB (p. 1552)** command. The value of the *KEY* field is ignored.

STAT

Prints the status of the settings of the symbol keys controlled by the **/PSYMB (p. 1552)** command. The *KEY* field is ignored.

MARK

Controls the marker size (**/GMARKER (p. 861)**). When *Label* = MARK, *KEY* = 10 by default.

KEY

Symbol key:

-1

Effective only if *Label* = LAYR and solid shape element display (**/ESHAPE (p. 665)**) is active. Orientation of all layers appears with the solid shape element display.

0

No symbol (default). If *Label* = LDIV, then *KEY*= 0 indicates that the displayed element divisions will correspond to the existing mesh (the word MESHED or EXISTING can also be substituted). Also, for *Label* = LDIV, if you execute any meshing command (such as **AMESH (p. 121)** or **VMESH (p. 2140)**), *KEY* is set to 0 (MESHED) automatically. If *Label* = FBCS, then *KEY*= 0 indicates that boundary condition scaling will not be common. The applied and derived forces/moments will be scaled to their respective maximum values.

1

Include symbol. If *Label* = LDIV, then *KEY* = 1 indicates that the displayed line divisions will correspond to the value assigned by **LESIZE (p. 1041)** (the word LESIZE can also be substituted). Also, for *Label* = LDIV, if you execute the **LESIZE (p. 1041)** command, *KEY* is set to 1 (LESIZE) automatically. If *Label* = FBCS, then *KEY*= 1 indicates that boundary condition scaling will be common. The applied and derived forces/moments will be scaled to the same maximum value.

N

If *Label* = LAYR, then *N* is equal to the layer number. If *Label* = DOT, then *N* can be equal to 0,1,.....15, indicating the dot size. If *Label* = MARK, then *N* can be equal to 1,…..10, indicating the marker size. If *Label* = LDIV, then *KEY* = -1, indicates that no element divisions will be displayed (the word OFF can also be substituted).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Includes various symbols on the display. Triads are right-handed with x displayed as the longest leg. Where color is displayed, x is white, y is green, and z is blue. For beams, x is always along the length of the element. For lines, an arrow represents the direction of a line, from the beginning keypoint to the end keypoint. See **/PLOPTS (p. 1435)** command for additional display options. Use **/PSTATUS (p. 1550)** or **/PSYMB (p. 1552)**,STAT to display settings. Use **/PSYMB (p. 1552)**,DEFA to reset all specifications back to their defaults. The command **/PSYMB (p. 1552)**,ECON,1 causes the symbol "M" to be displayed on keypoints and lines associated with meshed entities. When you issue the command **/PSYMB (p. 1552)**,DOT,1, a larger symbol is displayed for each node and keypoint location. Using **/PSYMB (p. 1552)**,MARK,1, a smaller marker size can be displayed.

PowerGraphics (**/GRAPHICS (p. 866)**,POWER) does not support **/PSYMB (p. 1552)**,ESYS and **/PSYMB (p. 1552)**,LAYR.

If *KEY* = *N* and PowerGraphics is off, the centroid of the surface elements is connected to the extra node using a gray line. However, if PowerGraphics is on, the color of the line connecting the centroid to the extra node is the same as that for the elements themselves (as determined by **/PNUM (p. 1457)**).

When *Label* = LAYR, the layer systems can be visualized with all current-technology layered elements and the smeared reinforcing element REINF265. To use **/PSYMB (p. 1552)**,LAYR with REINF265, first set the vector-mode graphics option (**/DEVICE (p. 523)**,VECTOR,1).

This command is valid in any processor.

PSYS, *KCN*

Sets the PML element coordinate system attribute pointer.

PREP7 (p. 22): Artificially Matched Layers (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Coordinate system number:

0

Use the global Cartesian coordinate system as the PML element coordinate system (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

N

Set the PML element coordinate system orientation based on a local Cartesian coordinate system N (where N must be greater than 10) defined by the **LOCAL (p. 1059)** or **CS (p. 435)** command (for example: **LOCAL (p. 1059)**,11,0).

Command Default

The PML element coordinate system orientation defaults to the global Cartesian system.

Notes

This command identifies the local coordinate system used to define the PML (perfectly matched layers) coordinate system of subsequently defined PML elements. It is only applicable to volume elements that support PML. The use of PML coordinate systems is similar to element coordinate systems, as discussed in Understanding the Element Coordinate System. N refers to the coordinate system reference number (*KCN*) defined using the **LOCAL (p. 1059)** (or similar) command.

Menu Paths

This command cannot be accessed from a menu.

PTR, *LOC*, *BASE*, *LOCH*, *BASEH*

Dumps the record of a binary file.

AUX2 (p. 61): Binary File Dump (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LOC*, *BASE

Dump the file record starting at pointer *LOC*. *BASE* is the base pointer, and would be used if *LOC* is a relative pointer.

LOCH*, *BASEH

Second 32-bit integer (if required) for defining the 64-bit pointer.

Notes

Dumps the record of the file named on the AUX2 **FILEAUX2 (p. 753)** command according the format specified on the **FORM (p. 773)** command.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PTXY, *X1*, *Y1*, *X2*, *Y2*, *X3*, *Y3*, *X4*, *Y4*

Defines coordinate pairs for use in polygons and prisms.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

X1, Y1, X2, Y2, X3, Y3, X4, Y4

X and Y coordinate pairs on the working plane.

Notes

Defines coordinate pairs for use in polygons and prisms (**POLY (p. 1460)**, **RPRISM (p. 1618)**). The coordinates must be in the Cartesian coordinate system. The coordinate pairs must be input in a continuous order. **PTXY (p. 1556)** may be repeated (up to 100 pairs) until the required pairs have been defined. The pairs will be saved until either the **POLY (p. 1460)** or **PRISM (p. 1497)** command is entered. Use **PTXY (p. 1556)**,STAT to list the saved coordinate pairs. Use **PTXY (p. 1556)**,DELE to delete all the saved coordinate pairs. See the **RPOLY (p. 1616)**, **RPRISM (p. 1618)**, and **RPR4 (p. 1617)** commands for other ways to create polygons and prisms.

Menu Paths

This command cannot be accessed from a menu.

PVECT, *Oper*, *LabXR*, *LabYR*, *LabZR*

Interpolates a set of items onto a path.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Oper

Valid operations for geometry operations along a path are:

NORM

Defines a unit normal vector at each interpolation point in the direction of the cross product of the tangent to the path and the active Z axis. Resulting vector components are in the active coordinate system (which must be Cartesian).

TANG

Defines a unit vector tangent to the path at each interpolation point. Vector components are in the active coordinate system (which must be Cartesian).

RADI

Defines the position vector of each interpolation point of the path from the center of the active coordinate system (which must be Cartesian).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LabXR

Label (8 characters maximum) assigned to X-component of the resulting vector.

LabYR

Label (8 characters maximum) assigned to Y-component of the resulting vector.

LabZR

Label (8 characters maximum) assigned to Z-component of the resulting vector.

Notes

Defines and interpolates a set of labeled path items along predefined path (**PATH (p. 1354)**) and performs various geometric operations on these path items. A path item must be defined before it can be used with other path operations. Additional path items may be defined with the **PDEF (p. 1372)**, **PCALC (p. 1362)**, **PDOT (p. 1375)**, and **PCROSS (p. 1371)** commands. Path items may be listed or displayed with the **PLPATH (p. 1439)**, **PLPAGM (p. 1438)** and **PRPATH (p. 1517)** commands. Path geometry items (XG, YG, ZG, S) are automatically interpolated (in the active CSYS) if not done so previously with the **PDEF (p. 1372)** command.

Menu Paths

Main Menu>General Postproc>Path Operations>Unit Vector

/**PWEDGE**,*XCENTR*,*YCENTR*,*XLRAD*,*ANGLE1*,*ANGLE2*

Creates an annotation wedge (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XCENTR

Wedge X center location (-1.0 < X < 2.0).

YCENTR

Wedge Y center location (-1.0 < Y < 1.0).

XLRAD

Wedge radius length.

ANGLE1

Starting angle of wedge.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANGLE2

Ending angle of wedge. The wedge is drawn counterclockwise from the starting angle, *ANGLE1*, to the ending angle, *ANGLE2*.

Notes

Creates an annotation wedge to be written directly onto the display at a specified location. This is a command generated by the Graphical User Interface (GUI) and will appear in the log file (`Jobname.log`) if annotation is used.

The command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with **/INPUT (p. 948)**).

All wedges are shown on subsequent displays unless the annotation is disabled or deleted. Issue **/LSPEC (p. 1081)** and **/PSPEC (p. 1548)** to set the attributes of the wedge.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Q Commands

QDVAL, *TBLN01*, *TBLN02*, *SV1*, *SV2*, *SV3*, *SV4*, *SV5*, *SV6*, *SV7*

Defines PSD quadspectral values.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLN01

First input PSD table number associated with this spectrum.

TBLN02

Second input PSD table number associated with this spectrum.

SV1, SV2, SV3, . . . , SV7

PSD quadspectral values corresponding to the frequency points (**PSDFRQ (p. 1528)**).

Notes

Defines PSD quadspectral values to be associated with the previously defined frequency points. Repeat **QDVAL (p. 1559)** command with the same table number for additional points. Unlike autospectra (**PSDVAL (p. 1534)**), the quadspectra can be positive or negative. The quadspectral curve segment where there is a sign change is interpolated linearly (the rest of the curve segments use log-log interpolation). For better accuracy, choose as small a curve segment as possible wherever a sign change occurs.

Two table numbers are required since values are off-diagonal terms. This command is valid for **SPOPT (p. 1837)**,PSD only.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>PSD>Correlation>Quadspectral

Main Menu>Solution>Load Step Opts>Spectrum>PSD>Correlation>Quadspectral

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

QRDOPT,*ReuseKey*,--,--,*SymMeth*,*CMCCoutKey*

Specifies additional QRDAMP modal analysis options.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 1144)

ReuseKey

Reuse key for method=*QRDAMP* specified in **MODOPT (p. 1140)** command.

ON

Reuse the symmetric eigensolution from the previous load steps or from the previous solution.

OFF

Do not reuse (calculates symmetric eigensolution at current load step). This is the default.

--,--

Unused fields.

SymMeth

Mode-extraction method to be used for the symmetric eigenvalue problem.

LANB

Block Lanczos algorithm (default).

SUBSP

Subspace algorithm.

SNODE

Supernode algorithm.

CMCCoutKey

Complex Modal Contribution Coefficients (CMCC) output key. See Calculate the Complex Mode Contribution Coefficients (CMCC) in the *Structural Analysis Guide* for details and usage.

ON

Output the CMCC to the text file `Jobname.CMCC`.

OFF

Do not output the CMCC. This is the default.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

If the `filename.modesym` file exists in the working directory and *ReuseKey* = ON, `filename.modesym` will be reused. If `filename.modesym` does not exist in the working directory, the symmetric eigensolution will be calculated.

When *ReuseKey*=ON, both the new modal analysis (`filename.modesym` usage) and the preceding modal analysis (`filename.modesym` generation) must be performed using the same product version number.

Menu Paths

This command cannot be accessed from a menu.

QSOPT, *Opt*

Specifies quasi static radiation options.

SOLUTION (p. 38): Radiosity (p. 50)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Opt

Quasi static option:

OFF

Do not run transient radiation problem to steady-state (default).

ON

Run transient radiation problem to steady-state.

Notes

For more information on solving a static problem using a false transient approach, see Further Options for Static Analysis in the *Thermal Analysis Guide*.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>Quasi-Static

Main Menu>Solution>Load Step Opts>Time/Frequenc>Quasi-Static

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

QUAD,*NODE1*,*NINTR*,*NODE2*,*NFILL*,*NSTRT*,*NINC*,*PKFAC*

Generates a quadratic line of nodes from three nodes.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE1

Begin fill-in from this node location. If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NINTR

Intermediate or guiding node. Quadratic curve will pass through this location. *NINTR* may have any node number and any location. If the quadratic line also generates a node with number *NINTR*, the generated location overrides the previous *NINTR* location.

NODE2

End quadratic fill-in at this node location.

NFILL

Fill-in *NFILL* nodes between *NODE1* and *NODE2* (defaults to |*NODE2*-*NODE1*|-1). *NFILL* must be positive.

NSTRT

Node number assigned to first filled-in node (defaults to *NODE1* + *NINC*).

NINC

Add this increment to each of the remaining filled-in node numbers (may be positive or negative). Defaults to (*NODE2*-*NODE1*)/(*NFILL* + 1), that is, linear interpolation.

PKFAC

Peak location factor. If *PKFAC*=0.5, the peak of the quadratic shape occurs at the *NINTR* location. If 0.0 < *PKFAC* < 0.5, the peak occurs to the *NODE2* side of the *NINTR* location. If 0.5 < *PKFAC* < 1.0, the peak occurs to the *NODE1* side of the *NINTR* location. Defaults to 0.5.

Notes

Generates a quadratic line of nodes (in the active coordinate system) from three nodes. The three nodes determine the plane of the curve and may have been defined in any coordinate system. Any number of nodes may be filled-in and any node number sequence may be assigned.

The quadratic line feature uses three nodes (*NODE1*,*NINTR*,*NODE2*) to determine the plane of the curve. The curve passes through the three points, beginning from *NODE1*, through the intermediate (or guiding) point *NINTR*, and toward *NODE2*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Generated nodes are also quadratically spaced. If the guiding node number is within the set being generated, it will be relocated according to the quadratic spacing.

The peak location factor is used to determine how the quadratic fits through the three points. Various nodal progressions can be obtained by different combinations of *PKFAC* and the guiding node location. If the guiding node is at mid-length between *NODE1* and *NODE2*, 0.293 ≤ *PKFAC*< 0.707 will ensure that all generated nodes fall within the *NODE1*,*NODE2* bounds. In the limit, as *PKFAC* approaches 0.0, the peak approaches the line through *NODE1* and *NINTR* at an infinite distance from *NODE1*. The **QUAD (p. 1562)** command generates quadratic lines of nodes, which in turn may be used as a base line for generating irregular surfaces of nodes (by repeating (***REPEAT (p. 1586)**), generating (**NGEN (p. 1218)**, **NSCALE (p. 1265)**), etc.). Irregular surfaces may also be generated with the meshing commands.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Nodes>Quadratic Fill

/QUIT

Exits a processor.

SESSION (p. 11): Processor Entry (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is an alternative to the **FINISH (p. 758)** command. If any cleanup or file writing is normally done by the **FINISH (p. 758)** command, it is bypassed if the **/QUIT (p. 1563)** command is used instead. A new processor may be entered after this command. See the **/EXIT (p. 708)** command to terminate the run.

This command is valid in any processor. This command is not valid at the Begin level.

Menu Paths

This command cannot be accessed from a menu.

QUOT, *IR*, *IA*, *IB*, - - , *Name*, - - , - - , *FACTA*, *FACTB*

Divides two variables.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to *NV* (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IA, IB

Reference numbers of the two variables to be operated on.

--

Unused field.

Name

Thirty-two character name identifying the variable on printouts and displays. Embedded blanks are compressed for output.

--, --

Unused fields.

FACTA, FACTB

Scaling factors (positive or negative) applied to the corresponding variables (default to 1.0).

Notes

Divides two variables according to the operation:

$$IR = (FACTA \times IA)/(FACTB \times IB)$$

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Divide

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

R Commands

R, *NSET*, *R1*, *R2*, *R3*, *R4*, *R5*, *R6*

Defines the element real constants.

PREP7 (p. 22): Real Constants (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSET

Real constant set identification number (arbitrary). If same as a previous set number, set is redefined. Set number relates to that defined with the element (**REAL (p. 1579)**). Note that the GUI automatically assigns this value.

R1, R2, R3, . . . , R6

Real constant values (interpreted as area, moment of inertia, thickness, etc., as required for the particular element type using this set), or table names for tabular input of boundary conditions. Use **RMORE (p. 1614)** command if more than six real constants per set are to be input.

Notes

Defines the element real constants. The real constants required for an element are shown in the Input Summary of each element description in the *Element Reference*. Constants must be input in the same order as shown in that table. If more than the required number of element real constants are specified in a set, only those required are used. If fewer than the required number are specified, zero values are assumed for the unspecified constants.

If using table inputs (COMBIN14, FLUID116, SURF151, SURF152, CONTA172, CONTA174, CONTA175, CONTA177, and COMBI214 only), enclose the table name in % signs (for example, `%tabname%`).

When copying real constants to new sets, Ansys, Inc. recommends that you use the command input. If you do use the GUI, restrict the real constant copy to only the first six real constants (real constants seven and greater will be incorrect for both the master and copy set).

This command is also valid in SOLUTION.

---

RACE, *XC*, *YC*, *RAD*, *TCUR*, *DY*, *DZ*, - - , - - , *Cname*

Defines a "racetrack" current source.

PREP7 (p. 22): Special Purpose (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XC

Location of the mid-thickness of the vertical leg along the working plane X-axis.

YC

Location of the mid-thickness of the horizontal leg along the working plane Y-axis.

RAD

Radius of curvature of the mid-thickness of the curves in the racetrack source. Defaults to .501 * DY

TCUR

Total current, amp-turns (MKS), flowing in the source.

DY

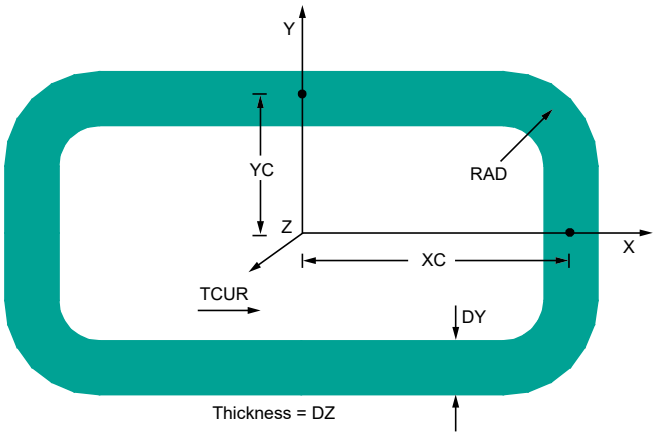
In-plane thickness of the racetrack source.

DZ

Out-of-plane thickness (depth) of the racetrack source.

- -, - -

Unused fields



Cname

An alphanumeric name assigned as a component name to the group of SOURC36 elements created by the command macro. Cname must be enclosed in single quotes in the **RACE (p. 1566)** command line. Cname may be up to 32 characters, beginning with a letter and containing only letters, numbers, dots (.), and underscores (_). Component names beginning with an underscore (e.g., _LOOP) are reserved for use by Mechanical APDL and should be avoided. If blank, no component name is assigned.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

RACE (p. 1566) invokes a Mechanical APDL macro which defines a racetrack current source in the working plane coordinate system.

The current source is generated from bar and arc source primitives using SOURC36 (which is assigned the next available element type number).

The macro is valid for use in 3D magnetic field analysis using a scalar potential formulation.

Current flows in a counterclockwise direction with respect to the working plane.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Magnetic>Excitation>Racetrack Coil

Main Menu>Preprocessor>Modeling>Create>Racetrack Coil

Main Menu>Solution>Define Loads>Apply>Magnetic>Excitation>Racetrack Coil

---

RADOPT, *--*, *FLUXTOL*, *SOLVER*, *MAXITER*, *TOLER*, *OVERRLEX*, *--*, *--*, *--*, *--*, *MAXFLUXITER*, *CONSERVATION*

Specifies Radiosity Solver options.

SOLUTION (p. 38): Radiosity (p. 50)
AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

--

Unused field.

FLUXTOL

Convergence tolerance for radiation flux. Defaults to 0.0001. This value is a relative tolerance.

SOLVER

Choice of solver for radiosity calculation:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Gauss-Seidel iterative solver.

1

Direct solver.

2

Jacobi iterative solver (default).

MAXITER

Maximum number of iterations for the iterative solvers (*SOLVER* = 0 or 2). Defaults to 1000.

TOLER

Convergence tolerance for the iterative solvers (*SOLVER* = 0 or 2). Defaults to 0.1.

If *TOLER* $\geq$ 0, the value is interpreted as an absolute tolerance. If *TOLER* < 0, it is interpreted as a relative tolerance.

OVERRLEX

Over-relaxation factor applied to the iterative solvers (*SOLVER* = 0 or 2). Defaults to 0.1.

- -, - -, - -, - -

Unused fields

MAXFLUXITER

Maximum number of flux iterations to be performed according to the specified solver type:

0

If the FULL solver is specified (**THOPT (p. 1997)**,FULL), convergence criteria are monitored and iterations are performed until convergence occurs. If the QUASI solver is specified (**THOPT (p. 1997)**,QUASI), convergence criteria are ignored and one iteration is performed. This value is the default.

1, 2, 3, ...N

If the FULL solver is specified (**THOPT (p. 1997)**,FULL), convergence criteria are monitored and iterations are performed until convergence occurs, or until the specified number of iterations has been completed, whichever comes first. If the QUASI solver is specified (**THOPT (p. 1997)**,QUASI), convergence criteria are ignored and the specified number of iterations are completed.

To view *MAXFLUXITER* usage illustrations, see Figure : FULL Solution Method When Radiosity Is Present and Figure : QUASI Solution Method When Radiosity Is Present

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CONSERVATION

Key to account for the midside node temperature of underlying solid elements for radiosity calculations. Under normal circumstations using lower order elements, this option does not need to be activated. However, when using higher elements, you can improve energy conservation by setting *CONSERVATION* = 1.

0

Not active (default). The midside node temperatures are not accounted for in the radiosity calculations.

1

Active. The midside node temperatures are accounted for in the radiosity calculations.

Note:

To work effectively, *CONSERVATION* requires a one-to-one correspondance between the surface elements and their underlying solid elements. Therefore, it cannot be activated if the **RDEC (p. 1575)** command was issued when generating SURF251 or SURF252 elements.

Command Default

The Jacobi iterative solver (*SOLVER* = 2) is the default; it is only available for 3D models. If the analysis is 2D, the Gauss-Seidel iterative solver (*SOLVER* = 0) is used instead.

Notes

The radiation heat flux is linearized, resulting in robust convergence.

The radiation flux norm for *FLUXTOL* is expressed as:

$$\sqrt{\frac{\sum_{j=1}^{Nsurf}\left(Q_j^{i+1}-Q_j^{i}\right)^2}{\sum_{j=1}^{Nsurf}\left(Q_j^{i+1}\right)^2}}$$

where i is the pass or iteration number and j is the surface facet for radiation.

For a sufficiently small absolute tolerance value, relative tolerance converges in fewer iterations than absolute tolerance. For a sufficiently large absolute tolerance value, relative tolerance may cause convergence difficulties.

For more information about *FLUXTOL* and *MAXFLUXITER* usage, see Figure : FULL Solution Method When Radiosity Is Present and Figure : QUASI Solution Method When Radiosity Is Present in the *Thermal Analysis Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In Figure : FULL Solution Method When Radiosity Is Present and Figure : QUASI Solution Method When Radiosity Is Present (under Solving for Temperature and Radiosity in the *Thermal Analysis Guide*), refer to the $K_Q Q = F_Q$ equation system via the iterative method.

If *TOLER* $\geq$ 0, the iterative solver (*SOLVER* = 0 or 2) is converged for maximum value over a different *j* as shown:

$$\max_j \left| Q_j^{k+1} - Q_j^k \right| \leq TOLER$$

If *TOLER* < 0, the iterative solver (*SOLVER* = 0 or 2) is converged for maximum value over a different *j* as shown:

$$\max_j \frac{\left| Q_j^{k+1} - Q_j^k \right|}{\left| Q_j^{k+1} \right|} \leq \left| TOLER \right|$$

where:

j = number of radiation facets

k = number of iterations (*k* = 1 to *MAXITER*)

The Jacobi iterative solver (*SOLVER* = 2) is the only solver choice that runs in a fully distributed parallel fashion. Therefore, it is typically the best choice for optimal performance when running in distributed-memory parallel mode.

Menu Paths

Main Menu>Radiation Opt>Radiosity Meth>Solution Opt

Main Menu>Solution>Radiation Opts>Solution Opt

RAPPND, *LSTEP*, *TIME*

Appends results data from the database to the results file.

POST1 (p. 51): Load Case Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LSTEP

Load step number to be assigned to the results data set. If it is the same as an existing load step number on the results file, the appended load step will be inaccessible. Defaults to 1.

TIME

Time value to be assigned to the results data set. Defaults to 0.0. A time value greater than the last load step should be used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command is typically used to append the results from a load case combination to the results file. See the **LCWRITE (p. 1031)** command to create a separate load case file. Only summable and constant data are written to the results file by default; non-summable data are not written unless requested (**LCSUM (p. 1031)** command). RAPPND should not be used to append results from a harmonic analysis.

Menu Paths

Main Menu>General Postproc>Write Results

RATE, *Option*

Specifies whether the effect of creep strain rate will be used in the solution of a load step.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 1571)

Option

Activates implicit creep analysis.

0 or OFF

No implicit creep analysis. This option is the default.

1 or ON

Perform implicit creep analysis.

Command Default

Issuing this command with no arguments deactivates implicit creep analysis.

Notes

Set *Option* = 1 (or ON) to perform an implicit creep analysis (**TB (p. 1899)**,CREEP with *TBOPT* ≥ 1). For viscoplasticity/creep analysis, *Option* specifies whether or not to include the creep calculation in the solution of a load step. If *Option* = 1 (or ON), the program performs the creep calculation. Set an appropriate time for solving the load step via a **TIME (p. 2000)**,*TIME* command.

Product Restrictions

This command works only when modeling *implicit* creep with either von Mises or Hill potentials.

When modeling implicit creep with von Mises potential, you can use the following elements: LINK180, SHELL181, PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, SOLID272, SOLID273, SOLID285, SOLSH190, BEAM188, BEAM189, SHELL208, SHELL209, REINF264, SHELL281, and ELBOW290.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When modeling anisotropic creep (**TB (p. 1899)**,CREEP with **TB (p. 1899)**,HILL), you can also use the following elements: LINK180, SHELL181, PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, BEAM188, BEAM189, SOLSH190, SHELL208, SHELL209, REINF264, REINF265, SOLID272, SOLID273, SHELL281, SOLID285, PIPE288, PIPE289, and ELBOW290.

Menu Paths

Main Menu>Solution>Load Step Opts>Nonlinear>Strn Rate Effect

/RATIO, *WN*, *RATOX*, *RATOY*

Distorts the object geometry.

GRAPHICS (p. 16): Scaling (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

RATOX

Distort object in the window X direction by this factor (defaults to 1.0).

RATOY

Distort object in the window Y direction by this factor (defaults to 1.0).

Command Default

No distortion.

Notes

Distorts the object geometry in a particular direction. An example of this command's use would be to allow long narrow sections to be distorted to a more square area for better display visualization.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Size and Shape

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RBE3, *INDEPEND*, *DOF*, *Depend*, *Wtfact*

Distributes the force/moment applied at an independent node to a set of dependent nodes.

PREP7 (p. 22): Constraint Equations (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

INDEPEND

Node at which the force/moment to be distributed will be applied (the independent node). To be included in the degree-of-freedom (DOF) solution, this node must be associated with an element.

DOF

Refers to the independent node DOFs to be used in the constraint equations. Valid labels are: UX, UY, UZ, ROTX, ROTY, ROTZ, UXYZ, RXYZ, ALL

Depend

The name of an array parameter that contains a list of dependent nodes. Must specify the starting index number. ALL can be used for the currently selected set of nodes. The dependent nodes must not be colinear (that is, must not be located on the same straight line). See "Notes" (p. 1573) for details.

Wtfact

The name of an array parameter that contains a list of weighting factors corresponding to each dependent node defined by *Depend*. Must have the starting index number. If not specified, the weighting factor for each dependent node defaults to 1.

Notes

RBE3 (p. 1573) distributes the force/moment applied at an independent node to a set of dependent nodes, taking into account the geometry of the dependent nodes as well as weighting factors. The force is distributed to the dependent nodes proportional to the weighting factors. The moment is distributed as forces to the dependent nodes; these forces are proportional to the distance from the center of gravity of the dependent nodes times the weighting factors. Only the translational degrees of freedom of the dependent nodes are used for constructing the constraint equations. Constraint equations are converted to distributed forces/moments on the dependent nodes during solution.

RBE3 (p. 1573) creates constraint equations such that the motion of the independent node is the average of the dependent nodes. For the rotations, a least-squares approach is used to define the "average rotation" at the independent node from the translations of the dependent nodes. If the dependent nodes are colinear, then one of the independent node rotations that is parallel to the colinear direction cannot be determined in terms of the translations of the dependent nodes. Therefore, the associated moment component on the independent node in that direction cannot be transmitted. When this case occurs, a warning message is issued and the constraint equations created by **RBE3 (p. 1573)** are ignored.

Applying this command to a large number of dependent nodes may result in constraint equations with a large number of coefficients. This may significantly increase the peak memory required during the process of element assembly. If real memory or virtual memory is not available, consider reducing the number of dependent nodes.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can use the **DOFSEL (p. 569)** command to select the degrees of freedom (DOFs) of the dependent nodes to be included in the resulting constraint equations. (Be sure to issue **DOFSEL (p. 569)**,ALL *after* issuing **RBE3 (p. 1573)**.) This capability is useful if, for example, you want to ignore radial constraints in cylindrical geometries. The selected DOFs must collectively generate forces and moments on the independent node in all six DOFs.

RBE3 (p. 1573) is restricted to small-deflection analysis (large-deflection is not supported). As an alternative to **RBE3 (p. 1573)**, you can apply a similar type of constraint using contact elements and the internal multipoint constraint (MPC) algorithm. For more information, see Surface-based Constraints.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Coupling / Ceqn>Dist F/M at Indep

RCON

Specifies "Real constants" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Real Constants

RCYC, *IR*, *IA*, *SECTOR*, *Name*

Calculates cyclic results for a mode-superposition harmonic solution.

POST26 (p. 58): Special Purpose (p. 60)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to *NV* (**NUMVAR (p. 1302)**)). If this number is the same as for a previous variable, the previous variable will be overwritten with this result.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IA

Reference number of the variable to be operated on.

SECTOR

Sector number to calculate the results for.

Name

Thirty-two character name identifying the variable on listings and displays. Embedded blanks are compressed for output.

Notes

This command calculates the harmonic response in the sector specified by *SECTOR* for the variable referenced by the reference number *IA*. Only component values for *IA* are valid (no principles or sums). The variable specified by *IR* will contain the harmonic solution. `Jobname.rfrq` from the cyclic mode-superposition harmonic solve and `Jobname.RST` or `Jobname.RSTP` from the cyclic modal solve must be available for the calculations to occur. The Jobname must be the same for the cyclic modal solve and the cyclic mode-superposition harmonic solve.

For *SECTOR* > 1, the result is in the nodal coordinate system of the base sector, and it is rotated to the expanded sector's location. Refer to Using the /CYCEXPAND Command in the *Cyclic Symmetry Analysis Guide* for more information.

See also Mode-Superposition Harmonic Cyclic Symmetry Analysis in the *Cyclic Symmetry Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

RDEC,*Option*,*REDUC*,*--*,*Nplace*

Defines the decimation parameters used by the radiosity solver method.

SOLUTION (p. 38): Radiosity (p. 50)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Command options:

DEFINE

Defines the decimation parameters (default).

STAT

Shows the status/listing. Other command options are ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

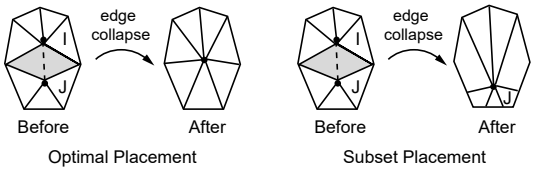
REDUC

Approximate reduction in the number of surface elements. Valid range is from 0.0 (no decimation, the default) to 1.0. This number is a factor applied to the initial number of element radiosity surfaces.

--

Unused field.

Nplace



Node placement algorithm

OPTI

Optimal placement. An edge is collapsed by moving both nodes (I and J in the figure below) to a new location.

SUBS

Subset placement. An edge is collapsed by moving one node to another one. In the figure below, node I is moved to node J.

Notes

The **RDEC (p. 1575)** command sets decimation parameters. These parameters are used by the next **RSURF (p. 1631)** command to generate radiosity surface elements.

Decimation is the process of simplifying a fine surface mesh into a coarse one. This process is accomplished by a sequence of edge collapses.

The maximum degree of decimation (1.0) is unreachable. The real degree of decimation is always less than 1.0 because the decimated mesh must always consist of at least one element.

Menu Paths

Main Menu>Preprocessor>Radiation Opts>Advanced Solution Option>Decimation Options>Define Specifications

Main Menu>Solution>Radiation Opts>Advanced Solution Option>Decimation Options>Define Specifications

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RDELE, *NSET1*, *NSET2*, *NINC*, *LCHK*

Deletes real constant sets.

PREP7 (p. 22): Real Constants (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSET1*, *NSET2*, *NINC

Delete real constant sets from *NSET1* to *NSET2* (defaults to *NSET1*) in steps of *NINC* (defaults to 1). If *NSET1* = ALL, ignore *NSET2* and *NINC* and all real constant sets are deleted.

LCHK

Specifies the level of element-associativity checking:

NOCHECK

No element-associativity check occurs. This option is the default.

WARN

When a section, material, or real constant is associated with an element, the program issues a message warning that the necessary entity has been deleted.

CHECK

The command terminates, and no section, material, or real constant is deleted if it is associated with an element.

Notes

Deletes real constant sets defined with the **R (p. 1565)** command.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Real Constants

Main Menu>Preprocessor>Real Constants>Add/Edit/Delete

Main Menu>Solution>Load Step Opts>Other>Real Constants>Add/Edit/Delete

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

READ,*Fname*,*NSKIP*,*Format*,*Xfield*,*Yfield*,*Zfield*,*pRfield*,*pIfield*

Reads coordinate and pressure data from a file.

/MAP (p. 63): Pressure Mapping (p. 63)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

NSKIP

Number of lines at the beginning of the file that will be skipped while it is read. Default = 0. *NSKIP* is ignored for *FileType* = CFXTBR or CFDPOST on the **FTYPE (p. 783)** command.

Format

For *FileType* = FORMATTED on the **FTYPE (p. 783)** command, *Format* is the read format in the FORTRAN FORMAT convention enclosed in parentheses; for example: (3e10.0,10x,e10.0,70x,e10.0)

Xfield*, *Yfield*, *Zfield*, *pRfield*, *pIfield

For *FileType* = CSV on the **FTYPE (p. 783)** command, these are field numbers locating the coordinates and real and imaginary (if present) pressures. The field value may not exceed 20.

Notes

Reads coordinate and pressure data from the specified file. The file type must have been previously specified on the **FTYPE (p. 783)** command.

Upon reading the file, nodes are created for the source points. For *FileType* = CFXTBR or CFDPOST on the **FTYPE (p. 783)** command, if face data is available, SURF154 elements are also created. A nodal component named SOURCENODES and an element component named SOURCEELEMS are created automatically.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

REAL, *NSET*

Sets the element real constant set attribute pointer.

PREP7 (p. 22): Meshing (p. 29)
PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSET

Assign this real constant set number to subsequently defined elements (defaults to 1).

Command Default

NSET = 1.

Notes

Identifies the real constant set number to be assigned to subsequently defined elements. This number refers to the real constant set number (*NSET*) defined with the real constant sets (**R (p. 1565)**). Real constant set numbers may be displayed (**/PNUM (p. 1457)**). If the element type requires no real constants, this entry is ignored. Elements of different type should not refer to the same real constant set.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh Attributes>Default Attribs

Main Menu>Preprocessor>Modeling>Create>Elements>Elem Attributes

---

REALVAR, *IR*, *IA*, - -, - -, *Name*, - -, - -, *FACTA*

Forms a variable using only the real part of a complex variable.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA

Reference number of the variable to be operated on.

--,--

Unused fields.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name

Thirty-two character name identifying the variable on printouts and displays. Embedded blanks are compressed for output.

--, --

Unused fields.

FACTA

Scaling factor (positive or negative) applied to variable *IA* (defaults to 1.0).

Notes

Forms a variable using only the real part of a variable. Used only with harmonic analyses (**ANTYPE (p. 162)**,HARMIC).

Complex variables are stored in two-column arrays with the real component stored in the first column and the imaginary component stored in the second column. This command extracts the value stored in the first column (that is, real component). However with harmonic analyses, all variables are stored in two-column arrays as complex variables. If the variable is not complex, then the same value is stored in both columns. This command will extract the variable in the first column of the array, even if this variable is not the real component of a complex variable.

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Real Part

RECTNG,*X1*,*X2*,*Y1*,*Y2*

Creates a rectangular area anywhere on the working plane.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

X1, X2

Working plane X coordinates of the rectangle.

Y1, Y2

Working plane Y coordinates of the rectangle.

Notes

The area will be defined with four keypoints and four lines. See the **BLC4 (p. 266)** and **BLC5 (p. 267)** commands for alternate ways to create rectangles.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Areas>Rectangle>By Dimensions

---

REMESH,*Action*,*Filename*,*Ext*,--,*Opt1*,*Opt2*

Specifies the starting and ending remeshing points, and other options, for rezoning.

SOLUTION (p. 38): Rezoning (p. 46)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

START

Starts the remeshing operation.

FINISH

Ends the remeshing operation.

READ

Reads in a generic (.cdb format) new mesh file generated by a third-party application. This remeshing option applies to both 2D and 3D rezoning.

SPLIT

Splits selected elements of an existing 2D or 3D mesh such that a quadrilateral element is split into four quadrilaterals, a degenerate quadrilateral is split into three quadrilaterals, and a quadratic triangular element is split into four quadratic triangles. A tetrahedral element is split into eight tetrahedra.

Filename

Name of a .cdb generic mesh file. The default value is *jobname*. Valid only when *Action* = READ.

Ext

File name extension. The only valid (and the default) extension is CDB. Valid only when *Action* = READ.

--

Unused field.

Opt1

Specifies options for the new mesh when using a generic imported mesh file or the mesh-splitting remeshing method. Valid only when *Action* = READ or *Action* = SPLIT.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

REGE

Regenerates all node and element numbers on the new mesh using an offset of the highest existing node and element numbers. This is the default behavior when *Action* = READ; otherwise, this value is ignored.

KEEP

Keeps the similarly numbered nodes and elements in the new and the old meshes unchanged. Valid only when *Action* = READ.

TRAN

Generates transition elements to ensure nodal compatibility between split and unsplit parts of the mesh. Valid only when *Action* = SPLIT for 2D analyses.

Opt2

Specifies transition options for the mesh when elements are split. These options are valid only when *Action* = SPLIT for 2D analyses.

QUAD

Minimizes the number of degenerate elements in the transition mesh and tries to maximize the number of quadrilateral transition elements across several layers of elements from the split regions. This is the default behavior.

DEGE

Creates transition zones between the split and unsplit parts of the mesh using mostly degenerate elements with a single element layer.

Notes

This command is valid only during the rezoning (**REZONE (p. 1606)**) process.

In rezoning, **REMESH (p. 1581)**,START exits the solution processor temporarily and enters a special mode of the PREP7 preprocessor, after which a limited number of preprocessing commands are available for mesh control, but no solution commands are valid.

REMESH (p. 1581),FINISH exits the remeshing process and reenters the solution processor, at which point no preprocessing commands are available. If the new mesh exists, the command creates contact elements if needed, and transfers all boundary conditions (BCs) and loads from the original mesh to the new mesh. You can issue any list or plot command to verify the created contact elements, transferred BCs, and loads. **REMESH (p. 1581)**,FINISH is valid only after a previously issued **REMESH (p. 1581)**,START, and is the only way to safely end the remeshing operation (and exit the special mode of PREP7).

REMESH (p. 1581),READ is valid only when you want to perform a rezoning operation using a generic new mesh generated by a third-party application (rather than a new mesh generated internally by Mechanical APDL). The command is valid between **REMESH (p. 1581)**,START and **REMESH (p. 1581)**,FINISH. In this case, the only valid file extension is `.cdb` (*Ext* = CDB). When *Option* = KEEP, Mechanical APDL assumes that the common node and element numbers between the old and the new mesh are topolo-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

gically similar (that is, these commonly numbered areas have the same element connectivity and nodal coordinates).

REMESH (p. 1581),SPLIT is valid only when performing a rezoning operation via splitting the existing mesh. The command is valid between **REMESH (p. 1581)**,START and **REMESH (p. 1581)**,FINISH.

You can use **REMESH (p. 1581)**,READ and **REMESH (p. 1581)**,SPLIT for horizontal multiple rezoning provided that the meshes used in **REMESH (p. 1581)**,READ do not intersect. (Avoid issuing **AREMESH (p. 180)** after issuing either of these commands.)

For more information about the remeshing options available during rezoning, see Rezoning in the *Nonlinear Adaptivity Analysis Guide*.

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

Menu Paths

***REMOVE**, *Name*, *Val1*, *Val2*, *Val3*

Suppresses rows or columns of a dense matrix or a vector.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Name

Name of the matrix or vector to be revised.

Val1*, *Val2*, *Val3

Additional input. The meaning of *Val1* to *Val3* varies depending on the entity type (matrix or vector). See details below.

The following *Val1* through *Val3* fields are used if *Name* refers to a dense matrix created by the *DMAT (p. 551) command:

Val1

First row or column number to suppress.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Val2

Last row or column number to suppress.

Val3

Specifies what to remove:

COL

Remove columns of the matrix (default).

ROW

Remove rows of the matrix.

The following *Val1* and *Val2* fields are used if *Name* refers to a vector created by the *VEC (p. 2085) command:

Val1

First value index to suppress.

Val2

Last value index to suppress.

Notes

The values of the original matrix or vector specified by *Name* are retained. The matrix or vector is resized to the new number of rows and columns.

Menu Paths

This command cannot be accessed from a menu.

***RENAME**,*OldName*,*NewName*,

Renames an existing vector or matrix.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

OldName

Name of the existing vector or matrix to be renamed.

NewName

New name for the vector or matrix.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The ***RENAME (p. 1584)** command is used to rename APDL Math objects.

Menu Paths

This command cannot be accessed from a menu.

/RENAME,*Fname1*,*Ext1*,--,*Fname2*,*Ext2*,--,*DistKey*

Renames a file.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname1

The file to be renamed. You can also include an optional directory path as part of the specified file name; if not, the default file location is the working directory.

File name defaults to the current Jobname.

Ext1

Filename extension (eight-character maximum).

--

Unused field.

Fname2

The new name for the file. You can also include an optional directory path as part of the new file name; if not, the default is the working directory. A maximum of 248 characters is allowed for the file name (or combined file name and directory path, if both are specified).

Fname2 defaults to *Fname1*.

Ext2

Filename extension (eight-character maximum).

Ext2 defaults to *Ext1*.

--

Unused field.

DistKey

Key that specifies which rename operation is performed on all processes in distributed-memory parallel mode:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0 (OFF or NO)

The program performs the rename operation only on the master process (default).

1 (ON or YES)

The program performs the rename operation locally on each process.

2 or BOTH

The program performs the rename operation for *Fname.Ext* on the master process and for *FnameN.Ext* on all processes.

Notes

Renames a file. Ex: **/RENAME (p. 1585)**,A,,,B renames file A to B in the same directory. **/RENAME (p. 1585)**,A,DAT,,,INP renames file A.DAT to A.INP. On all systems, this command will overwrite any existing file named B. See the *Operations Guide* for details. Only Mechanical APDL files should be renamed. Use **/SYS (p. 1895)** and system renaming commands for other files.

In distributed-memory parallel (DMP) mode, only the master process will rename *Fname1.Ext1* to *Fname2.Ext2* by default. However, when *DistKey* is set to 1 (or ON, or YES) or 2 (or BOTH), the command is executed by all processes. In this case, *Fname1* and *Fname2* will automatically have the process rank appended to them. This means *Fname1N.Ext1* will be renamed to *Fname2N.Ext2* by all processes, where *N* is the DMP process rank. For more information see Differences in General Behavior in the *Parallel Processing Guide*.

Renaming across system partitions may be internally done by a copy and delete operation on some systems.

This command is valid only at the Begin level.

***REPEAT**, *NTOT*, *VINC1*, *VINC2*, *VINC3*, *VINC4*, *VINC5*, *VINC6*, *VINC7*, *VINC8*, *VINC9*, *VINC10*, *VINC11*

Repeats the previous command.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

NTOT

Number of times the preceding command is executed (including the initial execution). Must be 2 or greater. *NTOT* of 2 causes one repeat (for a total of 2 executions).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VINC1, VINC2, VINC3, ..., VINC11

Value increments applied to first through eleventh data fields of the preceding command.

Notes

***REPEAT (p. 1586)** must immediately follow the command that is to be repeated. The numeric arguments of the initial command may be incremented in the generated commands. The numeric increment values may be integer or real, positive or negative, zero or blank. Alphanumeric arguments cannot be incremented. For large values of *NTOT*, consider printout suppression (**/NOPR (p. 1251)** command) first.

Most commands beginning with slash (/), star (*), as well as "unknown command" macros, cannot be repeated. For these commands, or if more than one command is to be repeated, include them within a do-loop. File switching commands (those reading additional commands) cannot be repeated. If a ***REPEAT (p. 1586)** command immediately follows another ***REPEAT (p. 1586)** command, the repeat action only applies to the last non-***REPEAT (p. 1586)** command. Also, ***REPEAT (p. 1586)** should not be used in interactive mode immediately after a) a command (or its log file equivalent) that uses picking, or b) a command that requires a response from the user.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

/REPLOT, *Label*

Reissues the last display command.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Controls the type of replot.

RESIZE

Issued internally when a graphics window resize occurs (Default).

FAST

Only applicable for 3D devices that allow a fast redisplay for changes in the view characteristics only.

Notes

Reissues the last display command (**NPLOT (p. 1254)**, **EPLOT (p. 648)**, **KPLOT (p. 988)**, **PLNSOL (p. 1425)**, **PLVAR (p. 1444)**, etc.), along with its parameters, for convenience. The current display specifications are used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When the last display command is invalid in a given processor, **/REPLOT (p. 1587)** is also invalid in that processor. However, if you attempt a **/REPLOT (p. 1587)** and the last display command is invalid in the current processor, Mechanical APDL generates an element display (**EPLOT (p. 648)**) instead, *as long as the last display command was* **PLNSOL (p. 1425)**, **PLESOL (p. 1401)**, *or* **PLDISP (p. 1400)**.

Example 12: /REPLOT (p. 1587) Replaced by EPLOT (p. 648) Automatically

PLNSOL (p. 1425), used to display solution results as continuous contours, is a valid command in the POST1 general postprocessor.

If you issue **PLNSOL (p. 1425)** followed by **/REPLOT (p. 1587)** while in POST1, **/REPLOT (p. 1587)** effectively reissues your earlier **PLNSOL (p. 1425)** command, along with its parameters.

If you then exit POST1, enter the PREP7 preprocessor, and again issue **/REPLOT (p. 1587)**, the program uses **EPLOT (p. 648)** internally instead.

The command substitution occurs because **PLNSOL (p. 1425)** is not a valid command in PREP7.

When you click one of the buttons on the Pan, Zoom, Rotate dialog box to manipulate the view of a model, **/REPLOT (p. 1587)** is issued internally. Thus, the substitution of **/REPLOT (p. 1587)** with **EPLOT (p. 648)** as described above may also occur for operations that you perform via with the Pan, Zoom, Rotate dialog box.

/REPLOT (p. 1587) does not show boundary conditions if they are applied only to a solid model and the last display command (such as **EPLOT (p. 648)**) displays the finite element model. To show boundary conditions, the following options are available:

- Issue **/REPLOT (p. 1587)** after you issue **SBCTRAN (p. 1647)** to transfer solid model boundary conditions to the finite element model.
- Issue **/REPLOT (p. 1587)** after you issue a solid model display command (such as **VPLOT (p. 2147)**).

This command is valid in any processor (except as noted above).

RESCOMBINE,*NUMFILES*,*Fname*,*Ext*,*Lstep*,*Sbstep*,*Fact*,*KIMG*,*TIME*,*ANGLE*,*NSET*,*ORDER*

Reads results from local results files into the database after a distributed-memory parallel solution.

POST1 (p. 51): Set Up (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NUMFILES

Number of local results files that are to be read into the database from the distributed-memory parallel solution. This number should be equal to the number of processes used in the parallel solution.

Fname

File name (jobname) used during the distributed parallel solution. The file name must be an alphanumeric string (up to 32 characters) enclosed in single quotes.

Ext

File extension for the results files (for example, RST, RTH, RMG, etc.). The file extension must be an alphanumeric string (up to 8 characters) enclosed in single quotes.

Lstep

Load step number of the data set to be read (defaults to 1):

N

Read load step *N*.

FIRST

Read the first data set (*Sbstep* and *TIME* are ignored).

LAST

Read the last data set (*Sbstep* and *TIME* are ignored).

NEXT

Read the next data set (*Sbstep* and *TIME* are ignored). If at the last data set, the first data set will be read as the next.

PREVIOUS

Read the previous data set (*Sbstep* and *TIME* are ignored). If at the first data set, the last data set will be read as the previous.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NEAR

Read the data set nearest to *TIME* (*Sbstep* is ignored). If *TIME* is blank, read the first data set.

LIST

Scan the results files and list a summary of each load step (*KIMG*, *TIME*, *ANGLE*, *NSET*, and *ORDER* are ignored.)

Sbstep

Substep number within *Lstep* (defaults to the last substep of the load step). For a buckling (**ANTYPE (p. 162)**,BUCKLE) or modal (**ANTYPE (p. 162)**,MODAL) analysis, *Sbstep* corresponds to the mode number (defaults to the first mode). Specify *Sbstep* = LAST to store the last substep for the specified load step.

If *Lstep* = LIST, *Sbstep* = 0 or 1 lists the basic step information; *Sbstep* = 2 also lists the basic step information, but includes the load step title, and labels imaginary data sets if they exist.

Fact

Scale factor applied to data read from the files. If zero (or blank), a value of 1.0 is used. A nonzero factor excludes non-summable items. Harmonic velocities or accelerations may be calculated from the displacement results from a modal (**ANTYPE (p. 162)**,MODAL) or harmonic (**ANTYPE (p. 162)**,HARMIC) analysis. If *Fact* = VELO, the harmonic velocities (v) are calculated from the displacements (d) at a particular frequency (f) according to the relationship $v = 2\pi fd$. Similarly, if *Fact* = ACEL, the harmonic accelerations (a) are calculated as $a = (2\pi f)^2 d$.

KIMG

Used only with complex results (harmonic and complex modal analyses).

0 or REAL

Store the real part of a complex solution (default).

1, 2 or IMAG

Store the imaginary part of a complex solution.

TIME

Time-point identifying the data set to be read. For a harmonic analysis, time corresponds to the frequency. For a buckling analysis, time corresponds to the load factor. Used only in the following cases: If *Lstep* = NEAR, read the data set nearest to *TIME*. If both *Lstep* and *Sbstep* are zero (or blank), read data set at time = *TIME*. If *TIME* is between two solution time points on the results file, a linear interpolation is done between the two data sets. Solution items not written to the results file (**OUTRES (p. 1336)**) for either data set will result in a null item after data set interpolation. If *TIME* is beyond the last time point on the file, the last time point will be used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANGLE

Circumferential location (0.0 to 360°). Defines the circumferential location for the harmonic calculations used when reading from the results file. The harmonic factor (based on the circumferential angle) is applied to the harmonic elements (PLANE25, PLANE75, PLANE78, PLANE83, and SHELL61) of the load case. See the *Mechanical APDL Theory Reference* for details. Note that factored values of applied constraints and loads will overwrite any values existing in the database.

NSET

Data set number of the data set to be read. If a positive value for *NSET* is entered, *Lstep*, *Sbstep*, *KIMG*, and *TIME* are ignored. Available set numbers can be determined by **RESCOMBINE (p. 1589)**,,,,LIST.

ORDER

Key to sort the harmonic index results. This option applies to cyclic symmetry buckling and modal analyses only, and is valid only when *Lstep* = FIRST, LAST, NEXT, PREVIOUS, NEAR or LIST.

ORDER

Sort the harmonic index results in ascending order of eigenfrequencies or buckling load multipliers.

(blank)

No sorting takes place.

Notes

RESCOMBINE (p. 1589) is a Mechanical APDL command macro enabling you to combine results from a distributed-memory parallel (DMP) solution. A character string input for any argument must be enclosed in single quotes (for example, 'FIRST' input for *Lstep*).

In a distributed memory parallel solution, a global results file is saved by default. However, if you issued **DMPOPTION (p. 559)**,RST,NO in the parallel solution, no global results file is written and all local results files will be kept. In this case, you can use **RESCOMBINE (p. 1589)** in the general postprocessor (**/POST1 (p. 1461)**) to read results into the database for postprocessing.

RESCOMBINE (p. 1589) cannot be used to combine results from local files generated during a distributed-memory parallel solution that used the frequency or cyclic harmonic index domain decomposition method (**DDOPTION (p. 508)**,FREQ or **DDOPTION (p. 508)**,CYCHI).

To use **RESCOMBINE (p. 1589)**, all local results files from the distributed-memory parallel solution must be in the current working directory. If running on a single machine, the local results files are saved in the working directory by default. If running on a cluster, the local results files are kept in the working directory on each compute node. For the latter case, copy the local results files to the working directory on the primary compute node.

Similar to **SET (p. 1724)**, **RESCOMBINE (p. 1589)** defines the data set to be read from the results files into the database. Various operations can also be performed during the read operation. (See **SET (p. 1724)** for more information.) The database must have the model data available (or issue **RESUME (p. 1601)** before **RESCOMBINE (p. 1589)** to restore the geometry from `Jobname.db`).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

After issuing **RESCOMBINE (p. 1589)** to combine a set of data into the database, you can issue **RESWRITE (p. 1604)** to write the data set into a new results file. The new results file will essentially contain the current set of results data for the entire (that is, global) model.

Upon completion of a **RESCOMBINE (p. 1589)** operation, the current file for postprocessing (**FILE (p. 752)**) is set to the last local results file specified via **RESCOMBINE (p. 1589)**. For example, if reading in four local results files, the results file for POST1 is specified as `Jobname3.RST` when **RESCOMBINE (p. 1589)** is complete. Therefore, be aware that some downstream postprocessing actions (such as **SET (p. 1724)**) may be operating on only this one local results file.

RESCOMBINE (p. 1589) is intended for use in POST1. If you want to postprocess DMP solution results using the POST26 time-history postprocessor, combine your local results files into one global results file (**DMPOPTION (p. 559)**,RST,YES).

The load case commands in the general postprocessor (such as **LCDEF (p. 1021)**, **LCFILE (p. 1023)**, **LCOPER (p. 1026)**, etc.) are not supported when using **RESCOMBINE (p. 1589)**. Those commands set up pointers in the results file used for postprocessing; they cannot be used with the local results files used by **RESCOMBINE (p. 1589)**.

/CYCEXPAND (p. 454), which performs a cyclic expansion, cannot be used with **RESCOMBINE (p. 1589)**.

Menu Paths

This command cannot be accessed from a menu.

RESCONTROL,*Action*,*Ldstep*,*Frequency*,*MAXFILES*,*--*,*MAXTotalFiles*,*Filetype*

Controls file writing for multiframe restarts.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Command action:

DEFINE

Specifies how often *.xnnn* restart files (default) or *.rdnn* remeshing database files (for nonlinear mesh adaptivity analysis) are written for a load step. The file type controlled by this command is determined by *Filetype*.

FILE_SUMMARY

Prints the substep and load-step information for all *.xnnn* or *.rdnn* files for the current jobname in the current directory. If specified, all other arguments are ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

STATUS

Issuing the command lists the current status in the tables of restart controls specified previously by **RESCONTROL (p. 1592)**. If this option is specified, all other arguments are ignored.

NORESTART

Cleans up some of the restart files after a distributed-memory parallel (DMP) solution. (Not valid for nonlinear mesh adaptivity.)

The master process will not have the following files in the working directory at the end of the run: `.esav`, `.osav`, `.xnnn`, `.rdb`, `.ldhi`. The worker processes will not have the following files in the working directory at the end of the run: `.esav`, `.osav`, `.xnnn`, `.rst` (or `.rth`, etc.). Some restart files are never written, some are removed upon exiting the solution processor (for example, upon **FINISH (p. 758)**), and some are removed upon exiting the program.

This option is useful for cleaning up files written by all distributed processes, especially when you know that these restart files will not be needed later. If this option is specified, all other arguments are ignored.

If this option is used in a shared-memory parallel (SMP) environment, most restart files in the working directory are removed. It has the same effect as issuing **RESCONTROL (p. 1592)**,,NONE.

LINEAR

Same as *Action* = DEFINE, but for linear static applications only. For a linear static analysis, the restart capability is normally not needed; however, it is typically needed when a subsequent linear perturbation analysis is desired. By default, none of the restart files are written for a linear static analysis.

DELETE

Delete the restart control specification corresponding to the *Ldstep* label on a previous **RESCONTROL (p. 1592)**,DEFINE command.

Ldstep

Specifies how the `.xnnn` or `.rdnn` files are written for the specified load steps. This option also affects how often the load history information is written to the `.ldhi` file.

ALL

Write the `.xnnn` or `.rdnn` files at the same substep *Frequency* for all load steps; write the load history information to the `.ldhi` file for all load steps. For `.rdnn` files, this option is the default.

LAST

Write the `.xnnn` or `.rdnn` files for the last load step only; write load-history information to the `.ldhi` file for the last load step only. This option is the default for nonlinear static and full transient analyses for `.xnnn` files. If specified, all remaining arguments are ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

N

Number that indicates how often the .*xnnn* or .rd*nn* files are written.

Input a positive number to write the .*xnnn* or .rd*nn* files at the substep *Frequency* indicated only for load step *N*. Other load steps will be written at the default substep frequency or at a frequency defined by a previous **RESCONTROL (p. 1592)** specification. Load-history information is written to the .ldhi file only for load steps *N*.

Specifying a negative number (-*N*) is valid for controlling .*xnnn* files only. The files are written for every *N*th load step at the specified substep *Frequency*. The load history information is written to the .ldhi file every *N*th load step. This option is suitable for restart applications in which more than a few hundred load steps are required. Compared to the ALL and positive *N* options, it can save disk space, as the .ldhi file is smaller and fewer .*xnnn* files are written.

If *Ldstep* = -*N*, all other *Ldstep* options specified by **RESCONTROL (p. 1592)** are ignored and the program follows the -*N* option (write load history information every *N*th load step). If you want to change this pattern, issue **RESCONTROL (p. 1592)**,DELETE, -*N*, then issue another **RESCONTROL (p. 1592)** command with the desired *Ldstep* option.

NONE

No multiframe restart files (.rdb, .ldhi, .*xnnn*) are created. (Not valid for nonlinear mesh adaptivity analysis.)

This option is the default for mode-superposition analyses. The remaining arguments are ignored.

For nonlinear static, linear static, and full transient analyses, this option enables a restart to occur at the last or abort point (using the .emat, .esav or .osav, and .db files).

For mode-superposition transient analyses, this option allows a restart from the last point using the .rdsp and .db files.

Frequency

Frequency at which the .*xnnn* files are written at the substep level, or at which the .rd*nn* files are written at the remeshing level:

NONE

Do not write .*xnnn* files for this load step (not available for .rd*nn* files).

LAST

Write the .*xnnn* files for the last substep of the load step only (default for nonlinear static and full transient analyses), or write the .rd*nn* files for the last remesh of the load step only (default for nonlinear mesh adaptivity analysis).

N

If *N* is positive, write the .*xnnn* files at every *N*th substep of a load step, or write the .rd*nn* files at every *N*th remesh of a load step.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If *N* is negative (not valid for .rd*nn* files), write *N* equally spaced .*xnnn* files within a load step.

In nonlinear static and full transient analyses, -*N* is valid only when automatic time stepping is enabled (**AUTOTS (p. 207)**,ON).

In mode-superposition analyses, negative *N* is always valid.

MAXFILES

Maximum number of .*xnnn* files to save within a load step (not available for .rd*nn* files):

-1

Overwrite existing .*xnnn* files (default). The total maximum number of .*xnnn* files for one run is 999. If this number is reached before the analysis is complete, the program will reset the .*xnnn* file numbering back to 1 and continue to write .*xnnn* files; the program keeps the newest 999 restart files and overwrites the oldest restart files. For this option, the maximum number of files can be changed to a number less than 999 by setting the *MAXTotalFiles* argument.

0

Do not overwrite any existing .*xnnn* files. The total maximum number of .*xnnn* files for one run is 999. If this number is reached before the analysis is complete, the analysis continues but no longer writes any .*xnnn* files.

N

Maximum number of .*xnnn* files to keep for each load step. When *N* .*xnnn* files have been written for a load step, the program overwrites the first .*xnnn* file of that load step for subsequent substeps. *N* must be <= 999. If a total of 999 restart files is reached before the analysis is complete, the analysis continues but writes no additional .*xnnn* files.

--

Reserved for future use.

MAXTotalFiles

Total number of restart files to keep. Default = 999 for .*xnnn* files and 99 for .rd*nn* files. This option is valid only when *MAXFILES* = -1 (default).

Valid *MAXTotalFiles* values are 1 through 999 for .*xnnn* files, and 1 through 99 for .rd*nn* files.

When the total number of restart files written exceeds *MAXTotalFiles*, the program resets the .*xnnn* or .rd*nn* file numbering back to 1 and continues to write .*xnnn* or .rd*nn* files. The newest files are retained and the oldest files are overwritten.

The *MAXtotalFiles* value specified applies to all subsequent load steps. To reset it to the default, reissue the command with *MAXTotalFiles* = 0 or some negative value.

If *MAXTotalFiles* is set to different values at different load steps, and if the value of *MAXTotalFiles* specified in the prior load step is larger than that of the current load step, the program can

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

only overwrite the current number of maximum restart files up to the number *MAXTotalFiles* currently specified (which is smaller than the previous number).

The recommended way to control the maximum number of restart files is to specify *MAXTotalFiles* at the first load step and not vary it in subsequent load steps. Also, *MAXTotalFiles* is best used when *Ldstep* = -*N* or ALL.

Filetype

The type of restart file to be controlled by this command. Valid only when *Action* = DEFINE:

XNNN

Control .*xnnn* files (default).

RDNN

Control .rd*nn* remeshing database files. Needed only for a nonlinear mesh adaptivity analysis.

Command Default

If the **RESCONTROL (p. 1592)** command is not issued during a structural analysis, the .rdb and .ldhi files are written as described in Restarting an Analysis.

For nonlinear static and full transient analysis:

The default behavior is multiframe restart: **RESCONTROL (p. 1592)**,DEFINE,LAST,LAST

The .*xnnn* file is written at the last substep of the last load step. An .r*nnn* file is also written at the iteration prior to the abort point of the run if a jobname.abt file was used (or the **Stop** button was pressed in the GUI), or if the job terminated because of a failure to reach convergence or some other solution error. No information at the aborted substep is saved to the .*xnnn* file.

For nonlinear mesh adaptivity analysis:

The default behavior for .rd*nn* files written is: **RESCONTROL (p. 1592)**,DEFINE,ALL,LAST,,,,RDNN

The .rd*nn* file is written at the last remesh of every load step by default.

The .rd*nn* and .r*nnn* files interact with each other. Generally, .rd*nn* file writing is superior to that of .r*nnn* file writing. For example, if no **RESCONTROL (p. 1592)**,DEFINE command is issued, the default behavior is that both .rd*nn* and .r*nnn* files are written at the last occurrence of every load step (equivalent to **RESCONTROL (p. 1592)**,DEFINE,ALL,LAST and **RESCONTROL (p. 1592)**,DEFINE,ALL,LAST,,,,RDNN).

Notes

RESCONTROL (p. 1592) sets up the restart parameters for a multiframe restart, enabling you to restart an analysis from any load step and substep for which there is an .*xnnn* file. You can perform a multiframe restart for static and transient (full or mode-superposition method) analyses only. For more information about multiframe restarts and descriptions of the contents of the files used, see Restarting an Analysis in the *Basic Analysis Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Syntax

Multiframe restart files are generically indicated here as .*xnnn* files. They correspond to .r*nnn* files for nonlinear static and full transient analyses, and .m*nnn* files for mode-superposition analyses.

Remeshing database files are indicated as .rd*nn* files. This type of restart file is needed only after remeshing during a nonlinear mesh adaptivity analysis.

When *Action* = DEFINE, the specified *Filetype* determines the type of file (.*xnnn* or .rd*nn*) controlled by this command.

Number of Restart Files Allowed

The total number of restart files for any analysis cannot exceed 999 (for example, jobname.r001 to jobname.r999).

The total number of remeshing database files cannot exceed 99 (for example, jobname.rd01 to jobname.rd99).

Considerations for Nonlinear Mesh Adaptivity Analysis

To control *both* .*xnnn* and .rd*nn* file writing (*Filetype* = XNNN and *Filetype* = RDNN, respectively), separate **RESCONTROL (p. 1592)** commands are necessary.

Action = NORESTART and *Ldstep* = NONE are not valid and will cause the analysis to fail.

Ldstep = *-N* is not valid for controlling .*xnnn* files.

Limiting the Number of Files Saved

If you have many substeps for each load step and are writing .*xnnn* files frequently, you may want to set *MAXFILES* to limit the number of .*xnnn* files saved, as they can fill your disk quickly.

You can specify *MAXFILES* and *Frequency* for individual load steps. These arguments take on the default value or the value defined by **RESCONTROL (p. 1592)**,,ALL,*Frequency*,*MAXFILES* if they are not explicitly defined for a specific load step.

When .*xnnn* files are written over many load steps, you may want to further limit the number of .*xnnn* files by setting *MAXTotalFiles*.

Maximum Number of Load Steps

You can specify a maximum of ten load steps; that is, you can issue the **RESCONTROL (p. 1592)**,,N command a maximum of ten times. Specified load steps cannot be changed in a restart.

Specifying *Ldstep* = LAST or *-N*

The program accepts only one occurrence of **RESCONTROL (p. 1592)** with *Ldstep* = LAST. If you issue **RESCONTROL (p. 1592)**,,LAST,*Frequency*,*MAXFILES* multiple times, the last specification overwrites the previous one.

The program accepts only one occurrence of **RESCONTROL (p. 1592)** with a negative *Ldstep* value (**RESCONTROL (p. 1592)**,,*N* where *N* is a negative number). If you issue **RESCONTROL (p. 1592)**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

multiple times with a negative *Ldstep* value, the last specification overwrites the previous one.

Using RESCONTROL (p. 1592) in a Restarted Analysis

The **RESCONTROL (p. 1592)** command is not valid in the restarted load step of a restart analysis. It is only valid in subsequent load steps.

Example Usage

Multiframe Restart

Linear Perturbation Analysis

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Sol'n Controls>Sol'n Options

Main Menu>Preprocessor>Loads>Load Step Opts>Nonlinear>Restart Control

Main Menu>Solution>Analysis Type>Sol'n Controls>Sol'n Options

Main Menu>Solution>Load Step Opts>Nonlinear>Restart Control

RESET

Resets all POST1 or POST26 specifications to initial defaults.

POST1 (p. 51): Set Up (p. 51)
POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Has the same effect as entering the processor the first time within the run. In POST1, resets all specifications to initial defaults, erases all element table items, path table data, and load case pointers. In POST26, resets all specifications to initial defaults, erases all variables defined, and zeroes the data storage space.

Menu Paths

Main Menu>General Postproc>Reset

Main Menu>TimeHist Postpro>Reset Postproc

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/RESET

Resets display specifications to their initial defaults.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Resets slash display specifications (**/WINDOW (p. 2177)**, **/TYPE (p. 2034)**, **/VIEW (p. 2131)**, etc.) back to their initial default settings (for convenience). Also resets the focus location to the geometric center of the object.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Reset Plot Ctrls

RESP,*IR*,*LFTAB*,*LDTAB*,*specType*,*dampRatio*,*DTIME*,*TMIN*,*TMAX*,*inputType*

Generates a response spectrum.

POST26 (p. 58): Special Purpose (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the response spectrum results (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with these results.

LFTAB

Reference number of variable containing frequency table (created with **FILLDATA (p. 756)** or **DATA (p. 497)** command). The frequency table defines the number and frequency of oscillating systems used to determine the response spectrum. The frequency interval need not be constant over the entire range. Frequencies must be input in ascending order.

LDTAB

Reference number of variable containing the input time-history.

specType

Defines the type of response spectrum to be calculated:

0 or 1

Displacement (relative to base excitation)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2

Velocity (relative to base excitation)

3

Acceleration response spectrum (absolute)

4

Pseudo-velocity

5

Pseudo-acceleration

dampRatio

Ratio of viscous damping to critical damping (input as a decimal number).

DTIME

Integration time step. This value should be equal to or greater than the integration time step used in the initial transient analysis performed to generate the input time-history (*LDTAB*).

DTIME defaults to a value of 1/(20*FMAX), where FMAX is the highest frequency in the frequency table (*LFTAB*) except when the time-history is read from the reduced displacement (RDSP) file following a mode-superposition transient analysis without an expansion pass. In this case, *DTIME* defaults to the time step value used in the analysis.

TMIN,TMAX

Specifies a subset of the input time-history (*LDTAB*) to be used in the response spectrum calculation. Defaults to the full time range.

inputType

Defines the type of the input time-history:

0

Displacement (default)

1

Acceleration

Notes

This command generates a response spectrum from a displacement or acceleration time-history and frequency data. The response spectrum is defined as the maximum response of single degree of freedom systems of varying frequency (or period) to a given input support excitation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A response spectrum analysis (**ANTYPE (p. 162)**, SPECTR with **SPOPT (p. 1837)**, SPRS or MPRS) requires a response spectrum input. This input can be determined from the response spectrum printout or display of this command.

If a response spectrum is to be calculated from a given displacement (or acceleration) time-history, the displacement time-history may be input to a single one-element reduced linear transient dynamic (**ANTYPE (p. 162)**,TRANS) analysis, so that the calculated output (which should be the same as the input) will be properly located on the file.

The integration time step (argument *DTIME* on the **RESP (p. 1599)** command) and the damping coefficient (argument *dampRatio*) are constant over the frequency range. The number of calculations done per response spectrum curve is the product of the number of input solution points (*TMAX*-*TMIN*)/*DTIME* and the number of frequency points (frequencies located in variable *LFTAB*).

Input solution points requested (using *DTIME* and the frequency range) at a time not corresponding to an actual displacement solution time on the file are linearly interpolated with respect to the existing points.

For the theory of the response spectrum calculation, see POST26 - Response Spectrum Generator (RESP).

For an example of the command usage, see Generating a Response Spectrum in the *Basic Analysis Guide*.

Menu Paths

Main Menu>TimeHist Postpro>Generate Spectrm

RESUME,*Fname*,*Ext*,--,*NOPAR*,*KNOPLOT*

Resumes the database from the database file.

DATABASE (p. 13): Set Up (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to DB if *Fname* is blank.

--

Unused field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NOPAR

Parameter resume key:

0

All data in the database, *including* the scalar parameters, are replaced with the data saved on `Jobname.db` (default).

1

All data in the database, *except* the scalar parameters, are replaced with the data saved on `Jobname.db`.

KNOPLOT

If equal to 1, will suppress automatic plot. Otherwise, if the GUI is on and this **RESUME (p. 1601)** command was not read from a file, the selected elements from *Fname* are plotted. (If there are no selected elements, selected nodes are plotted. If no nodes, volumes; if no volumes, areas; if no areas, lines; if no lines, keypoints. If there are no selected keypoints, the screen is erased.)

Notes

The **RESUME (p. 1601)** command resumes a database file into Mechanical APDL. The command causes the database file (`Jobname.db`) to be read, thereby resetting the database (including any geometry settings) either a) as it was at the last **SAVE (p. 1645)** command, or b) as it was saved with the last **/EXIT (p. 708)** command, whichever was last.

For multiple load step analyses (because only the data for one load step at a time may reside in the database), the load step data restored to the database will correspond to the load step data written when the save occurred.

If the database file was saved in another Ansys, Inc. product, it may contain element type and **KEYOPT (p. 979)** specifications which are invalid in the resuming product. Immediately after the database resume is completed, you should redefine these invalid element types and **KEYOPT (p. 979)** settings to valid ones (**ET (p. 686)**, **KEYOPT (p. 979)**).

The *NOPAR* = 1 option should *not* be used if array parameters are defined, as existing array parameters might be redefined with arbitrary values. For a more general method of preventing the replacement of both scalar and array parameters, see **PARSAV (p. 1352)** and **PARRES (p. 1351)**.)

If a radiosity mapping data file (`.rsm` file) was saved by the previous **SAVE (p. 1645)** command, that mapping file must be present in the directory along with the database file in order for radiosity surface elements (SURF251, SURF252) to be correctly mapped onto the model when **RESUME (p. 1601)** is issued.

This command is valid in any processor. If used in the solution processor, this command is valid only within the first load step.

Menu Paths

Utility Menu>File>Resume from

Utility Menu>File>Resume Jobname.db

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RESVEC, *KeyVect*, --, --, --, *KeyResp*

Calculates or includes residual vectors or residual responses

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KeyVect

Residual vector key:

OFF

Do not calculate or include residual vectors (default).

ON

Calculate or include residual vectors.

--, --, --

Unused fields.

KeyResp

Residual response key:

OFF

Do not calculate or include residual responses (default).

ON

Calculate or include residual responses.

Command Default

No residual quantities are calculated or included in the analysis.

Notes

In a modal analysis, the **RESVEC (p. 1603)** command calculates residual vectors (or responses). In a mode-superposition transient, mode-superposition harmonic, PSD or spectrum analysis, the command includes residual vectors. The command must be issued during the first modal solve.

In the expansion pass of a mode-superposition transient or mode-superposition harmonic analysis, the command includes residual responses.

In a component mode synthesis (CMS) generation pass, the **RESVEC (p. 1603)** command calculates one residual vector which is included in the normal modes basis used in the transformation matrix. It is supported for the three available CMS methods. **RESVEC (p. 1603)**,ON can only be specified in the first load step of a generation pass and is ignored if issued at another load step.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If rigid-body modes exist, pseudo-constraints are required for the calculation. Issue the **D (p. 483)**,,,SUPPORT command to specify only the minimum number of pseudo-constraints necessary to prevent rigid-body motion.

Both residual vector and residual response approaches cannot be used in the same analysis.

For more information about residual vector or residual response formulation, see Residual Vector Method or Residual Response Method in the *Mechanical APDL Theory Reference*.

Menu Paths

This command cannot be accessed from a menu.

RESWRITE, *Fname*, --, --, --, *cFlag*

Appends results data from the database to a results file.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name extension varies as follows:

- `.rst` for structural, fluid, or coupled-field analyses
- `.rth` for thermal or electrical analyses
- `.rmg` for magnetic analyses

--, --, --

Unused fields.

cFlag

0

The complex results flag is set to 0 in the results file header. This is the default option.

1

The complex results flag is set to 1 in the results file header.

Notes

The **RESWRITE (p. 1604)** command appends a data set to the specified file by writing the results data currently in the database. If the intended results file does not exist, it will be created and will include

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the geometry records. The current load step, substep, and time (or frequency) value are maintained. All data (summable and nonsummable) are written.

When complex results are appended, *cFlag* must be set to 1 so that the header is consistent with the results written on the file.

The command is primarily intended for use in a top-down substructuring analysis, where the full model is resumed and the results data read from the use pass results file (**SET (p. 1724)**), and subsequently from all substructure expansion pass results files (**APPEND (p. 173)**). The full set of data in memory can then be written out via the **RESWRITE (p. 1604)** command to create a complete results file (as though you had run a nonsubstructured analysis).

The **RESWRITE (p. 1604)** command can also be used to write a global results file for a distributed-memory parallel (DMP) solution. This should only be necessary if the **RESCOMBINE (p. 1589)** command was used to combine results from local results files into the database. The **RESWRITE (p. 1604)** command can then be used to write the combined results into a new results file. This new results file will essentially contain the current set of results data for the entire (that is, global) model.

Menu Paths

This command cannot be accessed from a menu.

---

*RETURN, *Level*

Returns input stream to a higher level.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Level

Number of levels to move up from the current level.

Negative --

Move relative to current level. For example: *Return,-2 will go up two levels from the current level.

Positive --

Move to absolute level. For example: *Return,2 will go to level 2.
Level 0 is the primary input file.

Notes

This command is used to jump to the macro call sequence, ending the current macro file, and returning to the line after the calling line in the previous file. Unlike the ***GO (p. 864)** command, this command may be used inside ***IF (p. 927)** or ***DO (p. 567)** constructs.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

REZONE, *Option*, *LDSTEP*, *SBSTEP*

Initiates the rezoning process, sets rezoning options, and rebuilds the database.

SOLUTION (p. 38): Rezoning (p. 46)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

The rezoning method to employ:

MANUAL

Manual rezoning. You decide when to use rezoning, what region(s) to rezone, and what remeshing method to use on the selected region(s). This method is currently the default and only option.

LDSTEP

The load step number at which rezoning should occur. The default value is the highest load step number found in the Jobname.R*nnn* files (for the current jobname and in the current directory).

SBSTEP

The substep number of the specified load step (*LDSTEP*) at which rezoning should occur. The default value is the highest substep number found in the specified load step in the Jobname.R*nnn* files (for the current jobname and in the current directory).

Notes

The **REZONE (p. 1606)** command rebuilds the database (.db file) based on the specified load step and substep information, and updates nodes to their deformed position for remeshing.

Before issuing this command, clear the database via the **/CLEAR (p. 350)** command.

For more information, see Rezoning in the *Advanced Analysis Guide*.

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

Menu Paths

Main Menu>Solution>Manual Rezoning>Start

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RFORCE, *NVAR*, *NODE*, *Item*, *Comp*, *Name*

Specifies the total reaction force data to be stored.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR

Arbitrary reference number assigned to this variable (2 to NV (**NUMVAR (p. 1302)**)). Overwrites any existing results for this variable.

NODE

Node for which data are to be stored. If *NODE* = P, graphical picking is enabled (valid only in the GUI).

Item

Label identifying the item. Valid item labels are shown in the table below. Some items also require a component label.

Comp

Component of the item (if required). Valid component labels are shown in the table below.

Name

Thirty-two character name identifying the item on printouts and displays. Defaults to an eight character label formed by concatenating the first four characters of the *Item* and *Comp* labels.

Notes

Defines the total reaction force data (static, damping, and inertial components) to be stored from single pass (**ANTYPE (p. 162)**,STATIC or TRANS) solutions or from the expansion pass of mode-superposition (**ANTYPE (p. 162)**,HARMIC or TRANS) solutions.

Table 225: RFORCE - Valid Item and Component Labels

Valid item and component labels for node results are:		
Item	**Comp**	**Description**
F	X,Y,Z	X, Y, or Z structural force
M	X,Y,Z	X, Y, or Z structural moment
HEAT[1]		Heat flow
FLOW		Fluid flow
AMPS		Current flow
FLUX		Magnetic flux
CSG	X,Y,Z	X, Y, or Z magnetic current segment component
RATE		Diffusion flow rate

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Valid item and component labels for node results are:

Item	Comp	Description
VLTG		Voltage drop
CURT		Current
CHRG		Charge

1. For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use the labels HBOT, HE2, HE3, . . ., HTOP instead of HEAT.

Menu Paths

Main Menu>TimeHist Postpro>Define Variables

Main Menu>TimeHist Postpro>Elec&Mag>Circuit>Define Variables

/**RGB**,*Keyword*,*PRED*,*PGRN*,*PBLU*,*N1*,*N2*,*NINC*,*NCNTR*

Specifies the RGB color values for indices and contours.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Keyword

Determines how RGB modifications will be applied.

INDEX

Specifies that subsequent color values apply to Mechanical APDL color indices (0-15).

CNTR

Specifies that subsequent color values apply to contours (1-128). Applies to C-option devices only (i.e. X11C or Win32C).

PRED

Intensity of the color red, expressed as a percentage.

PGRN

Intensity of the color green, expressed as a percentage.

PBLU

Intensity of the color blue, expressed as a percentage.

N1

First index (0-15), or contour (1-128) to which the designated RGB values apply.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

N2

Final index (0-15), or contour (1-128) to which the designated RGB values apply.

NINC

The step increment between the values *N1* and *N2* determining which contours or indices will be controlled by the specified RGB values.

NCNTR

The new maximum number of contours (1-128).

Notes

Issuing the **/CMAP (p. 359)** command (with no filename) will restore the default color settings.

Menu Paths

This command cannot be accessed from a menu.

RIGID,*Dof1*,*Dof2*,*Dof3*,*Dof4*,*Dof5*,*Dof6*

Specifies known rigid body modes (if any) of the model.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Dof1*,*Dof2*,*Dof3*,...,*Dof6

Up to six global Cartesian directions of the rigid modes. For a completely free 2D model, use ALL or UX, UY, ROTZ. For a completely free 3D model, use ALL or UX, UY, UZ, ROTX, ROTY, ROTZ. For a constrained model, use UX, UY, UZ, ROTX, ROTY, or ROTZ, as appropriate, to specify each and every unconstrained direction which exists in the model (not specifying every direction may cause difficulties in extracting the modes).

Notes

Specifies known rigid body modes (if any) of the model. This command applies only to a component mode synthesis (CMS) analysis (see the **CMSOPT (p. 378)** command). Any rigid body modes specified must be permitted by the applied displacement constraints (that is, do not specify a rigid body mode in a constrained direction). Reissue the command to redefine the specification. If used in SOLUTION, this command is valid only within the first load step.

This command is also valid in PREP7.

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>Analysis Options

RIGRESP, *Option*, *Method*, *Val1*, *Val2*

Specifies the rigid response calculation.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Flag to activate or deactivate the rigid response calculation:

1 (ON or YES)

Activate.

2 (OFF or NO)

Deactivate. This value is the default.

Method

Method used to calculate the rigid response:

GUPTA

Gupta method.

LINDLEY

Lindley-Yow method.

Val1

If *Method* = GUPTA, *Val1* represents the frequency F_1 in Hertz.

If *Method* = LINDLEY, *Val1* is the Zero Period Acceleration (ZPA). If a scale factor is defined (FACT in the **SVTYP (p. 1887)** command), it is used to scale this value

Val2

If *Method* = GUPTA, *Val2* represents the frequency F_2 in Hertz.

Notes

This rigid response calculation is only valid for single-point response spectrum analysis (**SPOPT (p. 1837)**, SPRS) and multiple-point response spectrum analysis (**SPOPT (p. 1837)**, MPRS) with combination methods

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

square root of sum of squares (**SRSS (p. 1845)**), complete quadratic (**CQC (p. 433)**) or Rosenblueth (**ROSE (p. 1615)**).

This command is also valid in PREP7.

Additional Information

Performing a Single-Point Response Spectrum (SPRS) Analysis in the *Structural Analysis Guide*

Performing a Multi-Point Response Spectrum (MPRS) Analysis in the *Structural Analysis Guide*

Rigid Responses in the *Mechanical APDL Theory Reference*

MMASS (p. 1131) command

Menu Paths

This command cannot be accessed from a menu.

RLIST,*NSET1*,*NSET2*,*NINC*

Lists the real constant sets.

PREP7 (p. 22): Real Constants (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSET1*, *NSET2*, *NINC

List real constant sets from *NSET1* to *NSET2* (defaults to *NSET1*) in steps of *NINC* (defaults to 1). If *NSET1* = ALL (default), ignore *NSET2* and *NINC* and list all real constant sets (**R (p. 1565)**).

Notes

The real constant sets listed contain only those values specifically set by the user. Default values for real constants set automatically within the various elements are not listed.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Properties>All Real Constants

Utility Menu>List>Properties>Specified Real Constants

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/RMDIR, *Dir*

Removes (deletes) a directory.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Dir

The directory to remove. If no path is provided, it will be assumed to be in the current working directory. All files in the directory are also removed.

Notes

Removes a directory on the computer on which Mechanical APDL is currently running. No warning or prompt is given, so use with extreme caution.

Menu Paths

This command cannot be accessed from a menu.

RMFLVEC

Writes eigenvectors of fluid nodes to a file for use in damping parameter extraction.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

RMFLVEC (p. 1612) extracts the modal information from the modal results file for all nodes specified in a node component called 'FLUN'. This component should include all nodes which are located at the fluid-structural interface. Mode shapes, element normal orientation, and a scaling factor are computed and stored in a file `Jobname`.EFL. For damping parameter extraction, use the **DMPEXT (p. 557)** command macro. See Introduction for more information on thin film analyses.

FLUID136 and FLUID138 are used to model the fluid interface. Both the structural and fluid element types must be active. The fluid interface nodes must be grouped into a component 'FLUN'. A results file of the last modal analysis must be available.

Menu Paths

Main Menu>General Postproc>ThinFilm>Extract Eigv

Main Menu>Solution>ThinFilm>DampExtract>Eigenfrequency

Main Menu>Solution>ThinFilm>DampExtract>Frequency Range

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Main Menu>Solution>ThinFilm>RayleighDamp

RMODIF, *NSET*, *STLOC*, *V1*, *V2*, *V3*, *V4*, *V5*, *V6*

Modifies real constant sets.

PREP7 (p. 22): Real Constants (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSET

Number of existing real constant set to be modified.

The labels CONT and GCN are also valid input for defining or modifying real constants associated with contact elements (see Notes (p. 1613)).

STLOC

Starting location in table for modifying data. For example, if *STLOC* = 1, data input in the *V1* field is the first constant in the set. If *STLOC* = 7, data input in the *V1* field is the seventh constant in the set, etc. Must be greater than zero.

V1

New value assigned to constant in location *STLOC*. If zero (or blank), a zero value will be assigned.

V2, V3, V4, . . . , V6

New values assigned to constants in the next five locations. If blank, the value remains unchanged.

Notes

Allows modifying (or adding) real constants to an existing set (**R (p. 1565)**) at any location.

Specify *NSET* = CONT to define or modify real constants for all real constant sets associated with contact elements in pair-based contact definitions. Specify *NSET* = GCN to define or modify real constants for real constant sets that were previously assigned by the **GCDEF (p. 788)** command; that is, real constants used in general contact interactions.

This command is also valid in SOLUTION. For important information about using this command within the solution phase, see What Are Nonstandard Uses? in the *Advanced Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RMORE, *R7*, *R8*, *R9*, *R10*, *R11*, *R12*

Adds real constants to a set.

PREP7 (p. 22): Real Constants (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

R7, R8, R9, . . . , R12

Add real constants 7 to 12 (numerical values or table names) to the most recently defined set.

Notes

Adds six more real constants to the most recently defined set. Repeat the **RMORE (p. 1614)** command for constants 13 to 18, again for 19-24, etc.

If using table inputs (SURF151, SURF152, FLUID116, CONTA172, CONTA174, CONTA175, and CONTA177 only), enclose the table name in % signs (for example, *%tabname%*).

When copying real constants to new sets, Ansys, Inc. recommends that you use the command input. If you do use the GUI, restrict the real constant copy to only the first six real constants (real constants seven and greater will be incorrect for both the master and copy set).

This command is also valid in SOLUTION.

Menu Paths

ROCK, *CGX*, *CGY*, *CGZ*, *OMX*, *OMY*, *OMZ*

Specifies a rocking response spectrum.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

CGX, CGY, CGZ

Global Cartesian X, Y, and Z location of center of rotation about which rocking occurs.

OMX, OMY, OMZ

Global Cartesian angular components of the rocking.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Specifies a rocking response spectrum effect in the spectrum (**ANTYPE (p. 162)**,SPECTR) analysis.

The excitation direction with rocking included is not normalized to one; rather, it scales the spectrum. For example, consider a node at coordinates (1,1,0), subject to an excitation in the X direction (*SEDX* = 1.0 on **SED (p. 1704)**), and a rocking with center *CGX* = 1.0, *CGY* = *CGZ* = 0, and angular component about Z (*OMZ* = 0.5). The total excitation direction at this node is:

$$\{D\}=\begin{Bmatrix}1\\0\\0\end{Bmatrix}+\begin{Bmatrix}0\\0\\0.5\end{Bmatrix}\times\left(\begin{Bmatrix}1\\1\\0\end{Bmatrix}-\begin{Bmatrix}1\\0\\0\end{Bmatrix}\right)=\begin{Bmatrix}0.5\\0\\0\end{Bmatrix}$$

So that half the spectrum input is applied at this node.

For more information on the equations, see Participation Factors and Mode Coefficients.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>SinglePt>Settings

Main Menu>Solution>Load Step Opts>Spectrum>SinglePt>Settings

ROSE, *SIGNIF*, *Label*, *TD*, *ForceType*

Specifies the Rosenblueth mode combination method.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SIGNIF

Combine only those modes whose significance level exceeds the SIGNIF threshold. For single-point, multi-point, or DDAM response spectrum (*Spectype* = SPRS, MPRS, or DDAM on **SPOPT (p. 1837)**), the significance level of a mode is defined as the mode coefficient divided by the maximum mode coefficient of all modes. Any mode whose significance level is less than *SIGNIF* is considered insignificant and does not contribute to the mode combinations. The higher the SIGNIF threshold, the fewer the number of modes combined. *SIGNIF* defaults to 0.001. If SIGNIF is specified as 0.0, it is taken as 0.0. (This mode combination method is not valid for **SPOPT (p. 1837)**,PSD.)

Label

Label identifying the combined mode solution output.

DISP

Displacement solution (default). Displacements, stresses, forces, etc., are available.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VELO

Velocity solution. Velocities, "stress velocities," "force velocities," etc., are available.

ACEL

Acceleration solution. Accelerations, "stress accelerations," "force accelerations," etc. are available.

TD

Time duration for earthquake or shock spectrum. *TD* defaults to 10.

ForceType

Label identifying the forces to be combined:

STATIC

Combine the modal static forces (default).

TOTAL

Combine the modal static plus inertial forces.

Notes

For more information on spectrum analysis combination methods, see Combination of Modes.

Modes whose effective damping ratio defined in Equation 14.42 exceeds or equals 1.0 are not combined.

This command is also valid in PREP7.

Menu Paths

This command cannot be accessed from a menu.

RPOLY,*NSIDES*,*LSIDE*,*MAJRAD*,*MINRAD*

Creates a regular polygonal area centered about the working plane origin.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSIDES

Number of sides in the regular polygon. Must be greater than 2.

LSIDE

Length of each side of the regular polygon.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MAJRAD

Radius of the major (or circumscribed) circle of the polygon. Not used if *LSIDE* is input.

MINRAD

Radius of the minor (or inscribed) circle of the polygon. Not used if *LSIDE* or *MAJRAD* is input.

Notes

Defines a regular polygonal area on the working plane. The polygon will be centered about the working plane origin, with the first keypoint defined at $\theta = 0°$. The area will be defined with *NSIDES* keypoints and *NSIDES* lines. See the **RPR4 (p. 1617)** and **POLY (p. 1460)** commands for other ways to create polygons.

Menu Paths

---

RPR4, *NSIDES*, *XCENTER*, *YCENTER*, *RADIUS*, *THETA*, *DEPTH*

Creates a regular polygonal area or prism volume anywhere on the working plane.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSIDES

The number of sides in the polygon or prism face. Must be greater than 2.

XCENTER, YCENTER

Working plane X and Y coordinates of the center of the polygon or prism face.

RADIUS

Distance (major radius) from the center to a vertex of the polygon or prism face (where the first keypoint is defined).

THETA

Angle (in degrees) from the working plane X-axis to the vertex of the polygon or prism face where the first keypoint is defined. Used to orient the polygon or prism face. Defaults to zero.

DEPTH

The perpendicular distance (either positive or negative based on the working plane Z direction) from the working plane representing the depth of the prism. If *DEPTH* = 0 (default), a polygonal area is created on the working plane.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Defines a regular polygonal area anywhere on the working plane or prism volume with one face anywhere on the working plane. The top and bottom faces of the prism are polygonal areas. See the **RPOLY (p. 1616)**, **POLY (p. 1460)**, **RPRISM (p. 1618)**, and **PRISM (p. 1497)** commands for other ways to create polygons and prisms.

---

RPRISM, *Z1*, *Z2*, *NSIDES*, *LSIDE*, *MAJRAD*, *MINRAD*

Creates a regular prism volume centered about the working plane origin.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Z1, Z2

Working plane Z coordinates of the prism.

NSIDES

Number of sides in the polygon defining the top and bottom faces of the prism. Must be greater than 2.

LSIDE

Length of each side of the polygon defining the top and bottom faces of the prism.

MAJRAD

Radius of the major (or circumscribed) circle of the polygon defining the top and bottom faces of the prism. Not used if *LSIDE* is input.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MINRAD

Radius of the minor (or inscribed circle) of the polygon defining the top and bottom faces of the prism. Not used if *LSIDE* or *MAJRAD* is input.

Notes

Defines a regular prism volume centered about the working plane origin. The prism must have a spatial volume greater than zero. (that is, this volume primitive command cannot be used to create a degenerate volume as a means of creating an area.) The top and bottom faces are polygonal areas that are parallel to the working plane but neither face need be coplanar with (that is, "on") the working plane. The first keypoint defined for each face is at $\theta = 0°$. See the **RPR4 (p. 1617)** and **PRISM (p. 1497)** commands for other ways to create prisms.

---

RPSD, *IR*, *IA*, *IB*, *ITYPE*, *DATUM*, *Name*, --, *SIGNIF*

Calculates response power spectral density (PSD).

POST26 (p. 58): Special Purpose (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to *NV* (**NUMVAR (p. 1302)**)). If this number is the same as for a previous variable, the previous variable will be overwritten with this result.

IA, IB

Reference numbers of the two variables to be operated on. If only one, leave *IB* blank.

ITYPE

Defines the type of response PSD to be calculated:

0,1

Displacement (default).

2

Velocity.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3

Acceleration.

DATUM

Defines the reference with respect to which response PSD is to be calculated:

1

Absolute value.

2

Relative to base (default).

Name

Thirty-two character name identifying variable on listings and displays. Embedded blanks are compressed for output.

SIGNIF

Combine only those modes whose significance level exceeds the *SIGNIF* threshold. The significance level is defined as the modal covariance matrix term divided by the maximum of all the modal covariance matrix terms. Any term whose significance level is less than *SIGNIF* is considered insignificant and does not contribute to the response. All modes are taken into account by default (*SIGNIF* = 0.0).

The significance level definition is identical to the one used for the combination (*SIGNIF* on the **PSDCOM (p. 1527)** command); however, the default value is different.

The significance does not apply to spatial correlation (**PSDSPL (p. 1532)**) and wave propagation (**PSDWAV (p. 1534)**) response power spectral density.

Notes

This command calculates response power spectral density (PSD) for the variables referenced by the reference numbers *IA* and *IB*. The variable referred by *IR* will contain the response PSD. You must issue the **STORE (p. 1867)**,PSD command first; `File.psd` must be available for the calculations to occur.

See POST26 - Response Power Spectral Density in the *Mechanical APDL Theory Reference* for more information on these equations.

Menu Paths

Main Menu>TimeHist Postpro>Calc Resp PSD

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RSMESH,*P0*,*RID*,*KCN*,*Kdir*,*VALUE*,*NDPLANE*,*PSTOL*,*Ecomp*

Generates a result section.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

P0

User-defined anchor point node number. This must be a previously defined target element pilot node (see "Notes" (p. 1622) for more information). If *P0* is specified, *RID*, *KCN*, *Kdir*, *VALUE*, and *NDPLANE* are ignored. The result section is defined in the x-direction of the nodal coordinate system of the pilot node.

If *P0* is not specified, the program computes the geometry center point as the anchor point location by default.

RID

Unique real constant ID number that has not been previously assigned to any other elements. If *RID* is not specified, the program selects the next available real constant ID number.

KCN

Coordinate system number used to define the result surface and normal direction.

Kdir

Direction (x, y, or z) normal to the result surface in the *KCN* coordinate system.

VALUE

Point along the *Kdir* axis at which to locate the result surface. Ignored if *NDPLANE* is specified.

NDPLANE

Node number of existing node used to locate the result surface. If *NDPLANE* is specified, the location of the result surface is defined by the *Kdir* coordinate of *NDPLANE* in the *KCN* coordinate system.

PSTOL

Optional tolerance below *VALUE*. Allows nodes occurring precisely at or slightly below the result surface to be identified properly as above the plane. Has the effect of shifting the plane down by *PSTOL*. The following expression represents the default value:

$$\frac{\sqrt{\Delta X^2+\Delta Y^2+\Delta Z^2}}{1000}$$

where ΔX, ΔY, and ΔZ are the dimensions of the locally selected region of the model based on nodal locations (that is, ΔX = X*max* - X*min*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ecomp

If specified, the name of a component to be composed of elements underneath the result section generated by the **RSMESH (p. 1621)** command.

Notes

This command defines a result section and automatically imbeds contact elements (CONTA172 or CONTA174) on the surface of the selected base elements. See Monitoring Result Section Data During Solution in the *Structural Analysis Guide* for more information on how to use this command.

A user-specified anchor point and local coordinate system can be specified by defining a pilot node (a target element defined using **TSHAP (p. 2023)**,PILO) before issuing the **RSMESH (p. 1621)** command. Input the pilot node number for *P0*. Only one pilot node should be associated with a result section; the pilot node should not be used for any other purpose (such as remote loading). The contact elements generated for the result section will have the same real constant ID as the pilot node target element.

Menu Paths

This command cannot be accessed from a menu.

RSOPT,*Opt*,*Filename*,*Ext*,*Dir*

Creates or loads the radiosity mapping data file for SURF251 or SURF252 element types.

SOLUTION (p. 38): Radiosity (p. 50)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Opt

File option:

SAVE

Write the radiosity mapping data to a file. (Default)

LOAD

Read in the specified mapping data file.

Fname

File name for radiosity mapping data file. Defaults to Jobname.

Ext

Filename extension for radiosity mapping data file (default = .rsm).

Dir

Directory path for radiosity mapping data file. If you do not specify a directory path, it will default to your working directory.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Use this command to manually create or load a radiosity mapping data file. This command is useful if you want to create the mapping data file without issuing **SAVE (p. 1645)** or **CDWRITE (p. 293)**, or if you want to specify that the file be located in a directory other than your working directory. Also use this command to manually load an existing mapping data file during a restart.

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

Menu Paths

This command cannot be accessed from a menu.

RSPLIT,*Option*,*Label*,*Name1*,*Name2*,*Name3*,*Name4*,*Name5*,*Name6*,*Name7*,*Name8*,*Name9*,*Name10*,*Name11*,*Name12*,*Name13*,*Name14*,*Name15*,*Name16*

Creates one or more results file(s) from the current results file based on subsets of elements.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Specify which results to include for the subset of elements.

ALL

Write all nodal and element results based on the subset of elements (default).

EXT

Write only the nodal and element results that are on the exterior surface of the element subset. The results data will be averaged as in PowerGraphics (see **AVRES (p. 212)**) when this results file is brought into POST1. Only valid for solid elements.

Label

Define where the element subset is coming from.

ALL

Use all selected element components (**CMSEL (p. 374)**) (default).

ESEL

Use the currently selected (**ESEL (p. 661)**) set of elements. *Name1* defines the results file name.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LIST

Use *Name1* to *Name16* to list the element component and/or assembly names (that contain element components).

Name1*, *Name2*, *Name3*, . . . , *Name16

Up to 16 element component and/or assembly names (that contain element components).

Command Default

Write all data available for the element subset.

Notes

Results files will be named based on the element component or assembly name, for example, *Cname*.rst, except for the ESEL option, for which you must specify the results file name (no extension) using the *Name1* field. Note that the .rst filename will be written in all uppercase letters (CNAME.rst) (unless using the ESEL option); when you read the file, you must specify the filename using all uppercase letters (that is, file,CNAME). You may repeat the **RSPLIT (p. 1623)** command as often as needed. All results sets on the results file are processed. Use **/AUX3 (p. 209)** to produce a results file with just a subset of the results sets.

Use **INRES (p. 953)** to limit the results data written to the results files.

The subset geometry is also written so that no database file is required to postprocess the subset results files. You must not resume any database when postprocessing one of these results files. The input results file must have geometry written to it (that is, do not use **/CONFIG (p. 410)**,NORSTGM,1).

Applied forces and reaction forces are not apportioned if their nodes are shared by multiple element subsets. Their full values are written to each results file.

Each results file renumbers its nodes and elements starting with 1.

This feature is useful when working with large models. For more information on the advantages and uses of the **RSPLIT (p. 1623)** command, see Splitting Large Results Files in the *Basic Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

RSTCONTROL, *Type*, *Cname*, *Method*, *MethodItem*

Controls whether element single value results are written to the results file.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Solution format for database and file-write control:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AUTO

Write element output quantities (STRS, EPEL, EPPL, EPCR, EPTH) in single value form for those element types that support it, and in element nodal form for all other element types (default). See Element Single-Value Results in the *Element Reference* for a list of supported element types.

ELSV

Write element output quantities only in single value form. If the single value form is not supported by the element types in the model, none of the applicable results (STRS, EPEL, EPPL, EPCR, EPTH) will be available.

ELND

Write all element output quantities only in element nodal form.

ERASE

Reset **RSTCONTROL (p. 1624)** specifications to their default values.

STAT

List the current **RSTCONTROL (p. 1624)** specifications.

Cname

Name of the component (created via **CM (p. 356)**) defining the selected set of elements for which this specification is active. If no name is entered, the specification applies to all elements.

Method

For single value results, *Method* controls how the integration point values of each element are reduced to one value:

AVG

Use a simple average of values from all integration points (default).

MAXE

Use only the integration point corresponding to the maximum equivalent (EQV) stress or strain quantity specified by *MethodItem*.

MAXP

Use only the integration point corresponding to the maximum 1st principal stress or strain quantity specified by *MethodItem*.

MAXS

Use only the integration point corresponding to the maximum shear stress or strain quantity specified by *MethodItem*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MethodItem

The quantity used to determine the integration point where single value results are reported. Only valid when *Method* = MAXE, MAXP, or MAXS.

STRS

Choose the integration point based on stress.

EPEL

Choose the integration point based on elastic strain.

EPPL

Choose the integration point based on plastic strain.

EPCR

Choose the integration point based on creep strain.

EPTH

Choose the integration point based on thermal strain.

Command Default

The program default is to write element nodal results for all elements.

Notes

RSTCONTROL (p. 1624) is an optional output control command that specifies whether element nodal results or element single value results are written to the results file. This command works in conjunction with the **OUTRES (p. 1336)** command. **OUTRES (p. 1336)** specifies when each element quantity will be output, while **RSTCONTROL (p. 1624)** specifies the type of result (element nodal versus single value). Not all elements support single value results. For more information, see Element Single-Value Results in the *Element Reference*.

The element output quantities affected by this command are:

stress (STRS)

elastic strain (EPEL)

plastic strain (EPPL)

creep strain (EPCR)

thermal/swelling strains (EPTH)

You can issue up to 50 **RSTCONTROL (p. 1624)** commands in an analysis. **RSTCONTROL (p. 1624)**,ERASE erases the existing output specifications and resets the counted number of **RSTCONTROL (p. 1624)** commands to zero.

RSTCONTROL (p. 1624) is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

RSTMAC,*File1*,*Lstep1*,*Sbstep1*,*File2*,*Lstep2*,*Sbstep2*,--,*MacLim*,*Cname*,*KeyPrint*

Calculates modal assurance criterion (MAC/FRF) and matches nodal solutions from two results files or from one results file and one universal format file.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

File1

File name (248 characters maximum) corresponding to the first results file (`.rst` or `.rstp` file). If the file name does not contain the extension, it defaults to `.rst`.

Lstep1

Load step number of the results to be read in *File1*.

N

Reads load step *N*. Defaults to 1.

Sbstep1

Substep number of the results to be read in *File1*.

N

Reads substep *N*. Only valid for MAC.

All

Reads all substeps. This value is the default.

File2

File name (248 characters maximum) corresponding to the second file (`.rst`, `.rstp`, or `.unv` file). If the file name does not contain the extension, it defaults to `.rst`.

Lstep2

Load step number of the results to be read in *File2*.

N

Reads load step *N*. Defaults to 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Sbstep2

Substep number of the results to be read in *File2*.

N

Reads substep *N*. Only valid for MAC.

All

Reads all substeps. This value is the default.

--

Unused field.

MacLim

Smallest acceptable criterion value. Must be ≥ 0 and ≤ 1. The default value is 0.90.

Cname

Name of the component from the first file (*File1*). The component must be based on nodes. If unspecified, all nodes are matched and used for MAC calculations. If a component name is specified, only nodes included in the specified component are used. Not applicable to node mapping (*Option* = NODMAP on **MACOPT (p. 1098)**).

KeyPrint

Printout options:

0

Printout matched solutions table. This value is the default.

1

Printout matched solutions table and full MAC table.

2

Printout matched solutions table, full MAC table and matched nodes table.

Notes

The **RSTMAC (p. 1627)** command allows the comparison of the solutions from either:

- Two different results files. Valid only for MAC calculations.
- One result file (`.rst`) and one universal format file (`.unv`).

Either the modal assurance criterion (MAC) or the frequency response function (FRF) correlation method is used. (For more details see POST1 - Modal Assurance Criterion (MAC) and POST1 – Frequency response function correlation in the *Theory Reference*.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The meshes read from *File1* and *File2* may be different. The nodes of *File1* are matched with the nodes of *File2* based on either node location (default) or node number. The solutions are compared for the identified pair of matched nodes. The nodes can also be mapped and the solutions interpolated from *File1*. See the **MACOPT (p. 1098)** command for all options.

Units and coordinate systems must be the same for both models.

Results may be real or complex; however, if results in *File1* have a different type than results in *File2*, only the real parts of the solutions are taken into account in MAC calculations. The analysis type can be arbitrary for MAC while only harmonic analysis is supported for FRF criteria calculations.

Non-structural degrees of freedom can be considered. Degrees of freedom can vary between *File1* and *File2*, but at least one common degree of freedom must exist.

The solutions read on the results files are not all written to the database; therefore, subsequent plotting or printing of solutions is not possible. A **SET (p. 1724)** command must be issued after the **RSTMAC (p. 1627)** command to post-process each solution.

The corresponding database file (`.db`) for `File1` on **RSTMAC (p. 1627)** must be resumed before running the command in the following cases:

- A component (*Cname*) is used on **RSTMAC (p. 1627)**.
- The nodes are mapped (**MACOPT (p. 1098)**,NODMAP,YES).
- The nodes are matched using a relative tolerance (**MACOPT (p. 1098)**,RELTOLN).

RSTMAC (p. 1627) comparison on cyclic symmetry analysis works only if the number of sectors on *File1* and *File2* are the same, and the database is saved ***after*** the solution is finished. Also, a comparison cannot be made between cyclic symmetry results and the full 360 degree model results (*File1* – cyclic solution, *File2* – full 360 degree model solution). Comparing cyclic symmetry solutions written on a selected set of nodes (**OUTRES (p. 1336)**) is not supported.

The modal assurance criterion values can be retrieved as parameters using the ***GET (p. 797)** command (*Entity* = **RSTMAC (p. 1627)**).

FRF correlation is only supported for the comparison of an `.rst` and a `.unv` file. All substeps are considered for both files to define the frequency domain for criteria calculations. The printout options consist of listing the table of the criterion results for each frequency in the frequency domain (*KeyPrint* = 0, 1, or 2) and the matched nodes table (*KeyPrint* = 2).

Example Usage

For a detailed discussion on using RSTMAC with examples see Comparing Nodal Solutions From Two Models (**RSTMAC (p. 1627)**) in the *Basic Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RSTOFF, *Lab*, *OFFSET*

Offsets node or element IDs in the FE geometry record.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

The offset type:

NODE

Offset the node IDs.

ELEM

Offset the element IDs.

OFFSET

A positive integer value specifying the offset value to apply. The value must be greater than the number of nodes or elements in the existing superelement results file.

Command Default

Issuing the **RSTOFF (p. 1630)** command with no specified argument values applies no offsets.

Notes

The **RSTOFF (p. 1630)** command offsets node or element IDs in the FE geometry record saved in the `.rst` results file. Use the command when expanding superelements in a bottom-up substructuring analysis (where each superelement is generated individually in a generation pass, and all superelements are assembled together in the use pass).

With appropriate offsets, you can write results files with unique node or element IDs and thus display the entire model even if the original superelements have overlapping element or node ID sets. (Such results files are incompatible with the `.db` database file saved at the generation pass.)

The offset that you specify is based on the original superelement node or element numbering, rather than on any offset specified via a **SESYMM (p. 1718)** or **SETRAN (p. 1730)** command. When issuing an **RSTOFF (p. 1630)** command, avoid specifying an offset that creates conflicting node or element numbers for a superelement generated via a **SESYMM (p. 1718)** or **SETRAN (p. 1730)** command.

If you issue the command to set non-zero offsets for node or element IDs, you must bring the geometry into the database via the **SET (p. 1724)** command so that Mechanical APDL can display the results. Specify appropriate offsets to avoid overlapping node or element IDs with other superelement results files.

The command is valid only in the first load step of a superelement expansion pass.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

RSURF,*Options*,*Delopts*,*ETNUM*

Generates the radiosity surface elements and stores them in the database.

SOLUTION (p. 38): Radiosity (p. 50)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Options

Command options:

CLEAR

Deletes radiosity surface elements and nodes. The set of elements and nodes to be deleted is defined by *Delopts*. *ETNUM* is ignored.

DEFINE

Creates the radiosity surface elements and nodes (default).

STAT

Shows the status/listing. Other command options are ignored.

Delopts

Deletion options

ALL

Deletes all radiosity surface elements and nodes.

LAST

Deletes radiosity surface elements and nodes created by the last **RSURF (p. 1631)** command.

ETNUM

Element type number. Leave blank to indicate the next available number.

Notes

This command generates the radiosity surface elements (SURF251, SURF252) based on the **RSYMM (p. 1632)** and **RDEC (p. 1575)** parameters and stores them in the database. It works only on the faces of selected underlying elements that have RDSF flags on them and all corner nodes selected. You can issue multiple **RSURF (p. 1631)** commands to build the radiosity model. However, all **RSURF (p. 1631)** commands must be issued after issuing the **RSYMM (p. 1632)** command, and after the model is complete (that is, after all meshing operations are complete).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If you do issue multiple **RSURF (p. 1631)** commands for different regions, you must first mesh the different regions, and then generate the radiosity surface elements on each meshed region individually. Use **RSURF (p. 1631)**,,,ETNUM to assign a separate element type number to each region. This procedure allow you to identify the individual regions later in the multi-field analysis.

If the underlying solid elements are higher order, the radiosity surface elements are always lower order (4- or 3-node in 3D or 2-node in 2D). Decimation will always occur before any symmetry operations.

For 2D axisymmetric YR models, the newly-generated nodes can have only positive Y coordinates.

The **RSURF (p. 1631)** command assigns real constant set number 1 to all SURF251 and SURF252 elements generated, irrespective of the current real constant set attribute pointer (**REAL (p. 1579)** command). If the generated elements require a real constant set other than number 1, you must manually change the set number for those elements by using the **EMODIF (p. 626)**,,REAL command.

If you have already issued **RSURF (p. 1631)** for a surface and you issue **RSURF (p. 1631)** again, the program creates a new set of radiosity surface elements and nodes over the existing set, resulting in an erroneous solution.

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

This is an action command (that creates or deletes surface meshes) and is serial in nature. Even if a DMP solution is running, the **RSURF (p. 1631)** command runs serially.

---

RSYMM,*Option*,*CS*,*Axis*,*NSECT*,*CONDVALUE*,*SVAL*,*EVAL*

Defines symmetry, rotation, or extrusion parameters for the radiosity method.

SOLUTION (p. 38): Radiosity (p. 50)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Command options:

CLEAR

Deletes all symmetry/extrusion definitions. Other command options are ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DEFINE

Defines the symmetry/extrusion definition (default).

STAT

Shows the status/listing. Other command options are ignored.

COND

Activates or deactivates condensation for all defined radiation symmetries/extrusions, which reduces the size of the radiosity equation system (see Figure 14: Usage Example:*Option* = COND (p. 1638)). Default is off.

Note:

Condensation via **RSYMM (p. 1632)**,COND is not recommended as the most efficient solution for symmetric models. To best leverage model symmetry to improve efficiency, use view factor condensation via the **VFCO (p. 2093)** command, which condenses the view factor matrix in addition to simplifying the radiosity equations (see Considerations for View Factor Condensation (p. 1636) for details).

CS

Local coordinate system (≥11) as defined using the **LOCAL (p. 1059)** or **CS (p. 435)** commands or the global coordinate system (0). For planar reflection, the coordinate system origin must be on the plane of symmetry (POS) and one of its axes must be normal to the POS. For cyclic reflection, the coordinate system origin must be coincident with the center of rotation (COR). Only Cartesian systems are valid.

Axis

Axis label of the coordinate system (*CS*) that is normal to the POS for planar reflection, or label to indicate the type of extrusion. For cyclic reflection, this field must be blank, and it is assumed that the Z axis is aligned with the axis of rotation.

X, Y, or Z

Planar reflection. For 2D model planar reflections, valid labels are X or Y. For 3D model planar reflections, valid labels are X, Y, or Z.

ZEXT

Linear extrusion of a line element in the X-Y plane, in the Z direction, to create 4-noded SURF252 elements. *NSECT* indicates how many elements will be created. *SVAL* is the starting Z value, and *EVAL* is the ending Z value. *CS* must be 0.

CEXT

Circumferential extrusion (theta direction) around the global Y-axis. A 2-noded line element in the X-Y plane is extruded to create 4-noded SURF252 elements. *NSECT* indicates how many elements will be created. *SVAL* is the starting angle, and EVAL is the ending angle (in degrees). The angles are with respect to the global X-axis. *CS* must be 0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(blank)

Cyclic reflection.

NSECT

Number of cyclic reflections to be done, or number of elements in the extrusion direction.

For planar reflection, this field must be 0 or blank.

For cyclic reflection, this field must be $\geq$ 1 or $\leq$ -1. Use a positive value if you want the sector angle to be computed automatically. Use a negative value if you want the sector angle to be computed manually. See Notes (p. 1634) for details.

CONDVALUE

Condensation key. Valid only when *Option* = COND.

ON

Activates condensation in the radiosity solver for all defined radiation symmetries/extrusions.

OFF

Deactivates condensation in the radiosity solver for all defined radiation symmetries/extrusions (default).

SVAL, EVAL

Starting and ending Z values (if *Axis* = ZEXT) or angle values (if *Axis* = CEXT) used for the extrusion. Not used for planar or cyclic reflection.

Notes

The **RSYMM (p. 1632)** command is used to define the plane of symmetry (POS) for planar reflection or the center of rotation (COR) for cyclic reflection. It can also be used to set parameters for a linear or circumferential extrusion. The input provided on this command is used to generate radiosity surface elements (SURF251/SURF252) when the **RSURF (p. 1631)** command is issued.

The **RSYMM (p. 1632)** command must be issued before **RSURF (p. 1631)**, and it may be issued multiple times to have more than one planar/cyclic reflection or extrusion. The **RSURF (p. 1631)** command processes **RSYMM (p. 1632)** commands in the order they are issued.

For planar reflection, you must define a local coordinate system (≥11) with its origin on the POS. One of its axes must be aligned so that it is normal to the plane. If possible, use the existing global coordinate system (0).

For cyclic reflection, you must define a local coordinate system (≥11) with its origin coincident with the COR. Reflections occur about the local Z-axis in the counterclockwise direction. You must align the Z-axis properly. If possible, use the existing global coordinate system (0).

For cyclic reflection, *NSECT* is used as follows:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

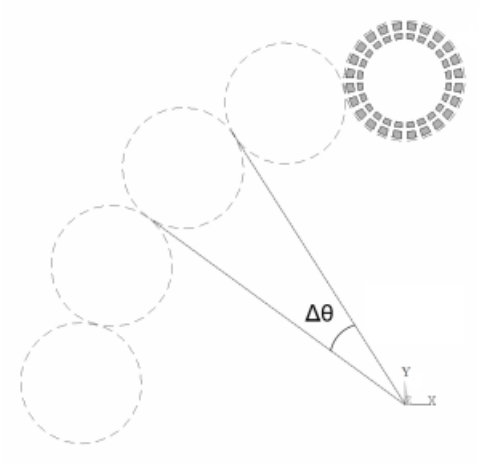
$\Delta\theta = \frac{2\pi}{abs(NSECT)+1}$ if NSECT ≤ 1

$\Delta\theta = \theta_{max} - \theta_{min}$ if NSECT ≥ 1

where θ_{max} and θ_{min} are computed internally based on location of the RDSF (surface-to-surface radiation) flagged surfaces.

See Figure 9: Usage Example: Positive and Negative *NSECT* Values (p. 1635) for an example of *NSECT* usage.

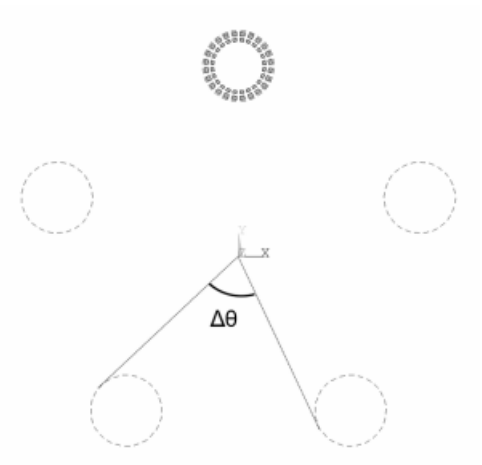
For linear or circumferential extrusion (*Axis* = ZEXT or CEXT), you must ensure that the extruded area matches the area of the underlying element; otherwise, the results may not be correct. For example, in the case of PLANE55 elements with a planar depth = 10, use *Axis* = ZEXT and set *SVAL* and *EVAL* such that *EVAL* - *SVAL* = 10. Likewise, for axisymmetric PLANE55 elements, use *Axis* = CEXT and set *SVAL* and *EVAL* such that *EVAL* - *SVAL* = 360. You must also issue **V2DOPT (p. 2070)**,1 for the axisymmetric case. See Figure 10: Usage Example: Extrusions with *Axis* = ZEXT and CEXT (p. 1636) for extrusion examples.



The *Axis*= ZEXT and CEXT options are not valid for SHELL131 and SHELL132 elements.

New surface elements generated by the **RSYMM (p. 1632)** command inherit the properties of the original elements.

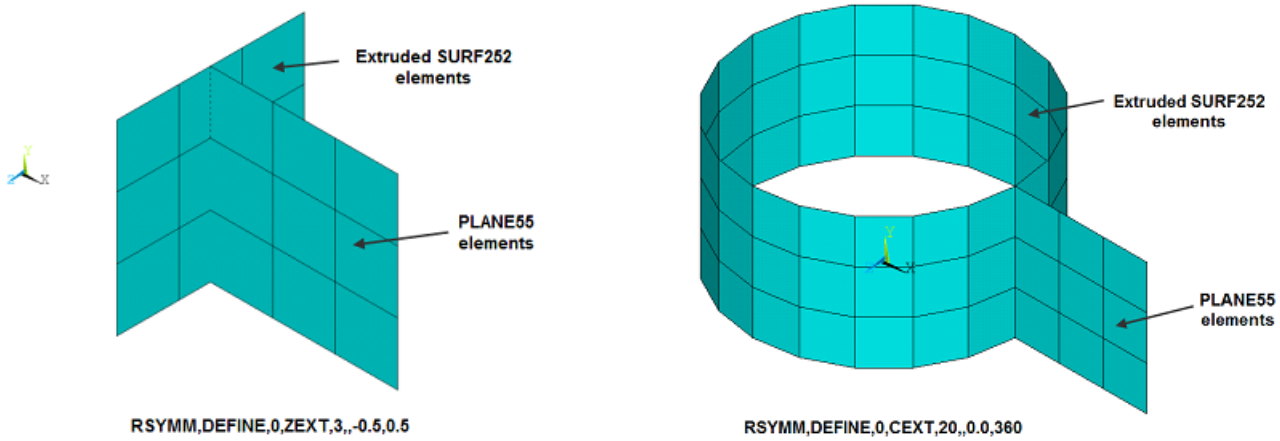
For 2D axisymmetric models, **RSYMM (p. 1632)** can be used only for symmetrization in the YR plane. It cannot be used for the theta direction. Use **V2DOPT (p. 2070)** in that case.



For 2D axisymmetric YR models, the newly-generated nodes can have only positive X coordinates.

Figure 9: Usage Example: Positive and Negative *NSECT* Values

RSYMM (p. 1632),,,4

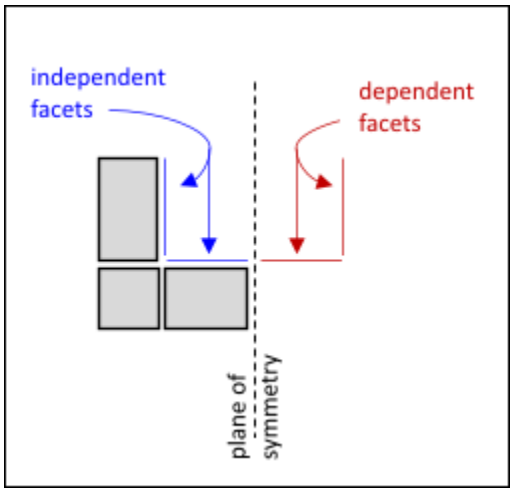


$\Delta\theta = \theta_{max} - \theta_{min}$

RSYMM (p. 1632),,,-4

$\Delta\theta = \frac{2\pi}{abs(-4)+1}$

Figure 10: Usage Example: Extrusions with *Axis* = ZEXT and CEXT



Considerations for View Factor Condensation

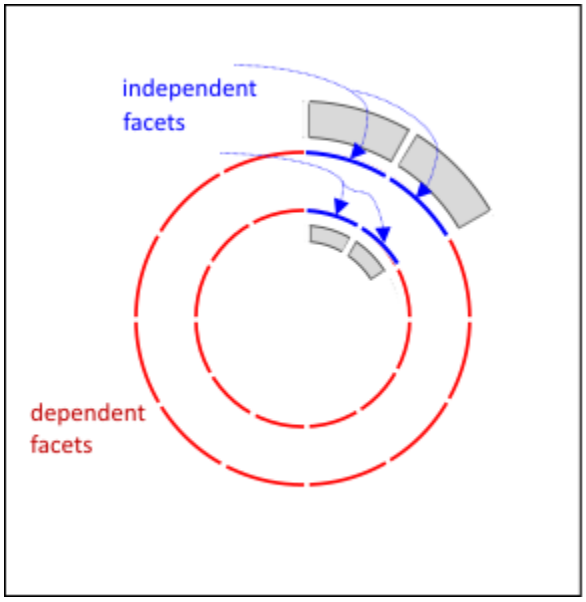
View Factor Condensation via the **VFCO (p. 2093)** command is the recommended method to improve solution efficiency for models with symmetry, which are defined with the **RSYMM (p. 1632)** command.

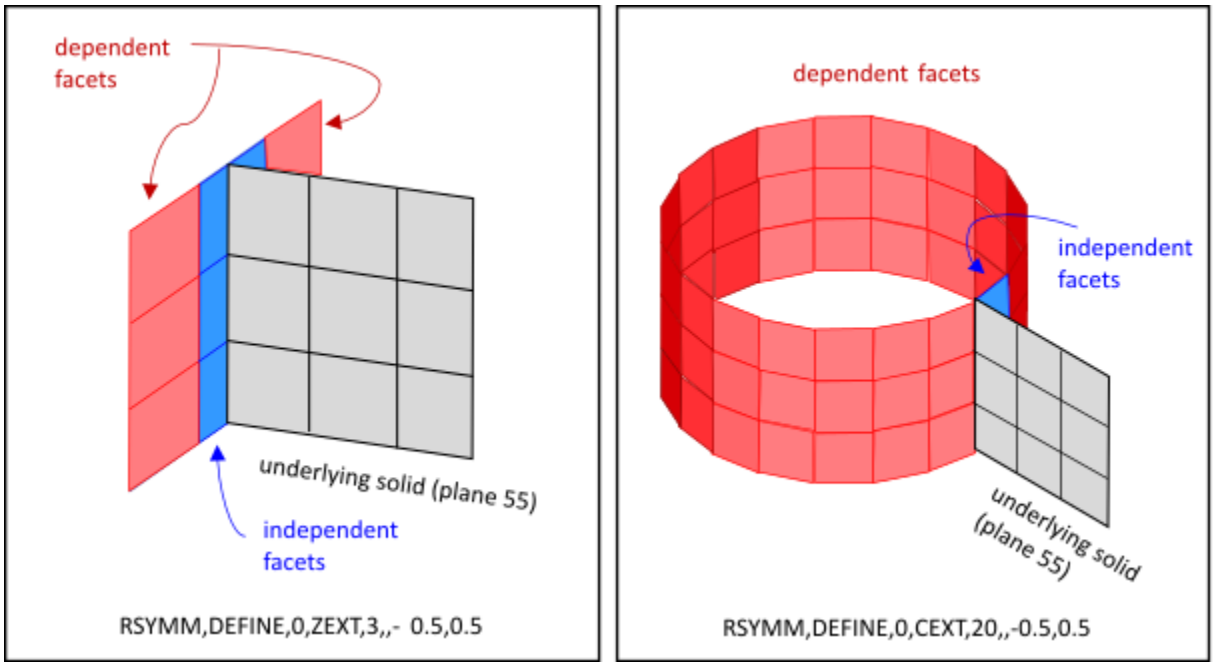
When the **RSYMM (p. 1632)** command is used, it implies that some radiation facets (SURF251 or SURF252) created by the **RSURF (p. 1631)** command will be a reflection of others. By definition, radiation facets with an underlying solid element are independent facets. Dependent facets are copies of the independent facets having the same dimensions but at different locations. The following figures illustrate solid elements (grey) and independent (blue) and dependent (red) facets for models with different types of symmetry. View factor condensation improves efficiency by condensing the view factor matrix to calculate view factors only for independent facets (View Factor Matrix for a Model with Symmetry) and simplifying the radiosity equations to solve only for the independent radiosity flux (Radiosity Equations Simplified for Models with Symmetry in the *Theory Reference*). For an illustrative example, see Example of a 3D Open Enclosure with Symmetry: Radiation Analysis with Condensed View Factor Calculation in the *Thermal Analysis Guide*.

Figure 11: Independent and Dependent Facets in a Model with Planar Symmetry Employing View Factor Condensation

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 12: Independent and Dependent Facets in a Model with Cyclic Symmetry Employing View Factor Condensation





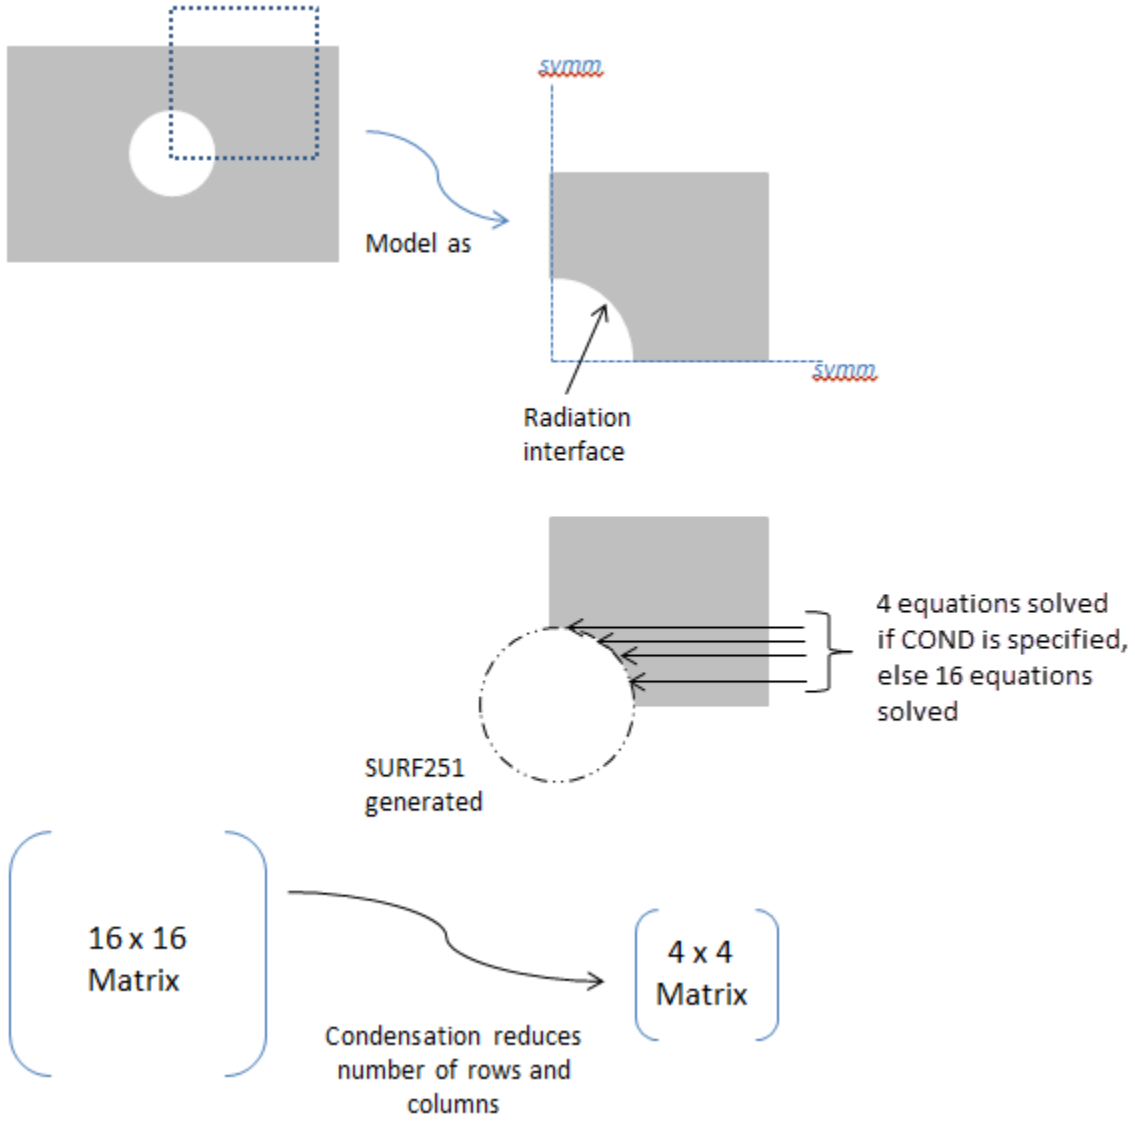


Figure 13: Independent and Dependent Facets for a Model Built by Extrusions Employing View Factor Condensation

Although it is not the recommended method, the following figure illustrates condensation via **RSYMM (p. 1632)**,COND. The efficiency gains by condensation via **RSYMM (p. 1632)**,COND are less than those obtained with view factor condensation via the **VFCO (p. 2093)** command, which reduces the view factor matrix in addition to simplifying the radiosity equations, as described in View Factor Matrix for a Model with Symmetry and Radiosity Equations Simplified for Models with Symmetry in the *Theory Reference*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 14: Usage Example: *Option* = COND

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

---

RSYS, *KCN*

Activates a coordinate system for printout or display of element and nodal results.

POST1 (p. 51): Controls (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

The coordinate system to use for results output:

0

Global Cartesian coordinate system (default, except for spectrum analyses).

1

Global cylindrical coordinate system in Z.

2

Global spherical coordinate system.

5

Global cylindrical coordinate system in Y.

6

Global cylindrical coordinate system in X.

> 10

Any existing local coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SOLU

Solution coordinate systems.

LSYS

Layer coordinate system (default for spectrum analysis).

Notes

The **RSYS (p. 1639)** command activates a coordinate system for printing or displaying element results data such as stresses and heat fluxes, and nodal results data such as degrees of freedom and reactions.

Mechanical APDL rotates the results data to the specified coordinate system during printout, display, or element table operations (such as **PRNSOL (p. 1505)**, **PRESOL (p. 1481)**, **PLNSOL (p. 1425)**, and **ETABLE (p. 687)**).

You can define coordinate systems with various Mechanical APDL commands such as **LOCAL (p. 1059)**, **CS (p. 435)**, **CLOCAL (p. 352)**, and **CSKP (p. 438)**.

The **RSYS (p. 1639)** command has no effect on beam or pipe stresses, which Mechanical APDL displays (via **/ESHAPE (p. 665)**,1 and PowerGraphics) in the element coordinate system.

Element Results

Element results such as stresses and heat fluxes are in the element coordinate systems when *KCN* = SOLU. Nodal requests for element results (for example, **PRNSOL (p. 1505)**,S,COMP) average the element values at the common node; that is, the orientation of the node is not a factor in the output of element quantities.

For nearly all solid elements, the default element coordinate systems are parallel to the global Cartesian coordinate system.

For shell elements and the remaining solid elements, the default element coordinate system can differ from element to element.

For layered shell and layered solid elements, Mechanical APDL initially selects the element coordinate system when *KCN* = SOLU. You can then select the layer coordinate system via the **LAYER (p. 1015)** command.

Nodal Results

Nodal results such as degrees of freedom and reactions can be properly rotated only if the resulting component set is consistent with the degree-of-freedom set at the node. The degree-of-freedom set at a node is determined by the elements attached to the node.

> *Example:* If a node does not have a UZ degree of freedom during solution, any Z component resulting from a rotation does not print or display in POST1. Results at nodes with a single degree-of-freedom (UY only, for example) should therefore not be rotated; that is, they should be viewed only in the nodal coordinate system or a system parallel to the nodal system. (The default global Cartesian system cannot be parallel to the nodal system.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Results at nodes with a 2D degree-of-freedom set (UX and UY, for example) should not be rotated out of the 2D plane.

Existing Local Coordinate Systems (*KCN* > 10)

When *KCN* > 10, and the specified system is subsequently redefined, reissue the **RSYS (p. 1639)** command for results to be rotated into the redefined system.

Solution Coordinate Systems (*KCN* = SOLU)

For element quantities, solution coordinate systems are the element coordinate system for each element. For nodal quantities, they are the nodal coordinate systems.

If an element or nodal coordinate system is not defined, Mechanical APDL uses the global Cartesian coordinate system.

If you issue a **LAYER (p. 1015)**,*N* command (where *N* refers to a layer number), the results appear in the layer coordinate system. (SOLU is the default for spectrum analyses.)

The default coordinate system for certain elements, notably shells, is not global Cartesian and is frequently not aligned at adjacent elements. Avoid setting *KCN* = SOLU with such elements, as it can make nodal averaging of component element results (such as SX, SY, SZ, SXY, SYZ, and SXZ) invalid.

When post-processing expanded nodal results in a cyclic symmetry analysis (**/CYCEXPAND (p. 454)**), use of **RSYS (p. 1639)**,SOLU is recommended so that the appropriate cyclic nodal coordinate system is used (see **CYCLIC (p. 462)** command). For any other coordinate system (for example, **RSYS (p. 1639)**,1), cyclic rotation is not carried out, and nodal results at all sectors are expressed in the specified coordinate system (*KCN*). See Result Coordinate System in the *Cyclic Symmetry Analysis Guide* for more details.

Layered Coordinate System (*KCN* = LSYS)

For layered shell and solid elements, the results appear in their respective layer coordinate systems. For a specific layer of interest, issue a **LAYER (p. 1015)**,*N* command (where *N* refers to a layer number).

If a model has both nonlayered and layered elements, you can use **RSYS (p. 1639)**,SOLU and **RSYS (p. 1639)**,LSYS simultaneously (with **RSYS (p. 1639)**,SOLU applicable to nonlayered elements and **RSYS (p. 1639)**,LSYS applicable to layered elements).

To reverse effects of the LSYS option, issue an **RSYS (p. 1639)**,0 command.

LSYS is the default for spectrum analysis.

PowerGraphics (/GRAPHICS (p. 866),POWER)

Mechanical APDL plots **PLVECT (p. 1445)** vector arrow displays (such temperature, velocity, and force) in the global Cartesian coordinate system (**RSYS (p. 1639)** = 0). Subsequent operations revert to your original coordinate system.

When using solution coordinate systems for results output (**RSYS (p. 1639)**,SOLU), the deformed or displaced shape in a POST1 contour display can be unexpected (although the contours are displayed in the expected colors). The program *does not* rotate displacement values (Ux,Uy,Uz) to global; instead, the displacements (stored locally) are added directly to the global coordinates (X,Y,Z). For example, if

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

in PREP7 the nodes are rotated 90 degrees about the z axis and the global Uy displacements are relatively large, the Ux values will be large, causing the model to display a large deformation in the global X direction.

Large Deflection

If large deflection is active (**NLGEOM (p. 1231)**,ON), Mechanical APDL rotates the element component result directions by the amount of rigid body rotation.

Mechanical APDL displays the element component results in the initial global coordinate system for the following elements: SHELL181, SHELL281, ELBOW290, PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, SOLID272, SOLID273, SOLID285, SOLSH190, SHELL208, SHELL209, CPT212, CPT213, CPT215, CPT216, CPT217, PLANE222, PLANE223, SOLID225, SOLID226, and SOLID227.

All other element result transformations, therefore, are also relative to the initial global system.

Nodal degree-of-freedom results are based on the *initial* geometry.

For all other element types, component results displayed in the co-rotated coordinate system include the element rigid body rotation from the initial global coordinate system, and all other element result transformations are relative to the rotated global system.

S Commands

SABS, *KEY*

Specifies absolute values for element table operations.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Absolute value key:

0

Use algebraic values in operations.

1

Use absolute values in operations.

Command Default

Use algebraic values.

Notes

Causes absolute values to be used in the **SADD (p. 1643)**, **SMULT (p. 1814)**, **SMAX (p. 1805)**, **SMIN (p. 1808)**, and **SSUM (p. 1858)** operations.

Menu Paths

Main Menu>General Postproc>Element Table>Abs Value Option

SADD, *LabR*, *Lab1*, *Lab2*, *FACT1*, *FACT2*, *CONST*

Forms an element table item by adding two existing items.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabR

Label assigned to results. If same as existing label, the existing values will be overwritten by these results.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Lab1

First labeled result item in operation.

Lab2

Second labeled result item in operation (may be blank).

FACT1

Scale factor applied to *Lab1*. A (blank) or '0' entry defaults to 1.0.

FACT2

Scale factor applied to *Lab2*. A (blank) or '0' entry defaults to 1.0.

CONST

Constant value.

Notes

Forms a labeled result (see **ETABLE (p. 687)** command) for the selected elements by adding two existing labeled result items according to the operation:

$$LabR = (FACT1 \times Lab1) + (FACT2 \times Lab2) + CONST$$

May also be used to scale results for a single labeled result item. If absolute values are requested (**SABS (p. 1643)**,1), absolute values of *Lab1* and *Lab2* are used.

Menu Paths

Main Menu>General Postproc>Safety Factor>Allowable Strs>Reset Stress

Main Menu>General Postproc>Safety Factor>Allowable Strs>Temp-depend

---

SAVE,*Fname*,*Ext*,--,*Slab*

Saves all current database information.

DATABASE (p. 13): Set Up (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to DB if *Fname* is blank.

--

Unused field.

Slab

Mode for saving the database:

ALL

Save the model data, solution data and post data (element tables, etc.). This value is the default.

MODEL

Save the model data (solid model, finite element model, loadings, etc.) only.

SOLU

Save the model data and the solution data (nodal and element results).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Saves all current database information to a file (`File.db`). In interactive mode, an existing `File.db` is first written to a backup file (`File.dbb`). In batch mode, an existing `File.db` is replaced by the current database information with no backup. The command should be issued periodically to ensure a current file backup in case of a system "crash" or a "line drop." It may also be issued before a "doubtful" command so that if the result is not what was intended the database may be easily restored to the previous state. A save may be time consuming for large models. Repeated use of this command overwrites the previous data on the file (but a backup file is first written during an interactive run). When issued from within POST1, the nodal boundary conditions in the database (which were read from the results file) will overwrite the nodal boundary conditions existing on the database file.

Internal nodes may be created during solution (for example, via the mixed u-P formulation or generalized plane strain option for current-technology elements, the Lagrangian multiplier method for contact elements or the MPC184 elements, or the quadratic or cubic option of the BEAM188 and PIPE288 elements). It is sometimes necessary to save the internal nodes in the database for later operations, such as cutting boundary interpolations (**CBDOF (p. 285)**) for submodeling. To do so, issue the **SAVE (p. 1645)** command after the first **SOLVE (p. 1822)** command.

In general, saving after solving is always a good practice.

If radiosity surface elements (SURF251 or SURF252) are present in the model, a radiosity mapping data file, *Fname*`.RSM`, is also saved when the **SAVE (p. 1645)** command is issued. For more information, see Advanced Radiosity Options in the *Thermal Analysis Guide*.

This command is valid in any processor.

Menu Paths

Utility Menu>File>Save as

Utility Menu>File>Save as Jobname.db

SBCLIST

Lists solid model boundary conditions.

`SOLUTION` (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Lists all solid model boundary conditions for the selected solid model entities. See also **DKLIST (p. 545)**, **DLLIST (p. 551)**, **DALIST (p. 493)**, **FKLIST (p. 765)**, **SFLLIST (p. 1781)**, **SFALIST (p. 1745)**, **BFLLIST (p. 256)**, **BFALIST (p. 233)**, **BFVLIST (p. 264)**, and **BFKLIST (p. 251)** to list items separately.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>List>Loads>Solid Model Loads

SBCTRAN

Transfers solid model loads and boundary conditions to the FE model.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Causes a manual transfer of solid model loads and boundary conditions to the finite element model. Loads and boundary conditions on unselected keypoints, lines, areas, and volumes are not transferred. Boundary conditions and loads will not be transferred to unselected nodes or elements. The **SBCTRAN (p. 1647)** operation is also automatically done upon initiation of the solution calculations (**SOLVE (p. 1822)**).

This command is also valid in PREP7.

---

*SCAL, *Name*, *Val1*, *VAL2*

Scales a vector or matrix by a constant or a vector.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Name

Name used to identify the vector or matrix to be scaled. Must be specified.

Val1

When scaling a matrix or a vector by a scalar value, *Val1* is the real part of the constant to use (default = 1).

When scaling a matrix or a vector by a vector, *Val1* is the name of the vector used for the scaling operation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL2

The imaginary part of the constant to use (default = 0). This value is used only if the vector or matrix specified by *Name* is complex.

VAL2 is only valid for scaling by a constant. It is not used when scaling by a vector.

Notes

This command can be applied to vectors and matrices created by the ***VEC (p. 2085)**, ***DMAT (p. 551)** and ***SMAT (p. 1801)** commands.

Data types must be consistent between the vectors and matrices being scaled and the scaling vector (or constant value).

When scaling a matrix with a vector, the matrix must be square and the scaling vector must be the same size. See examples below.

Example Usage

Scaling a vector by a constant results in all vector values multiplied by the same constant value:

```
*SCAL,V,2             ! V[i] = V[i]*2
```

Scaling a matrix by a constant results in all matrix values multiplied by the same constant value:

```
*SCAL,M,2             ! M[i][j] = M[i][j]*2
```

The following command scales a complex values vector by a constant value of (2,1):

```
*SCAL,ZV,2,1          ! ZV[i] = ZV[i] * (2,1)
```

The following command scales a vector by another vector. All vector values are multiplied by the corresponding value in the scaling vector:

```
*SCAL,V,W  ! V[i] = V[i] * W[i]
```

The following command scales a matrix by a vector, resulting in all matrix values scaled using the formula below:

```
*SCAL,M,V  ! M[i][j] = M[i][j] * V[i] * V[j]
```

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SCOPT, *TempDepKey*,*MappingKey*

Specifies System Coupling options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TempDepKey

Temperature-dependent behavior key based on the convection coefficient:

YES

A negative convection coefficient, -*N*, is assumed to be a function of temperature and is determined from the HF property table for material *N* (**MP (p. 1160)** command). This is the default behavior.

NO

A negative convection coefficient, -*N*, is used as is in the convection calculation.

MappingKey

Controls whether midside nodes of higher-order elements are used for mapping on System Coupling interfaces:

YES

Both corner and midside nodes are used (default).

NO

Only corner nodes are used.

Notes

By default in the Mechanical APDL program, a negative convection coefficient value triggers temperature-dependent behavior. In some one-way CFD to Mechanical APDL thermal simulations, it is desirable to allow convection coefficients to be used as negative values. To do so, issue the command **SCOPT (p. 1649)**,NO.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SDELETE, *SFIRST*, *SLAST*, *SINC*, *KNOCLEAN*, *LCHK*

Deletes sections from the database.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SFIRST

First section ID to be deleted; defaults to first available section in the database.

SLAST

Last section ID to be deleted; defaults to last available section in the database.

SINC

Increment of the section ID; defaults to 1.

KNOCLEAN

Pretension element cleanup key (pretension sections only).

0

Perform cleanup of PRETS179 pretension elements (delete pretension elements and reconnect elements split during **PSMESH (p. 1543)**).

1

Do not perform cleanup.

LCHK

Specifies the level of element-associativity checking:

NOCHECK

No element-associativity check occurs. This option is the default.

WARN

When a section, material, or real constant is associated with an element, the program issues a message warning that the necessary entity has been deleted.

CHECK

The command terminates, and no section, material, or real constant is deleted if it is associated with an element.

Notes

Deletes one or more specified sections and their associated data from the Mechanical APDL database.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Sections>Delete Section

SE,*File*,--,--,*TOLER*,*nStartVN*

Defines a superelement.

PREP7 (p. 22): Superelements (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

File

The name (case sensitive) of the file containing the original superelement matrix created by the generation pass (*Sename*.sub). The default is the current Jobname.

--,--

Unused fields.

TOLER

Tolerance used to determine if use pass nodes are noncoincident with master nodes having the same node numbers. Defaults to 0.0001. Use pass nodes will always be replaced by master nodes of the same node number. However, if a use pass node is more than *TOLER* away from the corresponding master node, a warning is generated.

nStartVN

Node number to be assigned to the first virtual node created to store the generalized coordinates in a component mode synthesis analysis. See "Notes" (p. 1651) for more information.

Notes

Defines a superelement by reading in the superelement matrices and master nodes from the superelement matrix file. The matrix file (File.sub) must be available from the substructure generation pass. The proper element type (MATRIX50) must be active (**TYPE (p. 2036)**) for this command. A scratch file called File.sord showing the superelement names and their corresponding element numbers is also written.

nStartVN should be chosen so as to offset the virtual node numbers from the other node numbers used in the model. Otherwise, *nStartVN* is internally set by the program to fulfill that condition. The node number defined through *nStartVN* is considered only if applied on the first issued **SE (p. 1651)** command. *nStartVN* can also be defined during the generation pass using the **CMSOPT (p. 378)** command. If *nStartVN* is defined on both **CMSOPT (p. 378)** and **SE (p. 1651)** commands, the larger number prevails.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>Superelem>From .SUB File

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SECCONTROL, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*, *VAL7*, *VAL8*, *VAL9*, *VAL10*, *VAL11*, *VAL12*, *VAL13*

Supplements or overrides default section properties.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAL1*, *VAL2*, *VAL3*, . . . , *VAL13

Values, such as the length of a side or the numbers of cells along the width, that describe the geometry of a section. See the "Notes" (p. 1652) section of this command description for details about these values for the various section types.

Notes

The **SECCONTROL (p. 1652)** command is divided into these operation types: Beams (p. 1652), Links (p. 1652), Pipes (p. 1653), Shells (p. 1653), and Reinforcings (p. 1654).

Values are associated with the most recently issued **SECTYPE (p. 1697)** command. The data required is determined by the section type and is different for each type.

SECCONTROL (p. 1652) overrides the program-calculated transverse-shear stiffness.

The command does not apply to thermal shell elements SHELL131 and SHELL132 or thermal solid elements SOLID278 and SOLID279.

Beams

Type: BEAM

Data to provide in the value fields (*VAL1* through *VAL4*):

TXZ – User transverse shear stiffness.

-- – Unused field.

TXY – User transverse shear stiffness.

ADDMAS – Added mass per unit length.

Links

Type: LINK

Data to provide in the value fields (*VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*):

ADDMAS – Added mass per unit length.

TENSKEY – Flag specifying tension and compression, tension only, or compression only (not valid for CABLE280:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0 – Tension *and* compression (default).

1 – Tension only.

-1 – Compression only.

CV1, *CV2* – Damping coefficients.

CV3 – Compressive stiffness scaling factor (for CABLE280 only). The ratio between compressive stiffness and tensile stiffness. Default – 1.0e-5. Maximum – 1.0.

CV4 – Viscous regularization factor (for CABLE280 only). Default – 0.05. Maximum – 1.0.

Pipes

Type: PIPE

Data to provide in the value field (*VAL1*):

ADDMAS – Added mass per unit length. Use this value to account for extra hardware only.

Notes

Other masses are handled as follows:

- The mass of the internal fluid is accounted for by M_{int} on the **SECDATA (p. 1655)** command.
- The mass of the outer covering (insulation) is accounted for by M_{ins} on the **SECDATA (p. 1655)** command.
- The mass of the external fluid is accounted for by *MATOC* on the **OCDATA (p. 1307)** command.

Shells

Type: SHELL

Data to provide in the value fields (*VAL1* through *VAL8*):

E_{11} – User transverse-shear stiffness.

E_{22} – User transverse-shear stiffness.

E_{12} – User transverse-shear stiffness.

ADDMAS – Added mass-per-unit area.

HMEMSCF – Hourglass-control membrane-scale factor.

HBENSCF – Hourglass-control bending-scale factor.

DRLSTIF – Drill-stiffness scale factor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BENSTIF – Bending-stiffness scale factor (SHELL181 and SHELL281).

Reinforcing

Type: REINF

Data to provide in the value fields (*VAL1*, *VAL2*, *VAL3*):

TENSKEY – Specifies tension-and-compression, tension-only, or compression-only reinforcing behavior (valid for structural reinforcing analysis):

0 – Tension *and* compression (default).

1 – Tension only.

-1 – Compression only.

––––––––––––

REMBASE – Specifies how base-element material is handled:

0 – Retain base-element material in the space occupied by the reinforcing fibers (default).

1 – Remove base-element material in the space occupied by the reinforcing fibers.

––––––––––––

STSSTATE – Specifies the reinforcing stress state or heat flow:

For smeared reinforcing:

0 – Uniaxial-stress state (for structural reinforcing analysis) *or* uniaxial heat flow (for thermal reinforcing analysis). Only *kxx* is required. (Default.)

1 – Plane-stress state (for structural reinforcing analysis) *or* anisotropic heat flow (for thermal reinforcing analysis). Both kxx and kyy are specified.

2 – Plane-stress state with transverse shear stiffness. Valid for 3D smeared structural reinforcing analysis.

3 – Plane-stress state with transverse shear stiffness and bending stiffness. Valid for 3D smeared structural reinforcing analysis with solid base elements.

For discrete reinforcing:

0 – Uniaxial stiffness, or uniaxial heat flow for thermal reinforcing analysis. (Default.)

1 – Uniaxial, bending, and torsional stiffness with square cross section. Valid for 3D structural reinforcing analysis with solid base elements.

2 – Uniaxial, bending, and torsional stiffness with circular cross section. Valid for 3D structural reinforcing analysis with solid base elements.

Notes

REMBASE = 1 typically leads to more accurate models. (The base material must support 1D stress states.) For structural-reinforcing analysis, the base-element material consists of mass, stiffness, and body force. For thermal-reinforcing analysis, the base-element material consists of damping, conduc-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

tion, and heat generation, and the base-element surface loads (convection and heat flux) are not subtracted. This option is not valid when the base-element material is anisotropic.

For smeared reinforcing with *STSSTATE* = 0, the equivalent thickness h of the smeared reinforcing layer is determined by h = *A* / *S*, where *A* is the cross-section area of a single fiber and *S* is the distance between two adjacent fibers. (See **SECDATA (p. 1655)**.)

STSSTATE = 1 to 3 is suitable for homogenous reinforcing layers (membrane) and applies to smeared reinforcing only (**SECTYPE (p. 1697)**,,REINF,SMEAR). For smeared reinforcing with *STSSTATE* = 1 to 3, discrete reinforcing with *STSSTATE* = 1 or 2, *TENSKEY* is ignored, and the default tension and compression behaviors apply to the reinforcing layers; also, the cross-section area input *A* is the thickness of the reinforcing layers and the distance input *S* is ignored. (See **SECDATA (p. 1655)** and REINF265 Structural/Thermal Input Data in the *Element Reference*.)

For smeared reinforcing with *STSSTATE* = 3 or discrete reinforcing with *STSSTATE* = 1 or 2, bending or torsional reinforcing stiffness may not be captured adequately when using reinforcing with overly refined high-order base tetrahedral elements (SOLID187 or degenerated SOLID186) and the stiffness ratio between reinforcing and base elements is excessive (> 100x).

Specified *TENSKEY*, *REMBASE* and *STSSTATE* values apply to *all* fibers defined in the current section.

For more information, see Reinforcing and Direct Element Embedding in the *Structural Analysis Guide*.

SECDATA,*VAL1*,*VAL2*,*VAL3*,*VAL4*,*VAL5*,*VAL6*,*VAL7*,*VAL8*,*VAL9*,*VAL10*,*VAL11*,*VAL12*

Describes the geometry of a section.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

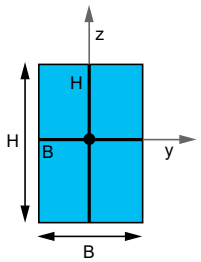
VAL1, VAL2, VAL3, . . . , VAL12

Values, such as thickness or the length of a side or the numbers of cells along the width, that describe the geometry of a section. The terms *VAL1*, *VAL2*, etc. are specialized for each type of cross-section.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **SECDATA (p. 1655)** command defines the data describing the geometry of a section. The command is divided into these section types: Beams (p. 1656), Contact (p. 1659), General Axisymmetric (p. 1661), Joints (p. 1662), Links (p. 1663), Pipes (p. 1663), Pretension (p. 1664), Reinforcing (p. 1665), Shells (p. 1675), Supports (p. 1676), and Taper (p. 1677).



The data input on the **SECDATA (p. 1655)** command is interpreted based on the most recently issued **SECTYPE (p. 1697)** command. The data required is determined by the section type and subtype, and is different for each one.

Beams

Type: BEAM

Beam sections are referenced by BEAM188 and BEAM189 elements. Not all **SECOFFSET (p. 1685)** location values are valid for each subtype.

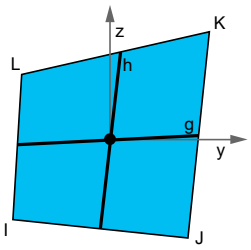
Type: BEAM, Subtype: RECT

Data to provide in the value fields:

B, *H*, *Nb*, *Nh*

where:

B = Width



H = Height

Nb = Number of cells along width; default = 2

Nh = Number of cells along height; default = 2

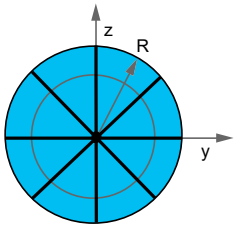
*Nb*Nh*

Type: BEAM, Subtype: QUAD

Data to provide in the value fields:

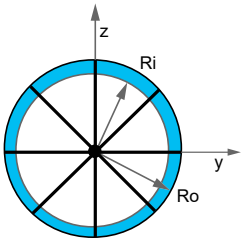
yI, *zI*, *yJ*, *zJ*, *yK*, *zK*, *yL*, *zL*, *Ng*, *Nh*

yI, *zI*, *yJ*, *zJ*, *yK*, *zK*, *yL*, *zL* = Coordinate location of various points



Ng = Number of cells along *g*; default = 2

Nh = Number of cells along *h*; default = 2



*Ng*Nh*

Degeneration to triangle is permitted by specifying the same coordinates for cells along an edge.

Type: BEAM, Subtype: CSOLID

Type: BEAM, Subtype: CTUBE

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Data to provide in the value fields:

R, *N*, *T*

where:

R = Radius

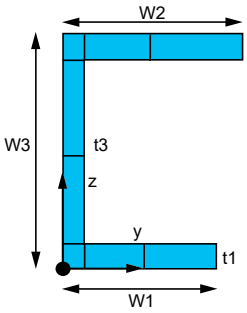
N = Number of divisions around the circumference; 8 ≤ *N* ≤ 120 (where a greater value improves accuracy slightly); default = 8

T = Number of divisions through the radius; default = 2

Data to provide in the value fields:

Ri, *Ro*, *N*

where:



Ri = Inner radius of the tube

Ro = Outer radius of the tube

N = Number of cells around the circumference; N ≥ 8 (where a greater value improves accuracy slightly); default = 8

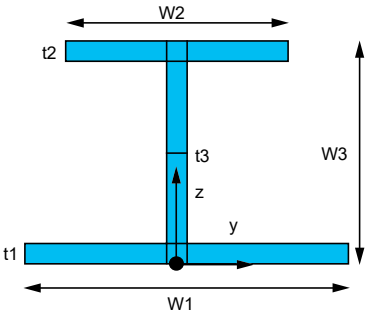
This subtype is similar to type PIPE (p. 1663). However, elements using PIPE account for internal or external pressures, whereas elements using CTUBE do not.

Type: BEAM, Subtype: CHAN

Data to provide in the value fields:

W1, *W2*, *W3*, *t1*, *t2*, *t3*

where:



W1, *W2* = Lengths of the flanges

W3 = Overall depth

t1, *t2* = Flange thicknesses

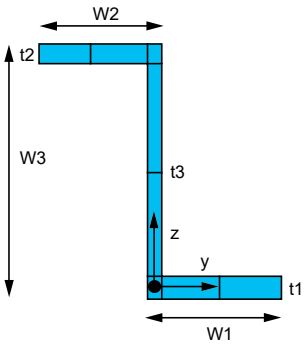
t3 = Web thicknesses

Type: BEAM, Subtype: I

Data to provide in the value fields:

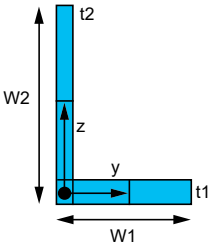
W1, *W2*, *W3*, *t1*, *t2*, *t3*

where:



W1, *W2* = Width of the top and bottom flanges

W3 = Overall depth



t1, *t2* = Flange thicknesses

t3 = Web thicknesses

Type: BEAM, Subtype: Z

Type: BEAM, Subtype: L

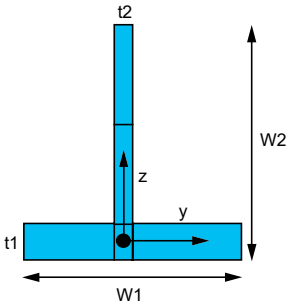
Data to provide in the value fields:

W1, *W2*, *t1*, *t2*

Data to provide in the value fields:

W1, *W2*, *W3*, *t1*, *t2*, *t3*

where:



W1, *W2* = Flange lengths

W3 = Overall depth

t1, *t2* = Flange thicknesses

t3 = Stem thicknesses

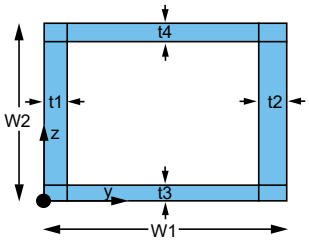
Type: BEAM, Subtype: T

Data to provide in the value fields:

W1, *W2*, *t1*, *t2*

where:

W1 = Flange width



W2 = Overall depth

t1 = Flange thicknesses

t2 = Stem thicknesses

If *W2* is a negative value, the section will be flipped.

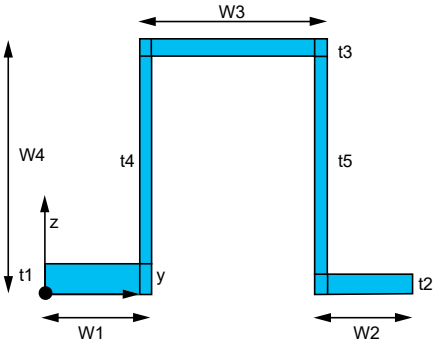
Type: BEAM, Subtype: HREC

Data to provide in the value fields:

W1, *W2*, *t1*, *t2*, *t3*, *t4*

where:

W1 = Outer width of the box



where:

W1, *W2* = Leg lengths

t1, *t2* = Leg thicknesses

If *W2* is a negative value, the section will be flipped.

Type: BEAM, Subtype: HATS

Data to provide in the value fields:

W1, *W2*, *W3*, *W4*, *t1*, *t2*, *t3*, *t4*, *t5*

where:

W1, *W2* = Width of the brim

W3 = Width of the top of the hat

W4 = Overall depth

t1, *t2* = Thickness of the brim

t3 = Thickness of the top of the hat

t4, *t5* = Web thicknesses

Type: BEAM, Subtype: ASEC

Arbitrary: User-supplied integrated section properties instead of basic geometry data.

Data to provide in the value fields:

A, *Iyy*, *Iyz*, *Izz*, *Iw*, *J*, *CGy*, *CGz*, *SHy*, *SHz*, *TKz*, *TKy*, *TSxz*, *TSxy*

where:

A = Area of section

Iyy = Moment of inertia about the y axis

Iyz = Product of inertia

Izz = Moment of inertia about the z axis

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

W2 = Outer height of the box

t1, *t2*, *t3*, *t4* = Wall thickness

Iw = Warping constant

J = Torsional constant

CGy = y coordinate of centroid

CGz = z coordinate of centroid

SHy = y coordinate of shear center

SHz = z coordinate of shear center

TKz = Thickness along Z axis (maximum height)

TKy = Thickness along Y axis (maximum width)

TSxz = Shear-correction factor for component xz

TSxy = Shear-correction factor for component xy

SECPLOT (p. 1688) cannot display an ASEC plot.

Type: BEAM, Subtype: MESH

User-defined mesh.

Data required is created by the **SECWRITE (p. 1703)** command and is read in by the **SECREAD (p. 1693)** command.

When a user mesh is input via **SECREAD (p. 1693)**, the program calculates the area, second moments of inertia, centroid, torsion constant, warping rigidity, and shear center.

If you redefine a material for a composite cross-section after creating the section, reissue the **SECREAD (p. 1693)** command.

CONTACT

Type: CONTACT

Geometry Correction

Contact sections for geometry correction (*Subtype* = CIRCLE, SPHERE, or CYLINDER) are referenced by the following elements: TARGE169, TARGE170, CONTA172, and CONTA174. This geometry correction applies to cases where the original meshes of contact elements or target elements are located on a portion of a circular, spherical, or revolute surface.

Type: CONTACT, Subtype: CIRCLE

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Data to provide in the value fields for *Subtype* = CIRCLE:

X0, *Y0* (circle center location in Global Cartesian coordinates - XY plane)

Type: CONTACT, Subtype: SPHERE

Data to provide in the value fields for *Subtype* = SPHERE:

X0, *Y0*, *Z0* (sphere center location in Global Cartesian coordinates)

Type: CONTACT, Subtype: CYLINDER

Data to provide in the value fields for *Subtype* = CYLINDER:

X1, *Y1*, *Z1*, *X2*, *Y2*, *Z2* (two ends of cylindrical axis in Global Cartesian coordinates)

User-Defined Contact Surface Normal

The contact section for a user-defined contact surface normal (*Subtype* = NORMAL) is referenced by the following elements: CONTA172, CONTA174, and CONTA175. This geometry correction is used to define a shift direction for interference fit solutions.

Type: CONTACT, Subtype: NORMAL

Data to provide in the value fields for *Subtype* = NORMAL:

CSYS, *NX*, *NY*, *NZ*

where:

CSYS = Local coordinate system number (defaults to global Cartesian).

NX, *NY*, *NZ* = Direction cosines with respect to *CSYS*.

Radius values associated with contact or target elements

The radius contact section (*Subtype* = RADIUS) is referenced by contact or target elements in a general contact definition under the following circumstances:

- **Equivalent 3D contact radius for beam-to-beam contact** - The contact section for a user-defined equivalent contact radius (*Subtype* = RADIUS) is referenced by the element type CONTA177 within a general contact definition. 3D beam-to-beam contact (or edge-to-edge contact) modeled by this line contact element assumes that its surface is a cylindrical surface.
- **Radius (or radii) of rigid target segments** - The contact section for rigid target segment radii is referenced by target elements TARGE169 (circle segment type) and TARGE170 (line, parabola, cylinder, sphere, or cone segment type) in a general contact definition.

Type: CONTACT, Subtype: RADIUS

Data to provide in the value fields for *Subtype* = RADIUS if the section is used as an equivalent contact radius for 3D beam-to-beam contact:

VAL1 = Equivalent radius - outer radius

VAL2 = Equivalent radius - inner radius (internal beam-to-beam contact)

VAL3: Set to 1 for internal beam-to-beam contact. Defaults to external beam-to-beam contact.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Data to provide in the value fields for *Subtype* = RADIUS if the section is used for 2D or 3D rigid target segments:

VAL1 = First radius of the target segment (used for circle, line, parabola, cylinder, sphere, and cone segment types)

VAL2 = Second radius of the target segment (used only for the cone segment type)

Simplified Bolt Thread Modeling

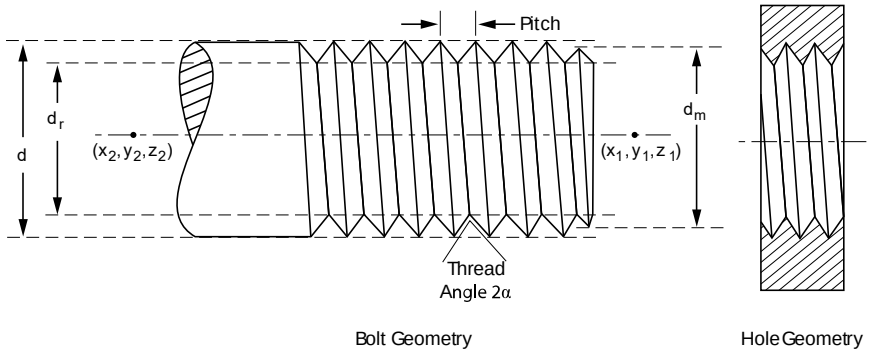
The contact section for bolt-thread modeling (*Subtype* = BOLT) is referenced by the following elements: CONTA172, CONTA174, and CONTA175. It applies to cases where the original meshes of contact elements are located on a portion of a bolt-thread surface. This feature allows you to include the behavior of bolt threads without having to add the geometric detail of the threads. Calculations are performed internally to approximate the behavior of the bolt-thread connections.

Type: CONTACT, Subtype: BOLT

Data to provide in the value fields for *Subtype* = BOLT:

D_m , *P*, *ALPHA*, *N*, *X1*, *Y1*, *Z1*, *X2*, *Y2*, *Z2*

where:



D_m = Pitch diameter, d_m.

P = Pitch distance, p.

ALPHA = Half-thread angle, α (defaults to 30 degrees).

N = Number of starts (defaults to 1).

X1, *Y1*, *Z1*, *X2*, *Y2*, *Z2* = Two end points of the bolt axis in global Cartesian coordinates.

General Axisymmetric

Type: AXIS

General axisymmetric sections are referenced by the SURF159, SOLID272, and SOLID273 elements. Use this command to locate the axisymmetric axis.

Data to provide in the value fields:

Pattern 1 (two points):

1, *X1*, *Y1*, *Z1*, *X2*, *Y2*, *Z2*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

where *X1*, *Y1*, *Z1*, *X2*, *Y2*, *Z2* are global Cartesian coordinates.

Pattern 2 (coordinate system number plus axis [1 = x, 2 = y, 3 = z]):

2, *csys*, *axis*

where *csys* is a Cartesian coordinate system.

Pattern 3 (origin plus direction):

3, *X0*, *Y0*, *Z0*, *xdir*, *ydir*, *zdir*

where *X0*, *Y0*, *Z0 are global Cartesian coordinates and xdir*, *ydir*, and *zdir* are direction cosines.

Joints

Type: JOINT

Joint sections are referenced by MPC184 joint elements.

Data to provide in the value fields:

length1, *length2*, *length3*, *angle1*, *angle2*, *angle3*

where:

length1-3 = Reference lengths used in the constitutive calculations.

angle1-3 = Reference angles used in the constitutive calculations.

The following table shows the lengths and angles to be specified for different kinds of joints.

Joint	Subtype	Reference lengths and angles
Revolute	REVO	angle1 for x-axis revolute joint angle3 for z-axis revolute joint
Universal	UNIV	angle1 and angle3
Slot	SLOT	length1
Point-in-plane	PINP	length2 and length3,
Revolute Translational	PRIS	length1
Cylindrical	CYLI	length1 and angle1 for x-axis cylindrical joint length3 and angle3 for z-axis cylindrical joint
Planar	PLAN	length2, length3, and angle1 for x-axis planar joint length1, length2, and angle3 for z-axis planar joint
Weld	WELD	(not used)
Orient	ORIE	(not used)
Spherical	SPHE	angle1, angle2, and angle3 (not used in friction calculations)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Joint	Subtype	Reference lengths and angles
General	GENE	length1, length2, length3, angle1, angle2, angle3 -- Depends upon which "unconstrained" relative degrees of freedom are available.
Screw	SCRE	length3 and angle3
Spotweld	SPWE	(not used)

The reference length and angle specifications correspond to the free relative degrees of freedom in a joint element for which constitutive calculations are performed. These values are used when stiffness and/or damping are specified for the joint elements.

If the reference lengths and angles are not specified, they are calculated from the default or starting configuration for the element.

See MPC184 or the individual joint element descriptions for more information on joint element constitutive calculations.

Links

Type: LINK

Link sections are referenced by the LINK33, LINK180, LINK228, and CABLE280 elements.

Data to provide in the value fields:

VAL1 = Area

Pipes

Type: PIPE

Pipe sections are referenced by the PIPE288, PIPE289, and ELBOW290 elements.

Data to provide in the value fields:

D_o, T_w, N_c, S_s, N_t, M_{int}, M_{ins}, T_{ins}

where:

D_o = Outside diameter of pipe. Use a constant value for a circular pipe and an array for a noncircular pipe. (Noncircular pipe sections are referenced by the ELBOW290 element only. See Defining a Noncircular Pipe in the *Structural Analysis Guide*.)

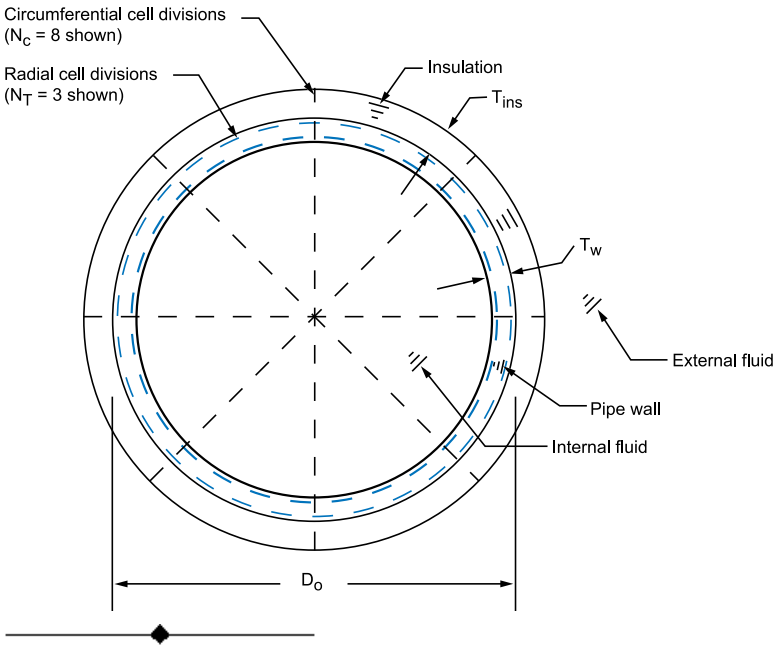
T_w = Wall thickness. Default = D_o / 2, or "solid" pipe. ("Solid" pipe is not applicable to ELBOW290; for that element, a thickness less than D_o / 4 is recommended.)

N_c = Number of cells around the circumference ($8 \le N_c \le 120$, where a greater value improves accuracy slightly; default = 8).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

S_s = Section number of the shell representing the pipe wall. Valid with ELBOW290 only. (Total thickness of the section is scaled to T_w. The program considers the innermost layer inside of the pipe to be the first layer.)

N_t = Number of cells through the pipe wall. Valid values are 1 (default), 3, 5, 7, and 9. Cells are graded such that they are thinner on the inner and outer surfaces. Valid with PIPE288 and PIPE289 only.



M_{int} = Material number of fluid inside of the pipe. The default value is 0 (no fluid). This value is used to input the density of the internal fluid. The fluid inside the pipe element is ignored unless the free surface in a global X-Y plane is added as face 3 (**SFE (p. 1761)**) and is high enough to include at least one end node of the element.

M_{ins} = Material number of material external to the pipe (such as insulation or armoring). The default value is 0 (no external material). This value is used to input the density of the external material. (External material adds mass and increases hydraulic diameter, but does not add to stiffness.)

T_{ins} = Thickness of material external to the pipe, such as insulation. The default value is 0 (no external material).

The accuracy of the ovalization value (OVAL) output by ELBOW290 (Structural Elbow form only) improves as the specified number of cells around the circumference (N_c) is increased.

External material (M_{ins}) adds mass and increases hydraulic diameter, but does not add to stiffness.

Pretension

Type: PRETENSION

Pretension sections are referenced by the PRETS179 element.

Data to provide in the value fields:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

node, *nx*, *ny*, *nz*

where:

node = Pretension node number.

nx = Orientation in global Cartesian x direction.

ny = Orientation in global Cartesian y direction.

nz = Orientation in global Cartesian z direction.

The following usage is typical:

```
SECTYPE, 1, PRETENSION
SECDATA, 13184, 0.000, 0.000, 1.000
SECMODIF, 1, NAME, example
SLOAD, 1, PL01, TINY, FORC, 100.00 , 1, 2
```

The *PRETENSION* section options of **SECTYPE (p. 1697)** and **SECDATA (p. 1655)** are documented mainly to aid in the understanding of data written by **CDWRITE (p. 293)**. Ansys, Inc. recommends that you generate pretension sections using **PSMESH (p. 1543)**.

Reinforcing

Type: REINF

Each **SECDATA (p. 1655)** command defines the material, geometry, and orientation (if Subtype = SMEAR) of one reinforcing member (discrete fiber or smeared surface) in the section. The reinforcing section can be referenced by reinforcing elements (REINF263, REINF264, and REINF265), or MESH200 elements when used for temporarily representing reinforcing members. Only one **SECDATA (p. 1655)** command is allowed per section when referenced by MESH200 elements. For more information, see Reinforcing and Direct Element Embedding in the *Structural Analysis Guide*.

- -

Type: REINF, Subtype: DISCRETE

Defines discrete reinforcing fibers with arbitrary orientations. For the MESH input pattern, reinforcing section data is referenced by MESH200 elements. For other patterns, issue separate **SECDATA (p. 1655)** commands to define each reinforcing fiber.

Data to provide in the value fields:

MAT, A, PATT, V1, V2, V3, V4, V5

MAT = Material ID for the fiber. (See REINF264 for valid material models.) When the reinforcing section is referenced by a MESH200 element, the default is the MESH200 element material ID (**MAT (p. 1111)**). When the section is referenced by reinforcing elements, the material ID is required for all fibers, and no default for this value is available.

A = Cross-section area of the reinforcing fiber.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PATT = Input pattern code (described below) indicating how the location of this fiber is defined. Available input patterns are MESH (when the section is referenced by a MESH200 element), and LAYN, EDGO, and BEAM (when the section is referenced by a reinforcing element).

V1, *V2*, *V3*, *V4*, *V5* = Values to define the location of the reinforcing fiber (depending on the *PATT* pattern code used), as shown:

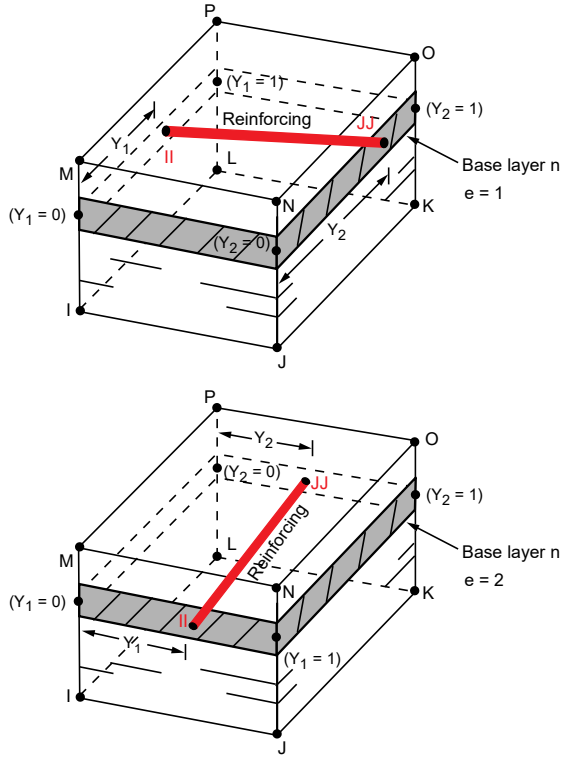
***PATT* : MESH**

Description: The locations of reinforcing fibers are defined directly via MESH200 element connectivity.

Required input: None.

***PATT* : LAYN**

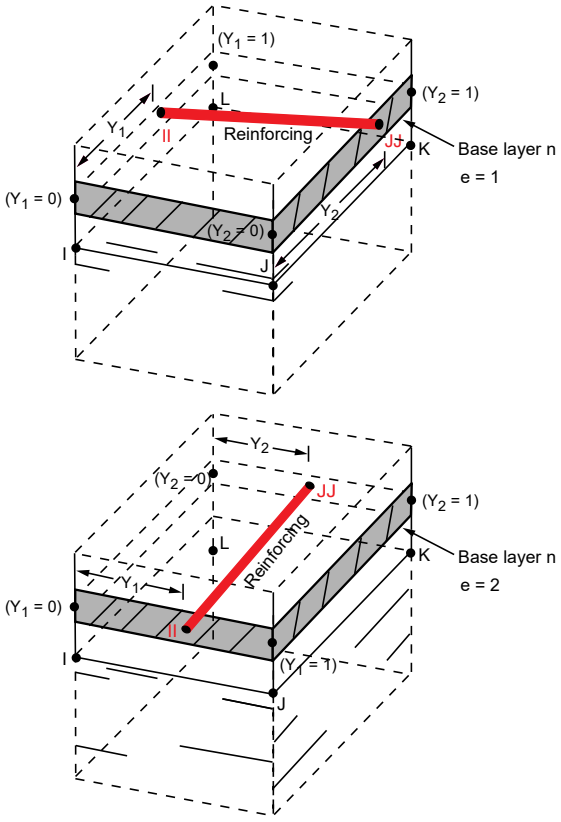
Description: The discrete reinforcing fiber is placed in the middle of a layer in a layered base element. The orientation of the fiber within the layer is adjustable via offsets with respect to a specified element edge.



Required input:

V1 (or *N*) -- The number of the layer in the base element on which to apply the reinforcing fiber. The default value is 1.

V2 (or *e*) -- The number to indicate the element edge to which the offsets are measured. The default value is 1.



V3 and *V4* (or *Y1* and *Y2*) -- The normalized distances from the fiber to the two ends of the specified element edge. Valid values for *Y1* and *Y2* are 0.0 through 1.0. The default value of *Y1* is 0.5. The default value of *Y2* is *Y1*.

When applied to 8-node or 20-node layered solid elements:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

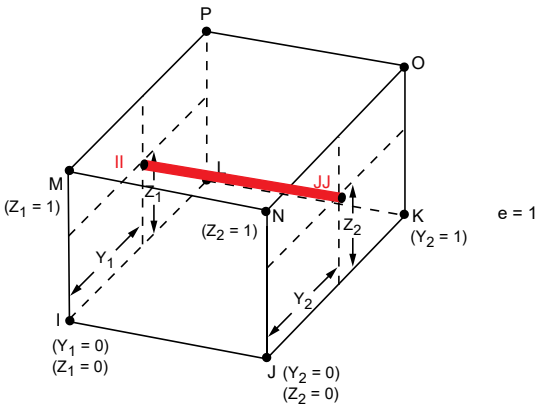
When applied to 4-node or 8-node layered shell elements:

***PATT* : EDGO**

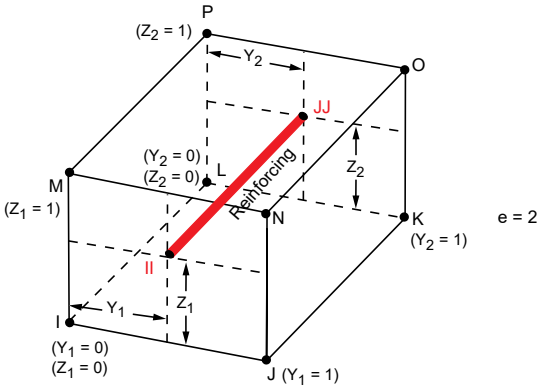
Description: The orientation of the discrete reinforcing fiber is similar to one of the specified element edges. The fiber orientation can be further adjusted via offsets with respect to the specified element edge.

Required input:

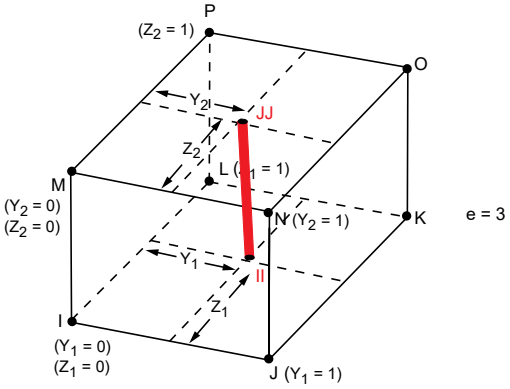
V1 (or *0*) -- The number to indicate the element edge to which the offsets are measured. The default value is 1.



V2 and *V3* (or *Y1* and *Z1*) -- The normalized distances from the fiber to the first end of the specified element edge. Valid values for *Y1* and *Z1* are 0.0 through 1.0. The default value for *Y1* and *Z1* is 0.5.

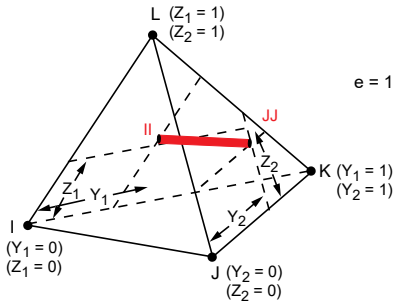


V4 and *V5* (or *Y2* and *Z2*) – The normalized distances from the fiber to the second end of the specified element edge. Value values for *Y2* and *Z2* are 0.0 through 1.0. The default value for *Y2* is *Y1*, and the default value for *Z2* is *Z1*.

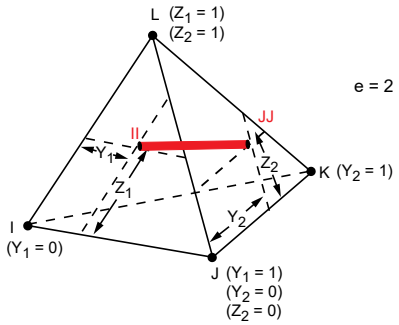


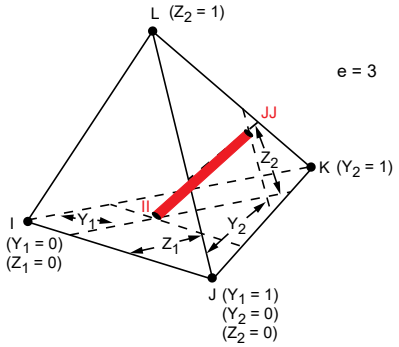
If the base element is a beam or link, the program ignores values *V2* through *V5* and instead places the reinforcing in the center of the beam or link.

When applied to 8-node or 20-node solid elements:

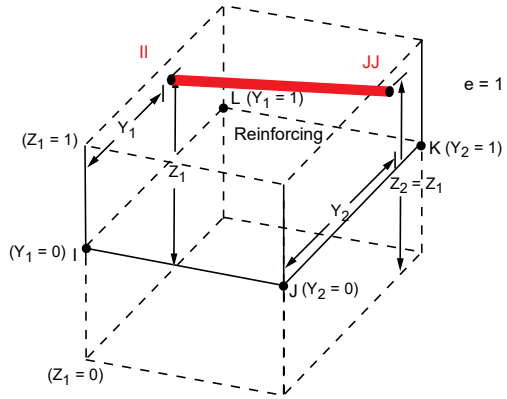


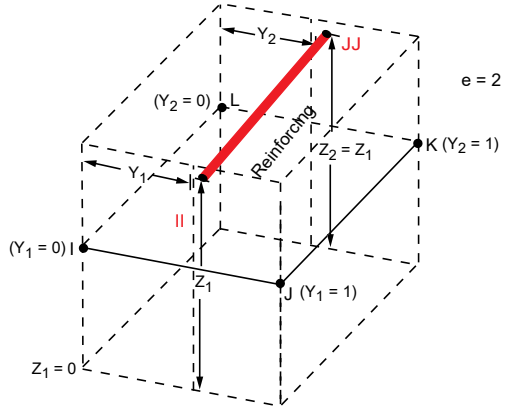
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



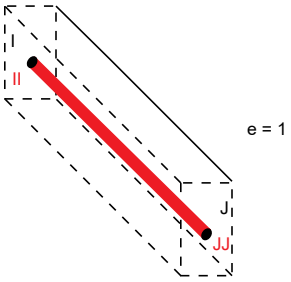


When applied to tetrahedral elements:





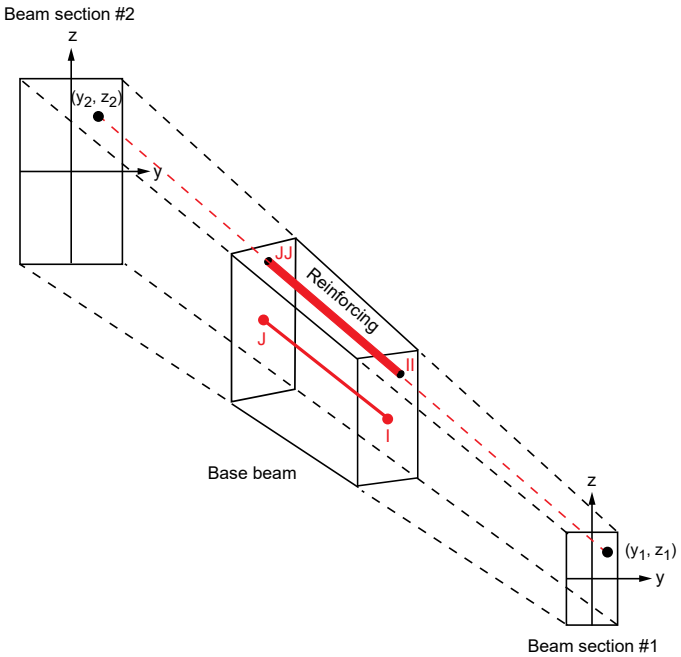
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



When applied to 3D shell elements:

When applied to beam or link elements:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



***PATT* : BEAM**

Description: Use this specialized input pattern for defining reinforcing in regular constant and tapered beams.

Required input:

V1 and *V2* (or *Y1* and *Z1*) -- Y and Z offsets with respect to the section origin in the first beam section referenced by the base beam element. The default value for Y1 and Z1 is 0.0.

V3 and *V4* (or *Y2* and *Z2*) -- Y and Z offsets with respect to the section origin in the second beam section referenced by the base beam element. The default value for *Y2* is *Y1*, and the default value for *Z2* is *Z1*. (Because *V3* and *V4* values apply only to tapered beams, the program ignores them if the base beam has a constant section.)

- -

Type: REINF, Subtype: SMEAR

Suitable for layers of reinforcing fibers with uniform cross-section area and spacing. Each **SECDATA (p. 1655)** command defines the one reinforcing layer in the section. When referenced by a MESH200 element, only one **SECDATA (p. 1655)** command per section is allowed. When referenced by reinforcing elements (REINF263 and REINF265), this limitation does not apply.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Data to provide in the value fields:

MAT, A, S, KCN, THETA, PATT, V1, V2, V3, V4, V5

where:

MAT = Material ID for layer. (See REINF263 or REINF265 for available material models.) When the section is referenced by a MESH200 element, the default is the MESH200 element material ID (**MAT (p. 1111)**). When the section is referenced by reinforcing elements, the material ID is required for all fibers, and no default for this value is available.

A = Cross-section area of a single reinforcing fiber (*or* the thickness of the reinforcing layer for homogeneous reinforcing membranes).

S = Distance between two adjacent reinforcing fibers (ignored for homogeneous reinforcing membranes).

Note: If the section is used to model the reinforcing layers with a uniaxial stress state (**SECCONTROL (p. 1652)**,,,0), the equivalent thickness h of the reinforcing layer is determined by h = *A* / *S*, where *A* is the cross-section area of a single fiber and *S* is the distance between two adjacent fibers. If the section is used to model homogeneous reinforcing membranes (**SECCONTROL (p. 1652)**,,,1), the cross-section area input *A* is the thickness of the reinforcing layer and the distance input *S* is ignored.

KCN = Local coordinate system reference number for this layer. (See **LOCAL (p. 1059)** for more information.) When the section is referenced by a MESH200 element, the default *KCN* value is the MESH200 element coordinate system ID (**ESYS (p. 685)**). For the 2D smeared reinforcing element REINF263, *KCN* input is not required. When *KCN* is not specified, the program uses a default layer coordinate system (described in REINF263 and REINF265).

THETA = Angle (in degrees) of the final layer coordinate system with respect to the default layer system or the layer system specified in the *KCN* field. This value is ignored for REINF263 when that element is embedded in 2D plane strain or plane stress base elements.

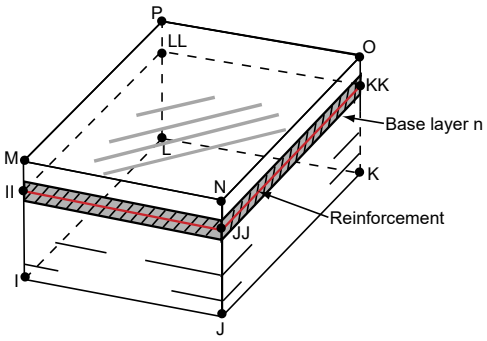
PATT = Input pattern code (described below) indicating how the location of this fiber is defined. Available input patterns are MESH (when the section is referenced by a MESH200 element), and LAYN, EDGO, and BEAM (when the section is referenced by a reinforcing element).

V1, V2, V3, V4, V5 = Values to define the location of the reinforcing layer, as shown:

***PATT* : MESH**

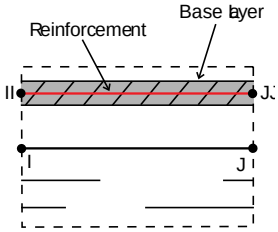
Description: The locations of reinforcing fibers are defined directly via MESH200 element connectivity.

Required input: None.



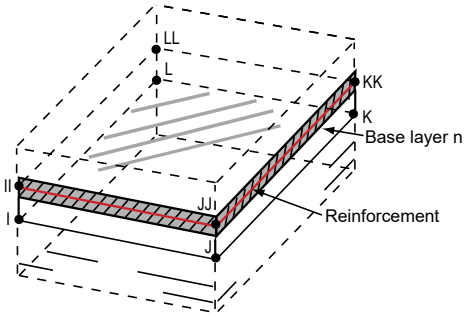
***PATT* : LAYN**

Description: The smeared reinforcing layer is placed in the middle of a layer in a layered base element.



Required input: *V1* (or *n*) -- The number of the layer in the base element on which to apply the reinforcing layer. The default value is 1.

When applied to layered solid elements:



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

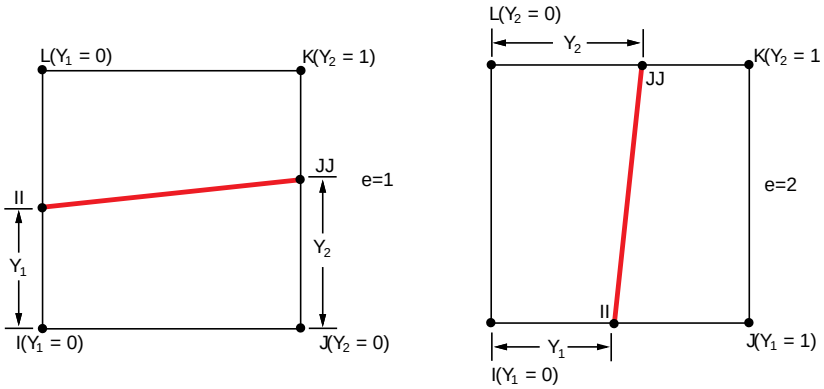
When applied to 2D axisymmetric shells:

When applied to 3D layered shells:

***PATT* : EDGO**

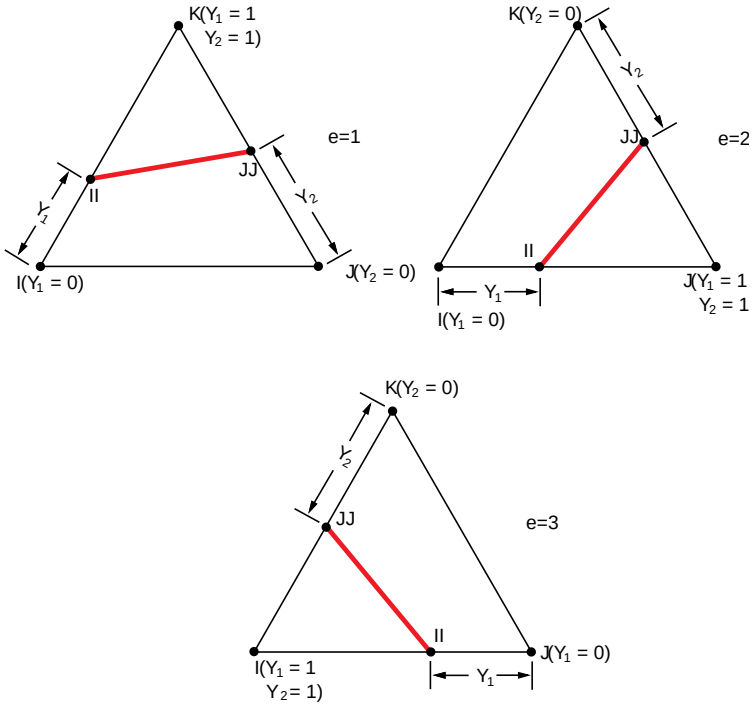
Description: This pattern applies only to 2D smeared reinforcing element REINF263. The smeared reinforcing layer is represented by a line in 2D. The orientation of the 2D smeared reinforcing layer is similar to one of the specified element edges. The fiber orientation can be further adjusted via offsets with respect to the specified element edge.

Required input:



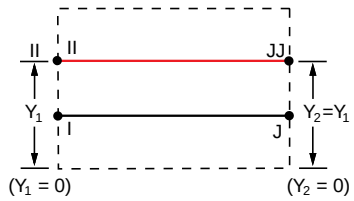
V1 (or *0*) -- The number to indicate the element edge to which the offsets are measured. The default value is 1.

V2 (or *Y1*) -- The normalized distances from the reinforcing layer to the first end of the specified element edge. Valid values for Y1 are 0.0 through 1.0. The default value for *Y1* is 0.5. *V3* (or *Z1*) input is ignored.



V4 (or *Y2*) -- The normalized distances from the reinforcing layer to the second end of the specified element edge. Valid value values for *Y2* are 0.0 through 1.0. The default value for *Y2* is *Y1*. *V4* (or *Y2*) is ignored for axisymmetric shell elements. *V5* (or *Z2* `) input is ignored.

When applied to 2D 4-node or 8-node solid elements:



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

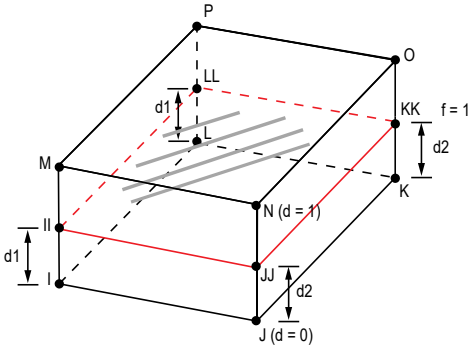
When applied to 2D 3-node or 6-node triangular solid elements:

When applied to 2-node or 3-node axisymmetric shell elements:

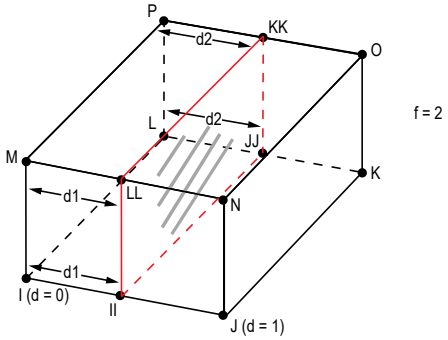
***PATT* : ELEF**

Description: The smeared reinforcing layer is oriented parallel to one of three adjacent element faces. (This pattern does not apply to 2D smeared reinforcing element REINF263.)

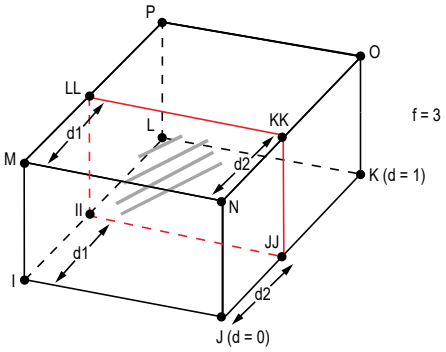
Required input:



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



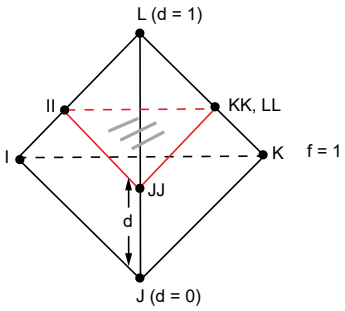
V1 (or *F*) -- The number to indicate the base element face. The default value is 1.

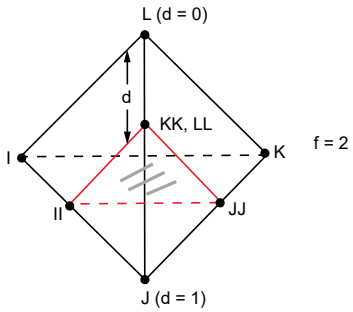


V2 (or *d1*) -- The normalized distance from the layer to the specified base element face. Valid values for *d1* are 0.0 through 1.0. The default value is 0.5.

V3 (or *d2*) -- The normalized distance from corners JJ and KK of the layer to the specified base element face (applicable to 8-node or 20-node solid elements only). Valid values for *d2* are 0.0 through 1.0. The default value is *d1*.

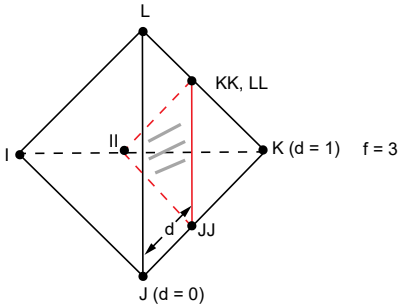
When applied to 8-node or 20-node solid elements:





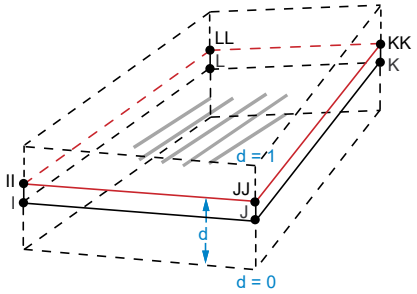
where:

d1 = distance II and LL



d2 = distance JJ and KK

When applied to tetrahedral elements:



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When applied to 3D shell elements:

Shells

Type: SHELL

Shell sections are referenced by the SHELL131, SHELL132, SHELL181, SOLID185 Layered Solid, SOLID186 Layered Solid, SOLSH190, SHELL208, SHELL209, SOLID278 Layered Solid, SOLID279 Layered Solid, and SHELL281 elements.

Data to provide in the value fields:

TK, *MAT*, *THETA*, *NUMPT*, `LayerName`

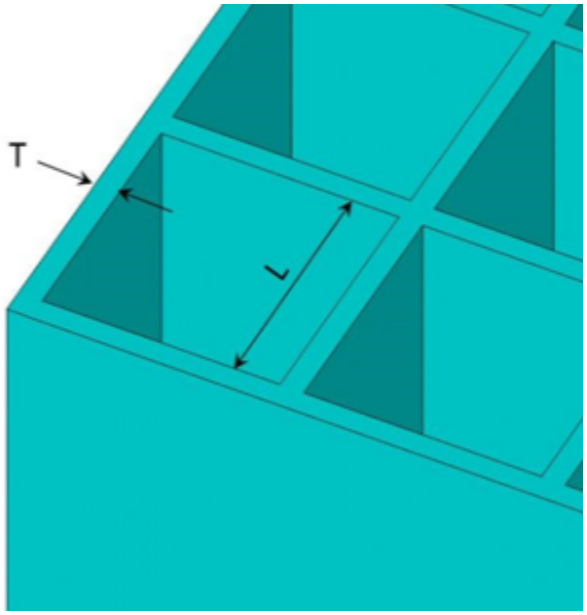
where:

TK = Thickness of shell layer. Zero thickness (not valid for SHELL131 and SHELL132) indicates a dropped layer. The sum of all layer thicknesses must be greater than zero. The total thickness can be tapered via the **SECFUNCTION (p. 1678)** command.

MAT = Material ID for layer (any current-technology material model is available for SHELL181, SOLID185 Layered Solid, SOLID186 Layered Solid, SOLSH190, SHELL208, SHELL209, SOLID278 Layered Solid and SOLID279 Layered Solid [including `UserMat`], and SHELL281). *MAT* is required for a composite (multi-layered) laminate. For a homogeneous (single-layered) shell, the default is the element material attribute. You can also address multiple reference temperatures (**TREF (p. 2013)** and/or **MP (p. 1160)**,REFT).

THETA = Angle (in degrees) of layer element coordinate system with respect to element coordinate system (ESYS).

NUMPT = Number of integration points in layer. The user interface offers 1, 3 (default), 5, 7, or 9 points; however, you can specify a higher number on the **SECDATA (p. 1655)** command. The integration rule used is Simpson's Rule. (*NUMPT* is not used by SHELL131 and SHELL132.)



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Supports

Type: SUPPORT

Support sections are referenced by SOLID185 and SOLID186 elements.

Type: SUPPORT, Subtype: BLOCK

Data to provide in the value fields for *Subtype* = BLOCK:

T, *L*

where:

T = Thickness of the block wall.

L = Spacing distance of the block walls.

Type: SUPPORT, Subtype: ASEC

Data to provide in the value fields for *Subtype* = ASEC:

Thermal	Structural
VAL1 = Multiplication factor for KXX	*VAL1* = Multiplication factor for EX
VAL2 = Multiplication factor for KYY	*VAL2* = Multiplication factor for EY
VAL3 = Multiplication factor for KZZ	*VAL3* = Multiplication factor for EZ
VAL4 = Multiplication factor for DENS	*VAL4* = Multiplication factor for GXY
	VAL5 = Multiplication factor for GYZ
	VAL6 = Multiplication factor for GXZ

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Thermal	Structural
	VAL7 = Multiplication factor for ALPX *VAL8* = Multiplication factor for DENS

The multiplication factors are homogenization factors, and in each direction reflect the ratio of the support area projected onto the area of a fully solid support.

Values default to 1.0.

Y and Z values default to X values.

GXY value defaults to EX value, GYZ to EY, and GXZ to EZ.

Taper

Type: TAPER

Tapered sections are referenced by BEAM188, BEAM189 and ELBOW290 elements. After specifying the tapered section type (**SECTYPE (p. 1697)**,,TAPER), issue separate **SECDATA (p. 1655)** commands to define each end of the tapered beam or pipe.

Data to provide in the value fields:

Sec_IDn, *XLOC*, *YLOC*, *ZLOC*

where:

Sec_IDn = Previously defined beam or pipe section at ends 1 and 2.

XLOC, *YLOC*, *ZLOC* = The location of Sec_ID*n* in the global Cartesian coordinate system.

For more information about tapered beams and pipes, including assumptions and example command input, see Defining a Tapered Beam or Pipe in the *Structural Analysis Guide*.

SECFUNCTION, *TABLE*, *PATTERN*

Specifies shell section thickness as a tabular function.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TABLE

Name of table parameter or array parameter for specifying thickness.

PATTERN

Interpretation pattern for array parameters.

Notes

The **SECFUNCTION (p. 1678)** command is associated with the section most recently defined via the **SECTYPE (p. 1697)** command.

A table parameter can define tabular thickness as a function of coordinates. Alternatively, you can use an array parameter (indexed by node number) that expresses the function to be mapped. (See *PATTERN* of NOD2 for array content.) Enclose the table or array name in percent signs (%) (**SECFUNCTION (p. 1678)**,%`tablename`%).

Issue the ***DIM (p. 530)** command to define a table or array.

The table or array defines the total shell thickness at any point in space. In multilayered sections, the total thickness and each layer thickness are scaled accordingly.

The Function Tool is a convenient way to define your thickness tables.

Refer to the ***DIM (p. 530)** command for interpreting a table in a local coordinate system.

Specifying the *PATTERN* Value

When *PATTERN* = NODE, *TABLE* should be a 1D array parameter (indexed by node number) that expresses the function to be mapped.

When *PATTERN* = NOD2, *TABLE* should be a 2D array parameter (where column 1 contains node numbers and column 2 contains the corresponding thicknesses) that expresses the function to be mapped.

Specify *PATTERN* when *TABLE* is an *array parameter* only (and not when it is a table parameter or a single value).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Sections>Shell>Lay-up>Add / Edit

SECJOINT, *DataType*, *Val1*, *Val2*, *Val3*, *Val4*, *Val5*, *Val6*

Defines local coordinate systems at joint element nodes and other data for joint elements.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DataType

The type of joint element data being defined:

LSYS

Define local coordinate systems at the nodes that form the MPC184 joint element (default).

RDOF

Define the relative degrees of freedom to be fixed for an MPC184-General joint element.

PITC

Define the pitch of an MPC184-Screw joint element.

FRIC

Define the geometric quantities required for Coulomb frictional behavior in the MPC184-Revolute, MPC184-Slot, MPC184-Translational, or MPC184-Spherical joint element.

PNLT

Define the penalty factors for the penalty-based joint element formulation.

SPWE

Define the spring-damper location for the MPC184-Spotweld joint element.

Val1, *Val2*, *Val3*, *Val4*, *Val5*, *Val6*

The values of *Val1* through *Val6* vary according to the specified *DataType*:

If *DataType* = LSYS (or blank), *Val1* and *Val2* are defined as follows:

Val1 = Local coordinate system at node I.

Val2 = Local coordinate system at node J.

(*Val3* through *Val6* are not used.)

Alternatively, a local coordinate system based on the vector from node I to node J of the joint element can be defined as follows:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Val1 = IJX (or IJY or IJZ), where:

IJX = vector from node I to node J is considered as the local X-axis at node I.

IJY = vector from node I to node J is considered as the local Y-axis at node I.

IJZ = vector from node I to node J is considered as the local Z-axis at node I.

(*Val2* through *Val6* are not used.)

A local coordinate system is constructed internally based on this vector from node I to J. The program selects the other two axes such that an orthonormal coordinate system is generated. This local coordinate system is used at both the nodes of the joint element in subsequent calculations.

If *DataType* = RDOF, *Val1* through *Val6* are the relative degrees of freedom to be fixed for a general joint element:

1 = UX

2 = UY

3 = UZ

4 = ROTX

5 = ROTY

6 = ROTZ

You can input the degrees of freedom in any order.

If *DataType* = PITC, *Val1* is the pitch of the screw joint element. The pitch is defined as the ratio of relative axial displacement (length units) to relative rotation (in radians). (*Val2* through *Val6* are not used.)

If *DataType* = FRIC, *Val1* through *Val3* are defined as follows (and *Val4* through *Val6* are not used):

For Revolute Joint:

Val1 = Outer radius

Val2 = Inner radius

Val3 = Effective length

For Translational Joint:

Val1 = Effective length

Val2 = Effective radius

For Spherical Joint:

Val1 = Effective radius

If *DataType* = PNLT, *Val1* and *Val2* are defined as follows (and *Val3* through *Val6* are not used):

Val1

Constraint type:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DISP - Displacement-based constraint

ROT - Rotation-based constraint

Val2

Scaling factor (positive number) or penalty factor (negative number) used with the penalty-based joint element formulation:

> 0 -- The number is used as a scaling factor to scale the internally calculated penalty values.

< 0 -- The absolute value of the number is used as the penalty factor in calculations.

If *DataType* = SPWE, *Val1*, *Val2*, *Val3*, and *Val4* are defined as follows:

Val1

Spring-damper location:

RATIO -- Specify only *Val2* (0 <= *Val2* <=1), indicating the spring-damper location between nodes I and J. (*Val3* through *Val6* are not used.)

COORD -- Specify *Val2*, *Val3*, and *Val4*. The values represent the global (X,Y,Z) coordinates, respectively, of the spring-damper location. (*Val5* and *Val6* are not used.)

If *Val1* is not specified, the default is RATIO with *Val2* = 0.5.

Notes

This command defines additional section data for MPC184 joint elements. The values that you input are interpreted based on the most recently issued **SECTYPE (p. 1697)** command. To overwrite current values, issue another **SECJOINT (p. 1679)** command with the same *DataType* value.

SECJOINT (p. 1679),LSYS,IJX (or IJY or IJZ) is typically used in spotweld applications. The joint element nodes should not be coincidental when this command is used. If the nodes are coincidental, the default global coordinate system applies. Specify axes to conform to the type of joint element used; otherwise, unexpected behavior may occur as the local coordinate system was not properly selected.

SECJOINT (p. 1679),PNLT applies to penalty-based joints only (KEYOPT(2) = 1 on most joint elements) and overwrites the default penalty factor. The default penalty factor (common to all constraints of the joint element) is of the order of $10*E_{avg}$, where E_{avg} is the average Young's modulus of the elements attached to the joint element or deduced from the connections to other elements. The penalty factor can affect the constraint satisfaction as well as overall solution convergence.

Defines the directory path from which to read section library files.

Notes

When the **SECREAD (p. 1693)** command is issued without a directory path, the command searches for a section library in the following order:

- The user's home directory
- The current working directory
- The path specified by the **/SECLIB (p. 1682)** command

Menu Paths

Main Menu>Preprocessor>Sections>Section Library>Library Path

SECLOCK,*dof*,*MINVALUE*,*MAXVALUE*,*dof*,*MINVALUE*,*MAXVALUE*,*dof*,*MINVALUE*,*MAXVALUE*

Specifies locks on the components of relative motion in a joint element.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

dof

Local degree of freedom to be locked.

MINVALUE

Low end of the range of allowed movement for the specified DOF.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MAXVALUE

High end of the range of allowed movement for the specified DOF.

Notes

Specify up to three degrees of freedom to be locked. Locks are activated when the limit values are reached, and further motion in that degree of freedom is frozen. If necessary, the command can be issued multiple times.

SECLOCK (p. 1682) is not available for spotweld joints.

Menu Paths

Main Menu>Preprocessor>Sections>Joints>Add / Edit

SECMODIF, *SECID*, *Keyword*

Modifies a pretension or joint section.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

If *Keyword* = NORM, command format is:

SECMODIF (p. 1683),*SECID*, NORM, *NX*, *NY*, *NZ*, *KCN*

SECID

Unique section number. This number must already be assigned to a section.

NORM

Modify the pretension section normal direction.

NX, NY, NZ

The individual normal components to modify.

KCN

Coordinate system number: 0 = global Cartesian, 1 = global cylindrical), 2 = global spherical, 4 = working plane), 5 = global Y axis cylindrical, or *n* = an arbitrary reference number assigned to a coordinate system.

If *Keyword* = NAME, the command format is:

SECMODIF (p. 1683),*SECID*, NAME, *Name*

SECID

Unique section number. This number must already be assigned to a section.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NAME

Change the name of the specified pretension section.

Name

The new name to be assigned to the pretension section.

If *Keyword* = JOIN, the command format is:

SECMODIF (p. 1683),*SECID*, JOIN, *Option*, *dispPnltVal*, *RotPnltVal*

SECID

Unique section number (which must already be assigned to a section), or unspecified. If no section number is specified, the penalty factors are applied to all joint sections associated with penalty-based joint elements only.

JOIN

Set command actions to apply to joint sections only.

Option

PNLT -- Modify penalty factors for the specified section.

dispPnltVal

Penalty value for displacement-based constraints:

> 0 -- The number is used as a scaling factor to scale the internally calculated penalty values.

< 0 -- The absolute value of the number is used as the penalty factor in calculations.

RotPnltVal

Penalty value for rotation-based constraints.

> 0 -- The number is used as a scaling factor to scale the internally calculated penalty values.

< 0 -- The absolute value of the number is used as the penalty factor in calculations.

Notes

SECMODIF (p. 1683) either modifies the normal for a specified pretension section, or changes the name of the specified pretension surface.

For joint sections associated with *penalty-based joint elements*, **SECMODIF (p. 1683)** modifies the penalty factors of a previously defined joint section.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Sections>Pretension>Modify Name

Main Menu>Preprocessor>Sections>Pretension>Modify Normal

SECNUM, *SECID*

Sets the element section attribute pointer.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SECID

Defines the section ID number to be assigned to the subsequently-defined elements. Defaults to 1. See **SECTYPE (p. 1697)** for more information about the section ID number.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh Attributes>Default Attribs

Main Menu>Preprocessor>Modeling>Create>Elements>Elem Attributes

---

SECOFFSET, *Location*, *OFFSET1*, *OFFSET2*, *CG-Y*, *CG-Z*, *SH-Y*, *SH-Z*

Defines the section offset for cross sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Location*, *OFFSET1*, *OFFSET2*, *CG-Y*, *CG-Z*, *SH-Y*, *SH-Z

The location of the nodes in the section. All are dependent on the type. See the "Notes" (p. 1685) section for information about the values for the various section types.

Notes

The **SECOFFSET (p. 1685)** command is divided into four types: Beams (p. 1686), Pipes (p. 1687), Shells (p. 1687), and Preintegrated General Shells (p. 1688).

The offsets defined by the **SECOFFSET (p. 1685)** command are associated with the section most recently defined using the **SECTYPE (p. 1697)** command. Not all **SECOFFSET (p. 1685)** location values are valid for each subtype.

For the thermal shell elements, SHELL131 and SHELL132, the node offset specified by **SECOFFSET (p. 1685)** is used in thermal contact analyses. Otherwise, the **SECOFFSET (p. 1685)** command has no effect on the solution for these elements and is used only for visualization purposes.

This command is not valid with thermal solid elements SOLID278 and SOLID279.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For beam elements BEAM188/BEAM189 and pipe elements PIPE288/PIPE289 in the XY plane, an offset is not allowed if it causes the elements to be nonsymmetric about the XY plane.

Beams

Type: BEAM

Argument data to provide:

Location, *OFFSETY*, *OFFSETZ*, *CG-Y*, *CG-Z*, *SH-Y*, *SH-Z*

Location

CENT --

Beam node will be offset to centroid (default).

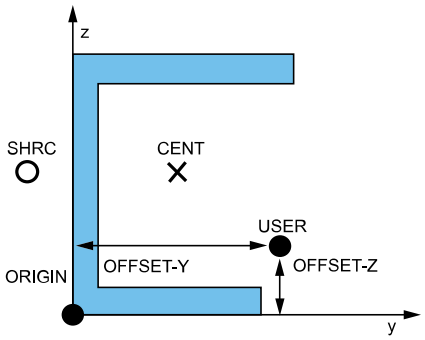
SHRC --

Beam node will be offset to shear center.

ORIGIN --

Beam node will be offset to origin of the cross section.

USER --



Beam node will be offset to the location specified by *OFFSETY* and *OFFSETZ*.

OFFSETY, OFFSETZ

Values that locate the node with respect to the default origin of the cross section when the *Location* argument is set to USER. Valid only when USER is set.

The following figure illustrates the offsets for a channel cross section, and shows the relative locations of SHRC and CENT.

Figure 15: Offsets for a CHAN Section Subtype

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CG-Y*, *CG-Z*, *SH-Y*, *SH-Z

Override the program-calculated centroid and shear centroid locations.

Note:

This option should only be used by *advanced users* modeling composite cross sections.

Pipes

Type: PIPE

Argument data to provide:

OFFSETY, *OFFSETZ*

OFFSETY*, *OFFSETZ

Values that locate the node with respect to the center of the pipe.

Shells

Type: SHELL

Argument data to provide:

Location, *OFFSET*

Location

TOP --

Shell node will be offset to top of the section.

MID --

Shell node will be offset to midplane of the section (default).

BOT --

Shell node will be offset to bottom of the section.

USER --

Shell node will be offset to the location specified by *OFFSET*.

OFFSET

Value that locates the node with respect to the default origin (midplane) of the section. Valid only when *Location* = USER.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The offset alters only the *reference surface* of the shell elements (that is, where the nodes are located). It does not change the physical dimensions of the shell itself; the volume and mass remain constant when an offset is specified.

Preintegrated General Shells

Type: GENS

Argument data to provide:

Location, *OFFSET*

Location

MID --

Shell node will be offset to midplane of the section (default).

USER --

Shell node will be offset to the location specified by *OFFSET*.

OFFSET

Value that locates the node with respect to the default origin (midplane) of the section. Valid only when *Location* = USER.

The offset alters only the *reference surface* of the shell elements (that is, where the nodes are located).

SECPLOT, *SECID*, *VAL1*, *VAL2*, *VAL3*

Plots the geometry of a beam, pipe, elbow, shell, or reinforcing section to scale.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SECID

The section ID number (as defined via the **SECTYPE (p. 1697)** command).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL1, VAL2, VAL3

Values that control the information to be plotted. See the "Notes" (p. 1689) section of this command description for more information. For clarity, the labels *VAL1*, *VAL2*, and *VAL3* are renamed according to the section type.

Notes

SECPLOT (p. 1688) is valid for "Beams and Pipes" (p. 1689), "Shells" (p. 1691), "Reinforcings" (p. 1692), and ELBOW290.

SECPLOT (p. 1688) cannot display the plot of an ASEC (arbitrary section) subtype.

Beams and Pipes

Plots the geometry of the beam or pipe section to scale depicting the centroid, shear center, and origin. **SECPLOT (p. 1688)** also lists various section properties such as *Iyy*, *Iyz*, and *Izz*.

Data to be supplied in the value fields:

MESHKEY

Beam or pipe section mesh-display options:

0 --

Display section outline only.

1 --

Display beam or pipe section mesh.

For ELBOW290, specify *ELBKEY* to display the section mesh.

2 --

Display the section mesh with cell node numbers.

For ELBOW290, display a pipe section mesh with integration station numbers when *ELBKEY* is specified. (If internal fluid and insulation are not defined, this option works the same as specifying *MESHKEY* = 6 for ELBOW290.)

3 --

Display the section mesh with cell numbers.

For ELBOW290, display a pipe section mesh with layer numbers when *ELBKEY* is specified.

4 --

Display the section mesh with material numbers and colors.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5 --

Display the section mesh with material colors only.

6 --

Display the section mesh with the RST node numbers or RST location numbers. RST nodes are section corner nodes where results are available. This option applies when the averaged results format (KEYOPT(15) = 0 for BEAM188, BEAM189, PIPE288, and PIPE289) is used.

For ELBOW290, RST location numbers are selected section-integration station numbers (where results are available). The numbers may vary based on *ELBKEY*.

7 --

Display the section mesh with the RST cell numbers or RST layer numbers. RST cells are section cells where results are available. This is applicable when the non-averaged results format (KEYOPT(15) = 1 for BEAM188, BEAM189, PIPE288, and PIPE289) is used.

For ELBOW290, RST layer numbers are section layers (where results are available).

Options 2 through 7 do not depict centroid and shear center, nor do they list section properties.

ELBKEY

Additional pipe-section mesh-display options for ELBOW290:

(Blank) --

Display as a standard pipe section.

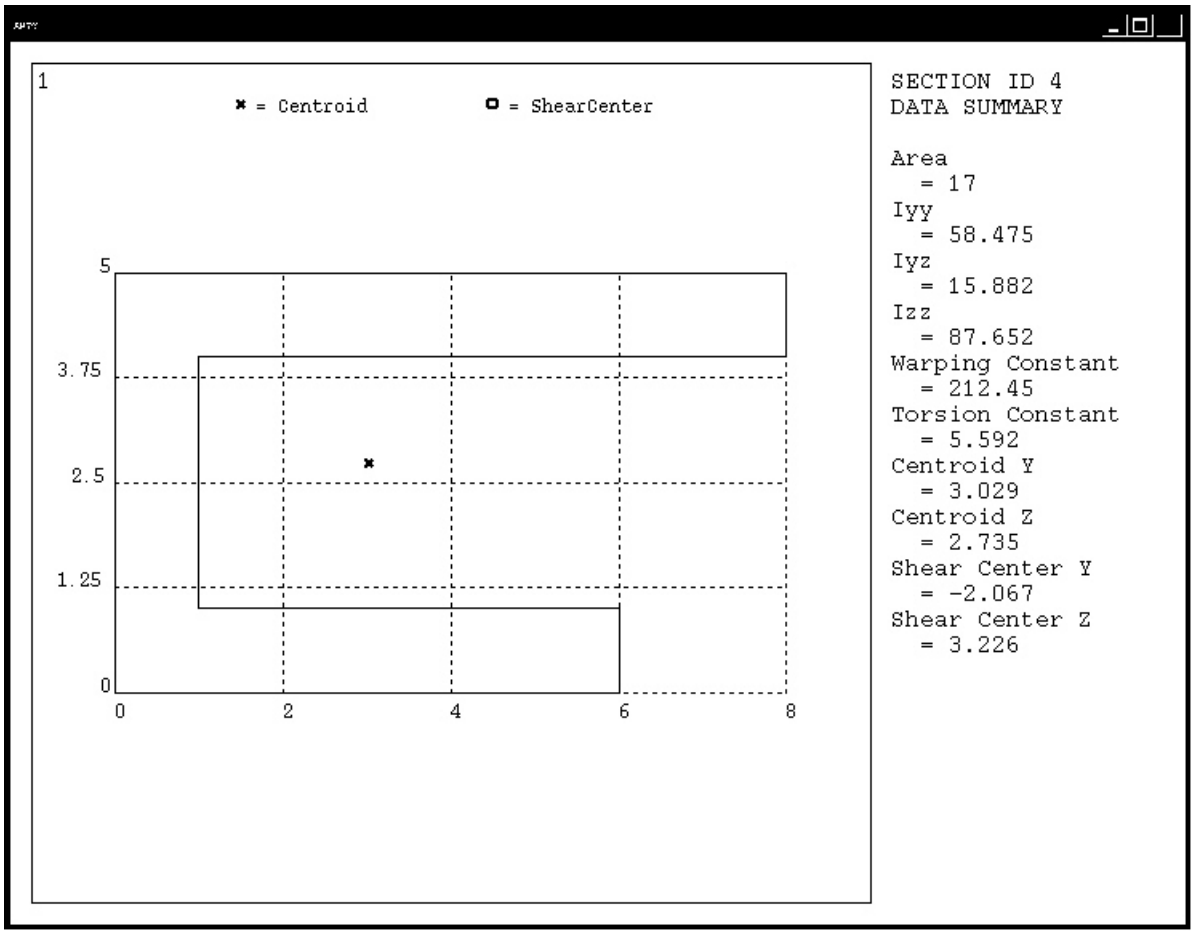
0 --

Display the section mesh for the option to save the results at the bottom of the bottom layer and the top of the top layer.

1 --

Display the section mesh for the option to save the results at the top and bottom surfaces of each layer.

2 --



Display the section mesh for the option to save the results at the top, bottom, and mid-side surfaces of each layer.

When *ELBKEY* is specified, the display for *MESHKEY* = 2 or 6 changes with respect to the *ELBKEY* value. The display for MESHKEY = 0, 1, 3, 4, 5, or 7 is the same regardless of the *ELBKEY* value.

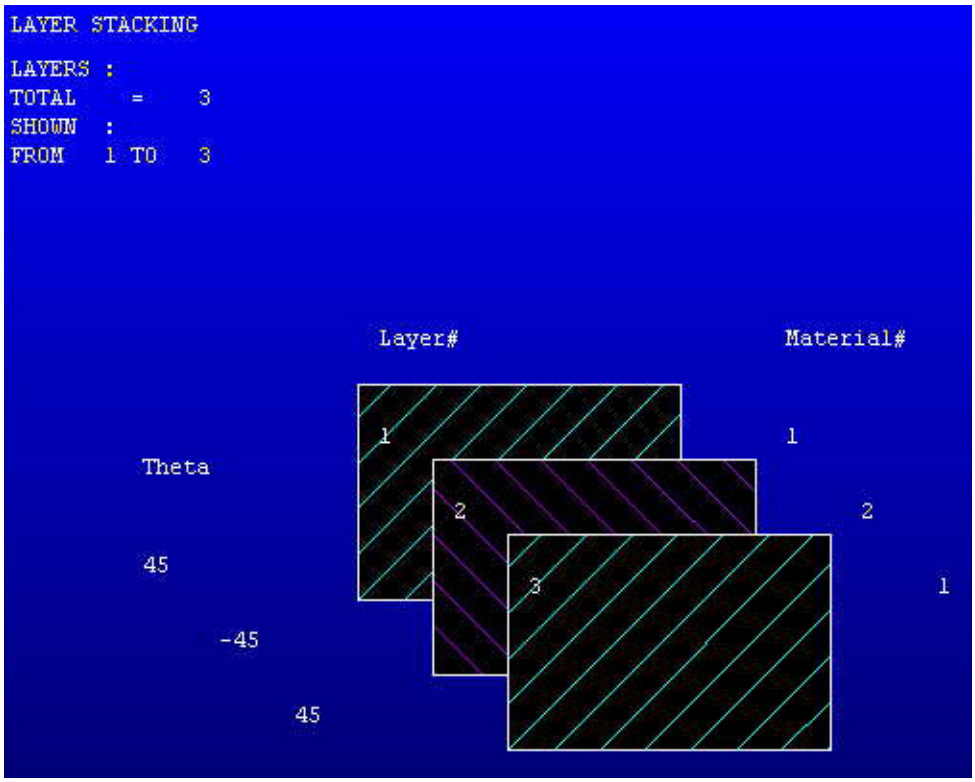
The specified *ELBKEY* must be appropriate for the selected ELBOW290 layer-data storage option (KEYOPT(8)).

Following is a sample section plot for the beam section type:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Shells

Plots the layer arrangement of the shell section showing the layer material and orientation.



Data to be supplied in the value fields:

LAYR1, LAYR2

The range of layer numbers to be displayed. If *LAYR1* is greater than *LAYR2*, a reversed order display is produced. Up to 20 layers may be displayed at the same time. *LAYR1* defaults to 1. *LAYR2* defaults to *LAYR1* if *LAYR1* is input or to the number of layers (or to 19+*LAYR1*, if smaller) if *LAYR1* is not input.

Following is a sample section plot for the shell section type:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

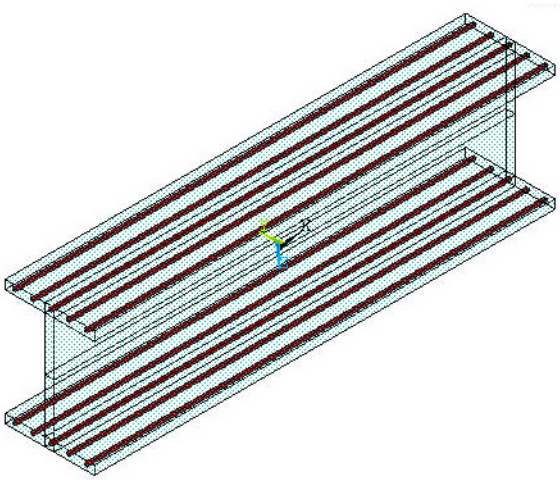
Reinforcings

Plots the arrangement of a reinforcing (p. 1665) section within the base element.

Data to be supplied in the value fields:

REINF1, REINF2, OVERLAY

REINF1, REINF2 -- The numerical range of reinforcings to be displayed. The default *REINF1* value is 1. The default *REINF2* value is the number of reinforcings.



OVERLAY -- The section ID of the base element within which to display the reinforcing section. The section appears translucent and the reinforcing section is solid. Valid values are:

- SOLID -- Display a translucent solid block over the reinforcing section
- *SECID* -- A number corresponding to a specific section ID of the base element.

If no *OVERLAY* value is specified, the program displays the reinforcing section only.

Following is a sample section plot for the reinforcing section type:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For more information about reinforcing, see the documentation for the **SECDATA (p. 1655)** command, and the REINF264 and REINF265 elements.

Main Menu>Preprocessor>Sections>Reinforcing>Plot Section

Main Menu>Preprocessor>Sections>Shell>Lay-up>Plot Section

SECREAD,*Fname*,*Ext*,--,*Option*

Reads a custom section library or a user-defined section mesh into Mechanical APDL.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

Section library file name and directory path containing the section library file (248 characters maximum, including directory). If you do not specify a directory path, it will default to your working directory and you can use all 248 characters for the file name.

When the **SECREAD (p. 1693)** command is given without a directory path, the command searches for a section library in the following order:

- The user's home directory
- The current working directory
- The path specified by the **/SECLIB (p. 1682)** command

The file name defaults to Jobname if *Fname* is left blank.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ext

Filename extension (eight-character maximum).

The extension defaults to SECT if *Ext* is left blank.

--

Unused field.

Option

LIBRARY

Reads in a library of sections and their associated section data values; the default. A section library may be created by editing the section-defining portions of the `Jobname.log` file and saving it with a `.sect` suffix.

MESH

Reads in a user mesh section file containing the cell connectivity, cell flags, and nodal coordinates for the current beam section of subtype MESH as defined by **SECTYPE (p. 1697)**. See the "Notes" (p. 1694) section of this command description for details about user mesh section files. **SECWRITE (p. 1703)** builds mesh files based on 2D models you create.

Notes

The **SECREAD (p. 1693)** command operates on the section specified via the most recently issued **SECTYPE** command. Issue a separate **SECREAD (p. 1693)** command for each section ID that you want to read in.

Sample User Section Cell Mesh File

Here are excerpts from a sample user section mesh file for a section with 75 nodes, 13 cells, and 9 nodes per cell for a two-hole box section. Illustrations of the two-hole box section and the cell mesh for it appear later in this command description.

First Line:

```
75   13
```

Cells Section:

```
      1   3   25   23   2   14   24   12   13   1
      3   5   27   25   4   16   26   14   15   1
      5   7   29   27   6   18   28   16   17   1
      7   9   31   29   8   20   30   18   19   1
      9   11  33   31   10  22   32   20   21   1
      23  25  45   43   24  36   44   34   35   1
...
      49  51  73   71   50  62   72   60   61   1
      51  53  75   73   52  64   74   62   63   1
0     0.0          0.0
0     0.025        0.0
0     0.05         0.0
0     5.0175       0.0
```

Nodes Section:

```
...
0    19.98        10.00
0    20.00        10.00
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The mesh file is divided into three sections: the First Line, the Cells Section, and the Nodes Section. Here are brief descriptions of the contents of each.

First Line: The First Line defines the number of nodes and the number of cells for the mesh.

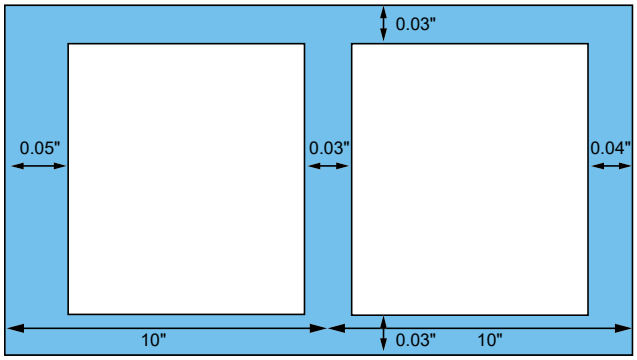
Cells Section: The Cells Section contains as many lines as there are cells. In this example, there are thirteen cells, so there are thirteen lines in this section. In each line, the number "1" that follows the cell connectivity information is the material number.

Cell nodal connectivity must be given in a counterclockwise direction, with the center node being the ninth node. For details, see Figure 17: Cell Mesh for the Two-hole Box Section (p. 1695).

Nodes Section: The Nodes Section contains as many lines as there are nodes. In this example, there are 75 nodes, so there are a total of 75 lines in this section. Each node line contains the node's boundary flag, the Y coordinate of the node, and the Z coordinate of the node. Currently, all node boundary flags appear as 0s in a cell mesh file (as illustrated in Figure 16: Two-hole Box Section (p. 1695)). Since all node boundary flags are 0, **SECREAD (p. 1693)** ignores them when it reads a cell mesh file into Mechanical APDL.

There cannot be any gaps in the node numbering of a cell mesh. The nodes in a cell mesh must be numbered consecutively, with the first node having a node number of 1, and the last node having a node number that is equal to the maximum number of nodes in the cell mesh.

Figure 16: Two-hole Box Section



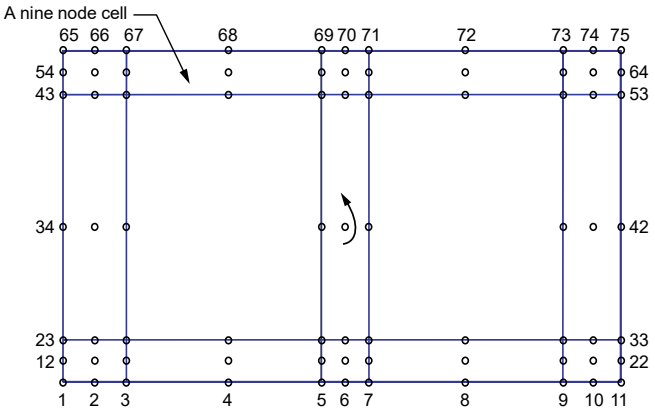


Figure 17: Cell Mesh for the Two-hole Box Section

Main Menu>Preprocessor>Sections>Section Library>Import Library

---

SECSTOP,*dof*,*MINVALUE*,*MAXVALUE*,*dof*,*MINVALUE*,*MAXVALUE*,*dof*,*MINVALUE*,*MAXVALUE*

Specifies stops on the components of relative motion in a joint element.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

dof

Local degree of freedom to be stopped.

MINVALUE

Low end of the range of allowed movement for the specified degree of freedom.

MAXVALUE

High end of the range of allowed movement for the specified degree of freedom.

Notes

Restricts motion in a degree of freedom. Motion beyond the *MINVALUE* or *MAXVALUE* is prevented. (Motion away from a limit is allowed.) You can specify up to three stops. If necessary, you can issue the command multiple times.

SECSTOP (p. 1696) is not available for spotweld joints.

Menu Paths

Main Menu>Preprocessor>Sections>Joints>Add / Edit

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SECTYPE, *SECID*, *Type*, *Subtype*, *Name*, *REFINEKEY*

Associates section type information with a section ID number.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 1702)

SECID

Section identification number. If *SECID* is blank or zero, the *SECID* number is incremented by one from the highest section ID number currently defined in the database. (See Notes (p. 1701) for *SECID* input specific to general contact.)

Type

AXIS

Define the axis for a general axisymmetric section.

BEAM

Defines a beam section. This option has a *Subtype*.

COMB

Defines a composite (temperature-dependent) beam section. This option has a *Subtype*.

CONTACT

Defines a contact section. This option has a *Subtype*.

GENB

Defines a nonlinear general (temperature-dependent) beam section. This option has a *Subtype*.

GENS

Defines a preintegrated general (temperature-dependent) shell section.

JOINT

Defines a joint section. This option has a *Subtype*.

LINK

Defines a link section.

PIPE

Defines a pipe section.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PRETENSION

Defines a pretension section.

REINF

Defines a reinforcing section. This option has a *Subtype*.

SHELL

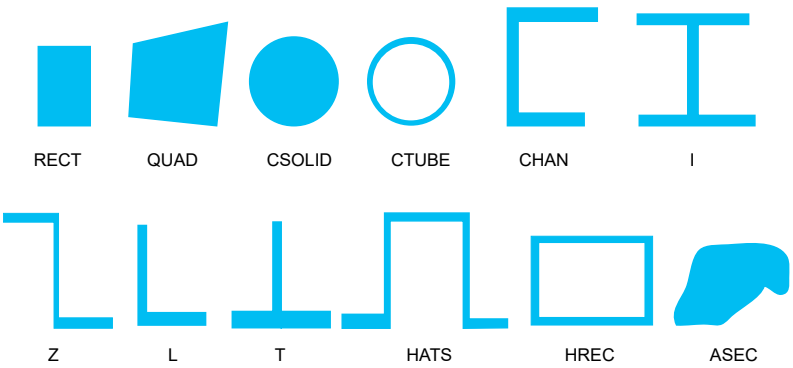
Defines a shell section.

SUPPORT

Additive manufacturing support. This option has a *Subtype*.

TAPER

Defines a tapered beam or pipe section. The sections at the end points must be topologically identical.



Subtype

When *Type* = BEAM, the possible beam sections that can be defined for *Subtype* are:

RECT	Rectangle
QUAD	Quadrilateral
CSOLID	Circular solid
CTUBE	Circular tube
CHAN	Channel
I	I-shaped section
Z	Z-shaped section
L	L-shaped section
T	T-shaped section
HATS	Hat-shaped section
HREC	Hollow rectangle or box
ASEC	Arbitrary section -- integrated cross-section inertia properties supplied by user
MESH	User-defined mesh -- see the **SECREAD (p. 1693)** command for more information about this data

The following figure shows the shape of each cross section subtype:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When *Type* = COMB, the only possible composite-beam section that can be defined for *Subtype* is:

MATRIX	Matrix.

When *Type* = CONTACT, the possible contact sections that can be defined for *Subtype* are:

CIRCLE	Geometry correction for a portion of a circle (or nearly a circle).
SPHERE	Geometry correction for a portion of a spherical (or nearly spherical) surface.
CYLINDER	Geometry correction for a portion of a revolute (or nearly revolute) surface.
NORMAL	Geometry correction to specify a user-defined contact surface normal.
BOLT	Geometry correction for a bolt thread surface.
RADIUS	Equivalent beam/edge radius for 3D beam-to-beam or 3D edge-to-edge contact in a general contact definition; or radii associated with rigid target segments in a general contact definition.

When *Type* = GENB, the possible nonlinear general beam sections that can be defined for *Subtype* are:

ELASTIC	The generalized-stress/generalized-strain relationship is elastic (linear or nonlinear).
PLASTIC	The generalized-stress/generalized-strain relationship is elastoplastic (and allows for permanent deformation).

When *Type* = JOINT, the possible joint sections that can be defined for *Subtype* are:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UNIV	Universal joint
REVO	Revolute joint
SLOT	3D Slot joint
PINP	Point-in-plane joint
PRIS	Translational joint
CYLI	Cylindrical joint
PLAN	Planar joint
WELD	Weld joint
ORIE	Orient joint
SPHE	Spherical joint
GENE	General joint
SCRE	Screw joint

When *Type* = REINF, the possible reinforcing sections that can be defined for *Subtype* are:

DISC	Discrete reinforcing. The reinforcing fibers are arbitrarily oriented and modeled individually.
SMEAR	Smeared reinforcing. The reinforcing fibers are homogeneous and defined as a membrane.
GCON	General connection reinforcing. This subtype is generated by **EEMBED (p. 595)** for REINF265 elements when using those elements to model the interior interfaces between embedded elements and base elements. You can expose this subtype (**SLIST (p. 1795)**) but cannot manually specify or modify it.

When *Type* = SUPPORT, the possible support sections that can be defined for *Subtype* are:

BLOCK	Block support structure.
ASEC	User-provided factors.

Name

An eight-character name for the section. *Name* can be a string such as "W36X210" or "HP13X73" for beam sections. Section name can consist of letters and numbers, but cannot contain punctuation, special characters, or spaces.

REFINEKEY

Sets mesh refinement level for thin-walled beam sections. Valid values are 0 (the default - no mesh refinement) through 5 (high level of mesh refinement). This value has meaning only when *Type* = BEAM.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

SECTYPE (p. 1697) sets the section ID number, section type, and subtype for a section. A previously-defined section with the same identification number will be redefined. The geometry data describing this section type is defined by a subsequent **SECDATA (p. 1655)** command. Define the offsets (if applicable) by a subsequent **SECOFFSET (p. 1685)** command. The **SLIST (p. 1795)** command lists the section properties, and the **SECPLOT (p. 1688)** command displays the section to scale. The **SECNUM (p. 1685)** command assigns the section ID number to any subsequently-defined elements.

When defining a section for contact elements (*Type* = CONTACT) that are used in a general contact definition, a section number representing a general contact surface can be specified. Alternatively, you may define a subset of a region by inputting a valid label for *SECID* (ALL_EDGE, ALL_FACE, ALL_VERT, ALL_TOP,or ALL_BOT), or by inputting a node component name with or without a component name extension (_EDGE, _FACE, _VERT, _TOP, or _BOT). For more information, see Applying Surface Geometry Correction in the *Contact Technology Guide*.

Beam Section Considerations

For a beam section (*Type* = BEAM), a subsequent **SECDATA (p. 1655)** command builds a numeric model using a nine-node cell for determining the properties (*Ixx*, *Iyy*, etc.) of the section and for the solution to the Poisson's equation for torsional behavior. See Beam Analysis and Cross Sections in the *Structural Analysis Guide* for examples using the section commands.

For a nonlinear general beam section (*Type* = GENB), the *Subtype* and *REFINEKEY* options do not apply. Subsequent commands are necessary to define the section: **BSAX (p. 271)**, **BSM1 (p. 273)**, **BSM2 (p. 274)**, **BSTQ (p. 278)**, **BSS1 (p. 276)**, **BSS2 (p. 277)**, **BSMD (p. 272)**, and **BSTE (p. 278)** are available. All other section commands are ignored for this section type.

For a preintegrated composite-beam section (*Type* = COMB), the *REFINEKEY* options do not apply. Subsequent commands are necessary to define the section: **CBTMP (p. 290)**, **CBMX (p. 288)**, **CBMD (p. 287)**, and **CBTE (p. 289)** are available. All other section commands are ignored for this section type.

Tapered Section Considerations

For a tapered beam or pipe section (*Type* = TAPER), two subsequent **SECDATA (p. 1655)** commands are required (one for each end section). Section ends must be topologically identical (same *Subtype*, number of cells and material IDs). For a tapered pipe section, end sections must have the same number of cells around the circumference and along the pipe wall, and the same shell section ID for a composite pipe wall.

Shell Section Considerations

For a preintegrated general shell section (*Type* = GENS), the *Subtype* and *REFINEKEY* options do not apply. Subsequent commands are necessary to define the section: **SSPA (p. 1851)**, **SSPB (p. 1852)**, **SSPD (p. 1853)**, **SSPE (p. 1854)**, **SSMT (p. 1849)**, **SSBT (p. 1846)**, and **SSPM (p. 1855)** are available. All other section commands are ignored for this section type.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Pretension Section Considerations

The PRETENSION section options of the **SECTYPE (p. 1697)** and **SECDATA (p. 1655)** commands are documented primarily to aid your understanding of the data written by the **CDWRITE (p. 293)** command. Ansys, Inc. recommends that you generate pretension sections via the **PSMESH (p. 1543)** command.

Reinforcing Section Considerations

For a reinforcing section (*Type* = REINF), each subsequent **SECDATA (p. 1655)** command defines the material, geometry, and orientation of one discrete reinforcing fiber (*Subtype* = DISC) or one smeared reinforcing surface (*Subtype* = SMEAR). When referenced by a MESH200 element, only one **SECDATA (p. 1655)** command is valid.

Support Section Considerations

A subsequent **SECDATA (p. 1655)** command defines the geometry data describing this section type.

Displaying Elements with Section Definition

To display elements with shapes determined from the section definition, issue the **/ESHAPE (p. 665)** command.

Product Restrictions

Ansys Mechanical Pro

SECTYPE (p. 1697),COMB is not valid.

SECWRITE, *Fname*, *Ext*, --, *ELEM_TYPE*

Creates an ASCII file containing user mesh section information.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname if *Fname* is left blank.

Ext

Filename extension (eight-character maximum).

The extension defaults to SECT if *Ext* is left blank.

--

Unused field.

ELEM_TYPE

Element type attribute pointer (**ET (p. 686)**) for the elements that are part of the section. See **SECREAD (p. 1693)** for a detailed description.

Notes

Before creating a user mesh file, first create a model using 2D meshing. Use PLANE183 or MESH200 with KEYOPT(1) = 7 (quadrilateral with 8 nodes option) to model the cells. **SECWRITE (p. 1703)** creates an ASCII file that contains information about the nodes and cells that describe a beam section. For detailed information on how to create a user mesh file, see Creating Custom Cross Sections with a User-defined Mesh in the *Structural Analysis Guide*.

Menu Paths

Main Menu>Preprocessor>Sections>Beam>Custom Sections>Write From Areas

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SED, *SEDX*, *SEDY*, *SEDZ*, *Cname*

Defines the excitation direction for response spectrum and PSD analyses.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SEDX*, *SEDY*, *SEDZ

Global Cartesian coordinates of a point that defines a line (through the origin) corresponding to the excitation direction. For example: 0.0, 1.0, 0.0 defines global Y as the spectrum direction.

Cname

The component name corresponding to the group of excited nodes. Only applies to base excitation multi-point response spectrum analysis (**SPOPT (p. 1837)**, MPRS) and power spectral density analysis (**SPOPT (p. 1837)**, PSD). Defaults to no component.

Notes

In single-point response spectrum analysis (**SPOPT (p. 1837)**,SPRS), the excitation direction without rocking (**ROCK (p. 1614)**) is normalized to one so that the *SEDX*, *SEDY*, and *SEDZ* values do not scale the spectrum. The excitation direction with rocking is not normalized. The *SEDX*, *SEDY*, and *SEDZ* values must be consistent with the linear components of *OMX*, *OMY*, and *OMZ* values on the **ROCK (p. 1614)** command. The calculated direction then scales the spectrum. For more information, see Participation Factors and Mode Coefficients.

In multi-point response spectrum analysis (**SPOPT (p. 1837)**,MPRS) and power spectral density analysis (**SPOPT (p. 1837)**,PSD), the excitation direction is normalized to one so that the *SEDX*, *SEDY*, and *SEDZ* values do not scale the spectrum. The component name (*Cname*) is required. The constraints corresponding to the excitation direction are applied to the component nodes.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SEDLIST, *Sename*, *KOPT*

Lists the DOF solution of a superelement after the use pass.

PREP7 (p. 22): Superelements (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Sename

Name of the superelement in `Jobname.dsub` to be listed. If a number, it is the element number of the superelement as used in the use pass. If ALL, list results for all superelements.

KOPT

List key:

0

List summary data only.

1

List full contents. Be aware that the listing may be extensive.

Notes

Lists the degree of freedom solution of a superelement after the substructure use pass. Results may be listed for any superelement on `File.dsub`.

This command is valid in any processor.

Menu Paths

Main Menu>General Postproc>List Results>Superelem DOF

Utility Menu>List>Results>Superelem DOF Solu

SEEXP, *Sename*, *Usefil*, *Imagky*, *Expopt*

Specifies options for the substructure expansion pass.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Sename

The name (case-sensitive) of the superelement matrix file created by the substructure generation pass (*Sename* .SUB). Defaults to the initial jobname `File`. If a number, it is the element number of the superelement as used in the use pass.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Usefil

The name of the file containing the superelement degree-of-freedom (DOF) solution created by the substructure use pass (*Usefil*.DSUB).

Imagky

Key to specify use of the imaginary component of the DOF solution. Applicable only if the use pass is a harmonic (**ANTYPE (p. 162)**,HARMIC) analysis:

OFF

Use real component of DOF solution (default).

ON

Use imaginary component of DOF solution.

Note:

If all solutions are to be expanded (**NUMEXP (p. 1293)**,ALL), *Imagky* is ignored and both the real and imaginary solutions are expanded.

Expopt

Key to specify whether the superelement (**ANTYPE (p. 162)**,SUBSTR) expansion pass (**EXPASS (p. 714)**,ON) should transform the geometry:

OFF

Do not transform node or element locations (default).

ON

Transform node or element locations in the FE geometry record of the .rst results file.

Notes

Specifies options for the expansion pass of the substructure analysis (**ANTYPE (p. 162)**,SUBSTR). If used in SOLUTION, this command is valid only within the first load step.

If you specify geometry transformation (*Expopt* = ON), you must retrieve the transformation matrix (if it exists) from the specified .SUB file. The command updates the nodal X, Y, and Z coordinates to represent the transformed node locations. The *Expopt* option is useful when you want to expand superelements created from other superelements (via **SETRAN (p. 1730)** or **SESYMM (p. 1718)** commands). For more information, see Superelement Expansion in Transformed Locations and Plotting or Printing Mode Shapes.

This command is also valid in **/PREP7 (p. 1479)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>ExpansionPass>Single Expand>Expand Superelem

Main Menu>Solution>Load Step Opts>ExpansionPass>Single Expand>Expand Superelem

---

/SEG, *Label*, *Aviname*, *DELAY*

Allows graphics data to be stored in the local terminal memory.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Storage key:

SINGL

Store subsequent display in a single segment (overwrites last storage).

MULTI

Store subsequent displays in unique segments (**ANIM (p. 142)**).

DELET

Delete all currently stored segments.

OFF

Stop storing display data in segments.

STAT

Display segment status.

PC

This option only applies to PC versions of Mechanical APDL and only when animating via the AVI movie player (**/DEVICE (p. 523)**,ANIM,2). The command appends frames to the `File.avi`, so that the animation goes in both directions (that is, forward--backward--forward). You must have a current animation file to use this option.

Aviname

Name of the animation file that will be created when each frame is saved. The `.avi` extension is applied automatically. Defaults to `Jobname.avi` if no filename is specified.

DELAY

Delay factor between each frame, in seconds. Defaults to 0.015 seconds if no value is specified.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

No segment storage.

Notes

Allows graphics data to be stored in the terminal local memory (device-dependent). Storage occurs concurrently with the display.

Although the information from your graphics window is stored as an individual segment, you cannot plot directly (**GPLOT (p. 866)**) from the segment memory.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Redirect Plots>Delete Segments

Utility Menu>PlotCtrls>Redirect Plots>Segment Status

Utility Menu>PlotCtrls>Redirect Plots>To Segment Memory

SELIST, *Sename*, *KOPT*, *KINT*

Lists the contents of a superelement matrix file.

PREP7 (p. 22): Superelements (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Sename

The name (case-sensitive) of the superelement matrix file created by the substructure generation pass (*Sename* . SUB). Defaults to the current Jobname. If a number, it is the element number of the superelement as used in the use pass.

KOPT

List key:

0

List summary data only.

1

List contents, except load vectors and matrices.

2

List contents, except matrices.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3

List full contents. Be aware that the listing may be extensive.

KINT

Integer printout format key:

OFF

Default.

ON

Long format for large integers.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>List>Other>Superelem Data

SELM

Specifies "Superelements" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Superelements

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SELTOL, *Toler*

Sets the tolerance for subsequent select operations.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Toler

Tolerance value. If blank, restores the default tolerance logic.

Notes

For selects based on non-integer numbers (e.g. coordinates, results, etc.), items within the range VMIN - *Toler* and VMAX + *Toler* are selected, where VMIN and VMAX are the range values input on the xSEL commands (**ASEL (p. 192)** (p. 192), **ESEL (p. 661)** (p. 661), **KSEL (p. 995)** (p. 995), **LSEL (p. 1074)** (p. 1074), **NSEL (p. 1266)** (p. 1266), and **VSEL (p. 2163)** (p. 2163)).

The default tolerance logic is based on the relative values of VMIN and VMAX as follows:

- If VMIN = VMAX, *Toler* = 0.005 x VMIN.
- If VMIN = VMAX = 0.0, *Toler* = 1.0E-6.
- If VMAX ≠ VMIN, *Toler* = 1.0E-8 x (VMAX-VMIN).

This command is typically used when VMAX-VMIN is very large so that the computed default tolerance is therefore large and the xSEL commands selects more than what is desired.

Toler remains active until respecified by a subsequent **SELTOL (p. 1710)** command. A **SELTOL (p. 1710)** < blank > resets back to the default *Toler* logic.

Menu Paths

This command cannot be accessed from a menu.

SEMIIMPLICIT, *Option*, *Type*, *Value*

Specifies parameters for a semi-implicit solution.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Option to be performed:

ETOI

Criterion for transitioning from the semi-implicit solution phase to the implicit solution phase.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MSCA

Selective mass scaling factor used during the semi-implicit solution phase.

SFAC

Safety factor for time incrementation used during the semi-implicit solution phase.

AUTS

Automatic time stepping and bisection controls used during the semi-implicit solution phase.

BVIS

Bulk viscosity controls used during the semi-implicit solution phase.

EFRQ

Output and restart file frequency used during the semi-implicit solution phase.

Type

Additional input; varies depending on the *Option* value. See table below.

Value

Additional input; varies depending on the *Option* and *Type* values. See table below.

Option **Label**	***Type*** **=**	***Value*** **=**
ETOI	TIME - Time to spend in the semi-implicit phase (default)	Time value (defaults to the minimum time increment specified in the implicit run)
MSCA	DTIM - Initial minimum stable time increment	Time increment; defaults to (1e-4)*(total step time) [1]
	MASS - Selective mass scaling factor	Scaling factor
SFAC	(not used)	Safety factor (defaults to 0.9)
AUTS	DSPL - Automatic time stepping and bisections control based on displacement (default for all analysis types except static)	Maximum allowable jump in the maximum displacement increment between two substeps at which bisection will be triggered (defaults to 100)
	ENER - Automatic time stepping and bisections control based on energy (default for static analysis)	Maximum allowable ratio of kinetic energy to potential energy at which bisectionn will be triggered (defaults to 100). For bisection to trigger, the potential energy

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Option Label	*Type* =	*Value* =
		should be more than the program calculated reference value
BVIS	LBVD - Linear bulk viscosity damping factor	Damping factor (defaults to 1.5)
	QBVD - Quadratic bulk viscosity damping factor	Damping factor (defaults to 0.06)
	RBVD - Rotational bulk viscosity damping factor	Damping factor (defaults to 0.06)
	LIMI - Bulk viscosity force upper limit	Upper limit percentage (general default is 0.05; for PLANE182 and SOLID185 with reduced integration, the default is 0.01)
	NONE - Bulk viscosity is not included	(not used)
EFRQ	OUTR - Solution output frequency (overwrites *Freq* value on **OUTRES (p. 1336)**). **SEMIIMPLICIT (p. 1710)**,EFRQ,OUTR must be issued after **OUTRES (p. 1336)**.	Frequency value (defaults to 100) [2]
	RESC - Frequency for writing restart files (overwrites *Frequency* value on **RESCONTROL (p. 1592)**). **SEMIIMPLICIT (p. 1710)**,EFRQ,RESC must be issued after **RESCONTROL (p. 1592)**.	Frequency value (defaults to 100) [2]

1. The default time increment (1e-4)*(total step time) is based on the total step time for the load step in which the solution transitions to the semi-implicit phase.

2. The frequencies specified by *Option* = EFRQ are based on *all* substeps, starting from the beginning of the analysis and spanning both the implicit and semi-implicit solution phases. For example, during the semi-implicit solution phase results are written for any substep that is divisible by the specified OUTR value.

Command Default

By default, the semi-implicit method is not used.

If the **SEMIIMPLICIT (p. 1710)** command is issued with no arguments specified, the semi-implicit scheme is activated with the following defaults:

The safety factor for time incrementation = 0.9.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The selective mass scaling factor is set such that the initial stable time increment in the semi-implicit phase is (1e-4)*(total step time).

For most analysis types, bisection is triggered if the maximum displacement increment increases more than 100 times that of the previous substep.

In a static analysis, bisection is triggered if the kinetic energy is more than 100 times the potential energy and the potential energy is more than the program calculated reference value.

Bulk viscosity is included.

The frequency at which the results file and restart files are written during the semi-implicit phase is every 100 substeps.

Notes

This command triggers a semi-implicit solution scheme in which the analysis transitions to a semi-implicit solution method when the implicit solution method fails to converge. The command is valid only in the solution processor (**/SOLU (p. 1821)**) and must be defined before the first **SOLVE (p. 1822)** command.

The **SEMIIMPLICIT (p. 1710)** command can be used in a restart, even if the base analysis did not include the command. Therefore, a problem that failed in the implicit analysis can be restarted with this command so that it can transition to the semi-implicit method and solve further.

The **SEMIIMPLICIT (p. 1710)** command can overwrite the values on some commands, as described in the following table.

Commands Affected by **SEMIIMPLICIT (p. 1710)**	Behavior
NSUBST (p. 1287) and **DELTIM (p. 515)**	During the semi-implicit solution phase, the time incrementation does not follow that set by the **NSUBST (p. 1287)** and **DELTIM (p. 515)** commands.
ETCONTROL (p. 701)	If the **SEMIIMPLICIT (p. 1710)** command is issued, the **ETCONTROL (p. 701)** command is ignored.
OUTRES (p. 1336)	During the semi-implicit solution phase, the frequency for writing results specified by the **OUTRES (p. 1336)** command is ignored, unless a negative number was specified on **OUTRES (p. 1336)**.
RESCONTROL (p. 1592)	During the semi-implicit solution phase, the restart file writing frequency specified by the **RESCONTROL (p. 1592)** command is ignored, unless a negative number was specified on **RESCONTROL (p. 1592)**.
AUTOTS (p. 207)	During the semi-implicit solution phase, automatic time incrementation is on, irrespective of what was specified on **AUTOTS (p. 207)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CUTCONTROL (p. 445)	During the semi-implicit solution phase, the **CUTCONTROL (p. 445)** command is ignored.

Menu Paths

This command cannot be accessed from a menu.

SENERGY, *OPT*, *ANTYPE*

Determines the stored magnetic energy or co-energy.

POST1 (p. 51): Magnetics Calculations (p. 55)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

OPT

Item to be calculated:

0

Stored magnetic energy.

1

Stored magnetic co-energy.

ANTYPE

Analysis type:

0

Static or transient.

1

Harmonic.

Notes

SENERGY (p. 1714) invokes a Mechanical APDL macro which calculates the stored magnetic energy or co-energy for all selected elements. (For a harmonic analysis, the macro calculates a time-averaged (rms) stored energy.)

A summary table listing the energy by material number is generated. The energy density is also calculated and stored on a per-element basis in the element table (**ETABLE (p. 687)**) with the label MG_ENG (energy density) or MG_COENG (co-energy density). The macro erases all other items in the element table and retains only the energy density or co-energy density.

Issue **PLETAB (p. 1411)** and **PRETAB (p. 1490)** to plot and list the energy density.

The macro is valid for static and low-frequency magnetic field formulations.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The macro will not calculate stored energy and co-energy for the following cases:

- Orthotropic nonlinear permanent magnets.
- Orthotropic nonlinear permeable materials.
- Temperature dependent materials.

SENERGY (p. 1714) is restricted to MKSA units.

Menu Paths

Main Menu>General Postproc>Elec&Mag Calc>Element Based>Co-Energy
Main Menu>General Postproc>Elec&Mag Calc>Element Based>Energy

---

SEOPT,*Sename*,*SEMATR*,*SEPR*,*SESST*,*ExpMth*,*SeOcLvL*,--,*LPnameKey*,*SeEdgeKey*

Specifies substructure analysis options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Sename

The name (case-sensitive, 32-character maximum) assigned to the .sub superelement matrix file. If not specified, the name defaults to *Fname* on the **/FILNAME (p. 757)** command.

SEMATR

Matrix generation key:

1

Generate stiffness (or conductivity) matrix (default).

2

Generate stiffness and mass (or conductivity and specific heat) matrices.

3

Generate stiffness, mass and damping matrices.

SEPR

Print key:

0

Do not print superelement matrices or load vectors (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Print both load vectors and superelement matrices.

2

Print load vectors but not matrices.

SESST

Stress-stiffening key:

0

Do not save space for stress stiffening in a later run.

1

Save space for the stress stiffening matrix (calculated in a subsequent generation run after the expansion pass).

ExpMth

Expansion method for expansion pass:

BACKSUB

Save necessary factorized matrix files (for example, the .LN22 file) for backsubstitution during the subsequent expansion passes (default). This normally results in a large usage of disk space.

MODDIR

This is the same expansion method as BACKSUB, except that the static correction vectors (see the first term of Equation 15.134 in the *Mechanical APDL Theory Reference*) are stored on the .bclv file instead of the .LN22 file. This option is required when remote read-only file usage is used during the first solution of the first restart of a generation pass (see the **MODDIR (p. 1134)** command).

RESOLVE

Do not save factorized matrix files. Global stiffness matrix will be reformed during expansion pass. This option provides an effective way to save disk space usage. This option cannot be used if the use pass uses large deflections (**NLGEOM (p. 1231)**,ON).

NONE

Do not save factorized matrix files. With this option, the expansion pass is not possible when factorized matrix files are required.

BCLV

Do not save factorized matrix files. The static correction vectors (see the first term of Equation 15.134 in the *Theory Reference*) are stored in the .bclv file. With this option, the expansion pass is not possible when factorized matrix files are required.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SeOcLvL

For the added-mass calculation, the ocean level to use when ocean waves (**OCTYPE (p. 1320)**,,WAVE) are present:

ATP

The ocean level at this point in time (default).

MSL

The mean ocean level.

- -

Unused field.

LPnameKey

ON

All files created during the generation pass are named using *Sename*.

OFF

All files created during the generation pass are named using the Jobname defined for the analysis (see **/FILNAME (p. 757)** command) except for the .sub file, which uses *Sename* if specified (default).

SeEdgeKey

Key to control confidentiality of the shape of the substructure finite element model:

ON

Substructure edges are written to the .sub file and can be viewed as an edge outline in graphics displays in the use pass by issuing **EPLOT (p. 648)** (default).

OFF

Substructure edges are not written to the .sub file and cannot be viewed as an edge outline in graphics displays in the use pass.

Notes

SEOPT (p. 1715) specifies substructure analysis options (**ANTYPE (p. 162)**,SUBSTR). If used during solution, the command is valid only within the first load step.

When ocean waves (**OCTYPE (p. 1320)**,,WAVE) are present, the *SeOcLvL* argument specifies the ocean height or level to use for the added-mass calculation, as the use-run analysis type is unknown during the generation run.

The expansion pass method RESOLVE is not supported with component mode synthesis analysis (**CMSOPT (p. 378)**). *ExpMth* is automatically set to BACKSUB for CMS analysis. The RESOLVE method inval-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

idates the use of the **NUMEXP (p. 1293)** command. The RESOLVE method does not allow the restarting of the substructure generation pass and the computation of results based on nodal velocity and nodal acceleration (damping force, inertial force, kinetic energy, etc.) in the substructure expansion pass.

If *ExpMth* = NONE or BCLV in a substructure analysis or component mode synthesis (CMS) analysis (**CMSOPT (p. 378)**) using the fixed-interface (**CMSOPT (p. 378)**,FIX) or free-interface (**CMSOPT (p. 378)**,FREE) methods, you cannot restart the generation pass or perform the expansion pass. (In CMS analyses using those methods, however, the expansion pass is possible when element-results calculation is activated in the generation pass (*Elcalc* = YES on **CMSOPT (p. 378)**)). The *ExpMth* argument is not required for CMS analysis using the residual-flexible free-interface method (**CMSOPT (p. 378)**,RFFB).

For linear perturbation substructure generation pass with multiple substructures, set *LPnameKey* = ON to avoid copying files at the end of each generation pass with the **/COPY (p. 416)** command. For an example with CMS analysis using the fixed-interface method, see Linear Perturbation Substructure with Two Generation Passes, Use Pass, and Two Expansion Passes in the *Structural Analysis Guide*.

To verify superelement location as an edge outline in graphics displays in the use pass by issuing **EPLOT (p. 648)**, *SeEdgeKey* must be set to ON. To keep the shape of the substructure finite element model confidential and prohibit visualization of the superelement and any transformed superelements created with the **SETRAN (p. 1730)** or **SESYMM (p. 1718)** commands, set *SeEdgeKey* to OFF.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>Analysis Options

SESYMM,*Sename*,*Ncomp*,*INC*,*File*,*Ext*,--

Performs a symmetry operation on a superelement within the use pass.

PREP7 (p. 22): Superelements (p. 34)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Sename

The name (case-sensitive) of the superelement matrix file created by the substructure generation pass (*Sename*.sub). Defaults to the current Jobname. If a number, it is the element number of a previously defined superelement in the current use pass.

Ncomp

Symmetry key:

X

X symmetry (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Y

Y symmetry.

Z

Z symmetry.

INC

Increment all nodes in the superelement by *INC*.

File

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

This field must be input.

Ext

Filename extension (eight-character maximum).

The extension defaults to SUB.

--

Unused field.

Notes

Performs a symmetry operation on a superelement within the substructure use pass by reversing the sign of component *Ncomp* in the global Cartesian coordinate system. The node numbers are incremented by *INC*. The new superelement is written to `File.sub` in the current directory (by default). All master node nodal coordinate systems must be global Cartesian (no rotated nodes allowed).

The maximum number of transformations for a given superelement is five (including **SETRAN (p. 1730)**, **SESYMM (p. 1718)**, and the large rotation transformation if **NLGEOM (p. 1231)** is ON in the use pass).

This command is not supported if the original superelement matrix was created in a component mode synthesis analysis generation pass with the element results calculation activated (*Elcalc* = YES on **CMSOPT (p. 378)**).

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>Superelem>By Reflection

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*SET, *Par*, *VALUE*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*, *VAL7*, *VAL8*, *VAL9*, *VAL10*

Assigns values to user-named parameters.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Par

An alphanumeric name used to identify this parameter. *Par* can contain up to 32 characters, beginning with a letter and containing only letters, numbers, and underscores. *Examples:* **ABC A3X TOP_END**

Command names, function names, label names, component and assembly names, etc., are invalid, as are parameter names beginning with an underscore (for example, **_LOOP**).

Parameter names ending in an underscore are not listed by the ***STATUS (p. 1863)** command. Array parameter names must be followed by a subscript, and the entire expression must be 32 characters or less. *Examples:* **A(1,1) NEW_VAL(3,2,5) RESULT(1000)**

There is no character parameter substitution for the *Par* field. Table parameters used in command fields (where constant values are normally given) are limited to 32 characters.

VALUE

Numerical value or alphanumeric character string (up to 32 characters enclosed in single quotes) to be assigned to this parameter. Examples: **A(1,3)=7.4 B='ABC3'** Can also be a parameter or a parametric expression. *Examples:* **C=A(1,3) A(2,2)=(C+4)/2**. If *VALUE* is the table array name, the subscripts are the values of the primary variables and the table is evaluated at these specified index values.

If blank, delete this parameter. *Example:* **A=** deletes parameter **A**.

VAL2, VAL3, VAL4, VAL5, VAL6, VAL7, VAL8, VAL9, VAL10

If *Par* is an array parameter, values *VAL2* through *VAL10* (up to the last nonblank value) are sequentially assigned to the succeeding array elements of the column. *Examples:*
***SET,A(1,4),10,11** assigns **A(1,4)=10, A(2,4)=11**, and
***SET,B(2,3),'file10','file11'** assigns **B(2,3)='file10', B(3,3)='file11'**.

Notes

Assigns values to user-named parameters that can be substituted later in the run. The equivalent (and recommended) format is

Par = *VALUE*,*VAL2*,*VAL3*, . . . , *VAL10*

which can be used in place of ***SET (p. 1720)**,*Par*, ... for convenience.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Parameter Definitions

Parameters (numeric or character) can be scalars (single valued) or arrays (multiple valued in one, two, or three dimensions). An unlimited number of parameter names can be defined in any run. For very large numbers of parameters, it is most efficient to define them in alphabetical order.

Parameter values can be redefined at any time. Array parameters can also be assigned values within a do-loop (***DO (p. 567)**) for convenience. Internally programmed do-loop commands are also available with the ***VXX*** commands (***VFILL (p. 2097)**). Parameter values (except for parameters ending in an underscore) can be listed with the ***STATUS (p. 1863)** command, displayed via ***VPLOT (p. 2146)** (numeric parameters only), and modified via ***VEDIT (p. 2089)** (numeric parameters only).

Older program-provided macro files can use parameter names that do not begin with an underscore. Using these macros embedded in your own macros may cause conflicts if the same parameter names are used.

Parameters can also be resolved in comments created via **/COM (p. 404)**. A parameter can be deleted by redefining it with a blank *VALUE*. If the parameter is an array, the entire array is deleted. Parameters can also be defined by a response to a query via ***ASK (p. 84)** or from a Mechanical APDL-provided value via ***GET (p. 797)**.

Array Parameters

Array parameters must be dimensioned (***DIM (p. 530)**) before being assigned values unless they are the result of an array operation or defined using the implied loop convention.

Undefined scalar parameters are initialized to a near-zero value. Numeric array parameters are initialized to zero when dimensioned, and character array parameters are initialized to blank.

An existing array parameter must be deleted before it can be redimensioned.

Array parameter names must be followed by a subscript list (enclosed in parentheses) identifying the element of the array. The subscript list can have one, two, or three values (separated by commas). Typical array parameter elements are A(1,1), NEW_VAL(3,2,5), RESULT(1000). Subscripts for defining an array element must be integers (or parameter expressions that evaluate to integers). Non-integer values are rounded to the nearest integer value.

All array parameters are stored as 3D arrays with the unspecified dimensions set to 1. For example, the 4th array element of a 1-dimensional array, A(4), is stored as array element A(4,1,1).

Arrays adhere to standard FORTRAN conventions.

Numerical Parameter Substitution

If the parameter name *Par* is input in a numeric argument of a command, the numeric value of the parameter (as assigned with ***SET (p. 1720)**, ***GET (p. 797)**, =, etc.) is substituted into the command at that point. Substitution occurs only if the parameter name is used between blanks, commas, parentheses, or arithmetic operators (or any combination) in a numeric argument. Substitution can be prevented by enclosing the parameter name *Par* within single quotes ('), if the parameter is alone in the argument; if the parameter is part of an arithmetic expression, the entire expression must be enclosed within single quotes to prevent substitution. In either case the character string will be used instead of the numeric value (and the string will be taken as 0.0 if it is in a numeric argument).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A forced substitution is available in the text fields of **/TITLE (p. 2007)**, **/STITLE (p. 1867)**, **/TLABEL (p. 2007)**, **/AN3D (p. 129)**, **/SYP (p. 1894)** (*ARG1*--*ARG8*), and ***ABBR (p. 81)** by enclosing the parameter within percent (%) signs. Also, parameter substitution can be forced within the file name or extension fields of commands having these fields by enclosing the parameter within percent (%) signs. Array parameters (***DIM (p. 530)**) must include a subscript (within parentheses) to identify the array element whose value is to be substituted, such as A(1,3). Out-of-range subscripts result in an error message. Non-integer subscripts are allowed when identifying a TABLE array element for substitution. A proportional linear interpolation of values among the nearest array elements is performed before substitution. Interpolation is done in all three dimensions.

Note:

Interpolation is based upon the assigned index numbers which must be defined when the table is filled (***DIM (p. 530)**).

Character Parameter Substitution

Most alphanumeric arguments permit the use of character parameter substitution. When the parameter name *Par* input, the alphanumeric value of the parameter is substituted into the command at that point. Substitution can be suppressed by enclosing the parameter name within single quotes ('). Forced substitution is available in some fields by enclosing the parameter name within percent (%) signs. Valid forced substitution fields include command name fields, *Fname* (filename) or *Ext* (extension) arguments, ***ABBR (p. 81)** command (*Abbr* arguments), **/TITLE (p. 2007)** and **/STITLE (p. 1867)** commands (*Title* argument) and **/TLABEL (p. 2007)** command (*Text* argument). Character parameter substitution is also available in the ***ASK (p. 84)**, **/AN3D (p. 129)**, ***CFWRITE (p. 318)**, ***IF (p. 927)**, ***ELSEIF (p. 620)**, ***MSG (p. 1185)**, ***SET (p. 1720)**, ***USE (p. 2059)**, ***VREAD (p. 2153)**, and ***VWRITE (p. 2174)** commands. Character array parameters must include a subscript (within parentheses) to identify the array element whose value is to be substituted.

Parameter Expressions

If a parameter *operation expression* is input in a numeric argument, the numeric value of the expression is substituted into the command at that point. Allowable operation expressions are of the form

E1oE2oE3 ...oE10

where E1, E2, etc. are expressions connected by operators (o). The allowable operations (o) are

+ - * / ** < >

For example, **A+B**C/D*E** is a valid operation expression. The ***** represents multiplication and the ****** represents exponentiation.

Note:

Exponentiation of a negative number (without parentheses) to an integer power follows standard FORTRAN hierarchy conventions; that is, the positive number is exponentiated and then the sign is attached. Thus, -4**2 is evaluated as -16. If parentheses are applied, such as (-4)**2, the result is 16.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A parameter is evaluated as a number within parentheses before exponentiation. Exponentiation of a negative number to a non-integer power is performed by exponentiating the positive number and prepending the minus sign, for example, -4**2.3 is -(4**2.3). The < and > operators allow conditional substitution. For example, E1<E2 substitutes the value of E1 if the comparison is true or the value of E2 if the comparison is false.

Do not use spaces around operation symbols, as " *" (a space and a star) makes the remainder of the line a comment. Operation symbols (or symbols and signs) cannot be immediately adjacent to each other. Parentheses can be used to separate symbols and signs, to determine a hierarchy of operations, or for clarity. For example, use A**(-B) instead of A**-B. Numbers ending with +0nn or -0nn are assumed to be of exponential form (as written on files by some computer systems) so that 123-002 is 123E-2 while 123-2 is 121. Avoid inputting this form of exponential data directly. The default hierarchy follows the standard FORTRAN conventions, namely:

- operations in parentheses (innermost first)
- then exponentiation (right to left)
- then multiplication or division (left to right)
- then unary association (such as +A or -A)
- then addition or subtraction (left to right)
- then logical evaluations (left to right).

Expressions (E) can be a constant, a parameter, a function, or another operation expression (of the form E1oE2oE3 ...oE10). Functions are of the form FTN(A) where the argument (A) can itself be of the form E1oE2oE3 ...oE10. Operations are recursive to a level of four deep (three levels of internally nested parentheses). Iterative floating point parameter arithmetic should not be used for high precision input because of the accumulated numerical round off-error. Up to 10 expressions are accepted within a set of parenthesis.

Valid functions (which are based on standard FORTRAN functions where possible) are:

SIN(*X*)	Sine
COS(*X*)	Cosine
TAN(*X*)	Tangent
ASIN(*X*)	Arcsine
ACOS(*X*)	Arccosine
ATAN(*X*)	Arctangent
ATAN2(*Y*,*X*)	Arctangent (*Y*/*X*) with the sign of each component considered
SINH(*X*)	Hyperbolic sine
COSH(*X*)	Hyperbolic cosine
TANH(*X*)	Hyperbolic tangent
SQRT(*X*)	Square root
ABS(*X*)	Absolute value
SIGN(*X*,*Y*)	Absolute value of *X* with sign of *Y*. *Y*=0 results in positive sign
NINT(*X*)	Nearest integer

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MOD(*X*,*Y*)	Remainder of *X*/*Y* *Y*=0 returns zero (0)
EXP(*X*)	Exponential
LOG(*X*)	Natural log
LOG10(*X*)	Common log
RAND(*X*,*Y*)	Random number, where *X* is the lower bound, and *Y* is the upper bound
GDIS(*X*,*Y*)	Random sample of Gaussian distributions, where *X* is the mean, and *Y* is the standard deviation
LWCASE(*CPARM*)	Lowercase equivalent of character parameter *CPARM*
UPCASE(*CPARM*)	Uppercase equivalent of character parameter *CPARM*
VALCHR(*CPARM*)	Numeric value of character parameter *CPARM* (If *CPARM* is a numeric parameter, returns 0.0)
CHRVAL(*PARM*)	Character value of numerical parameter *PARM*. For ABS(*PARM*) < 10, character value format is F8.5; for 10 ≤ ABS(*PARM*) < 1000, format is F8.3; for 1,000 ≤ ABS(*PARM*)< 10,000,000, format is F8.0. For 10,000,000 ≤ PARM < 100,000,000, format is also F8.0. Otherwise result is 0.0 and is not a character value.
IBSET(b1,n2)	Set the n2 bit in value b1 (bits are numbered from 0 to 31)
IBCLR(b1,n2)	Clear the n2 bit in value b1
BTEST(b1,n2)	Test the n2 bit in value b1 (return true (1.0) if bit is set)
BITAND(b1,b2)	Bitwise AND of value b1 and b2
BITOR(b1,b2)	Bitwise OR of value b1 and b2
BITXOR(b1,b2)	Bitwise XOR of value b1 and b2
BITSET(b1,b2)	Set the b2 bits in b1
BITCLEAR(b1,b2)	Clear the b2 bits in b1

Function arguments (*X*,*Y*, etc.) must be enclosed within parentheses and can be numeric values, parameters, or expressions. Input arguments for angular functions must evaluate to radians by default. Output from angular functions are also in radians by default. See ***AFUN (p. 83)** to use degrees instead of radians for the angular functions. See ***VFUN (p. 2106)** for applying these parameter functions to a sequence of array elements. Additional functions, called *get functions*, are described via ***GET (p. 797)**.

Menu Paths

Utility Menu>Parameters>Scalar Parameters

SET,*Lstep*,*Sbstep*,*Fact*,*KIMG*,*TIME*,*ANGLE*,*NSET*,*ORDER*

Defines the data set to be read from the results file.

POST1 (p. 51): Set Up (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lstep

Load step number of the data set to be read (defaults to 1):

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

N

Read load step *N*.

FIRST

Read the first data set (*Sbstep* and *TIME* are ignored).

LAST

Read the last data set (*Sbstep* and *TIME* are ignored).

NEXT

Read the next data set (*Sbstep* and *TIME* are ignored). If at the last data set, the first data set will be read as the next.

PREVIOUS

Read the previous data set (*Sbstep* and *TIME* are ignored). If at the first data set, the last data set will be read as the previous.

NEAR

Read the data set nearest to *TIME* (*Sbstep* is ignored). If *TIME* is blank, read the first data set.

LIST

Scan the results file and list a summary of each load step. (*KIMG*, *TIME*, *ANGLE*, and *NSET* are ignored.)

Sbstep

Substep number (within *Lstep*). Defaults to the last substep of the load step (except in a buckling or modal analysis). For a buckling (**ANTYPE (p. 162)**,BUCKLE) or modal (**ANTYPE (p. 162)**,MODAL) analysis, *Sbstep* corresponds to the mode number. Specify *Sbstep* = LAST to store the last substep for the specified load step (that is, issue a **SET (p. 1724)**,*Lstep*,LAST command).

If *Lstep* = LIST, *Sbstep* = 0 or 1 lists the basic step information. *Sbstep* = 2 also lists the basic step information, but includes the load step title, and labels imaginary data sets if they exist.

Fact

Scale factor applied to data read from the file. If zero (or blank), a value of 1.0 is used. A nonzero factor excludes non-summable items.

Harmonic velocities or accelerations can be calculated from the displacement results from a modal (**ANTYPE (p. 162)**,MODAL) or harmonic (**ANTYPE (p. 162)**,HARMIC) analysis. If *Fact* = VELO, the harmonic velocities (v) are calculated from the displacements (d) at a particular frequency (f) according to the relationship $v = 2 \pi f d$. Similarly, if *Fact* = ACEL, the harmonic accelerations (a) are calculated as $a = (2 \pi f)^2 d$.

If *Lstep* = LIST in an analysis using rezoning, *Fact* across all rezoning data sets is listed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KIMG

Used only with complex results (harmonic and complex modal analyses).

0 or REAL

Store the real part of complex solution (default).

1, 2 or IMAG

Store the imaginary part of a complex solution.

3 or AMPL

Store the amplitude.

4 or PHAS

Store the phase angle. The angle value, expressed in degrees, will be between -180° and +180°.

TIME

Time-point identifying the data set to be read. For a harmonic analyses, time corresponds to the frequency.

For a buckling analysis, time corresponds to the load factor.

Used only in the following cases: If *Lstep* = NEAR, read the data set nearest to *TIME*. If both *Lstep* and *Sbstep* are zero (or blank), read data set at time = *TIME*.

Do not use *TIME* to identify the data set to be read if you used the arc-length method (**ARCLEN (p. 175)**) in your solution.

If *TIME* is between two solution time points in the results file, a linear interpolation occurs between the two data sets (except in cases where rezoning or selected results output (**OSRESULT (p. 1327)**) is used).

Solution items not written to the results file (**OUTRES (p. 1336)**) for either data set will result in a null item after data set interpolation.

If *TIME* is beyond the last time point on the file, the last time point will be used.

If *TIME* is between two solution time points and both *Lstep* and *Sbstep* are zero (or blank), no interpolation is performed for the **PRCINT (p. 1472)**/**PLCINT (p. 1396)** commands. (That is, for results generated by the **CINT (p. 334)** command, only the data set associated with the lower of the solution time points is used.)

ANGLE

For harmonic elements (PLANE25, PLANE75, PLANE78, PLANE83, and SHELL61), *ANGLE* specifies the circumferential location (0.0 to 360°) used when reading from the results file. The harmonic factor (based on the circumferential angle) is applied to the displacements and element results, and to

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the applied constraints and loads which overwrites any values existing in the database. If *ANGLE* = NONE, all harmonic factors are set to 1 and postprocessing yields the solution output.

When using *ANGLE* = NONE with *MODE* > 0, the combined stresses and strains are not valid.

The default value of *ANGLE* is 0.0; however if the **SET (p. 1724)** command is not used, the effective default is NONE.

For full harmonic analyses with the amplitude option (*KIMG* = 3 or AMPL), *ANGLE* is the prescribed phase angle at which the amplitude is computed.

NSET

Data set number of the data set to be read. If a positive value for *NSET* is entered, *Lstep*, *Sbstep*, *KIMG*, and *TIME* are ignored. Available set numbers can be determined by **SET (p. 1724)**,LIST.

ORDER

Key to sort the harmonic index results. This option applies to cyclic symmetry buckling and modal analyses only, and is valid only when *Lstep* = FIRST, LAST, NEXT, PREVIOUS, NEAR or LIST.

ORDER

Sort the harmonic index results in ascending order of eigenfrequencies or buckling load multipliers.

(blank)

No sorting takes place.

Notes

Defines the data set to be read from the results file into the database. Various operations may also be performed during the read operation. The database must have the model geometry available (or use the **RESUME (p. 1601)** command before the **SET (p. 1724)** command to restore the geometry from Jobname.db). Values for applied constraints (**D (p. 483)**) and loads (**F (p. 729)**) in the database will be replaced by their corresponding values on the results file, if available. (See the description of the **OUTRES (p. 1336)** command.) In a single load step analysis, these values are usually the same, except for results from harmonic elements. (See the description of the *ANGLE* value above.)

In an interactive run, the sorted list (*ORDER* option) is also available for results-set reading via a GUI pick option.

You can postprocess results without issuing a **SET (p. 1724)** command if the solution results were saved to the database file (Jobname.db). A distributed-memory parallel simulation, however, can only postprocess using the results file (for example, Jobname.rst) and cannot use the Jobname.db file since no solution results are written to the database. Therefore, you must issue a **SET (p. 1724)** command or a **RESCOMBINE (p. 1589)** command before postprocessing in a distributed-memory parallel run.

When postprocessing amplitudes or phases (*KIMG* = AMPL or PHAS):

- The only appropriate coordinate system is the solution coordinate system (**RSYS (p. 1639)** ,SOLU). For layered elements, a layer (**LAYER (p. 1015)**) must also be specified. When displaying the displacement

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

amplitudes, use a contour display (**PLNSOL (p. 1425)** command). Because a deformed shape display (**PLDISP (p. 1400)** command) could lead to a non-physical shape, the displacement scaling is off by default (**/DSCALE (p. 575)**,,OFF).

- The conversion is not valid for averaged results, derived results (such as principal stress/strain, equivalent stress/strain, and USUM), or summed results obtained using **FSUM (p. 780)**, **NFORCE (p. 1216)**, **PRNLD (p. 1503)**, and **PRRFOR (p. 1517)**.
- Cyclic symmetry and multistage cyclic symmetry analysis results are not supported. To compute the amplitude of a single complex mode that was calculated in a cyclic symmetry or multistage cyclic symmetry modal analysis using the damped eigensolver (**MODOPT (p. 1140)**, DAMP), issue the **MAXCYCMODE (p. 1112)** command.
- Coupled-field analysis results are supported when *KIMG* = AMPL, but they are not supported when *KIMG* = PHAS.

Issuing EXPAND (p. 711) in a Cyclic Symmetry Modal Analysis

After issuing **EXPAND (p. 711)**,*Nrepeat* in a cyclic symmetry modal analysis, subsequent **SET (p. 1724)** commands read data from the results file and expand them to *Nrepeat* sectors.

Issuing MSOPT (p. 1195),EXPAND in a Multistage Cyclic Symmetry Analysis

When issuing **MSOPT (p. 1195)**,EXPAND in a multistage cyclic symmetry analysis, subsequent **SET (p. 1724)** commands read the data set from the specified results file and expand the nodes and elements to the stages and sectors specified via **MSOPT (p. 1195)**,EXPAND.

SETFGAP, *GAP*, *ROPT*, - - , *PAMB*, *ACF1*, *ACF2*, *PREF*, *MFP*

Updates or defines the real constant table for squeeze film elements.

PREP7 (p. 22): Real Constants (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

GAP

Gap separation.

ROPT

Real constant set option.

0

Creates separate real constant sets for each selected element with the specified real constant values (default).

1

Updates existing real constant sets. The gap separation is updated from displacement results in the database. Other real constants are updated as specified in the command input parameters.

- -

Unused field

PAMB

Ambient pressure.

ACF1, ACF2

Accommodation factor 1 and 2.

PREF

Reference pressure for mean free path.

MFP

Mean free path.

Notes

This command is used for large signal cases to update the gap separation real constant on a per-element basis. Issue this command prior to solution using the default *ROPT* value to initialize real constant sets for every fluid element. After a solution, you can re-issue the command to update the real constant set for a subsequent analysis. See Introduction for more information on thin film analyses.

---

SETRAN, *Sename*, *KCNTO*, *INC*, *File*, *Ext*, --, *DX*, *DY*, *DZ*, *NOROT*

Creates a superelement from an existing superelement.

PREP7 (p. 22): Superelements (p. 34)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Sename

The name (case-sensitive) of the file containing the original superelement matrix created by the generation pass (*Sename*.SUB). The default is the current Jobname. If *Sename* is a number, it is the element number of a previously defined superelement in the current use pass.

KCNTO

The reference number of the coordinate system to where the superelement is to be transferred. The default is the global Cartesian system. Transfer occurs from the active coordinate system.

INC

The node offset. The default is zero. All new element node numbers are offset from those on the original by *INC*.

File

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

This field requires input.

Ext

Filename extension (eight-character maximum).

The extension defaults to SUB.

--

Unused field.

DX, DY, DZ

Node location increments in the global Cartesian coordinate system. Defaults to zero.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NOROT

Node rotation key (p. 1731):

0

The nodal coordinate systems of the transferred superelement rotate into the *KCNTO* system. (That is, the nodal coordinate systems rotate with the superelement.) The superelement matrices remain unchanged. This value is the default.

1

The nodal coordinate systems do not rotate. (That is, they remain fixed in their original global orientation.) The superelement matrices and load vectors are modified if any rotations occur.

Notes

The **SETRAN (p. 1730)** command creates a superelement from an existing superelement and writes the new element to a file. You can then issue an **SE (p. 1651)** command to read the new element (during the use pass).

You can create a superelement from an original by:

- Transferring the original's geometry from the active coordinate system into another coordinate system (*KCNTO*)
- Offsetting its geometry in the global Cartesian coordinate system (*DX*, *DY*, and *DZ*)
- Offsetting its node numbers (*INC*).

A combination of methods is valid. If you specify both the geometry transfer and the geometry offset, the transfer occurs first.

If you specify rotation of the transferred superelement's nodal coordinate systems into the *KCNTO* system (*NOROT* = 0), the rotated nodes cannot be coupled via the **CP (p. 421)** command; in this case, issue the **CE (p. 297)** command instead. If you specify *no* rotation of the nodal coordinate systems (*NOROT* = 1) for models with displacement degrees of freedom, and *KCNTO* is not the active system, the superelement *Sename* must have six MDOF at each node that has MDOF; therefore, only elements with all six structural DOFs are valid in such cases.

There is no limit to the number of copies that can be made of a superelement, provided the copies are all generated from the same original superelement. However, nested copies are limited to five. In other words, the total number of different *Sename* usages on the **SETRAN (p. 1730)** and **SESYMM (p. 1718)** commands is limited to five.

This command is not supported if the original superelement matrix was created in a component mode synthesis analysis generation pass with the element results calculation activated (*Elcalc* = YES on **CMSOPT (p. 378)**).

Main Menu>Preprocessor>Modeling>Create>Elements>Superelem>By Geom Offset

---

SEXP, *LabR*, *Lab1*, *Lab2*, *EXP1*, *EXP2*

Forms an element table item by exponentiating and multiplying.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabR

Label assigned to results. If same as existing label, the existing values will be overwritten by these results.

Lab1

First labeled result item in operation.

Lab2

Second labeled result item in operation (may be blank).

EXP1

Exponent applied to *Lab1*.

EXP2

Exponent applied to *Lab2*.

Notes

Forms a labeled result item (see **ETABLE (p. 687)** command) for the selected elements by exponentiating and multiplying two existing labeled result items according to the operation:

$$LabR = (|Lab1|^{EXP1}) \times (|Lab2|^{EXP2})$$

Roots, reciprocals, and divides may also be done with this command.

Menu Paths

Main Menu>General Postproc>Element Table>Exponentiate

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SF,*Nlist*,*Lab*,*VALUE*,*VALUE2*,–,*MESHFLAG*

Defines surface loads on nodes.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 1738)

Nlist

Nodes defining the surface upon which the load is to be applied. Use the label ALL or P, or a component name. If ALL, all selected nodes (**NSEL (p. 1266)**) are used (default). If P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Lab

Valid surface load label. Load labels are listed under **Surface Loads** in the input table for each element type.

Discipline	Surface Load Label	Label Description
Structural	PRES	Pressure
	FREQ	Frequency (harmonic analyses only)
	MXWF	Equivalent source surface flag
Thermal	CONV [1]	Convection
	HFLUX [1]	Heat flux
	RAD	Radiation
	RDSF	Surface-to-surface radiation
Acoustic fluid	FSI [2]	Fluid-structure interaction flag
	IMPD	Impedance or admittance coefficient
	SHLD	Surface normal velocity or acceleration
	MXWF	Maxwell surface flag or equivalent source surface flag
	FREE	Free surface flag
	INF	Exterior Robin radiation boundary flag
	PORT	Port number
	ATTN	Absorption coefficient and transmission loss
	BLI	Viscous-thermal boundary layer surface flag
	RIGW	Rigid wall flag (Neumann boundary)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discipline	Surface Load Label	Label Description
	FSIN	One-way structure-to-acoustic coupling interface number
	PRES	Pressure in viscous-thermal acoustics
	CONV	Heat flux in viscous-thermal acoustics
	VIMP	Viscous impedance in viscous-thermal acoustics
	TIMP	Thermal impedance in viscous-thermal acoustics
	PERM	Permeability in poroelastic acoustics
Magnetic	MXWF	Maxwell force flag
Electric	CHRGS	Surface charge density
	MXWF	Maxwell force flag
Infinite element	INF	Exterior surface flag for INFIN110 and INFIN111
Field-surface interface	FSIN	Field-surface interface number
Poromechanics	FFLX	Fluid flow flux
Diffusion	DFLUX	Diffusion flux

1. Thermal labels CONV and HFLUX are mutually exclusive.
2. For an acoustic analysis, apply the fluid-structure interaction flag (Label = FSI) to only the FLUID29, FLUID30, FLUID220, and FLUID221 elements.

VALUE

Surface load value or table name reference for specifying tabular boundary conditions.

If *Lab* = PRES, *VALUE* is the real component of the pressure.

If *Lab* = CONV:

VALUE is typically the film coefficient and *VALUE2* (below) is typically the bulk temperature. If *VALUE* = -*N*, the film coefficient may be a function of temperature and is determined from the HF property table for material *N* (**MP (p. 1160)**). (See the **SCOPT (p. 1649)** command for a way to override this option and use -*N* as the film coefficient.) The temperature used to evaluate the film coefficient is usually the average between the bulk and wall temperatures, but may be user-defined for some elements.

If **KBC (p. 970)**,0 has been issued for ramped loads, it affects only *VALUE2* the bulk temperature (p. 1736), and the film coefficient specification is unaffected.

In a viscous-thermal acoustic analysis, if *Lab* = CONV, *VALUE* is the real part of the heat flux and *VALUE2* is the imaginary part of the heat flux.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If *Lab* = RAD, *VALUE* is surface emissivity.

If *Lab* = PORT, *VALUE* is a port number representing a waveguide exterior port. The port number must be an integer between 1 and 50. For acoustic 2×2 transfer admittance matrix, the port number can be any positive integer. The smaller port number corresponds to the port 1 of the 2×2 transfer admittance matrix and the greater number corresponds to the port 2. If one port of the transfer admittance matrix is connecting to the acoustic-structural interaction interface, the port number corresponds to the port 2 of the transfer admittance matrix. A pair of ports of the 2×2 transfer admittance matrix must be defined in the same element. In an acoustic analysis, the positive port number defines a transparent port, through which the reflected sound pressure wave propagates to the infinity; the negative port number defines a vibro port that is the structural vibration surface.

If *Lab* = SHLD, *VALUE* is the surface normal velocity in a harmonic analysis or in a transient analysis solved with the velocity potential formulation; *VALUE* is the surface normal acceleration in a transient analysis solved with the pressure formulation.

If *Lab* = IMPD, *VALUE* is resistance in (N)(s)/m^3 if *VALUE* > 0 and is conductance in mho if *VALUE* < 0 for acoustic or harmonic response analyses. In acoustic transient analyses, *VALUE2* is not used.

If *Lab* = RDSF, *VALUE* is the emissivity value; the following conditions apply: If *VALUE* is between 0 and 1, apply a single value to the surface. If *VALUE*= *-N*, the emissivity may be a function of the temperature, and is determined from the EMISS property table for material *N* (**MP (p. 1160)**). The material *N* does not need to correlate with the underlying solid thermal elements.

If *Lab* = FSIN in a one-way structure-to-acoustic coupling, *VALUE* is the surface interface number.

If *Lab* = FSIN in a unidirectional Mechanical APDL to CFX analysis, *VALUE* is not used.

If *Lab* = ATTN, *VALUE* is the absorption coefficient of the surface.

If *Lab* = VIMP , *VALUE* is resistance of viscous impedance in (N)(s)/m^3.

If *Lab* = TIMP , *VALUE* is resistance of thermal impedance in (N)(s)/m^3.

If *Lab* = PERM , *VALUE* is permeability in m^2.

VALUE2

Second surface load value (if any).

If *Lab* = PRES, this value is the imaginary pressure component, used by the following supported elements:

- Surface elements: SURF153, SURF154 and SURF159.
- Solid and solid-shell elements: PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, SOLSH190, and SOLID285.
- Shell elements: SHELL181, SHELL281, SHELL208, and SHELL209.
- Coupled-field elements with structural degrees of freedom: PLANE222, PLANE223, SOLID225, SOLID226, and SOLID227.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Supported analysis types in this case are:

- Full harmonic (**HROPT (p. 912)**,FULL)
- Mode-superposition harmonic (**HROPT (p. 912)**,MSUP), if the mode-extraction method is Block Lanczos (**MODOPT (p. 1140)**,LANB), PCG Lanczos (**MODOPT (p. 1140)**,LANPCG), Supernode (**MODOPT (p. 1140)**,SNODE), Subspace (**MODOPT (p. 1140)**,SUBSP), or Unsymmetric (**MODOPT (p. 1140)**,UNSYM)

If *Lab* = CONV:

VALUE2 is the bulk temperature for thermal analyses.

If **KBC (p. 970)**,0 has been issued for ramped loads, the bulk temperature is ramped from the value defined by **TUNIF (p. 2027)** to the value specified by *VALUE2* for the first loadstep. If tabular boundary conditions (p. 1737) are defined, the **KBC (p. 970)** command is ignored and tabular values are used.

For viscous-thermal acoustics *VALUE2* is the imaginary part of heat flux.

If *Lab* = RAD, *VALUE2* is the ambient temperature.

If *Lab* = SHLD, *VALUE2* is the phase angle of the normal surface velocity (defaults to zero) for harmonic response analyses while *VALUE2* is not used for transient analyses in acoustics.

If *Lab* = IMPD, *VALUE2* is reactance in (N)(s)/m^3 if *VALUE* > 0 and is the product of susceptance and angular frequency if *VALUE* < 0 for acoustics.

If *Lab* = RDSF, *VALUE2* is the enclosure number. Radiation will occur between surfaces flagged with the same enclosure numbers. If the enclosure is open, radiation will also occur to ambient. If *VALUE2* is negative radiation direction is reversed and will occur inside the element for the flagged radiation surfaces.

If *Lab* = FSIN in a unidirectional Mechanical APDL to CFX analysis, *VALUE2* is the surface interface number (not available from within the GUI).

If *Lab* = PORT, *VALUE2* is not used.

If *Lab* = ATTN, *VALUE2* is the transmission loss (dB) of the coupled wall in an energy diffusion solution for room acoustics.

If *Lab* = VIMP, *VALUE2* is reactance of viscous impedance in (N)(s)/m^3.

If *Lab* = TIMP, *VALUE2* is reactance of thermal impedance in (N)(s)/m^3.

–

Reserved for future use.

MESHFLAG

Specifies how to apply normal pressure loading on the mesh. Valid in a nonlinear adaptivity analysis when *Lab* = PRES and *Nlist* is a nodal component defined prior to any remeshing activity.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0 – Pressure loading occurs on the current mesh (default).

1 – Pressure loading occurs on the initial mesh for nonlinear adaptivity.

Notes

Individual nodes cannot be entered for this command. The node list is to identify a surface and the *Nlist* field must contain a sufficient number of nodes to define an element surface. The loads are internally stored on element faces defined by the specified nodes. All nodes on an element face (including midside nodes, if any) must be specified for the face to be used, and the element must be selected.

If all nodes defining a face are shared by an adjacent face of another selected element, the face is not free and will not have a load applied. If more than one element can share the same nodes (for example, a surface element attached to a solid element), select the desired element type before issuing the **SF (p. 1733)** command. The **SF (p. 1733)** command applies only to area and volume elements.

For shell elements, if the specified nodes include face one (which is usually the bottom face) along with other faces (such as edges), only face one is used. Where faces cannot be uniquely determined from the nodes, or where the face does not fully describe the load application, issue **SFE (p. 1761)** instead of **SF (p. 1733)**. A load key of 1 (which is typically the first loading condition on the first face) is used if the face determination is not unique. A uniform load value is applied over the element face.

You can use these related surface-load commands with **SF (p. 1733)**:

SFE (p. 1761) – Defines surface loads on *elements*. You can also use it to apply tapered loads on individual element faces.

SFBEAM (p. 1746) – Applies surface loads to beam elements.

SFCONTROL (p. 1748) – Applies general (normal, tangential, and other) surface loads to supported structural elements (p. 1751).

SFCUM (p. 1758) – Accumulates (adds) surface loads applied via **SF (p. 1733)**.

SFDELE (p. 1760) – Delete loads applied via **SF (p. 1733)**.

SFFUN (p. 1771) – Applies loads from a node-vs.-value function.

SFGRAD (p. 1772) – Applies an alternate tapered load.

Tabular boundary conditions

Tabular boundary conditions (*VALUE* = %*tabname*% and/or *VALUE2* = %*tabname*%) are available for the following surface load labels (*Lab*) only: PRES (real and/or imaginary components), CONV (film coefficient and/or bulk temperature; or heat flux for viscous-thermal acoustics), HFLUX, DFLUX (diffusion flux), RAD (surface emissivity and ambient temperature), IMPD (resistance and reactance), SHLD (normal velocity and phase or acceleration), ATTN (absorption coefficient or transmission loss), VIMP (viscous impedance), and TIMP (thermal impedance). Issue ***DIM (p. 530)** to define a table.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in the PREP7 and **/MAP (p. 1107)** processors.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Product Restrictions

Ansys Mechanical Enterprise

SF (p. 1733),FSI and **SF (p. 1733)**,FSIN are available only in the Ansys Mechanical Enterprise family of products (Ansys Mechanical Enterprise, Ansys Mechanical Enterprise PrepPost, and Ansys Mechanical Enterprise Solver).

The following commands cannot be accessed from a menu: SF,,ATTN; SF,,RIGW; SF,,VIMP; SF,,TIMP; and SF,,PERM.

SFA,*Area*,*LKEY*,*Lab*,*VALUE*,*VALUE2*

Specifies surface loads on the selected areas.

SOLUTION (p. 38): Solid Surface Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Area

Area to which surface load applies. If ALL, apply load to all selected areas (**ASEL (p. 192)**). If *Area* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component may be substituted for *Area*.

LKEY

Load key associated with surface load (defaults to 1). Load keys (1,2,3, etc.) are listed under "Surface Loads" in the input data table for each element type in the *Element Reference*. *LKEY* is ignored if the area is the face of a volume region meshed with volume elements.

Lab

Valid surface load label. Load labels are listed under "Surface Loads" in the input table for each area type in the *Element Reference*.

Discipline	Body Load Label	Label Description
Structural	PRES	pressure
Thermal	CONV[1]	convection
	HFLUX[1]	heat flux
	RAD	radiation
	RDSF	surface-to-surface radiation
Acoustic fluid	FSI[2]	fluid-structure interaction flag
	IMPD	impedance boundary flag
	SHLD	surface normal velocity or acceleration
	MXWF	Maxwell surface flag or equivalent source surface
	FREE	free surface flag

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discipline	Body Load Label	Label Description
	INF	exterior Robin radiation boundary flag
	PORT	Port number
	ATTN	Absorption coefficient
	BLI	Viscous-thermal boundary layer surface flag
Magnetic	MXWF	Maxwell force flag
Electric	CHRGS	surface charge density
	MXWF	Maxwell force flag
Infinite element	INF	Exterior surface flag for INFIN110 and INFIN111
Field-surface interface	FSIN	field-surface interface number

1. Thermal labels CONV and HFLUX are mutually exclusive.
2. For an acoustic analysis, apply the fluid-structure interaction flag (Label = FSI) to only the FLUID129 or FLUID130 elements.

VALUE

Surface load value or table name reference for specifying tabular boundary conditions.

If *Lab* = CONV:

VALUE is typically the film coefficient and *VALUE2* (below) is typically the bulk temperature. If *Lab* = CONV and *VALUE* = *-N*, the film coefficient may be a function of temperature and is determined from the HF property table for material *N* (**MP (p. 1160)**). (See the **SCOPT (p. 1649)** command for a way to override this option and use *-N* as the film coefficient.) The temperature used to evaluate the film coefficient is usually the average between the bulk and wall temperatures, but may be user-defined for some elements.

If **KBC (p. 970)**,0 has been issued for ramped loads, it affects only *VALUE2*, the bulk temperature (p. 1741), and the film coefficient specification is unaffected.

If *Lab* = RAD, *VALUE* is the surface emissivity.

If *Lab* = PORT, *VALUE* is a port number representing a waveguide exterior port. The port number must be an integer between 1 and 50. For acoustic 2×2 transfer admittance matrix, the port number can be any positive integer. The smaller port number corresponds to the port 1 of the 2×2 transfer admittance matrix and the greater port number corresponds to the port 2. If one port of the transfer admittance matrix is connecting to the acoustic-structural interaction interface, the port number corresponds to the port 2 of the transfer admittance matrix. A pair of ports of the 2×2 transfer admittance matrix must be defined in the same element.

If *Lab* = SHLD, *VALUE* is the surface normal velocity in harmonic analysis and the surface normal acceleration in transient analysis for acoustics.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If *Lab* = IMPD, *VALUE* is resistance in (N)(s)/m^3 if *VALUE* > 0 and is conductance in mho if *VALUE* < 0 for acoustics. In acoustic transient analyses, *VALUE2* is not used.

If *Lab* = RDSF, *VALUE* is the emissivity value; the following conditions apply: If *VALUE* is between 0 and 1, apply a single value to the surface. If *VALUE* = -*N*, the emissivity may be a function of the temperature, and is determined from the EMISS property table for material *N* (**MP (p. 1160)**). The material *N* does not need to correlate with the underlying solid thermal elements.

If *Lab* = FSIN in a unidirectional Mechanical APDL to CFX analysis, *VALUE* is not used.

If *Lab* = ATTN, *VALUE* is the absorption coefficient of the surface.

VALUE2

Second surface load value (if any).

If *Lab* = CONV:

VALUE2 is typically the bulk temperature for thermal analyses.

If **KBC (p. 970)**,0 has been issued for ramped loads, the bulk temperature is ramped from the value defined by **TUNIF (p. 2027)** to the value specified by *VALUE2* for the first loadstep. If tabular boundary conditions (p. 1741) are defined, the **KBC (p. 970)** command is ignored and tabular values are used.

For acoustic analyses, VALUE2 is not used.

If *Lab* = RAD*VALUE2* is ambient temperature.

If *Lab* = SHLD, *VALUE2* is the phase angle of the normal surface velocity (defaults to zero) for harmonic response analyses while *VALUE2* is not used for transient analyses in acoustics.

If *Lab* = IMPD, *VALUE2* is reactance in (N)(s)/m^3 if *VALUE* > 0 and is the product of susceptance and angular frequency if *VALUE* < 0 for acoustics.

If *Lab* = RDSF, *VALUE2* is the enclosure number. Radiation will occur between surfaces flagged with the same enclosure numbers. If the enclosure is open, radiation will also occur to ambient. If *VALUE2* is negative, radiation direction is reversed and will occur inside the element for the flagged radiation surfaces.

If *Lab* = FSIN in a unidirectional Mechanical APDL to CFX analysis, *VALUE2* is the surface interface number (not available from within the GUI).

Notes

Surface loads may be transferred from areas to elements with the **SFTRAN (p. 1782)** or **SBCTRAN (p. 1647)** commands. See the **SFGRAD (p. 1772)** command for an alternate tapered load capability.

Tabular boundary conditions

Tabular boundary conditions (*VALUE* = %*tabname*% and/or *VALUE2* = %*tabname*%) are available for the following surface load labels (*Lab*) only: PRES (real and/or imaginary components), CONV

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(film coefficient and/or bulk temperature) or HFLUX, and RAD (surface emissivity and ambient temperature). Use the ***DIM (p. 530)** command to define a table.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in PREP7.

The SFA,,,ATTN command cannot be accessed from a menu.

SFACT, *TYPE*

Allows safety factor or margin of safety calculations to be made.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TYPE

Type of calculation:

0

No nodal safety factor or margin of safety calculations.

1

Calculate and store safety factors in place of nodal stresses.

2

Calculate and store margins of safety in place of nodal stresses.

Command Default

No nodal safety factor or margin of safety calculations.

Notes

Allows safety factor (SF) or margin of safety (MS) calculations to be made for the average nodal stresses according to:

SF = SALLOW/|Stress|

MS = (SALLOW/|Stress|) -- 1.0

Calculations are done during the display, select, or sort operation in the active coordinate system (**RSYS (p. 1639)**) with results stored in place of the nodal stresses. Use the **PRNSOL (p. 1505)** or **PLNSOL (p. 1425)** command to display the results.

Note:

The results are meaningful only for the stress (SIG1, SIGE, etc.) upon which **SALLOW (p. 1644)** is based. Nodal temperatures used are those automatically stored for the node. Related commands are **SFCALC (p. 1747)**, **SALLOW (p. 1644)**, **TALLOW (p. 1897)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SFADELE, *AREA*, *LKEY*, *Lab*

Deletes surface loads from areas.

SOLUTION (p. 38): Solid Surface Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AREA

Area to which surface load deletion applies. If ALL, delete load from all selected areas (**ASEL (p. 192)**). If *AREA* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *AREA*.

LKEY

Load key associated with surface load (defaults to 1). See the **SFA (p. 1739)** command for details.

Lab

Valid surface load label. If ALL, use all appropriate labels. See the **SFA (p. 1739)** command for labels.

Notes

Deletes surface loads (and all corresponding finite element loads) from selected areas.

This command is also valid in PREP7.

SFALIST, *AREA*, *Lab*

Lists the surface loads for the specified area.

SOLUTION (p. 38): Solid Surface Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AREA

Area at which surface load is to be listed. If ALL (or blank), list for all selected areas (**ASEL (p. 192)**). If *AREA* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *AREA*.

Lab

Valid surface load label. If ALL (or blank), use all appropriate labels. See the **SFA (p. 1739)** command for labels.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Surface Loads>On All Areas

Utility Menu>List>Loads>Surface Loads>On Picked Areas

SFBEAM, *Elem*, *LKEY*, *Lab*, *VALI*, *VALJ*, *VAL2I*, *VAL2J*, *IOFFST*, *JOFFST*, *LENRAT*

Specifies surface loads on beam and pipe elements.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Elem

Element to which surface load is applied. If ALL, apply load to all selected beam elements (**ESEL (p. 661)**). If *Elem* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted in *Elem*.

LKEY

Load key associated with surface load (defaults to 1). Load keys (1, 2, 3, etc.) are listed under "Surface Loads" in the input table for each element type in the *Element Reference*. For beam and some pipe elements, the load key defines the load orientation.

Lab

Valid surface load label. Load labels are listed under "Surface Loads" in the input table for each element type in the *Element Reference*. Structural labels: PRES (pressure).

VALI, VALJ

Surface load values at nodes I and J. If *VALJ* is blank, it defaults to *VALI*. If *VALJ* is zero, a zero is used.

VAL2I, VAL2J

Second surface load values at nodes I and J. Currently not used.

IOFFST, JOFFST

Offset distance from node I (toward node J) where *VALI* is applied, and offset distance from node J (toward node I) where *VALJ* is applied, respectively.

LENRAT

Offset distance flag:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Offset is in terms of length units (default).

1

Offset is in terms of a length ratio (0.0 to 1.0).

Notes

Specifies surface loads on the selected beam elements. Distributed loads are applied on a force-per-length basis (that is, the width of the underlying element is not considered). To list and delete surface loads applied with this command, use the **SFELIST (p. 1770)** and **SFEDELE (p. 1768)** commands, respectively.

If no offset values (*IOFFSET* and *JOFFSET*) are specified, the load is applied over the full element length. Values may also be input as length fractions, depending on the *LENRAT* setting. For example, assuming a line length of 5.0, an *IOFFST* of 2.0 with *LENRAT* = 0 or an *IOFFST* of 0.4 with *LENRAT* = 1 represent the same point. If *JOFFST* = -1, *VALI* is assumed to be a point load at the location specified via *IOFFST*, and *VALJ* is ignored. (*IOFFSET* cannot be equal to -1.) The offset values are stepped even if you issue a **KBC (p. 970)**,0 command.

Offsets are only available for element types BEAM188 and PIPE288 if using the cubic shape function (KEYOPT(3) = 3) for those element types.

To accumulate (add) surface loads applied with this command, use the **SFCUM (p. 1758)**,,ADD command. Use the same offset values used on the previous **SFBEAM (p. 1746)** command (for a given element face); otherwise, the loads do not accumulate. If no offsets are specified, the command applies the previous offset values.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Structural>Pressure>On Beams

SFCALC, *LabR*, *LabS*, *LabT*, *TYPE*

Calculates the safety factor or margin of safety.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabR

Label assigned to results. If same as existing label, the existing values will be overwritten by these results.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LabS

Labeled result item corresponding to the element stress.

LabT

Labeled result item corresponding to the element temperature.

TYPE

Type of calculation:

0 or 1

Use safety factor (SF) calculation.

2

Use margin of safety (MS) calculation.

3

Use 1/SF calculation.

Notes

Calculates safety factor (SF) or margin of safety (MS) as described for the **SFACT (p. 1743)** command for any labeled result item (see **ETABLE (p. 687)** command) for the selected elements. Use the **PRETAB (p. 1490)** or **PLETAB (p. 1411)** command to display results. Allowable element stress is determined from the SALLOW-TALLOW table (**SALLOW (p. 1644)**, **TALLOW (p. 1897)**).

Menu Paths

Main Menu>General Postproc>Safety Factor>SF for ElemTable

SFCONTROL, *KCSYS*, *LCOMP*, *VAL1*, *VAL2*, *VAL3*, *KTAPER*, *KUSE*, *KAREA*, *KPROJ*, *KFOLLOW*

Defines structural surface-load properties on selected elements and nodes for subsequent loading commands.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCSYS

Specifies how the load direction is determined:

0 (or blank) – Use the coordinate system of an element face. A local coordinate system is projected onto the face, if defined (*VAL1*) (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1 – Use a local coordinate system. A local coordinate system must be defined and is not projected onto the face.

2 – Use a custom (user-defined) vector in the global Cartesian coordinate system.

LCOMP

Load-component definition when *KCSYS* = 0 or 1. The following table shows how the component (or primary direction) is determined based on the coordinate system (p. 1751):

LCOMP [a]	**Direction**		
	KCSYS = 0		*KCSYS* = 1[b]
	VAL1 = 0	*VAL1* > 10[c]	--
0	Normal	Normal	x direction
1	x direction[d]	x direction[e]	y direction
2	y direction[d]	y direction[e]	z direction

[a] Because *KCSYS* = 0 and *KCSYS* = 1 use the same *LCOMP*, the most recent load-component definition overwrites the previous component even if *KCSYS* differs.

[b] The local coordinate system is not projected onto the element face.

[c] *VAL1* < 0 is not valid. 0 < *VAL1* < 11 is ignored.

[d] The positive x and y directions are determined by the default surface coordinate directions. (See Figure 18: Coordinate System for Load Application on the Faces of 3D Solid and Shell Elements (p. 1751).)

[e] The positive x and y directions are determined by the user-defined local coordinate system.

VAL1, VAL2, VAL3

When *KCSYS* = 0:

VAL1 – Determines the first tangential axis (x axis). Not valid for the edges of 3D shell or 2D elements.

0 – Aligns the x axis to the first parametric direction $\overline{\xi}$ (default).

1 – Aligns x axis to the second parametric direction $\overline{\eta}$.

>10 – ID of the local coordinate system. The local coordinate system is projected to selected face of the element.

VAL2 – Not used.

VAL3 – Rotation angle of a tangential load (optional). Not valid for the edges of 3D shell or 2D elements. If this value is specified, the tangential load rotates further with respect to the surface normal. The load component (*LCOMP*) becomes the reference axis to rotate.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When *KCSYS* = 1:

VAL1 – ID of the local coordinate system for the load. The axes of the local coordinate system are fixed in the global cartesian coordinate system.

VAL2 – *Not used.*

VAL3 – *Not used.*

When *KCSYS* = 2:

VAL1, *VAL2*, *VAL3* – The X / Y / Z components, respectively, of the direction vector in the global Cartesian coordinate system.

KTAPER

Global tapered load behavior (valid for **SFE (p. 1761)** only):

0 – Load does not vary (default).

1 – Load varies with respect to the current element locations. The magnitude changes with respect to the element deformation.

2 – Load varies with respect to the initial element locations. The load magnitude for each element remains constant throughout the solution. .

For more information, see "Global Tapered Load Behavior (*KTAPER*)" (p. 1755).

KUSE

Load direction with respect to the surface normal of the selected face:

0 – Use the load as calculated (default).

1 – Use a positive load only (negative set to zero, valid for *LCOMP* = 0 and *KCSYS* = 0).

2 – Use a negative load only (positive set to zero, valid for *LCOMP* = 0 and *KCSYS* = 0).

3 – Applied load is not used if the surface normal is oriented in the same general direction as the user-defined vector. Valid for *KCSYS* = 2 only.

KAREA

Loaded area during large deformation:

0 – Use the current (deformed) area (default).

1 – Use the initial area.

KPROJ

Vector-oriented load (*KCSYS* = 2) behavior:

0 – Apply the load on the full area and include the tangential component (default).

1 – Apply the load on the projected area and include the tangential component.

2 – Apply the load on the projected area and exclude the tangential component.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KFOLLOW

Controls follower-load behavior. Valid when *KCSYS* = 1 or 2, or when *KCSYS* = 0 and *VAL1* > 10.

0 – The load maintains a fixed direction (default).

1 –The load follows the element deformation.

For more information, see "Follower Load Behavior" (p. 1755).

Notes

SFCONTROL (p. 1748) defines the properties of structural distributed loads for all subsequent **SF (p. 1733)** or **SFE (p. 1761)** loading commands. (**SFA (p. 1739)** and **SFL (p. 1774)** are not supported.)

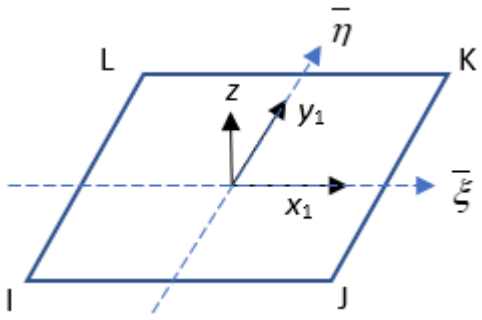
The command does not support 2D-to-3D analysis.

To update a load property or properties, reissue **SFCONTROL (p. 1748)** with the new option(s) before issuing further **SF (p. 1733)** or **SFE (p. 1761)** commands.

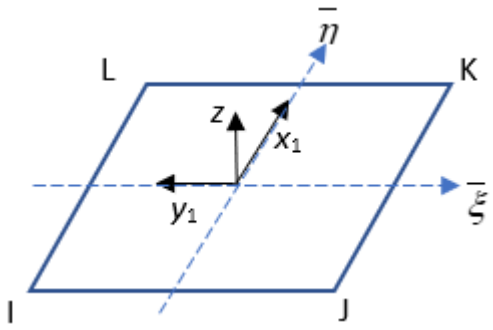
SFCONTROL (p. 1748) supports these structural solid, shell, solid-shell, and coupled-field elements:

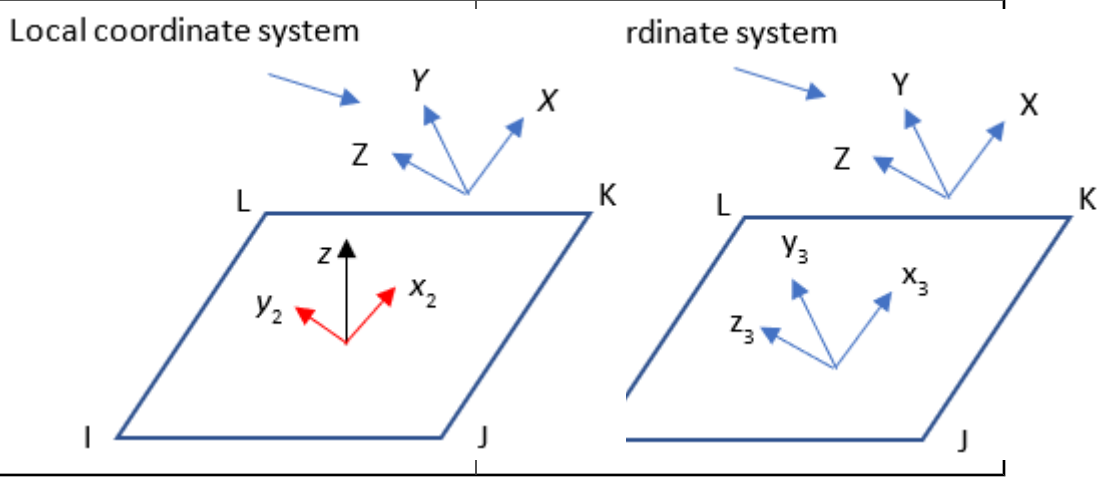
SHELL181, PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, SOLSH190, SHELL208, SHELL209, SHELL281, SOLID285, PLANE222, PLANE223, SOLID225, SOLID226, and SOLID227.

To list the current set of control data, issue **SFCONTROL (p. 1748)**,STAT.



To reset all input values to defaults, issue **SFCONTROL (p. 1748)**,NONE.





When *KCSYS* = 0, the positive normal load acts in the negative surface normal (-*z*) direction. The positive tangential loads act in the positive coordinate direction. A user-defined coordinate system (*VAL1*) is ignored if the load is applied on an edge of a plane element (PLANE182, PLANE183, SHELL208, SHELL209, PLANE222, and PLANE223).

When *KCSYS* = 1, the loading direction follows the positive direction of the local coordinate system. The ID of a local coordinate system (*VAL1*) is required.

The following figure shows how the coordinate directions are determined on a face of a solid or shell element with different *KCSYS* and *VAL1* input:

Figure 18: Coordinate System for Load Application on the Faces of 3D Solid and Shell Elements

	KCSYS = 0	*KCSYS* = 1
VAL1 = 0		–

VAL1 = 1		–
VAL1 > 10		

where:

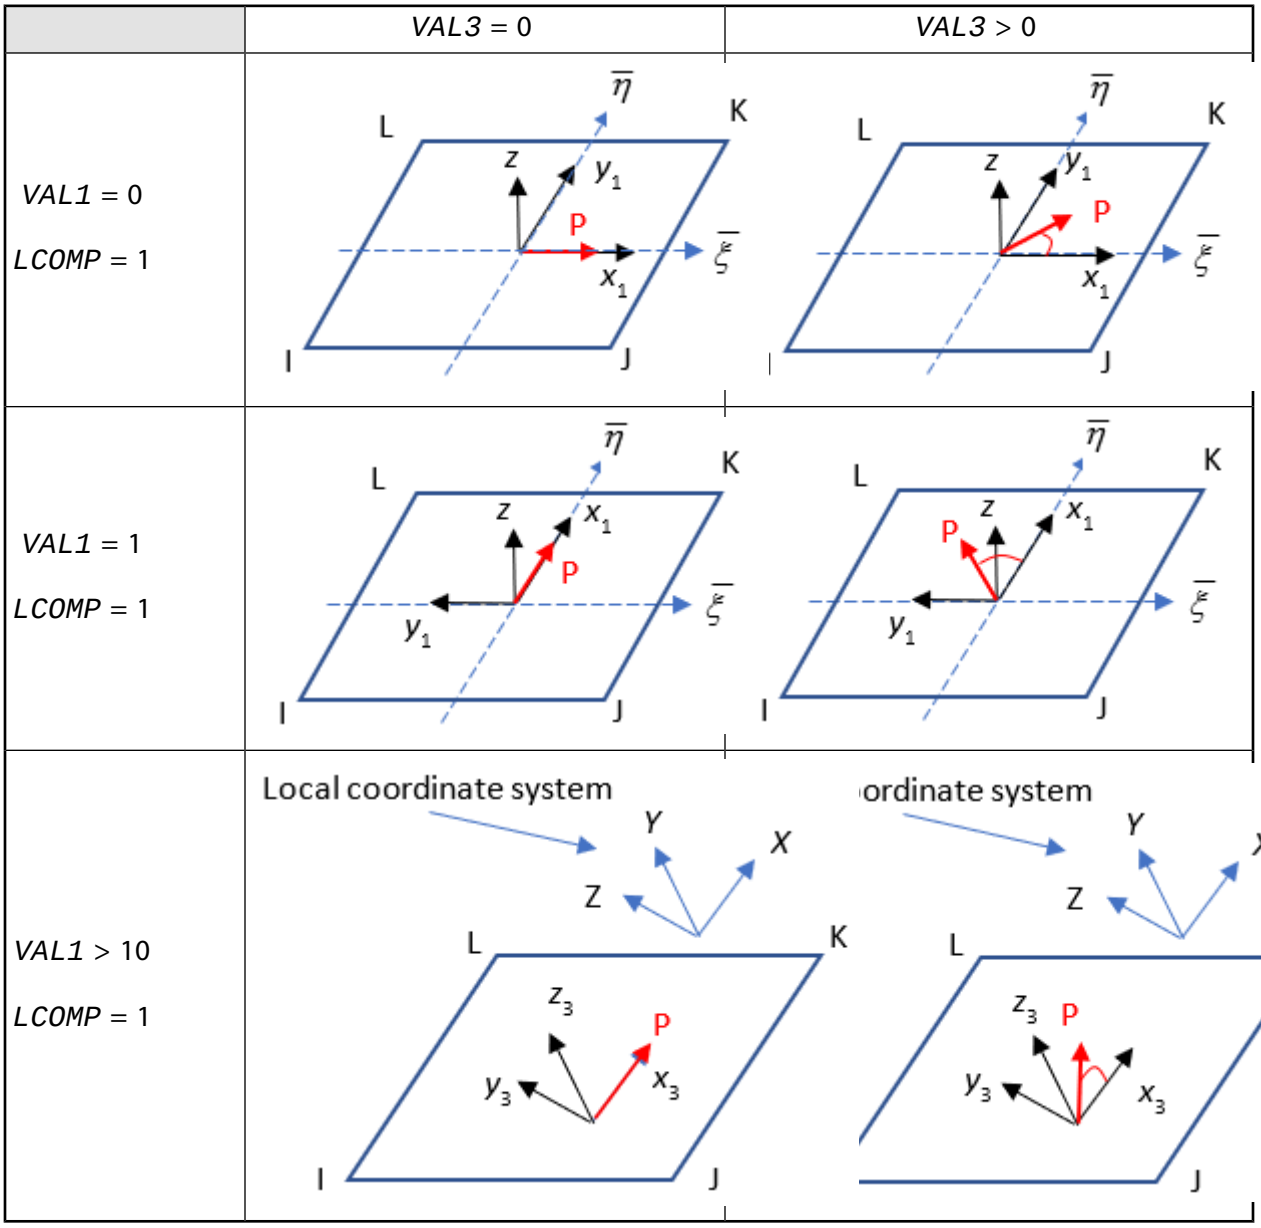
z, x_1, y_1 : normal and tangential directions (default surface coordinate system)

z, x_2, y_2 : normal and user-defined tangential directions (user-defined surface coordinate system)

x_3, y_3, z_3 : x, y, and z directions defined by the local coordinate system when *KCSYS* = 1

When *KCSYS* = 0:

The parametric direction determines the default coordinate system on a face. By default, the first parametric direction ($\overline{\xi}$) becomes the first tangential direction (x direction). If *VAL1* = 1, the second parametric direction ($\overline{\eta}$) is selected as the x direction.



For the projected local coordinate system (*VAL1* > 10), the direction of the first tangential axes (x_2) is determined by the projection of the local coordinate system onto the face. The projected tangential axes may rotate if the direction of the face normal (z) changes in the space during solution. If the direction of the face normal (z) is fixed (for in-plane rotation, for example), the tangential axes do not follow element deformation. To enable your coordinate system to always follow the element deformation, specify the follower option (*KFOLLOW*).

Coordinate System vs. Load Direction

For the loads defined in the default coordinate system (*KCSYS* = 0), the tangential direction of a load is restricted because it is aligned to the direction of the axis (*LCOMP*). The load direction can be arbitrary by adding additional rotation to the load (*VAL3*). The following figure shows how the load direction is determined on the face of an element. If *VAL3* > 0, *LCOMP* becomes the reference axis to define the rotation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

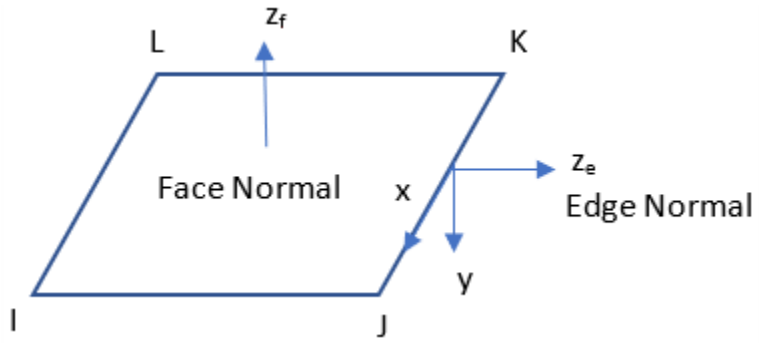
Figure 19: Load Direction in the Default Coordinate System

When *KCSYS* = 1:

The positive direction of the x_3, y_3, and z_3 axes follow the direction of the local coordinate system without adjustment. Therefore, they do not follow element deformation.

When *KCSYS* = 2:

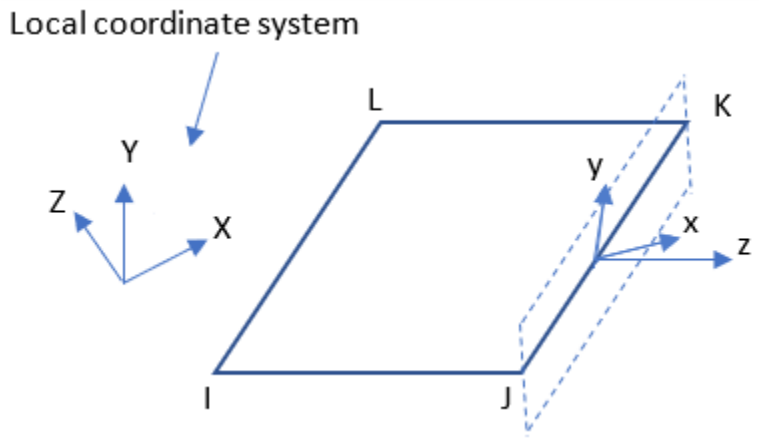
The loading direction follows the positive direction of the orientation vector, defined via *VAL1*, *VAL2*, and *VAL3*. The direction is calculated as $VAL1\bar{i}+VAL2\bar{j}+VAL3\bar{k}\Big/\sqrt{VAL1^2+VAL2^2+VAL3^2}$, where $\bar{i}$, $\bar{j}$, and $\bar{k}$ are unit vectors in the global Cartesian coordinate system. The loading direction is fixed and does not follow the deformation of a face of a selected element.



You can adjust the load magnitude (*KUSE* and *KPROJ*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Use the follower option (*KFOLLOW*) to specify whether the load has a fixed direction (*KCSYS* = 1 or 2), or projects the local coordinate system to the element face to follow element deformation (*KCSYS* = 0 and *VAL1* > 10) .



The following figure shows the default direction of the normal (z) and tangential (x) components on an edge of a 3D shell element (SHELL181 or SHELL281).

Figure 20: Default Coordinate System of Surface Load on the Edge of a 3D Shell Element

If a local coordinate system is defined and *KCSYS* = 0 for the edge of the 3D shell element, the tangential directions are adjusted in the plane of the edge.

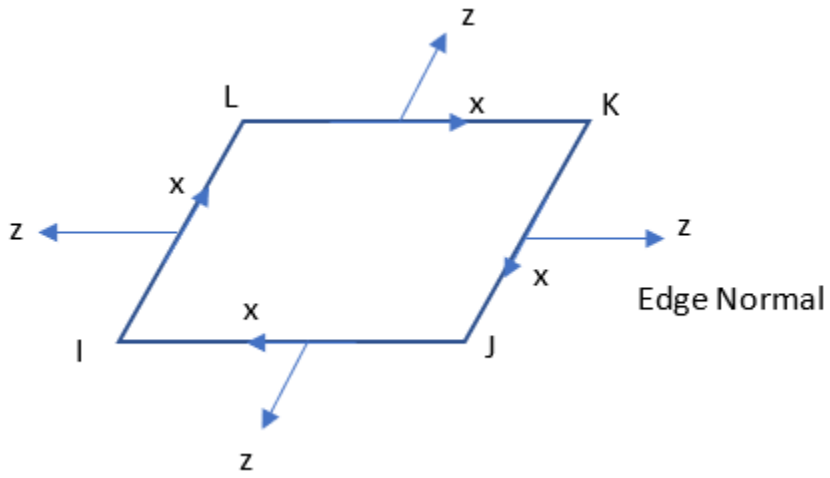


Figure 21: Projected Coordinate System of Surface Load on the Edge of a 3D Shell Element

The following figure shows the positive direction of the loads on the edge of a plane element when *KCSYS* = 0. The positive direction of the tangential load is defined by the definition of the faces (J-I, K-J, L-K, I-L).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 22: Positive Tangential Load on the Edge of a Plane Element

If *KCSYS* = 1 or 2, the load direction does not change and *KUSE* = 1 or 2 is ignored.

If *KCSYS* = 1 or 2, or *KTAPER* > 0, you cannot specify a gradient (slope) for surface loads (**SFGRAD (p. 1772)**) or a varying surface load (**SFFUN (p. 1771)**).

This command is also valid in the PREP7 processor.

Global Tapered Load Behavior (*KTAPER*)

If *KTAPER* = 1, the magnitude of the load is determined by the *current* location of a point:

$$P=P_I+P_JX+P_KY+P_LZ$$

where:

$P_I \sim P_L$: Values on **SFE (p. 1761)** (*VAL1* ~ *VAL4*)

X, Y, Z : Global Cartesian coordinates at the current location of the point.

If *KTAPER* = 2, the magnitude of the load is determined by the *initial* location of a point:

$$P=P_I+P_JX_0+P_KY_0+P_LZ_0$$

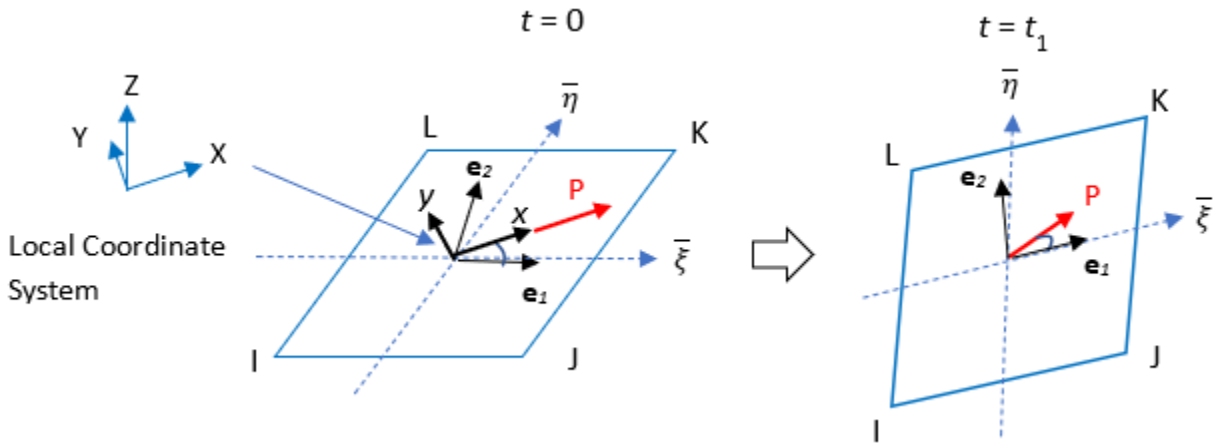
where:

$P_I \sim P_L$: Values on **SFE (p. 1761)** (*VAL1* ~ *VAL4*)

X_0, Y_0, Z_0 : Global Cartesian coordinates at the initial location of the point.

KTAPER is not valid for use with **SF (p. 1733)**.

Follower Load Behavior



The follower option (*KFOLLOW*) determines whether the load maintains a fixed direction (default) or follows element deformation. The option applies to surface loads defined by a fixed direction (*KCSYS* = 1 or 2) or by a projected user-defined coordinate system (*KCSYS* = 0 and *VAL1* > 10).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When *KCSYS* = 0 and *VAL1* > 10:

The selected local coordinate system is projected onto the face at the initial state, then the projected tangential component (*LCOMP*) is attached to the orthonormal basis ($\mathbf{e}_1$, $\mathbf{e}_2$, $\mathbf{e}_3$) of the face. The orthonormal basis may or may not be coincident to the $\bar{\xi}-\bar{\eta}$ coordinate system. During solution, the basis is updated at the current time step and the load direction is updated with respect to the basis.

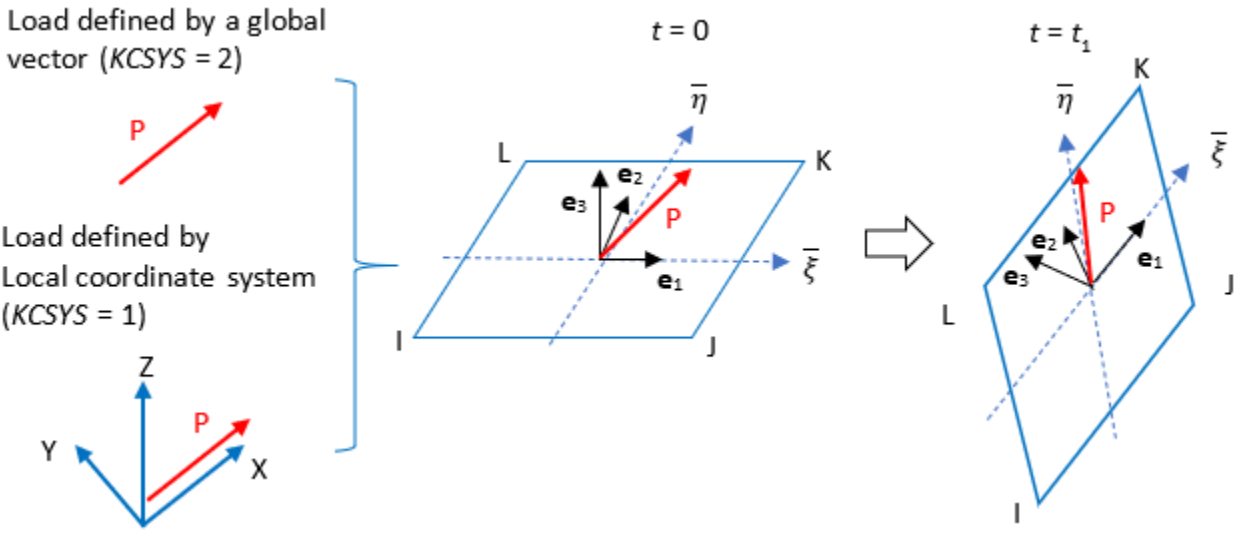


Figure 23: Follower Load Behavior in the Projected Coordinate System

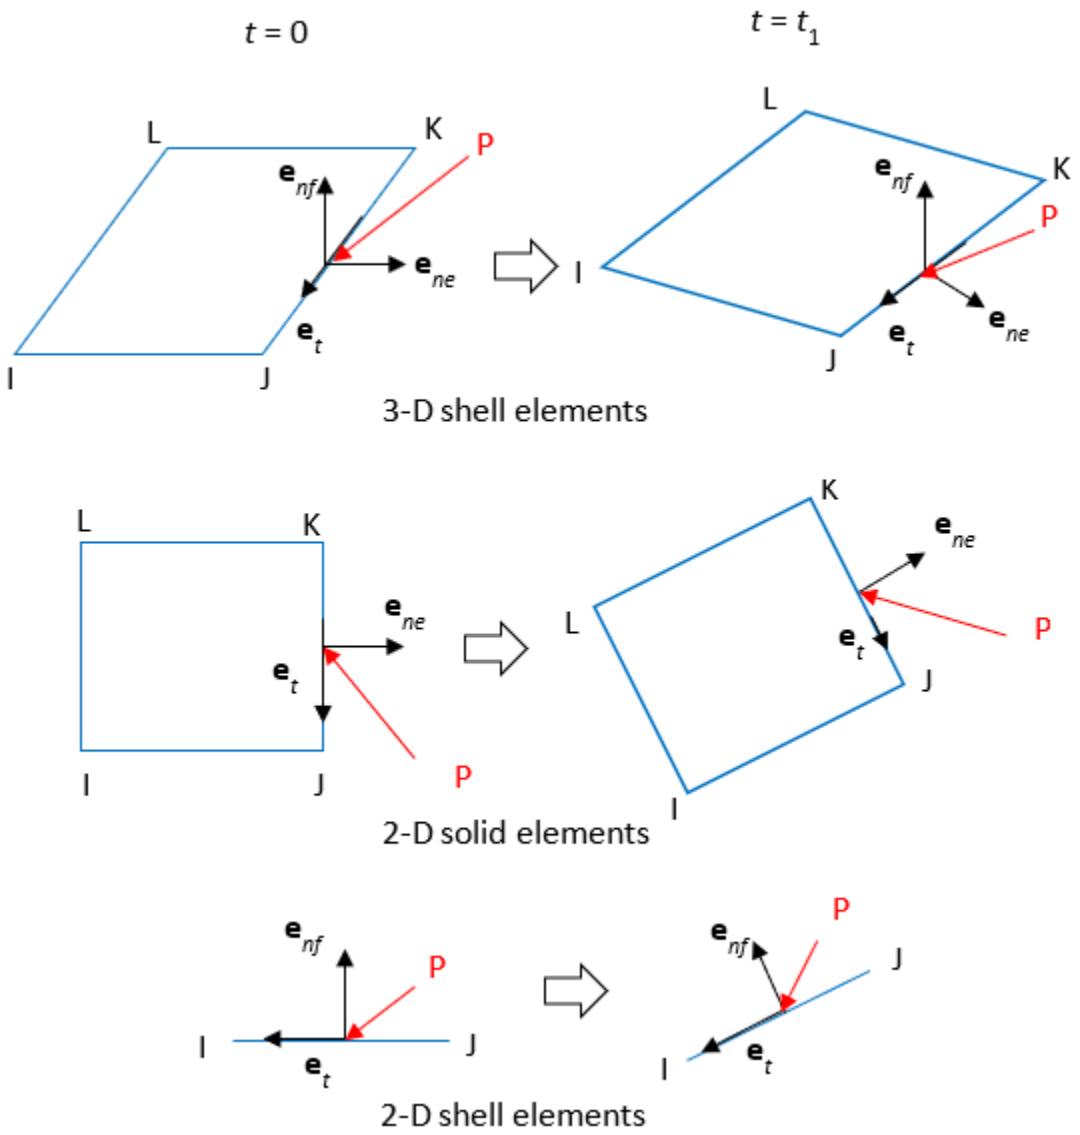
When *KCSYS* = 1 or 2:

The global direction vector is attached to the orthonormal basis of selected face at the initial state. When *KCSYS* = 1, the direction of selected axis is considered as the direction vector and attached to the basis. During solution, the basis is updated at current time step and the load direction is updated with respect to the basis.

Figure 24: Follower Load Behavior for a User-Defined Orientation



Follower loads on the edges of 3D shell and 2D elements:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The load is attached to the basis defined on the edge ($\mathbf{e}_t$, $\mathbf{e}_{ne}$, $\mathbf{e}_{nf}$ [tangential, edge-normal, and face-normal vector, respectively]). For 2D solid elements, the face-normal orientation ($\mathbf{e}_{nf}$) is that of the global Z axis. For 2D shell elements, the edge-normal ($\mathbf{e}_{ne}$) is that of the global Z axis.

Figure 25: Follower Load Behavior on the Edges of 3D Shell and 2D Elements

If it is necessary to use the follower option after the first load step or at the restart analysis, define the load direction with respect to the current geometry (that is, the current basis of an element face). The follower option for the local coordinate system (*KCSYS* = 1) is not allowed after the first load step or at the restart analysis.

Load-Stiffness Effects

Load-stiffness effects are included in the supported elements for the real part of all loads at the current configuration. All other load properties are included in the load vector of the elements.

You can specify an unsymmetric matrix (**NROPT (p. 1261)**,UNSYM) for the load-stiffness effects if needed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

SFCUM, *Lab*, *Oper*, *FACT*, *FACT2*

Specifies that surface loads are to be accumulated.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid surface load label. If ALL, use all appropriate labels.

Discipline	Surface Load Label	Label Description
Structural	PRES	pressure
Thermal	CONV[1]	convection
	HFLUX[1]	heat flux
Substructure	SELV	load vector number
Electric	CHRGS	surface charge density
	MXWF	Maxwell force flag
Magnetic	MXWF	Maxwell force flag
Infinite element	INF	Exterior surface flag for INFIN110 and INFIN111
Diffusion	DFLUX	Diffusion flux

1. Thermal labels CONV and HFLUX are mutually exclusive.

Oper

Accumulation key:

REPL

Subsequent values replace the previous values (default).

ADD

Subsequent values are added to the previous values.

IGNO

Subsequent values are ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FACT

Scale factor for the first surface load value. A (blank) or '0' entry defaults to 1.0.

FACT2

Scale factor for the second surface load value. A (blank) or '0' entry defaults to 1.0.

Command Default

Replace previous values.

Notes

Allows repeated surface loads (pressure, convection, etc.) to be replaced, added, or ignored. Surface loads are applied with the **SF (p. 1733)**, **SFE (p. 1761)**, and **SFBEAM (p. 1746)** commands. Issue the **SFELIST (p. 1770)** command to list the surface loads. The operations occur when the next surface load specifications are defined. For example, issuing the **SF (p. 1733)** command with a pressure value of 25 after a previous **SF (p. 1733)** command with a pressure value of 20 causes the current value of that pressure to be 45 with the add operation, 25 with the replace operation, or 20 with the ignore operation. All new pressures applied with **SF (p. 1733)** after the ignore operation will be ignored, even if no current pressure exists on that surface.

Scale factors are also available to multiply the next value before the add or replace operation. A scale factor of 2.0 with the previous "add" example results in a pressure of 70. Scale factors are applied even if no previous values exist. Issue **SFCUM (p. 1758)**,STAT to show the current label, operation, and scale factors. Solid model boundary conditions are not affected by this command, but boundary conditions on the FE model are affected.

Note:

The FE boundary conditions may still be overwritten by existing solid model boundary conditions if a subsequent boundary condition transfer occurs.

SFCUM (p. 1758) does not work for tabular boundary conditions.

This command is also valid in PREP7.

Menu Paths

Main Menu>Solution>Define Loads>Settings>Replace vs Add>Surface Loads

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SFDELE,*Nlist*,*Lab*

Deletes surface loads.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Nlist

Label defining where to find the list of nodes:

ALL

Use all selected nodes (**NSEL (p. 1266)**). If P, use graphical picking in GUI. A component label may be substituted for *Nlist*.

Lab

Valid surface load label. If ALL, use all appropriate labels. See the **SF (p. 1733)** command for labels.

Notes

Deletes surface loads as applied via **SF (p. 1733)**. Loads are deleted only for the specified nodes on external faces of selected area and volume elements. For shell elements, if the specified nodes include face one (which is usually the bottom face) along with other faces (such as edges), only the loads on face one will be deleted. The element faces are determined from the list of selected nodes as described for **SF (p. 1733)**. Issue **SFEDELE (p. 1768)** to delete loads explicitly by element faces.

This command is also valid in PREP7.

---

SFE, *Elem*, *LKEY*, *Lab*, *KVAL*, *VALUE1*, *VALUE2*, *VALUE3*, *VALUE4*, *MESHFLAG*

Defines surface loads on elements.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Elem

Element to which surface load applies. If ALL, apply load to all selected elements (**ESEL (p. 661)**). If *Elem* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *Elem*.

LKEY

Load key or face number associated with surface load (defaults to 1). Load keys (1,2,3, etc.) are listed under "Surface Loads" in the input data table for each element type in the *Element Reference*.

If you issue **SFCONTROL (p. 1748)** before **SFE (p. 1761)**, *LKEY* is the face number for supported structural solid and shell elements (p. 1751).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Lab

Valid surface load label. Load labels are listed under "Surface Loads" in the input table for each element type in the *Element Reference*.

Discipline	Surface Load Label	Label Description
Structural	PRES	Pressure
	FREQ	Frequency (harmonic analyses only)
Thermal	CONV[1]	Convection
	HFLUX[1]	Heat flux
	RAD	Radiation
	RDSF	Surface-to-surface radiation
Fluid	FSI[2]	Fluid-structure interaction flag
	IMPD	Impedance boundary flag
Electric	CHRGS	Surface charge density
	MXWF	Maxwell force flag
Magnetic	MXWF	Maxwell force flag
Acoustic fluid	FSI[2]	Fluid-structure interaction flag
	IMPD	Impedance or admittance coefficient
	SHLD	Surface normal velocity or acceleration
	MXWF	Maxwell surface flag or equivalent source surface
	FREE	Free surface flag
	INF	Exterior Robin radiation boundary flag
	PORT	Port number
	ATTN	Absorption coefficient or transmission loss
	BLI	Viscous-thermal boundary layer surface flag
Field-surface interface	FSIN	Field-surface interface number
Poromechanics	FFLX	Fluid flow flux
Infinite element	INF	Exterior surface flag for INFIN110 and INFIN111
Substructure	SELV[3]	Load vector number
Diffusion	DFLUX	Diffusion flux

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Thermal labels CONV and HFLUX are mutually exclusive.
2. For an acoustic analysis, apply the fluid-structure interaction flag (Label = FSI) to only the FLUID29, FLUID30, FLUID220, and FLUID221 elements.
3. When a load vector exists for a thermal superelement, it must be applied and have a scale factor of 1 (**SFE (p. 1761)**,,,,SELV,,1).

KVAL

Value key. If *Lab* = PRES:

0 or 1

VALUE1 through *VALUE4* are used as real components of pressures.

2

VALUE1 through *VALUE4* are used as imaginary components of pressures.

Value key. If *Lab* = CONV:

0 or 1

For thermal analyses, *VALUE1* through *VALUE4* are used as the film coefficients.

2

For thermal analyses, *VALUE1* through *VALUE4* are the bulk temperatures.

3

VALUE1 through *VALUE4* are used as film effectiveness.

4

VALUE1 through *VALUE4* are used as free stream temperature.

Value key. If *Lab* = RAD:

0 or 1

VALUE1 through *VALUE4* are used as the emissivities.

2

VALUE1 through *VALUE4* are ambient temperatures.

Value key. If *Lab* = RDSF:

0 or 1

VALUE1 is the emissivity value between 0 and 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2

VALUE1 is the enclosure number.

Value key. If *Lab* = IMPD:

0 or 1

For acoustic harmonic analyses, VALUE1 through VALUE4 are used as the real part of the impedance.

2

For acoustic harmonic analyses, VALUE1 through VALUE4 are used as the imaginary part of the impedance.

Value key. If *Lab* = SHLD:

0 or 1

For acoustic analyses, *VALUE1* through *VALUE4* are used as the normal velocity (harmonic) or normal acceleration (transient).

2

For acoustic analyses, *VALUE1* through *VALUE4* are used as the phase angle for harmonic response analyses.

Value key. If *Lab* = ATTN:

0 or 1

For acoustic analyses, *VALUE1* through *VALUE4* are used as the absorption coefficient of the surface.

2

For acoustic analyses, *VALUE1* through *VALUE4* are used as the transmission loss (dB) of the coupled wall in an energy diffusion solution for room acoustics.

Value key. If *Lab* = SELV:

0 or 1

VALUE1 is the multiplier on real load vector *LKEY*.

2

VALUE1 is the multiplier on imaginary load vector *LKEY*.

If only one set of data is supplied, the other set of data defaults to previously specified values (or zero if not previously specified) in the all of the following cases:

- Emissivities are supplied and *Lab* = RAD

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Temperatures are supplied and *Lab* = RAD
- Temperatures are supplied and *Lab* = CONV
- Film coefficients are supplied and *Lab* = CONV
- Normal velocity/acceleration for acoustics is supplied and *Lab* = SHLD
- Phase angle for acoustics is supplied and *Lab* = SHLD

Not applicable for *Lab* = FREQ, CHRGS, PORT, FSIN, FFLX, DFLUX

VALUE1

First surface load value (typically at the first node of the face), or the name of a table for specifying tabular boundary conditions.

Face nodes are listed in the order given for **Surface Loads** in the input data table for each element type in the *Element Reference*. For example, for SOLID185, the item 1-JILK associates *LKEY* = 1 (face 1) with nodes J, I, L, and K. Surface load value *VALUE1* then applies to node J of face 1. To specify a table, enclose the table name in percent signs (%), for example, %*tabname*%. Use the ***DIM (p. 530)** command to define a table. Only one table can be specified, and it must be specified in the *VALUE1* position; tables specified in the *VALUE2*, *VALUE3*, or *VALUE4* positions are ignored. *VALUE2* applies to node I, etc.

If *Lab* = PRES and *KVAL* = 2, this value is the imaginary pressure component, used by the following supported elements:

- Surface elements: SURF153, SURF154 and SURF159.
- Solid and solid-shell elements: PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, SOLSH190, and SOLID285.
- Shell elements: SHELL181, SHELL281, SHELL208, and SHELL209.
- Coupled-field elements with structural degrees of freedom: PLANE222, PLANE223, SOLID225, SOLID226, and SOLID227.

If *Lab* = CONV, *KVAL* = 0 or 1, and *VALUE1* = -*N*, the film coefficient is assumed to be a function of temperature and is determined from the HF property table for material *N* (**MP (p. 1160)**). (See the **SCOPT (p. 1649)** command for a way to override this option and use -*N* as the film coefficient.) The temperature used to evaluate the film coefficient is usually the average between the bulk and wall temperatures, but may be user-defined for some elements.

If *Lab* = CONV, *KVAL* = 2, *VALUE1* specifies the bulk temperature. If **KBC (p. 970)**,0 has been issued for ramped loads, the bulk temperature is ramped from the value defined by **TUNIF (p. 2027)** to that specified on *VALUE1* (for the first loadstep). If a table name is specified for *VALUE1*, the **KBC (p. 970)** command is ignored and tabular values are used.

If *Lab* = PORT, *VALUE1* is a port number representing a waveguide port. The port number must be an integer between 1 and 50. For an acoustic 2×2 transfer admittance matrix, the port number can be any positive integer. The smaller port number corresponds to port 1 of the 2×2 transfer admittance matrix, and the greater port number corresponds to port 2. If one port of the transfer admittance matrix is connecting to the acoustic-structural interaction interface, the port number cor-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

responds to port 2 of the transfer admittance matrix. A pair of ports of the 2×2 transfer admittance matrix must be defined in the same element.

If *Lab* = RDSF, *KVAL* = 0 or 1, and *VALUE1* = -*N*, the emissivity is assumed to be a function of the temperature, and is determined from the EMISS property table for material *N* (**MP (p. 1160)**). The material *N* does not need to correlate with the underlying solid thermal elements. If *Lab* = RDSF, *KVAL* = 2, and *VALUE1* is negative, radiation direction is reversed and will occur inside the element for the flagged radiation surfaces.

If *Lab* = FSIN in a unidirectional Mechanical APDL-to-CFX analysis, *VALUE1* is not used.

If *Lab* = SELV, *VALUE1* represents the scale factor (default = 0.0).

If *Lab* = ATTN, *VALUE1* is the absorption coefficient.

VALUE2, VALUE3, VALUE4

Surface load values at the second, third, and fourth nodes (if any) of the face.

If all three values are blank, all default to *VALUE1*, giving a constant load. Zero or other blank values are used as zero.

If *VALUE2*, *VALUE3*, or *VALUE4* are magnitudes of the load, they are ignored if *VALUE1* is a table. If *VALUE2*, *VALUE3*, or *VALUE4* are any other values, they are used even if *VALUE1* is a table (for example, the load direction for face 5 of SURF154).

If *Lab* = FSIN in a unidirectional Mechanical APDL-to-CFX analysis, *VALUE2* is the surface interface number (not available in the GUI). *VALUE3* and *VALUE4* are not used.

MESHFLAG

Specifies how to apply normal pressure loading on the mesh. Valid in a nonlinear adaptivity analysis when *Lab* = PRES and *KVAL* = 0 or 1.

0 – Pressure loading occurs on the current mesh (default).

1 – Pressure loading occurs on the initial mesh for nonlinear adaptivity.

Notes

SFE (p. 1761) defines surface loads on selected elements.

Caution:

You cannot use **SFE (p. 1761)** with the INFIN110 or INFIN111 elements without prior knowledge of element-face orientation (that is, you must know which face is the exterior in order to flag it). Also, for surface-effect elements SURF153 and SURF154, use *LKEY* to enable tangential and other loads. For supported structural solid and shell elements (p. 1751), issue **SFCONTROL (p. 1748)** to define tangential and other loads.

SFE (p. 1761) can apply tapered loads over the faces of most elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can use these related surface-load commands with **SFE (p. 1761)**:

SF (p. 1733) – Defines surface loads on *nodes*.

SFBEAM (p. 1746) – For beam elements allowing lateral surface loads that can be offset from the nodes, this command specifies the loads and offsets.

SFCONTROL (p. 1748) – Applies general (normal, tangential, and other) surface loads to supported structural elements (p. 1751).

SFCUM (p. 1758) – Accumulates (adds) surface loads applied via **SFE (p. 1761)**.

SFDELE (p. 1760) – Delete loads applied via **SFE (p. 1761)**.

SFFUN (p. 1771) – Applies loads from a node-vs.-value function.

SFGRAD (p. 1772) – Applies an alternate tapered load.

The **SFE (p. 1761)** command can also define fluid-pressure-penetration loads (*Lab* = PRES) at a contact interface. For this type of load, *LKEY* = 1 is used to specify the normal pressure values, *LKEY* = 3 is used to specify the tangential pressure values along the x direction of **ESYS (p. 685)**, *LKEY* = 4 is used to specify the tangential pressure values along the y direction of **ESYS (p. 685)**, and *LKEY* = 2 is used to specify starting points and penetrating points. See Applying Fluid-Penetration Pressure in the *Contact Technology Guide* for details on how to apply this type of load.

Film effectiveness and free-stream temperatures specified via *Lab* = CONV are valid only for SURF151 and SURF152. Film effectiveness must be between 0 and 1 and it defaults to 0. If film effectiveness is applied, bulk temperature is ignored. When film effectiveness and free stream temperatures are specified, the commands to specify a surface-load gradient (**SFGRAD (p. 1772)**) or surface-load accumulation (**SFCUM (p. 1758)**) are not valid. For more information about film effectiveness, see Conduction, Convection, and Mass Transport (Advection) in the *Theory Reference*.

You can specify a table name only when using structural (PRES) and thermal (CONV [film coefficient, bulk temperature, film effectiveness, and free stream temperature], HFLUX), diffusion flux (DFLUX), surface emissivity and ambient temperature (RAD), impedance (IMPD), normal velocity or acceleration (SHLD), absorption coefficient (ATTN), and substructure (SELV) surface load labels.

When a tabular function load is applied to an element, the load will not vary according to the positioning of the element in space.

For cases where Lab=FSI, MXWF, FREE, and INF, VALUE is not needed.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in the PREP7 and **/MAP (p. 1107)** processors.

SFEDELE, *ELEM*, *LKEY*, *Lab*, *Lcomp*

Deletes surface loads from elements.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element to which surface load deletion applies. If ALL, delete load from all selected elements (**ESEL (p. 661)**). If *ELEM* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *ELEM*.

LKEY

Load key associated with surface load (defaults to 1). If ALL, delete surface loads for all load keys. If **SFCONTROL (p. 1748)** is issued for selected elements, this value is the face number. If ALL, deletes the surface load based on *Lcomp*.

Lab

Surface load label. If ALL, use all appropriate labels. See **SFE (p. 1761)** for valid labels.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Lcomp

Label of surface-load components. Valid when the surface load is defined via **SFCONTROL (p. 1748)**. Valid labels are NORM, TANX, TAXY when *KCSYS* = 0, LOCX, LOCY, LOCZ when *KCSYS* = 1, and USER when *KCSYS* = 2. (*KCSYS* is specified when issuing **SFCONTROL (p. 1748)**.) If ALL, deletes all component on the face defined by *LKEY*.

Notes

Deletes surface loads from selected elements. See the **SFDELE (p. 1760)** command for an alternate surface load deletion capability based upon selected nodes.

This command is also valid in PREP7.

---

SFELIST, *ELEM*, *Lab*

Lists the surface loads for elements.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element at which surface load is to be listed. If ALL (or blank), list loads for all selected elements (**ESEL (p. 661)**). If *ELEM* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *ELEM*.

Lab

Valid surface load label. If ALL (or blank), use all appropriate labels. See the **SFE (p. 1761)** command for labels.

Notes

The surface loads listed correspond to the current database values. The database is not updated for surface loads in POST1. Surface loads specified in tabular form, however, do list their values corresponding to the current results set in POST1.

For SURF151 or SURF152 elements with an extra node for radiation and/or convection calculations (KEYOPT(5) = 1), the bulk temperature listed is the temperature of the extra node. If the thermal solution does not converge, the extra node temperature is not available for listing.

Film effectiveness and free stream temperatures specified by the **SFE (p. 1761)** command (*Lab* = CONV) can only be listed by this command. The command lists film coefficients and bulk temperatures first and then film effectiveness and free stream temperatures below those values.

Distributed-Memory Parallel (DMP) Restriction

In a DMP analysis within the SOLUTION processor, **SFELIST (p. 1770)** support is not available for elements SURF151 and SURF152 when surface loading is applied via extra nodes (KEYOPT(5 > 0).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If the command is issued under these circumstances, the resulting surface loads shown are not reliable.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Surface Loads>On All Elements

Utility Menu>List>Loads>Surface Loads>On Picked Elems

SFFUN, *Lab*, *Par*, *Par2*

Specifies a varying surface load.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid surface load label. Load labels are listed under "Surface Loads" in the input table for each element type in the *Element Reference*. Issue **SFFUN (p. 1771)**,STATUS to list current command settings.

Discipline	Surface Load Label	Label Description
Structural	PRES	pressure
Thermal	CONV[1]	convection
	HFLUX[1]	heat flux
Electric	CHRGS	surface charge density
Diffusion	DFLUX	Diffusion flux

1. Thermal labels CONV and HFLUX are mutually exclusive.

Par

Parameter containing list of surface load values. If *Lab* = CONV, values are typically the film coefficients and *Par2* values (below) are typically the bulk temperatures.

Par2

Parameter containing list of second surface load values (if any). If *Lab* = CONV, the *Par2* values are typically the bulk temperatures. *Par2* is not used for other surface load labels.

Notes

Specifies a surface load "function" to be used when the **SF (p. 1733)** or **SFE (p. 1761)** command is issued. The function is supplied through an array parameter vector which contains nodal surface load values. Node numbers are implied from the sequential location in the array parameter. For example, a value in location 11 applies to node 11. The element faces are determined from the implied list of nodes when the **SF (p. 1733)** or **SFE (p. 1761)** command is issued. Zero values should be supplied for nodes that

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

have no load. A tapered load value may be applied over the element face. These loads are in addition to any loads that are also specified with the **SF (p. 1733)** or **SFE (p. 1761)** commands. Issue **SFFUN (p. 1771)** (with blank remaining fields) to remove this specification. Issue **SFFUN (p. 1771)**,STATUS to list current settings.

Starting array element numbers must be defined for each array parameter vector. For example, **SFFUN (p. 1771)**,CONV,A(1,1),A(1,2) reads the first and second columns of array A (starting with the first array element of each column) and associates the values with the nodes. Operations continue on successive column array elements until the end of the column. Another example to show the order of the commands:

```
*dim,nodepres,array,2
nodepres(1)=11,12
/prep7
et,1,42
n,1
n,2,1
n,3,1,1
n,4,,1
e,1,2,3,4
sfe,1,1,pres,1,3
sfelist ! expected answer: 3 at both nodes 1 and 2
sfedel,all,pres,all
sffun,pres, nodepres(1)
sfe,1,1,pres,1,5
sfelist ! expected answer: 5+11=16 at node 1, 5+12=17 at node 2
fini
```

SFFUN (p. 1771) does not work for tabular boundary conditions.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in PREP7.

Main Menu>Preprocessor>Loads>Define Loads>Settings>For Surface Ld>Node Function

Main Menu>Solution>Define Loads>Settings>For Surface Ld>Node Function

---

SFGRAD, *Lab*, *SLKCN*, *Sldir*, *SLZER*, *SLOPE*

Specifies a gradient (slope) for surface loads.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid surface load label. Load labels are listed under "Surface Loads" in the input table for each element type in the *Element Reference*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discipline	Surface Load Label	Label Description
Structural	PRES	pressure (real pressure only)
Thermal	CONV[1]	convection (bulk temperatures only)
	HFLUX[1]	heat flux
Electric	CHRGS	surface charge density
Diffusion	DFLUX	Diffusion flux

1. Thermal labels CONV and HFLUX are mutually exclusive.

SLKCN

Reference number of slope coordinate system (used with *Sldir* and *SLZER* to determine COORD). Defaults to 0 (the global Cartesian coordinate system).

Sldir

Slope direction in coordinate system *SLKCN*:

X

Slope is along X direction (default). Interpreted as R direction for non-Cartesian coordinate systems.

Y

Slope is along Y direction. Interpreted as θ direction for non-Cartesian coordinate systems.

Z

Slope is along Z direction. Interpreted as Φ direction for spherical or toroidal coordinate systems.

SLZER

Coordinate location (degrees for angular input) where slope contribution is zero (CVALUE = VALUE). Allows the slope contribution to be shifted along the slope direction. For angular input, *SLZER* should be between ±180° if the singularity (**CSCIR (p. 436)**) is at 180° and should be between 0° and 360° if the singularity is at 0°.

SLOPE

Slope value (load per unit length or per degree).

Notes

Specifies a gradient (slope) for surface loads. All surface loads issued with the **SF (p. 1733)**, **SFE (p. 1761)**, **SFL (p. 1774)**, or **SFA (p. 1739)** commands while this specification is active will have this gradient applied

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(for complex pressures, only the real component will be affected; for convections, only the bulk temperature will be affected). The load value, CVALUE, calculated at each node is:

CVALUE = VALUE + (*SLOPE* X (COORD-*SLZER*))

where VALUE is the load value specified on the subsequent **SF (p. 1733)**, **SFE (p. 1761)**, **SFL (p. 1774)**, or **SFA (p. 1739)** commands and COORD is the coordinate value (in the *Sldir* direction of coordinate system *SLKCN*) of the node. Only one **SFGRAD (p. 1772)** specification may be active at a time (repeated use of this command replaces the previous specification with the new specification). Issue **SFGRAD (p. 1772)** (with blank fields) to remove the specification. Issue **SFGRAD (p. 1772)**,STAT to show the current command status. The **SFGRAD (p. 1772)** specification (if active) is removed when the **LSREAD (p. 1083)** (if any) command is issued.

SFGRAD (p. 1772) does not work for tabular boundary conditions.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Settings>For Surface Ld>Gradient

Main Menu>Solution>Define Loads>Settings>For Surface Ld>Gradient

---

SFL, *Line*, *Lab*, *VALI*, *VALJ*, *VAL2I*, *VAL2J*

Specifies surface loads on lines of an area.

SOLUTION (p. 38): Solid Surface Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Line

Line to which surface load applies. If ALL, apply load to all selected lines (**LSEL (p. 1074)**). If *Line* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *Line*.

Lab

Valid surface load label. Load labels are listed under "Surface Loads" in the input table for each element type in the *Element Reference*.

Discipline	Body Load Label	Label Description
Structural	PRES	pressure
Thermal	CONV[1]	convection
	HFLUX[1]	heat flux

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discipline	Body Load Label	Label Description
	RAD	radiation
	RDSF	surface-to-surface radiation
Fluid	FSI[2]	fluid-structure interaction flag
	IMPD	impedance boundary flag
Magnetic	MXWF	Maxwell force flag
Infinite element	INF	Exterior surface flag for INFIN110 and INFIN111
Electric	CHRGS	surface charge density
	MXWF	Maxwell electrostatic force flag
Field-surface interface	FSIN	field-surface interface number

1. Thermal labels CONV and HFLUX are mutually exclusive.
2. For an acoustic analysis, apply the fluid-structure interaction flag (Label = FSI) to only the FLUID129 or FLUID130 elements.

VALI*, *VALJ

Surface load values at the first keypoint (*VALI*) and at the second keypoint (*VALJ*) of the line, or table name for specifying tabular boundary conditions. If *VALJ* is blank, it defaults to *VALI*. If *VALJ* is zero, a zero is used.

If *Lab* = CONV:

VALI and *VALJ* are the film coefficients and *VAL2I* and *VAL2J* are the bulk temperatures.

To specify a table, enclose the table name in percent signs (%), e.g., %*tabname*%. (Issue ***DIM (p. 530)** to define a table.)

If *Lab* = CONV and *VALI* = -*N*, the film coefficient may be a function of temperature and is determined from the HF property table for material *N* (**MP (p. 1160)**). (See **SCOPT (p. 1649)** for a way to override this option and use -*N* as the film coefficient.)

If **KBC (p. 970)**,0 has been issued for ramped loads, it affects only the bulk temperatures, *VAL2I* and *VAL2J*, and the film coefficient specification, *VALI* and *VALJ*, are unaffected.

If *Lab* = RAD, *VALI* and *VALJ* values are surface emissivities and *VAL2I* and *VAL2J* are ambient temperatures. The temperature used to evaluate the film coefficient is usually the average between the bulk and wall temperatures, but may be user-defined for some elements.

If *Lab* = RDSF, *VALI* is the emissivity value. If *VALI* = -*N*, the emissivity may be a function of the temperature and is determined from the EMISS property table for material *N* (**MP (p. 1160)**).

If *Lab* = FSIN in a unidirectional Mechanical APDL-to-CFX analysis, *VALJ* is the surface interface number (not available from within the GUI) and *VALI* is not used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL2I, VAL2J

Second surface load values (if any). If *VAL2J* is blank, it defaults to *VAL2I*. If *VAL2J* is zero, a zero is used. To specify a table (*Lab* = CONV), enclose the table name in percent signs (%), for example, %*tabname*%. Use the ***DIM (p. 530)** command to define a table.

If *Lab* = CONV:

VAL2I and *VAL2J* are the bulk temperatures.

If **KBC (p. 970)**,0 has been issued for ramped loads, the bulk temperature is ramped from the value defined by **TUNIF (p. 2027)** to the value specified by *VALI* and *VALJ* for the first loadstep. If tabular boundary conditions are defined, the **KBC (p. 970)** command is ignored and tabular values are used for the bulk temperatures.

If *Lab* = RAD, *VAL2I* and *VAL2J* are the ambient temperatures.

If *Lab* = RDSF, *VAL2I* is the enclosure number. Radiation will occur between surfaces flagged with the same enclosure numbers. If the enclosure is open, radiation will occur to the ambient.

VAL2I and *VAL2J* are not used for other surface load labels.

Notes

Specifies surface loads on the selected lines of area regions. The lines represent either the edges of area elements or axisymmetric shell elements themselves. Surface loads may be transferred from lines to elements via **SFTRAN (p. 1782)** or **SBCTRAN (p. 1647)**. See **SFE (p. 1761)** for a description of surface loads. Loads input on this command may be tapered. See **SFGRAD (p. 1772)** for an alternate tapered load capability.

You can specify a table name only when using structural (PRES) and thermal (CONV [film coefficient and/or bulk temperature], HFLUX), and surface emissivity and ambient temperature (RAD) surface load labels. *VALJ* and *VAL2J* are ignored for tabular boundary conditions.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via **LVSCALE (p. 1094)**.

This command is also valid in PREP7.

SFLDELE, *LINE*, *Lab*

Deletes surface loads from lines.

SOLUTION (p. 38): Solid Surface Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LINE

Line to which surface load deletion applies. If ALL, delete load from all selected lines (**LSEL (p. 1074)**). If *LINE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *LINE*.

Lab

Valid surface load label. If ALL, use all appropriate labels. See the **SFL (p. 1774)** command for labels.

Notes

Deletes surface loads (and all corresponding finite element loads) from selected lines.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SFLEX, *FFAX*, *FFBY*, *FFBZ*, *FFT0*, *FFTSY*, *FFTSZ*

Sets flexibility factors for the currently defined pipe element section.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FFAX

Factor to increase axial flexibility. The default value is 1.0.

FFBY

Factor to increase bending flexibility about element y axis (bending in the element x-z plane). The default value is 1.0.

FFBZ

Factor to increase bending flexibility about element z axis (bending in the element x-y plane). The default value is *FFBY*.

FFT0

Factor to increase torsional flexibility. The default value is 1.0.

FFTSY

Factor to increase transverse shear flexibility in the element x-z plane. The default value is 1.0.

FFTSZ

Factor to increase transverse shear flexibility in the element x-y plane. The default value is *FFTSY*.

Notes

The **SFLEX (p. 1779)** command sets section-flexibility factors for sections used by pipe elements.

To increase *stiffness*, use a flexibility factor of less than 1.0.

The *FFBY* and *FFTSY* arguments affect motion in the element x-z plane, and the *FFBZ* and *FFTSZ* arguments affect motion in the element x-y plane. For stout pipe structures with low slenderness ratios, set *both* FFBY and FFTSY--and/or *both* FFBZ and FFTSZ (the related bending and transverse shear factors)--to the same value to obtain the expected flexibility effect.

When issued, the **SFLEX (p. 1779)** command applies to the pipe section most recently defined via the **SECTYPE (p. 1697)** command.

SFLEX (p. 1779) is valid only for linear material properties and small strain analyses. The command does not support offsets, temperature loading, or initial state loading. While the resulting displacements and reactions are valid, the stresses may not be valid.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Sections>Pipe>Flexibility Factors

SFLIST, *NODE*, *Lab*

Lists surface loads.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Node at which surface load is to be listed. If ALL (or blank), list for all selected nodes (**NSEL (p. 1266)**). If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *NODE*.

Lab

Valid surface load label. If ALL (or blank), use all appropriate labels. See the **SF (p. 1733)** command for labels

Notes

Lists the surface loads as applied with the **SF (p. 1733)** command. Loads are listed only for the specified nodes on external faces of selected area and volume elements. Use **SFELIST (p. 1770)** for line elements. The surface loads listed correspond to the current database values. The database is not updated for surface loads in POST1. Surface loads specified in tabular form, however, do list their values corresponding to the current results set in POST1.

For SURF151 or SURF152 elements with an extra node for radiation and/or convection calculations (KEYOPT(5) = 1), the bulk temperature listed is the temperature of the extra node. If the thermal solution does not converge, the extra node temperature is not available for listing.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Surface Loads>On All Nodes

Utility Menu>List>Loads>Surface Loads>On Picked Nodes

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SFLLIST, *LINE*, *Lab*

Lists the surface loads for lines.

SOLUTION (p. 38): Solid Surface Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LINE

Line at which surface load is to be listed. If ALL (or blank), list for all selected lines (**LSEL (p. 1074)**). If *LINE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *LINE*.

Lab

Valid surface load label. If ALL (or blank), use all appropriate labels. See the **SFL (p. 1774)** command for labels.

Notes

Lists the surface loads for the specified line.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Surface Loads>On All Lines

Utility Menu>List>Loads>Surface Loads>On Picked Lines

SFSCALE, *Lab*, *FACT*, *FACT2*

Scales surface loads on elements.

SOLUTION (p. 38): FE Surface Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid surface load label. If ALL, use all appropriate labels.

Discipline	Surface Load Label	Label Description
Structural	PRES	pressure
Thermal	CONV[1]	convection
	HFLUX[1]	heat flux
Substructure	SELV	load vector number
Electric	CHRGS	surface charge density

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discipline	Surface Load Label	Label Description
Diffusion	DFLUX	Diffusion flux

1. Thermal labels CONV and HFLUX are mutually exclusive.

FACT

Scale factor for the first surface load value. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor.

FACT2

Scale factor for the second surface load value. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor.

Notes

Scales surface loads (pressure, convection, etc.) in the database on the selected elements. Surface loads are applied with the **SF (p. 1733)**, **SFE (p. 1761)**, or **SFBEAM (p. 1746)** commands. Issue the **SFELIST (p. 1770)** command to list the surface loads. Solid model boundary conditions are not scaled by this command, but boundary conditions on the FE model are scaled.

Note:

Such scaled FE boundary conditions may still be overwritten by unscaled solid model boundary conditions if a subsequent boundary condition transfer occurs.

SFSCALE (p. 1781) does not work for tabular boundary conditions.

This command is also valid in PREP7 and in the **/MAP (p. 1107)** processor.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Operate>Scale FE Loads>Surface Loads

Main Menu>Solution>Define Loads>Operate>Scale FE Loads>Surface Loads

SFTRAN

Transfer the solid model surface loads to the finite element model.

SOLUTION (p. 38): Solid Surface Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Surface loads are transferred only from selected lines and areas to all selected elements. The **SFTRAN (p. 1782)** operation is also done if the **SBCTRAN (p. 1647)** command is issued or automatically done upon initiation of the solution calculations (**SOLVE (p. 1822)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Operate>Transfer to FE>Surface Loads

Main Menu>Solution>Define Loads>Operate>Transfer to FE>Surface Loads

---

/SHADE, *WN*, *Type*

Defines the type of surface shading used with Z-buffering.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

Type

Shading type:

FACET or 0

Facet shading (one color per area face).

GOURAUD or 1

Gouraud smooth shading (smooth variation of color based on interpolated vertex colors) (default).

PHONG or 2

Phong smooth shading (smooth variation of color based on interpolated vertex normals).

Command Default

Facet shading.

Notes

Defines the type of surface shading used on area, volume, and PowerGraphics (**/GRAPHICS (p. 866)**,POWER) displays when software Z-buffering is enabled (**/TYPE (p. 2034)**). This command is only functional for 2D display devices.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Hidden-Line Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SHELL, *Loc*

Selects a shell element or shell layer location for results output.

POST1 (p. 51): Controls (p. 51)
POST26 (p. 58): Controls (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Loc

Location within shell element (or layer) to obtain stress results:

TOP

Top of shell element (or layer) (default).

MID

Middle of shell element (or layer). The default method averages the TOP and BOT values to obtain a mid value. Setting KEYOPT(8) = 2 for SHELL181, SHELL208, SHELL209, SHELL281, and ELBOW290 uses MID results obtained directly from the results file.

BOT

Bottom of shell element (or layer).

Command Default

Shell element (or layer) top location.

Notes

Selects the location within a shell element (or a shell layer) for results output (nodal stresses, strains, etc.). Applies to POST1 selects, sorts, and output (**NSEL (p. 1266)**, **NSORT (p. 1283)**, **PRNSOL (p. 1505)**, **PLNSOL (p. 1425)**, **PRPATH (p. 1517)**, **PLPATH (p. 1439)**, etc.), and is used for storage with the POST26 **ESOL (p. 672)** command. For example, **SHELL (p. 1784)**,TOP causes item S of the POST1 **PRNSOL (p. 1505)** command or the POST26 **ESOL (p. 672)** command to be the stresses at the top of the shell elements. For layered shell elements, use the **LAYER (p. 1015)** (POST1) or **LAYERP26 (p. 1016)** (POST26) command to select the layer. The **SHELL (p. 1784)** command does not apply to the layered thermal shell elements, SHELL131 and SHELL132.

For PowerGraphics (**/GRAPHICS (p. 866)**,POWER), the **SHELL (p. 1784)**,MID command affects both the printed output and the displayed results, while the **SHELL (p. 1784)** (TOP or BOT) command prints and displays both the top and bottom layers simultaneously. Note that **/CYCEXPAND (p. 454)**,ON automatically turns on PowerGraphics; however, for cyclic mode-superposition harmonic postprocessing (**CYCFILES (p. 457)**), the **SHELL (p. 1784)** command prints and displays only the requested layer.

In POST26, the **ESOL (p. 672)** data stored is based on the active **SHELL (p. 1784)** specification at the time the data is stored. To store data at various specifications (for example, stresses at the top and bottom locations), issue a **STORE (p. 1867)** command before each new specification.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>General Postproc>Options for Outp

Main Menu>TimeHist Postpro>Define Variables

Main Menu>TimeHist Postpro>Elec&Mag>Circuit>Define Variables

Utility Menu>List>Results>Options

/**SHOW**,*Fname*,*Option*,*VECT*,*NCPL*

Specifies the device and other parameters for graphics displays.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

Device name, file name, or keyword, as listed below:

<device name>

Any valid graphics display device name (for example, X11, 3D etc.). Defaults to X11 for most systems. See Getting Started with Graphics in the *Basic Analysis Guide* for details. A device name must be defined before activating the Graphical User Interface (GUI). Once the GUI is activated, the device name cannot be changed for that session, except for switching between X11 and X11C.

TERM

Graphics displays are switched back to the last-specified device name.

CLOSE

This option purges the graphics file buffer. The CLOSE option should be issued any time you are changing graphics devices or file output types during a session. Graphics displays are switched back to the last-specified device name, and any open graphics files are closed. The CLOSE option is similar to the TERM option, however, with the CLOSE option, another process can access the data in the graphics file. The CLOSE option causes graphics file buffers to be flushed to the graphics file.

OFF

Graphics display requests are ignored.

(blank)

If blank in interactive mode, graphics will be displayed on screen as requested by display commands (no file written).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

JPEG

Creates JPEG files that are named Jobname*nnn*.jpg, where *nnn* is a numeric value that is incremented by one as each additional file is created; that is, Jobname000.jpg, Jobname001.jpg, Jobname002.jpg, and so on. Ignores the *Ext* field.

TIFF

Creates tagged image format files that are named Jobname*nnn*.tif, where *nnn* is a numeric value that is incremented by one as each additional file is created; that is, Jobname000.tif, Jobname001.tif, Jobname002.tif, and so on. This value for the *Fname* argument ignores the *Ext* field. (See the **TIFF (p. 1999)** command for options.)

PNG

Creates PNG (Portable Network Graphics) files that are named Jobname*nnn*.png, where *nnn* is a numeric value that is incremented by one as each additional file is created; that is, Jobname000.png, Jobname001.png, Jobname002.png, and so on. This value for the *Fname* argument ignores the *Ext* field. (See the **PNGR (p. 1455)** command for options.)

VRML

Creates Virtual Reality Meta Language files named Jobname000.wrl that can be displayed on 3D Internet web browsers. Ignores the *Ext* and *NCPL* fields.

Option

Assign a file name extension or specify reverse video output:

Ext

File name extension (eight-character maximum).

REV

Reverse background/image (black/white) colors. Valid with *Fname* = PNG (recommended), JPEG, and TIFF. This option is ignored if a previously specified color map table (**/CMAP (p. 359)** or **/RGB (p. 1608)**) is in effect.

VECT

Specifies raster or vector display mode. This affects area, volume, and element displays, as well as geometric results displays such as contour plots. See the **/DEVICE (p. 523)** command for an alternate way to toggle between raster and vector mode. Changing *VECT* also resets the **/TYPE (p. 2034)** command to its default.

0

Raster display (color filled entities; default)

1

Vector display (outlined entities; that is, "wireframe")

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NCPL

Sets the number of color planes (4 to 8). Default is device-dependent. *NCPL* is not supported by all graphics devices.

Command Default

For interactive runs, display is shown on the screen; for batch runs, display commands are ignored (graphics file not written).

Notes

Specifies the device to be used for graphics displays, and specifies other graphics display parameters. Display may be shown at the time of generation (for interactive runs at a graphics display terminal) or diverted to a file. Issue **/PSTATUS (p. 1550)** for display status.

Batch runs do not have access to the fonts available on your system. The Courier and Helvetica font files used for JPEG, PNG and TIFF batch output are copyrighted by Adobe Systems Inc. and Digital Equipment Corp. Permission to use these trademarks is hereby granted only in association with the images described above. Batch run JPEG output is produced at the default quality index value of 75, unless specified otherwise.

Interactive displays default to eight color planes (*NCPL* = 8) for most monitors, while graph file output defaults to eight color planes for VRML output, and four color planes for JPEG, PNG, and TIFF.

This command is valid in any processor.

SHPP, *Lab*, *VALUE1*, *VALUE2*

Controls element shape checking.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Shape-checking option. (When *Lab* = WARN, STATUS, SUMMARY, or DEFAULT, the remaining arguments are ignored.)

ON

Activates element shape-checking. New elements, regardless of how they are created, are tested against existing warning and error limits. (The existing limits may be the default limits, or previously modified limits.) Elements that violate error limits produce *error* messages and either (a) cause a meshing failure, or (b) for element creation or storage other than

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AMESH (p. 121) or **VMESH (p. 2140)**, *are not stored*. Elements that violate warning limits produce *warning* messages. If shape-checking was previously turned off (**SHPP (p. 1787)**,OFF) and you turn it on, existing elements are marked as untested; use the **CHECK (p. 333)** command to retest them. With this option, you may also specify a value for *VALUE1* to turn individual shape tests on. If you do not specify a value for *VALUE1*, all shape tests are turned on.

WARN

Activates element shape-checking; however, in contrast to **SHPP (p. 1787)**,ON, elements that violate error limits do not cause either a meshing or element storage failure. Instead, they produce *warning* messages to notify you that error limits have been violated. This option does not alter current shape parameter limits. Since the default shape parameter error limits are set to allow almost any usable element, the elements this option allows, which would otherwise be forbidden, are likely to be *very poorly shaped*.

OFF

Deactivates element shape-checking. This setting does not alter current shape parameter limits. Use of this option is risky, since poorly shaped elements can lead to analysis results that are less accurate than would otherwise be expected for a given mesh density. With this option, you may also specify a value for *VALUE1* to turn individual shape tests off. If you do not specify a value for *VALUE1*, all element shape tests are turned off.

SILENT

Determines whether element shape-checking runs in silent mode. In silent mode, Mechanical APDL checks elements without issuing warnings, *with the exception of* the generic warnings that it issues at solution. With this option, you must also specify a value for *VALUE1* (During the execution of certain commands, Mechanical APDL automatically runs element shape-checking in silent mode, then internally summarizes the shape test results for all of the new or modified elements. Mechanical APDL does this when it executes any of the following commands: **AGEN (p. 107)**, **AMESH (p. 121)**, **AREFINE (p. 178)**, **ARSYM (p. 184)**, **ATRAN (p. 205)**, **CDREAD (p. 291)**, **EGEN (p. 603)**, **ENGEN (p. 642)**, **ENSYM (p. 644)**, **EREAD (p. 653)**, **EREFINE (p. 654)**, **ESYM (p. 684)**, **ET (p. 686)**, **FVMESH (p. 784)**, **KREFINE (p. 990)**, **LREFINE (p. 1062)**, **NREFINE (p. 1257)**, **TIMP (p. 2003)**, **VEXT (p. 2091)**, **VGEN (p. 2116)**, **VIMP (p. 2132)**, **VMESH (p. 2140)**, **VOFFST (p. 2140)**, **VROTAT (p. 2155)**, **VSWEEP (p. 2168)**, **VSYMM (p. 2169)**, and **VTRAN (p. 2171)**.)

STATUS

Lists the shape parameter limits currently in effect, along with status information about element shape-checking (for example, whether any individual shape tests are off, whether any of the shape parameter limits have been modified, and so on).

SUMMARY

Lists a summary of element shape test results for all selected elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DEFAULT

Resets element shape parameter limits to their default values. Also, if any individual tests were turned off, turns them back on. (The **SHPP (p. 1787)**,DEFAULT command may be useful if any parameter limits were previously altered by using the MODIFY option.)

OBJECT

Determines whether element shape test results data is *stored in memory*. When this option is turned on, an "object" is created for storing test results in memory. When this option is turned off, no object is created and no data is stored; thus, any operation that requires shape parameters for an existing element (such as use of the **CHECK (p. 333)** command) causes the shape parameters to be recomputed. (Note the distinction between storing the data in memory and storing it in the database; regardless of whether this option is turned on or off, no element shape test results data will be stored in the database. The element shape parameter object is deleted automatically before any solution.) This setting is independent of shape-checking status, with one exception--if shape-checking is turned off (**SHPP (p. 1787)**,OFF), the object is not created. Keep in mind that recomputing shape parameters is more computationally expensive than retrieving them from the object. With this option, you must also specify a value for the *VALUE1* argument; the *VALUE2* argument is ignored.

LSTET

Determines, for Jacobian ratio tests, whether sampling is done at integration points or at corner nodes. When this option is turned on, sampling is done at integration points, and the default limits for h-element Jacobian ratios are a warning tolerance of 10 and an error tolerance of 40. When this option is turned off, sampling is done at corner nodes, and the corresponding default limits are a warning tolerance of 30 and an error tolerance of 1000. Sampling at the integration points (option on) results in a lower Jacobian ratio, but that ratio is also subjected to a more restrictive error limit. Some elements that have passed the integration point sampling criterion, have failed the corner mode sampling criterion. Because of this, use integration point sampling only for simple linear analyses. For other types of analyses (e.g., nonlinear, electromagnetic), use sampling at corner nodes, which is the more conservative approach. With this option, you must also specify a value for the *VALUE1* argument; the *VALUE2* argument is ignored.

MODIFY

Indicates that you want to respecify a shape parameter limit. With this option, you must also specify values for the *VALUE1* and *VALUE2* arguments.

FLAT

Determines the warning and error limits used to test elements that may exhibit nonzero/nonconstant Z coordinates. With this option, you must also specify values for the *VALUE1* and/or *VALUE2* arguments.

VALUE1

Valid for the ON, OFF, SILENT, OBJECT, LSTET, MODIFY, and FLAT options only. When *Lab* = ON or OFF, use *VALUE1* to individually control (that is, turn off or turn on) specific element shape tests. Thus, *VALUE1* can be ASPECT (aspect ratio tests), PARAL (deviation from parallelism of opposite

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

edges tests), MAXANG (maximum corner angle tests), JACRAT (Jacobian ratio tests), WARP (warping factor tests), or ALL (all tests). When *Lab* = SILENT, *VALUE1* can be ON (to turn silent mode on) or OFF (to turn silent mode off). When *Lab* = OBJECT, *VALUE1* can be either 1, YES, or ON to turn on storage of element shape test data (the default); or it can be 0, NO, or OFF to turn off storage of element shape test data (delete the data and recompute as necessary). When *Lab* = LSTET, *VALUE1* can be either 1, YES, or ON to choose Jacobian sampling at integration points; or it can be 0, NO, or OFF to choose Jacobian sampling at nodes (the default). When *Lab* = MODIFY, *VALUE1* is the numeric location (within the shape parameter limit array) of the shape parameter limit to be modified. Locations are identified in the element shape-checking status listing (**SHPP (p. 1787)**,STATUS). For more information, see the examples in the **Notes** section. When *Lab* = FLAT, *VALUE1* is the warning limit for XY element constant Z sets performed at **CHECK (p. 333)** or **SOLVE (p. 1822)**. The default is 1.0e-8.

VALUE2

Valid for the MODIFY and FLAT options only. When *Lab* = MODIFY, specifies the new limit for the shape parameter that is in the location indicated by the *VALUE1* argument. See the examples in the **Notes** section. When *Lab* = FLAT, *VALUE2* is the error limit. The default is 1.0e-2.

Command Default

All shape-checking tests are enabled (**SHPP (p. 1787)**,ON,ALL) with default shape parameter limits. Silent mode is off. Memory object storage of element shape parameters is on.

Notes

The following examples illustrate how to use the **SHPP (p. 1787)**,MODIFY,*VALUE1*,*VALUE2* command to respecify shape parameter limits. Assume that you issued the **SHPP (p. 1787)**,STATUS command, and you received the output below:

```
ASPECT RATIO (EXCEPT EMAG)

   QUAD OR TRIANGLE ELEMENT OR FACE
        WARNING TOLERANCE ( 1) =   20.00000
        ERROR TOLERANCE   ( 2) =  1000000.
                    .
                    .
                    .
MAXIMUM CORNER ANGLE IN DEGREES (EXCEPT OR EMAG)
   TRIANGLE ELEMENT OR FACE
        WARNING TOLERANCE (15) =   165.0000
        ERROR TOLERANCE   (16) =   179.9000
```

Notice that in the sample output, the *warning* tolerance for aspect ratios is set to 20. Now assume that you want to "loosen" this shape parameter limit so that it is less restrictive. To allow elements with aspect ratios of up to 500 without causing warning messages, you would issue this command:

```
SHPP (p. 1787),MODIFY,1,500
```

Also notice that each shape parameter's numeric location within the shape parameter limit array appears in the sample output within parentheses. For example, the numeric location of the aspect ratio shape parameter (for warning tolerance) is 1, which is why "1" is specified for the *VALUE1* argument in the example command above.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Now notice that the sample output indicates that any triangle element with an internal angle that is greater than 179.9 degrees will produce an *error* message. Suppose that you want to "tighten" this shape parameter limit, so that it is more restrictive. To cause any triangle or tetrahedron with an internal angle greater than 170 degrees to produce an error message, you would issue this command:

```
SHPP (p. 1787),MODIFY,16,170
```

The existence of badly shaped elements in a model may lead to certain computational errors that can cause your system to terminate during solution. Therefore, you run the risk of a system abort during solution any time that you disable element shape-checking entirely, run shape-checking in warning-only mode, disable individual shape-checks, or loosen shape-parameter limits.

Changing any shape parameter limit marks all existing elements as untested; use the **CHECK (p. 333)** command to retest them.

For more information about element shape-checking, see Meshing Your Solid Model.

This command is also valid for rezoning.

---

SHSD,*RID*,*Action*,*CHCH_Opt*,*CGAP*,*CPEN*

Creates or deletes a shell-solid interface to be used in shell-to-solid assemblies.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RID

The real constant set ID that identifies the contact pair on which a shell-to-solid assembly is defined. If ALL, all selected contact pairs will be considered for assembly.

Action

Action to be performed:

EDGE

Create virtual shell elements based on the shell edge (default).

SURFACE

Create virtual shell elements based on the solid element surface.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DELETE

Delete the nodes and elements created during a previous execution of **SHSD (p. 1791)** for the real constant set identified by *RID*.

CNCH_Opt

CNCHECK (p. 382) option to close initial penetration or gap:

NONE

No adjustment of initial penetration or gap (default).

ADJUST

Use **CNCHECK (p. 382)**,ADJUST logic internally to close the initial gap or penetration (see the **CNCHECK (p. 382)** command for detail). *CGAP* or *CPEN* must be specified.

CGAP

Control parameter for opening gap; must be greater than or equal to zero. Close the gap if the gap distance is smaller than the *CGAP* value. *CGAP* defaults to 0.25*PINB (where PINB is the pinball radius) for bonded and no-separation contact. Otherwise, it defaults to the value of real constant ICONT.

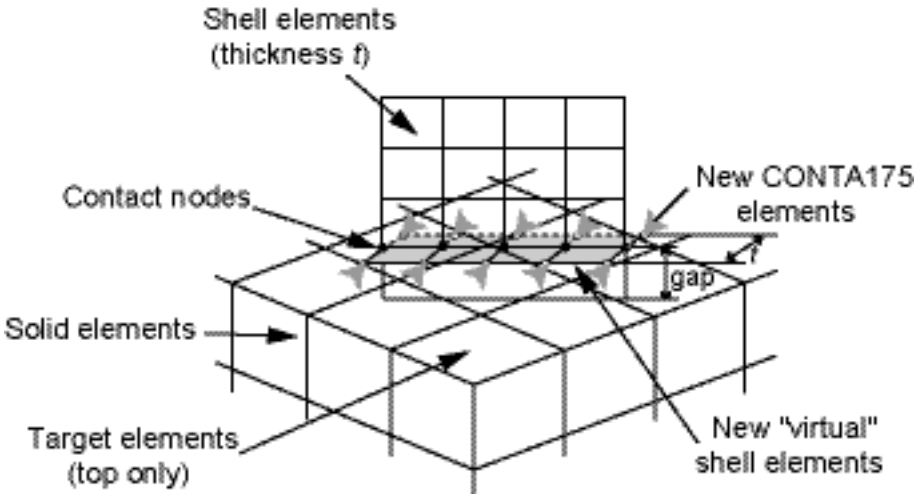
CPEN

Control parameter for initial penetration; must be greater than or equal to zero. Close the penetration if the penetration distance is smaller than the *CPEN* value. *CPEN* defaults to 0.25*PINB (where PINB is the pinball radius) for any type of interface behavior (either bonded or standard contact).

Notes

The **SHSD (p. 1791)** command creates a shell-solid interface to be used in shell-to-solid assemblies, or deletes a previously-created shell-solid interface. *Virtual* shell elements and additional CONTA175 or CONTA177 elements are created at the contact pair identified by *RID* when *Action* = EDGE or SURFACE. Set *Action* = DELETE to remove the generated nodes and elements at the contact pair identified by *RID*.

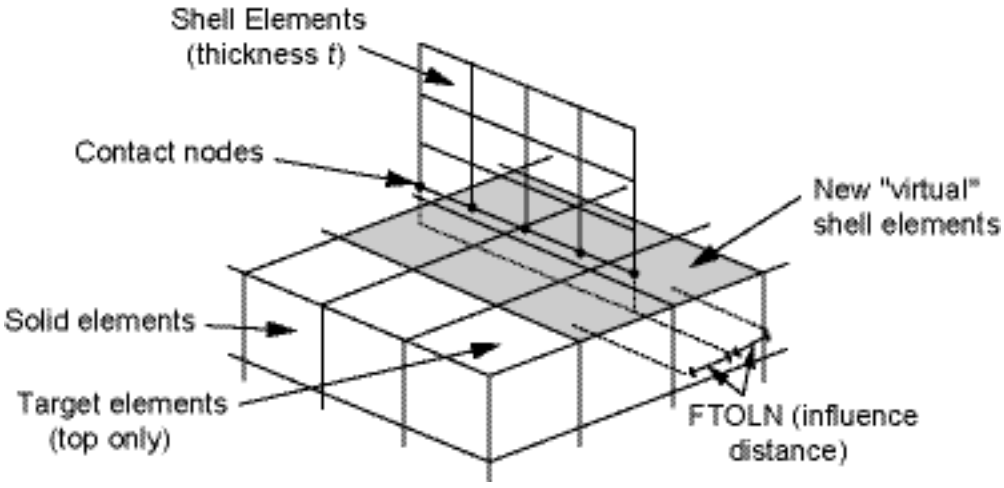
The **SHSD (p. 1791)** command is active only when the following element KEYOPTs of associated CONTA175 or CONTA177 element types are predefined:



Element	KEYOPT	Detail
CONTA175 or CONTA177	KEYOPT(2) = 2	MPC algorithm
	KEYOPT(12) = 5, 6	Bonded contact
	KEYOPT(4) = 0	Contact normal perpendicular to target surface

When *ACTION* = EDGE, the virtual shell elements are built perpendicular to the pre-existing shell elements attached to the contact elements. They geometrically follow the contact interface edge and are built on both sides of this interface in such a way that each new shell element (SHELL181) has two nodes that belong to the associated pre-existing shell element in the shell edge. (See Figure 26: Virtual Shell Elements Following the Contact Interface Edge (p. 1793).) The width of the new shell elements is half the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



thickness of the pre-existing shell element. If CONTA175 is used at the shell nodes, the CONTA175 elements are then created at each node of the virtual shell elements where no CONTA175 element exists. If CONTA177 is used at the shell edge, new CONTA174 elements are created and overlayed on the virtual shell. The new contact elements are identified by the same contact pair ID as the pre-existing contact elements. The virtual shell elements are assigned the next available element type number and material number.

Figure 26: Virtual Shell Elements Following the Contact Interface Edge

When *ACTION* = SURFACE, the virtual shell elements (SHELL181 - low order; SHELL281 - high order) overlap the existing low or high order target elements identified with the *RID* argument, and share their nodes. Only those target elements close enough to the contact interface (identified using the PINB real constant) are overlapped. The program uses the FTOLN real constant (defaults to half the shell element thickness) to define an influence distance. The associated virtual shell elements are created only for target elements that lie partially inside the influence distance region (see Figure 27: Virtual Shell Elements Overlapping Target Elements (p. 1793)).

Figure 27: Virtual Shell Elements Overlapping Target Elements

For the bonded always option (KEYOPT(12) = 5), any contact node inside the pinball region (gap < PINB) is included in the KEYOPT(5) = 2 process. A relatively small PINB value may be used to prevent false contact. PINB defaults to 25% of the contact depth for small deformation analyses.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information
of ANSYS, Inc. and its subsidiaries and affiliates.

For the bonded initial option (KEYOPT(12) = 6), only those contact nodes which initially lie inside the adjustment zone (gap < ICONT) are always included in the KEYOPT(5) = 2 process. ICONT defaults to 5% of the contact depth.

For both processes, the new nodes and elements are stored in internally-named components. The internal naming convention is based on the real constant set ID specified by *RID*, as illustrated in the following table.

Nodes	SHSD_ND_*RID*
Contact Elements	SHSD_CN_*RID*
Shell Elements	SHSD_SH_*RID*

Issuing **SHSD (p. 1791)**,*RID*,DELETE deletes components based on their generated names. *Only components whose names match the internal naming convention will be deleted.*

Caution:

Do not rename or manually delete generated components. Use the **SHSD (p. 1791)** command to delete generated components.

Renaming or manually deleting generated components will cause these components to be ignored when **SHSD (p. 1791)**,*RID*,DELETE is executed and when the program searches for these components to verify if **SHSD (p. 1791)**,*RID*,EDGE or SURFACE can be safely executed. Manually renaming or deleting generated components and reissuing **SHSD (p. 1791)**,*RID*,EDGE or SURFACE may result in erroneous generation of virtual shell or contact elements.

SHSD (p. 1791) does not support assemblies that contain a preintegrated shell section (**SECTYPE (p. 1697)**,,GENS).

See Modeling a Shell-Solid Assembly in the *Contact Technology Guide* for more information.

Menu Paths

This command cannot be accessed from a menu.

/SHRINK, *RATIO*

Shrinks elements, lines, areas, and volumes for display clarity.

GRAPHICS (p. 16): Scaling (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RATIO

Shrinkage ratio (input as a decimal (0.0 to 0.5)). Defaults to 0.0 (no shrinkage). Values greater than 0.5 default to 0.1 (10% shrinkage).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Full size entities.

Notes

Shrinks the elements, lines, areas, and volumes so that adjacent entities are separated for clarity. Portions of this command are not supported by PowerGraphics (**/GRAPHICS (p. 866)**,POWER).

If only the common lines of non-coplanar faces are drawn (as per the **/EDGE (p. 594)** command), then this command is ignored.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Size and Shape

SLIST,*SFIRST*,*SLAST*,*SINC*,*Details*,*Type*

Summarizes the section properties for all defined sections in the current session.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SFIRST

First section ID to be summarized. Default = First available section in the database.

SLAST

Last section ID to be summarized. Default = Last available section in the database.

SINC

Increment of the section ID. Default = 1.

Details

Determines the content of the summarized information for beam, pipe, shell, and reinforcing sections.

BRIEF

For beams, lists only the section integrated properties (such as *Area*, *Iyy*, and *Iyz*). This option is the default.

For reinforcing, lists only the input reinforcing properties (such as material, cross-section area, fiber spacing, and input fiber location parameters).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FULL

For beams, lists the section integrated properties, as well as the section nodal coordinates, section cell connectivity information, and section cell integration point coordinates. For shells, the section stiffness (membrane, bending, membrane-bending coupling and transverse shear) are printed.

The shell section stiffness listed considers elastic behavior of materials at reference temperature only. The elements that use the section data may alter the transverse shear stiffness based on slenderness considerations (in addition to the shear correction factors shown).

Section stiffness terms listed via the FULL option do not include section offsets. The program accounts for section offsets during the solution phase of the analysis.

For predefined reinforcing sections used by the standard method, lists the complete information of reinforcing fibers or surfaces (including material ID, cross-section area, fiber spacing, orientation, and locations in natural coordinates). For predefined section reinforcing used by the mesh-independent method, lists section properties to generate the fibers or surfaces (including material ID, cross-section area, fiber spacing, and orientation) For reinforcing sections generated (**ERE-INF (p. 656)**) via the mesh-independent method, lists element ID, material ID, and locations in natural coordinates.

GROUP

If a section calls other sections, this option lists those sections too.

Type

The section type. Valid arguments are ALL (default) or any valid section type (**SECTYPE (p. 1697)**).

Notes

By default, the command lists information about all sections. You can limit the output to specific section types via the *Type* key.

When ocean loading is present, the command lists beam section properties used by ocean loading.

Example Output

Following is example output from the **SLIST (p. 1795)**,,,,BRIEF command for a rectangular beam section subtype (**SECTYPE (p. 1697)**,,BEAM,RECT):

```
LIST SECTION ID SETS     1 TO     1 BY     1

  SECTION ID NUMBER:         1
  BEAM SECTION TYPE:     Rectangle
  BEAM SECTION NAME IS:
  BEAM SECTION DATA SUMMARY:
   Area                =  6.0000
   Iyy                 =  4.5000
   Iyz                 = 0.11281E-15
   Izz                 =  2.0000
   Warping Constant    = 0.23299
   Torsion Constant    =  4.7330
   Center of Gravity Y  =-0.30973E-16
   Center of Gravity Z  = 0.15376E-15
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
 Shear Center Y       =-0.22957E-13
 Shear Center Z       = 0.31281E-13

 Beam Section is offset to CENTROID of cross section
```

Menu Paths

Main Menu>Preprocessor>Sections>List Sections

SLOAD, *SECID*, *PLNLAB*, *KINIT*, *KFD*, *FDVALUE*, *LSLOAD*, *LSLOCK*

Loads a pretension section.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SECID

Unique section number. The number must already be assigned to a pretension section.

PLNLAB

Label representing the pretension load sequence number in the format "PL*nn*" where *nn* is an integer from 1 through 99 (for example, PL01 through PL99).

Specify a value of DELETE to delete all loads on the specified pretension section (*SECID*). In this case, the command ignores any other argument values.

KINIT

Initial action key for pretension load PL01. (This field is omitted for PL02 and up.) Three scenarios are possible:

LOCK

Constrains (connects) the cutting plane on the pretension section. This value is the default.

SLID

Unconstrains (disconnects) the cutting plane on the pretension section.

TINY

Applies a very small pretension load (0.1% of *FDVALUE*) before the desired load is established. The small load prevents convergence problems which can occur when the desired load is not established in the first load step. This value is valid only if *KFD* = FORC.

KFD

Force/Displacement key. Specifies whether *FDVALUE* is a force or a displacement:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FORC

Apply a force on the specified pretension section. This value is the default.

DISP

Apply a displacement (adjustment) on the specified pretension section.

FDVALUE

Pretension load value. If *KFD* = FORC, this value is a pretension force. If *KFD* = DISP, this value is a pretension displacement (adjustment).

LSLOAD

Load step in which to apply the *FDVALUE*.

LSLOCK

The load step in which the displacement value resulting from the pretension force is locked. This value is valid only if *KFD* = FORC.

Command Default

The default pretension load value *FDVALUE* is zero (no load). A positive value puts the pretension elements in tension.

No default exists for the *LSLOAD* applied load step value. You must specify the load step in which to apply the *FDVALUE*.

No default exists for the *LSLOCK* locked load step value. You must specify the load step in which to lock the *FDVALUE*.

Notes

The **SLOAD (p. 1797)** command applies pretension loads to specified pretension sections (PRETS179-based) created via the **PSMESH (p. 1543)** command. A pretension load is ramp-applied (**KBC (p. 970)** = 0) if it is a force (*KFD* = FORC), and step-applied (**KBC (p. 970)** = 1) if it is a displacement (*KFD* = DISP).

You can lock the load value at a specified load step. When locked, the load changes from a force to a displacement, and the program applies the load as a constant displacement in all future load steps. Locking is useful when applying additional loadings. The additional loadings alter the effect of the initial load value, but because locking transforms the load into a displacement, it preserves the initial load's effect.

In modal and harmonic analyses, any pretension load (force, displacement, or locked) is ignored and no load is produced.

The **SLOAD (p. 1797)** command is not valid for MPC184-based preload sections created with **PSMESH (p. 1543)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Example 13: Applying a Load

The following command shows how to establish loads on a pretension section:

```
SLOAD,1,PL01,TINY,FORC,5000,2,3
```

In this example, the load is applied to pretension section **1**, and the sequence begins with the initial action key, *KINIT*, set to TINY. A small stabilization load (5 = 0.10% of 5000) is applied in the first load step, as the actual pretension force is not applied until the second load step. The next four fields set the actual load: the *KFD* value FORC specifies the type of load, *FDVALUE* defines the pretension load value (5000), *LSLOAD* specifies the load step in which the force is applied (2), and the *LSLOCK* field specifies the load step in which the force is locked (3). Additional sets of four fields can be used to define additional loads.

Example 14: Editing an Existing Load

You can use the **SLOAD (p. 1797)** command to edit (overwrite) existing loads on a pretension section. This example changes the load on pretension section 1 (set above) to 6000:

```
SLOAD,1,PL01,,,6000,2,3
```

Unspecified values (blank fields), as shown in this example, remain unchanged from prior settings. If no prior specifications exist, then default values (*KINIT* = LOCK and *KFD* = FORC) apply.

Example 15: Deleting All Loads

The command can also delete all loads on a specified pretension section, as shown here:

```
SLOAD,1,DELETE
```

Example 16: Locking a Pretension Element

For a prestressed modal analysis, this command locks the pretension element:

```
SLOAD,1,PL01,LOCK,DISP,0,1,2
```

Multiple Loadings

The **SLOAD (p. 1797)** command allows you to apply multiple loadings. You can add up to 15 loadings (PL01 through PL15), or delete loadings, for any given pretension section(s).

Example 17: Applying Multiple Loadings

The following **SLOAD (p. 1797)** commands, issued in the order shown, establish a pretension load sequence in pretension section 2 with a force of 25 in load step (LS) 2, locked in LS 3-6, a force of 50 in LS 7, locked in LS 8-11, a force of 75 in LS 12, locked in LS 13 and beyond:

```
SLOAD,2,PL01,LOCK,FORC,25,2,3

SLOAD,2,PL02,,FORC,50,7,8

SLOAD,2,PL03,,FORC,75,12,13
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

At the same time, you can issue SLOAD commands to apply loads on *other* pretension sections. For example, in addition to the commands listed above, you could issue the following command to apply a load on pretension section 3:

```
SLOAD,3,PL01,LOCK,FORC,25,3,4
```

Using the Pretension Section Loads GUI

Any addition or deletion of a loading applies to the selected sections only. Mechanical APDL does not apply or delete a load until you click the **Apply** or **OK** button.

After you have successfully solved for a specified *LSLOAD* (GUI field **Apply at LS**) and eventually *LSLOCK* (GUI field **Lock at LS**) value, you cannot modify that loading's settings during subsequent steps of the analysis. Similarly, you cannot delete loadings that you have already partially or completely solved.

You can select more than one pretension section at a time in order to specify identical loadings on them. Before you completely solve a given loading, any combination of pretension sections is valid. The following limitations apply:

- After you have completely solved one or more loadings, Mechanical APDL allows multiple selection of *only* those pretension sections having

  -- the same number of defined loadings, *and*

  -- the identical loading number from the most recent completely solved loading.

- A multiple selection meeting the necessary criteria retains the settings that are identical for all selected pretension sections and leaves all other fields blank.

---

SMALL, *IR*, *IA*, *IB*, *IC*, *Name*, - - , - - , *FACTA*, *FACTB*, *FACTC*

Finds the smallest of three variables.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to *NV* (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IA*, *IB*, *IC

Reference numbers of the three variables to be operated on. If only two, leave *IC* blank. If only one, leave *IB* blank also.

Name

Thirty-two character name identifying the variable on printouts and displays. Embedded blanks are compressed for output.

--, --

Unused fields.

FACTA*, *FACTB*, *FACTC

Scaling factors (positive or negative) applied to the corresponding variables (defaults to 1.0).

Notes

Finds the smallest of three variables according to the operation:

IR = smallest of (*FACTA* x *IA*, *FACTB* x *IB*, *FACTC* x *IC*)

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Find Minimum

***SMAT**, *Matrix*, *Type*, *Method*, *Val1*, *Val2*, *Val3*, *Val4* , *Val5*

Creates a sparse matrix.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Matrix

Name used to identify the matrix. Must be specified.

Type

Matrix type:

D --

Double precision real values (default).

Z --

Complex double precision values.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Method

Method used to create the matrix:

ALLOC --

Allocate a new matrix.

COPY --

Copy an existing matrix.

IMPORT --

Import the matrix from a file.

Val1, *Val2*, *Val3*, *Val4*, *Val5*

Additional input. The meaning of *Val1* through *Val5* will vary depending on the specified *Method*. See details below.

The following *Valx* fields are used with *Method* = ALLOC.

Val1

Method used to create the matrix:

DIAG --

Allocate a diagonal square matrix. *Val2* is used; *Val3*, *Val4*, and *Val5* are ignored.

Val2

Matrix size.

CSR --

Create a square sparse matrix based on Compressed Sparse Row (CSR) format description vectors. This format requires 3 input vectors specified as *Val2*, *Val3* and *Val4*.

Val2, *Val3*, *Val4*

Names of required *row_ptr*, *col_ind* and *val* vectors. These vectors must be created using the ***VEC (p. 2085)** command.

> **Note:**
>
> *row_ptr* is a long integer vector (use of L instead of I as the scalar type in the ***VEC (p. 2085)** call); *col_ind* is an integer vector. *Val* can be a real of complex values vector, according to the matrix type.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Val5

Specifies whether the matrix is symmetric (TRUE) or unsymmetric (FALSE). Default = TRUE.

The following *Valx* fields are used with *Method* = COPY.

Val1

Name of the matrix to copy (can be either a dense or a sparse matrix).

Val2

Method used for copying the matrix:

DIAG --

Copy only the diagonal of the matrix. *Val3* and *Val4* are ignored.

TRANS --

Transpose the original matrix. *Val3* and *Val4* are ignored.

EXTRACT --

Extract a submatrix based on row and column numbers specified by *Val3* and *Val4*.

Val3

Name of integer vector (***VEC (p. 2085)**) containing row numbers. If no vector is specified, defaults to all rows.

Val4

Name of integer vector (***VEC (p. 2085)**) containing column numbers. If no vector is specified, defaults to all columns.

The following table describes the *Valx* fields used with *Method* = IMPORT.

***Method* = IMPORT**					
Val1	***Val2***	***Val3***	***Val4***	***Val5***	**Description**
FULL	File name [a]	Matrix type: STIFF - Stiffness matrix MASS - Mass matrix DAMP - Damping matrix NOD2SOLV - Mapping vector	(not used)	(not used)	Import a matrix from an existing FULL file. For a complex stiffness matrix, you can use the K_RE or K_IM label to import only the real part or only the imaginary part. The K_RE and

		relating the full set of nodal DOFs to the subset that the solver uses USR2SOLV - Mapping vector relating the full set of external nodal DOFs to the subset that the solver uses GMAT - Constraint equation matrix K_RE - Real part of the stiffness matrix K_IM - Imaginary part of the stiffness matrix			K_IM options both create real matrices. Note that the K_IM matrix is only available for **MODOPT (p. 1140)**,UNSYM and **MODOPT (p. 1140)**,DAMP modal analyses.
HBMAT	File name [a]	File format: ASCII BINARY	(not used)	(not used)	Import a matrix from an existing Harwell-Boeing format file.
MMF	File name [a]	(not used)	(not used)	(not used)	Import a matrix from an existing Matrix Market format file.
DMIG	File name [a]	File Format: FREE - Free field format LARGE - Large field format (default)	Delimeter character (only for FREE field format); defautl is ‘,’	Matrix name (default is the first matrix of the DMIG file)	Import a matrix from an existing NASTRAN `DMIG` file.
MAT	File name [a]	(not used)	(not used)	(not used)	Restore from a previous ***EXPORT (p. 716)** (*FORMAT* = MAT) command..

[a] File name is case-sensitive with a 32-character maximum.

Notes

Use the ***DMAT (p. 551)** command to create a dense matrix.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For more information on the CSR format, see Creating a Sparse Matrix Using the CSR Format in the *Ansys Parametric Design Language Guide*.

For more information on the NOD2SOLV and USR2SOLV mapping vectors, see Degree of Freedom Ordering in the *Ansys Parametric Design Language Guide*.

For more information about `.full` file contents, see the **HBMAT (p. 888)** in the *Command Reference* (p. 1).

Menu Paths

This command cannot be accessed from a menu.

SMAX, *LabR*, *Lab1*, *Lab2*, *FACT1*, *FACT2*

Forms an element table item from the maximum of two other items.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabR

Label assigned to results. If same as existing label, the existing values will be overwritten by these results.

Lab1

First labeled result item in operation.

Lab2

Second labeled result item in operation (may be blank).

FACT1

Scale factor applied to *Lab1*. A (blank) or '0' entry defaults to 1.0.

FACT2

Scale factor applied to *Lab2*. A (blank) or '0' entry defaults to 1.0.

Notes

Forms a labeled result item (see **ETABLE (p. 687)** command) for the selected elements by comparing two existing labeled result items according to the operation:

LabR = (*FACT1* x *Lab1*) cmx (*FACT2* x *Lab2*)

where "cmx" means "compare and save maximum." If absolute values are requested (**SABS (p. 1643)**,1), the absolute values of *Lab1* and *Lab2* are used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>General Postproc>Element Table>Find Maximum

/SMBC, *Mode*

Controls the display of solid model boundary condition symbols and labels.

DATABASE (p. 13): Set Up (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Mode

CENT

Solid model boundary condition symbols and labels appear at the centroid of the solid model entity (default).

TESS

Solid model boundary condition symbols and labels appear inside each constituent element of the tessellation.

Notes

Mode = CENT is designed to reduce the clutter of boundary condition symbols in solid model plots. For example, if you have assigned normal pressure loads to an area, you may choose to display the pressures as arrows with the **/PSF (p. 1537)** command using **/PSF (p. 1537)**,PRES,NORM,2. When *Mode* = CENT, the pressure arrow is displayed at the centroid of the area. When *Mode* = TESS, a pressure arrow is displayed at the centroid of each polygon of the area's tessellation.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

SMBODY

Specifies "Body loads on the solid model" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu>**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

List> Status. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Body Loads

SMCONS

Specifies "Constraints on the solid model" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>DOF Constraints

SMFOR

Specifies "Forces on the solid model" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SMIN, *LabR*, *Lab1*, *Lab2*, *FACT1*, *FACT2*

Forms an element table item from the minimum of two other items.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabR

Label assigned to results. If same as existing label, the existing values will be overwritten by these results.

Lab1

First labeled result item in operation.

Lab2

Second labeled result item in operation (may be blank).

FACT1

Scale factor applied to *Lab1*. A (blank) or '0' entry defaults to 1.0.

FACT2

Scale factor applied to *Lab2*. A (blank) or '0' entry defaults to 1.0.

Notes

Forms a labeled result item (see **ETABLE (p. 687)** command) for the selected elements by comparing two existing labeled result items according to the operation:

LabR = (*FACT1* x *Lab1*) cmn (*FACT2* x *Lab2*)

where "cmn" means "compare and save minimum." If absolute values are requested (**SABS (p. 1643)**,1), the absolute values of *Lab1* and *Lab2* are used.

Menu Paths

Main Menu>General Postproc>Element Table>Find Minimum

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SMOOTH,*Vect1*,*Vect2*,*DATAP*,*FITPT*,*Vect3*,*Vect4*,*DISP*

Allows smoothing of noisy data and provides a graphical representation of the data.

POST26 (p. 58): Special Purpose (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Vect1

Name of the first vector that contains the noisy data set (that is, independent variable). You must create and fill this vector before issuing **SMOOTH (p. 1809)**.

Vect2

Name of the second vector that contains the dependent set of data. Must be the same length as the first vector. You must create and fill this vector before issuing **SMOOTH (p. 1809)**.

DATAP

Number of data points to be fitted, starting from the beginning of the vector. If left blank, the entire vector will be fitted. The maximum number of data points is 100,000 (or greater, depending on the memory of the computer).

FITPT

Order of the fitting curve that will be used as a smooth representation of the data. This number should be less than or equal to the number of the data points. Default (blank) is one-half the number of data points. Maximum number of smoothed data fitting order is the number of data points up to 50. Depending on this number, the smoothed curve will be one of the following:

1

Curve is the absolute average of all of the data points.

2

Curve is the least square average of all of the data points.

3 or more

Curve is a polynomial of the order (n-1), where n is the number of data fitting order points.

Vect3

Name of the vector that contains the smoothed data of the independent variable. This vector should have a length equal to or greater than the number of smoothed data points. In batch (command) mode, you must create this vector before issuing the **SMOOTH (p. 1809)** command. In interactive mode, the GUI automatically creates this vector (if it does not exist). If you do not specify a vector name, the GUI will name the vector smth_ind.

Vect4

Name of the vector that contains the smoothed data of the dependent variable. This vector must be the same length as *Vect3*. In batch (command) mode, you must create this vector before issuing

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the **SMOOTH (p. 1809)** command. In interactive mode, the GUI automatically creates this vector (if it does not exist). If you do not specify a vector name, the GUI will name the vector smth_dep.

DISP

Specifies how you want to display data. No default; you must specify an option.

1

Unsmoothed data only

2

Smoothed data only

3

Both smoothed and unsmoothed data

Notes

This command enables you to control the attributes of the graph using standard Mechanical APDL controls (**/GRID (p. 869)**, **/GTHK (p. 882)**, **/COLOR (p. 400)**, etc.).

If working interactively, the controls appear in this dialog box for convenience, as well as in their standard dialog boxes.

You must always create *Vect1* and *Vect2* (using ***DIM (p. 530)**) and fill these vectors before smoothing the data. If working interactively, the program automatically creates *Vect3* and *Vect4*. If working in batch (command) mode, you must create *Vect3* and *Vect4* (using ***DIM (p. 530)**) before issuing **SMOOTH (p. 1809)**. *Vect3* and *Vect4* are then filled automatically by the program.

The program also creates an additional TABLE type array that contains the smoothed array and the unsmoothed data to enable plotting later with ***VPLOT (p. 2146)**. Column 1 in the table corresponds to *Vect1*, column 2 to *Vect2*, and column 3 to *Vect4*. The array is named *Vect3*_SMOOTH, up to a limit of 32 characters. For example, if the array name is X1, the table name is X1_SMOOTH.

This command is also valid in PREP7 and SOLUTION.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SMRTSIZE, *SIZLVL*, *FAC*, *EXPND*, *TRANS*, *ANGL*, *ANGH*, *GRATIO*, *SMHLC*, *SMANC*, *MXITR*, *SPRX*

Specifies meshing parameters for automatic (smart) element sizing.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SIZLVL

Overall element size level for meshing. The level value controls the fineness of the mesh. (Any input in this field causes remaining arguments to be ignored.) Valid inputs are:

n

Activate SmartSizing and set the size level to *n*. Must be an integer value from 1 (fine mesh) to 10 (coarse mesh). Remaining arguments are ignored, and argument values are set as shown in Table 226: SMRTSIZE - Argument Values for h-elements (p. 1813).

STAT

List current **SMRTSIZE (p. 1811)** settings.

DEFA

Set all **SMRTSIZE (p. 1811)** settings to default values (as shown in Table 226: SMRTSIZE - Argument Values for h-elements (p. 1813) for size level 6).

OFF

Deactivate SmartSizing. Current settings of **DESIZE (p. 519)** will be used. To reactivate SmartSizing, issue **SMRTSIZE (p. 1811)**,*n*.

FAC

Scaling factor applied to the computed default mesh sizing. Defaults to 1 for h-elements (size level 6), which is medium. Values from 0.2 to 5.0 are allowed.

EXPND

Mesh expansion (or contraction) factor. (This factor is the same as **MOPT (p. 1151)**,EXPND,*Value*.) *EXPND* is used to size internal elements in an area based on the size of the elements on the area's boundaries. For example, issuing **SMRTSIZE (p. 1811)**,,,2 before meshing an area will allow a mesh with elements that are approximately twice as large in the interior of an area as they are on the boundary. If *EXPND* is less than 1, a mesh with smaller elements on the interior of the area will be allowed. *EXPND* should be greater than 0.5 but less than 4. *EXPND* defaults to 1 for h-elements (size level 6), which does not allow expansion or contraction of internal element sizes (except when using **AESIZE (p. 104)** element sizing). (If *EXPND* is set to zero, the default value of 1 will be used.) The actual size of the internal elements will also depend on the *TRANS* option or upon **AESIZE (p. 104)** or **ESIZE (p. 668)** sizing, if used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TRANS

Mesh transition factor. (This factor is the same as **MOPT (p. 1151)**,TRANS,*Value*.) *TRANS* is used to control how rapidly elements are permitted to change in size from the boundary to the interior of an area. *TRANS* defaults to 2.0 for h-elements (size level 6), which permits elements to approximately double in size from one element to the next as they approach the interior of the area. (If *TRANS* is set to zero, the default value will be used.) *TRANS* must be greater than 1 and, for best results, should be less than 4. The actual size of the internal elements will also depend on the *EXPND* option or upon **AESIZE (p. 104)** or **ESIZE (p. 668)** sizing, if used.

ANGL

Maximum spanned angle per lower-order element for curved lines. Defaults to 22.5 degrees per element (size level 6). This angle limit may be exceeded if the mesher encounters a small feature (hole, fillet, etc.). (This value is *not* the same as that set by **DESIZE (p. 519)**,,,,*ANGL*.)

ANGH

Maximum spanned angle per higher-order element for curved lines. Defaults to 30 degrees per element (size level 6). This angle limit may be exceeded if the mesher encounters a small feature (hole, fillet, etc.). (This value is NOT the same as that set by **DESIZE (p. 519)**,,,,,*ANGH*.)

GRATIO

Allowable growth ratio used for proximity checking. Defaults to 1.5 for h-elements (size level 6). Values from 1.2 to 5.0 are allowed; however, values from 1.5 to 2.0 are recommended.

SMHLC

Small hole coarsening key, can be ON (default for size level 6) or OFF. If ON, this feature suppresses curvature refinement that would result in very small element edges (that is, refinement around small features).

SMANC

Small angle coarsening key, can be ON (default for all levels) or OFF. If ON, this feature restricts proximity refinement in areas where it is ill-advised (that is, in tight corners on areas, especially those that approach 0 degrees).

MXITR

Maximum number of sizing iterations (defaults to 4 for all levels).

SPRX

Surface proximity refinement key, can be off (*SPRX* = 0, *which is the default for all levels*) or on via two different values (*SPRX* = 1 or *SPRX* = 2). If *SPRX* = 1, surface proximity refinement is performed and any shell elements that need to be modified are modified. If *SPRX*=2, surface proximity refinement is performed but no shell elements are altered.

Command Default

SmartSizing is off and **DESIZE (p. 519)** is used for automatic element sizing.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

If a valid level number (1 (fine) to 10 (coarse)) is input on *SIZLVL*, inputs for remaining arguments are ignored, and the argument values are set as shown in Table 226: SMRTSIZE - Argument Values for h-elements (p. 1813).

The settings shown are for h-elements. The first column contains *SIZLV* data, ranging from 10 (coarse) to 1 (fine). The default is 6 (indicated by the shaded row).

Table 226: SMRTSIZE - Argument Values for h-elements

	FAC	EXPND	TRANS	ANGL	ANGH	GRATIO	SMHLC	SMANC	MXITR	SPRX
10	5.0	2.0	2.0*	45.0	45.0*	2.0	on	on	4*	off

2	0.25	1.0*	2.0*	10.0	15.0	1.5	off	on	4*	off
1	0.2	1.0*	2.0*	7.5	15.0	1.4	off	on	4*	off

Where appropriate, SmartSizing will start with **AESIZE (p. 104)** settings. Elsewhere, it will start with any defined **ESIZE (p. 668)**,SIZE setting. It will locally override **AESIZE (p. 104)** or **ESIZE (p. 668)** for proximity and curvature. SmartSizing ignores any **ESIZE (p. 668)**,,NDIV setting.

LESIZE (p. 1041) line division and spacing specifications will be honored by SmartSizing, unless you give permission for SmartSizing to override them (for proximity or curvature) by setting KYNDIV to 1. Lines not having an **LESIZE (p. 1041)** specification are meshed as well as they can be.

This command is also valid for rezoning.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SMSURF

Specifies "Surface loads on the solid model" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Surface Loads

SMULT, *LabR*, *Lab1*, *Lab2*, *FACT1*, *FACT2*

Forms an element table item by multiplying two other items.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabR

Label assigned to results. If same as existing label, the existing values will be overwritten by these results.

Lab1

First labeled result item in operation.

Lab2

Second labeled result item in operation (may be blank).

FACT1

Scale factor applied to *Lab1*. A (blank) or '0' entry defaults to 1.0.

FACT2

Scale factor applied to *Lab2*. A (blank) or '0' entry defaults to 1.0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Forms a labeled result item (see **ETABLE (p. 687)** command) for the selected elements by multiplying two existing labeled result items according to the operation:

LabR = (*FACT1* x *Lab1*) x (*FACT2* x *Lab2*)

May also be used to scale results for a single labeled result item. If absolute values are requested (**SABS (p. 1643)**,1), the absolute values of *Lab1* and *Lab2* are used.

Menu Paths

Main Menu>General Postproc>Element Table>Multiply

SNOPTION,*RangeFact*,*BlockSize*,*RobustLev*,*Compute*,--,*Solve_Info*

Specifies Supernode (SNODE) eigensolver options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RangeFact

Factor used to control the range of eigenvalues computed for each supernode. The value of *RangeFact* must be a number between 1.0 and 10.0. By default the *RangeFact* value is set to 2.0, which means that all eigenvalues between 0 and 2**FREQE* are computed for each supernode (where *FREQE* is the upper end of the frequency range of interest as specified on the **MODOPT (p. 1140)** command). As the *RangeFact* value increases, the eigensolution for the SNODE solver becomes more accurate and the computational time increases.

BlockSize

BlockSize to be used when computing the final eigenvectors. The value of *Blocksize* must be either MAX or a number between 1 and *NMODE*, where *NMODE* is the number of modes to be computed as set on the **MODOPT (p. 1140)** command. Input a value of MAX to force the algorithm to allocate enough memory to hold all of the final eigenvectors in memory and, therefore, only read through the file containing the supernode eigenvectors once. Note that this setting is ONLY recommended when there is sufficient physical memory on the machine to safely hold all of the final eigenvectors in memory.

RobustLev

Parameter used to control the robustness of the SNODE eigensolver. The value of *RobustLev* must be a number between 0 and 10. Lower values of *RobustLev* allow the eigensolver to run in the most efficient manner for optimal performance. Higher values of *RobustLev* often slow down the performance of the eigensolver, but can increase the robustness; this may be desirable if a problem is detected with the eigensolver or its eigensolution.

Compute

Key to control which computations are performed by the Supernode eigensolver:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EVALUE

The eigensolver computes only the eigenvalues.

EVECTOR

The eigensolver computes only the eigenvectors (must be preceded by a modal analysis where the eigenvalues were computed using the Supernode eigensolver).

BOTH

The eigensolver computes both the eigenvalues and eigenvectors in the same pass (default).

--

Unused field

Solve_Info

Solver output option:

OFF

Turns off additional output printing from the Supernode eigensolver (default).

PERFORMANCE

Turns on additional output printing from the Supernode eigensolver, including a performance summary and a summary of file I/O for the Supernode eigensolver. Information on memory usage during assembly of the global matrices (that is, creation of the `Jobname.full` file) is also printed with this option.

Command Default

RangeFact = 2.0. *BlockSize* is set to min(*NMODE*,40), where *NMODE* is the number of modes to be computed as set on the **MODOPT (p. 1140)** command. *RobustLev* = 0. *Compute* = BOTH. Additional output is not printed (*Solve_Info* = OFF).

Notes

This command specifies options for the Supernode (SNODE) eigensolver.

Setting *RangeFact* to a value between 2.0 and 10.0 will improve the accuracy of the computed eigenvalues and eigenvectors, but will often increase the computing time of the SNODE eigensolver. Conversely, setting *RangeFact* to a value less than 2.0 will deteriorate the accuracy of the computed eigenvalues and eigenvectors, but will often speed up the computing time of the SNODE eigensolver. The default value of 2.0 has been set as a good blend of accuracy and performance. If the model has rigid body modes, setting *RangeFact* higher than 2 is recommended to achieve better solution accuracy for the lower flexible modes.

The SNODE eigensolver reads the eigenvectors and related information for each supernode from a file and uses that information to compute the final eigenvectors. For each eigenvalue/eigenvector requested by the user, the program must do one pass through the entire file that contains the supernode eigen-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

vectors. By choosing a *BlockSize* value greater than 1, the program can compute *BlockSize* number of final eigenvectors for each pass through the file. Therefore, smaller values of *BlockSize* result in more I/O, and larger values of *BlockSize* result in less I/O. Larger values of *BlockSize* also result in significant additional memory usage, as *BlockSize* number of final eigenvectors must be stored in memory. The default *Blocksize* of min(*NMODE*,40) is normally a good choice to balance memory and I/O usage.

The *RobustLev* field should only be used when a problem is detected with the accuracy of the final solution or if the Supernode eigensolver fails while computing the eigenvalues/eigenvectors. Setting *RobustLev* to a value greater than 0 will cause the performance of the eigensolver to deteriorate. If the performance deteriorates too much or if the eigensolver continues to fail when setting the *RobustLev* field to higher values, then switching to another eigensolver such as Block Lanczos or PCG Lanczos is recommended.

Setting *Compute* = EVALUE causes the Supernode eigensolver to compute only the requested eigenvalues. During this process a Jobname.SNODE file is written; however, a Jobname.mode file is not written. Thus, errors will likely occur in any downstream computations that require the Jobname.mode file (for example, participation factor computations, mode superpostion transient/harmonic analysis, PSD analysis). Setting *Compute* = EVECTOR causes the Supernode eigensolver to compute only the corresponding eigenvectors. The Jobname.SNODE file and the associated Jobname.full file are required when requesting these eigenvectors. In other words, the eigenvalues must have already been computed for this model before computing the eigenvectors. This field can be useful in order to separate the two steps (computing eigenvalues and computing eigenvectors).

For more information on the eigensolver's accuracy and a discussion of its known limitations, see Supernode Method in the *Mechanical APDL Theory Reference*

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>Analysis Options

SOLOPTION, *Option*, *Type*, *Value*

Specifies solution transition options.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Transition option:

STOT

Use criterion for transitioning from a static solution to a transient dynamic solution.

TTOS

Use criterion for transitioning from a transient dynamic solution to a static solution.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TTOT

Use criterion for transitioning from one time integration algorithm to another for a transient dynamic solution between load steps.

Type

Additional input that varies depending on the *Option* value. See table below.

Value

Additional input that varies depending on the *Option* and *Type* values. See table below.

Option Label	*Type* =	*Value* =
STOT (default)	CONV – Transition from a static solution to a transient solution when the static solution fails to converge (default).	Time integration scheme for the transient solution: QUASI - Quasi static transient (default) NMK - Newmark time integration HHT - HHT time integration
	FORC – Transition from a static solution to a transient solution upon reading this command (useful in forcing a transition during a restart).	
	RBM – Transition from a static solution to a transient solution the first time the solution experiences rigid body motion, which is determined by maximum DOF increment. The transition occurs if the maximum DOF increment is more than the criterion specified (or the default) on the **CUTCONTROL (p. 445)** command.	
	CONT – Transition from a static solution to a transient solution the first time any contact pair goes from having some points in contact to the entire pair being in a far-field status.	
TTOS	TIME – Time to spend in the transient solution before an attempt is made to come back into a static solution.	Time value
TTOT	FORC – Transition from one time integration algorithm to another upon reading this command. This option can be used between load steps or during restart.	Time integration scheme for the transient solution: QUASI - Quasi static transient (default)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Option Label	*Type* =	*Value* =
		NMK - Newmark time integration HHT - HHT time integration

Notes

This command triggers an automatic transition from a static solution to a transient solution based on the specified criterion. The command is valid only in the solution processor (**/SOLU (p. 1821)**) and must be defined either before the first **SOLVE (p. 1822)** command or during a restart analysis.

If **SOLOPTION (p. 1817)** is issued with no arguments specified, the static solution will transition to a quasi-static transient solution if the static solution fails to converge (that is, **SOLOPTION (p. 1817)**,STOT,CONV,QUASI).

SOLOPTION (p. 1817) can be used in a restart even if the base analysis did not include the command. Therefore, a problem that failed in the static analysis can be restarted using this command so that it transitions to a transient solution and solves further. Material densities are required for the transient solution, but they must be defined during the static solution since the restart framework does not permit material density to be defined in the restart analysis.

For more information on using **SOLOPTION (p. 1817)**, see Automatic Transition Between Static and Transient Solutions in the *Advanced Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

SOLU,*NVAR*,*Item*,*Comp*,*Name*

Specifies solution summary data per substep to be stored.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR

Arbitrary reference number assigned to this variable (2 to *NV* (**NUMVAR (p. 1302)**)).

Item

Label identifying the item. Valid item labels are shown in the table below. Some items may also require a component label.

Comp

Component of the item (if required). Valid component labels are shown in the table below. None are currently required.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name

Thirty-two character name identifying the item on printouts and displays. Defaults to an eight character label formed by concatenating the first four characters of the *Item* and *Comp* labels.

Notes

See also the **PRITER (p. 1497)** command of POST1 to display some of these items directly. Valid for a static or full transient analysis. All other analyses have zeros for the data. Valid item and component labels for solution summary values are:

Valid Item Labels

Item	Description
ALLF	Total arc-length load factor (ratio of the load at equilibrium to the total applied load)
ALDLF	Arc-length load factor increment (change in ALLF)
ARCL	Normalized arc-length radius
CNVG	Convergence indicator.
CRPRAT	Maximum creep ratio.
CSCV	Current segment convergence value.
CUCV	Current convergence value.
DICV	Displacement convergence value.
DSPRM	Descent parameter.
DTIME	Time step size.
EQIT	Number of equilibrium iterations.
FFCV	Fluid flow convergence value.
FOCV	Force convergence value.
HFCV	Heat flow convergence value.
NCMIT	Cumulative number of iterations.
NCMLS	Cumulative number of load steps
NCMSS	Cumulative number of substeps
MFCV	Magnetic flux convergence value.
MOCV	Moment convergence value.
MXDVL	Maximum degree of freedom value.
PRCV	Pressure convergence value.
PSINC	Maximum plastic strain increment.
RESFRQ	Response frequency for 2nd order systems.
RESEIG	Response eigenvalue for 1st order systems.
ROCV	Rotation convergence value.
SMCV	Scalar magnetic potential convergence value.
TECV	Temperature convergence value.
VECV	Velocity convergence value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Valid Item Labels

Item	Description
VOCV	Voltage convergence value.
VMCV	Vector magnetic potential convergence value.

Starts a solution.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | PrepPost | **Solver** | AS add-on

Action

Action to be performed on solve (used only for linear perturbation analyses).

ELFORM

Reform all appropriate element matrices in the first phase of a linear perturbation analysis.

Notes

Starts the solution of one load step of a solution sequence based on the current analysis type and option settings. Use *Action* = ELFORM only in the first phase of a linear perturbation analysis.

Menu Paths

Main Menu>Solution>Solve>Current LS

***SORT**,*Name*,*SortType*,*Val1*,*Val2*

Sorts the values of the specified vector.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Name

Name of the vector to be sorted. This vector can contain real or complex values.

SortType

Criteria used to sort the values:

VALUE –

Values are sorted based on their real value (default).

ABS –

Values are sorted based on their absolute value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PERM –

Values are sorted based on the input permutation vector (*Val1*).

Val1, Val2

Additional input. The meaning of *Val1*, *Val2* varies depending on the specified *SortType*. See below for details.

The following *Valx* fields are used with *SortType* = VALUE or ABS:

Val1

Name of the vector in which permutation values will be saved (optional). This should be an empty vector of type integer that was created with the ***VEC (p. 2085)** command. The size of this permutation vector must be identical to the size of the vector to be sorted. After the sort, this vector contains the permutation used to sort the values.

Val2

Order of the sort operation:

0 –

Increasing order (default).

1 –

Decreasing order.

The following *Valx* fields are used with *Method* = PERM:

Val1

Name of the permutation vector used to sort the values. This must be a vector of integer values that was created with the ***VEC (p. 2085)** command. The size of this permutation vector must be identical to the size of the vector to be sorted.

This permutation vector is required when using *Method* = PERM.

Notes

The examples below demonstrate using ***SORT (p. 1822)** to sort the values of an input vector.

The following input:

```
*VEC,V,I,ALLOC,5
V(1)=5,-3,2,0,-1
*SORT,V,VALUE
*PRINT,V
```

generates this output:

```
       -3        -1         0         2         5
```

To reverse the order, this input:

```
*SORT,V,VALUE,,1
*PRINT,V
```

generates this output:

```
        5        2        0       -1       -3
```

Menu Paths

This command cannot be accessed from a menu.

SORT

Specifies "Sort settings" as the subsequent status topic.

POST1 (p. 51): Status (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>General Postproc>Sort Module

SOURCE, *X*, *Y*, *Z*

Defines a default location for undefined nodes or keypoints.

PREP7 (p. 22): Keypoints (p. 25)
PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

X, Y, Z

Global Cartesian coordinates for source nodes or keypoints (defaults to the origin).

Command Default

Global Cartesian origin.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Defines a global Cartesian location for undefined nodes or keypoints moved during intersection calculations (**MOVE (p. 1158)** or **KMOVE (p. 986)**).

Menu Paths

This command cannot be accessed from a menu.

SPACE, *NODE*

Defines a space node for radiation using the Radiation Matrix method.

AUX12 (p. 62): Radiation Matrix Method (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Node defined to be the space node.

Command Default

No space node (no radiation to space).

Notes

A space node is required in an open system to account for radiation losses.

Menu Paths

Main Menu>Radiation Opt>Matrix Method>Other Settings

SPCNOD, *ENCL*, *NODE*

Defines a space node for radiation using the Radiosity method.

SOLUTION (p. 38): Radiosity (p. 50)
AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ENCL

Radiating surface enclosure number. Defaults to 1. If ENCL = STAT, the command lists all enclosure space nodes. If ENCL = DELE, the command deletes all enclosure space nodes.

NODE

Node defined to be the space node.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

For open systems, an enclosure may radiate to a space node (*NODE*).

Open systems may be characterized by one or more enclosures (*ENCL*). Each enclosure may radiate to a different space node (*NODE*).

For a space node that is not part of the finite element model, specify the temperature using the **D (p. 483)** command. For the first load step, the space node temperature ramps from the uniform temperature specified by the **TUNIF (p. 2027)** command to the temperature specified by the **D (p. 483)** command. For subsequent load steps, it ramps from the previous value of the space node temperature. For intermediate load steps, use the **SPCNOD (p. 1825)**,DELETE command and specify the space node temperature again to ramp from the uniform temperature.

For a space node that is part of the finite element model, the temperature is that calculated during the finite element solution.

Menu Paths

Main Menu>Preprocessor>Radiation Opts>Solution Opt

Main Menu>Radiation Opt>Radiosity Meth>Solution Opt

Main Menu>Solution>Radiation Opts>Solution Opt

SPCTEMP, *ENCL*, *TEMP*

Defines a free-space ambient temperature for radiation using the Radiosity method.

SOLUTION (p. 38): Radiosity (p. 50)
AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ENCL

Radiating surface enclosure number. Defaults to 1. If *ENCL* = STAT, the command lists all enclosure space temperatures. If *ENCL* = DELE, the command deletes all enclosure space temperatures.

TEMP

Temperature of free-space in the reference temperature system. The temperature will be offset by the value specified in the **TOFFST (p. 2008)** command for internal calculations.

Notes

For open systems, an enclosure may radiate to the free-space ambient temperature (*TEMP*).

Open systems may be characterized by one or more enclosures (*ENCL*). Each enclosure may radiate to a different free-space ambient temperature (*TEMP*).

For the first load step, the space temperature ramps from the uniform temperature specified by the **TUNIF (p. 2027)** command to the temperature specified by the **SPCTEMP (p. 1826)** command. For subsequent

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

load steps, it ramps from the previous value of the space temperature. For intermediate load steps, use the **SPCTEMP (p. 1826)**,DELETE command and specify the space temperature again to ramp from the uniform temperature.

Important:

Reissuing **SPCTEMP (p. 1826)** does not overwrite the previous value. To change the free-space ambient temperature (*TEMP*) between loadsteps, you must issue **SPCTEMP (p. 1826)**,DELETE and then reissue **SPCTEMP (p. 1826)**,*ENCL*,*TEMP*.

Main Menu>Preprocessor>Radiation Opts>Solution Opt

Main Menu>Radiation Opt>Radiosity Meth>Solution Opt

Main Menu>Solution>Radiation Opts>Solution Opt

SPDAMP, *TBLNO*, *CURVNO*, *DampRatio*

Defines input spectrum damping in a multi-point response spectrum analysis.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLNO

Input table number. Corresponds to the frequency table number (*TBLNO* on the **SPFREQ (p. 1828)** command).

CURVNO

Input curve number. Corresponds to the spectrum values curve number (*CURVNO* on the **SPVAL (p. 1842)** command).

DampRatio

Damping ratio for the response spectrum curve. Up to 20 different curves may be defined, each with a different damping ratio. Damping values must be input in ascending order.

Notes

Defines multi-point response spectrum damping value to be associated with:

- Previously defined frequency points (**SPFREQ (p. 1828)**).
- Subsequently defined spectrum points (**SPVAL (p. 1842)**).

Damping values are used only to identify input spectrum values for the mode coefficients calculation.

The curve number must be input in ascending order starting with 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>MultiPt>Spect vs Freq

Main Menu>Solution>Load Step Opts>Spectrum>MultiPt>Spect vs Freq

SPEC

Specifies "Miscellaneous specifications" as the subsequent status topic.

POST1 (p. 51): Status (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>General Postproc>Output Options

SPFREQ, *TBLNO*, *FREQ1*, *FREQ2*, *FREQ3*, *FREQ4*, *FREQ5*, *FREQ6*, *FREQ7*

Defines the frequency points for the input spectrum tables SPVAL (p. 1842) vs. SPFREQ (p. 1828) for multi-point spectrum analysis.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLNO

Input table number. Up to 200 tables may be defined.

FREQ1, FREQ2, FREQ3,..., FREQ7

Frequency points (Hz) for spectrum vs. frequency tables. *FREQ1* should be greater than zero, and values must be in ascending order.

Notes

The spectrum values are input with the **SPVAL (p. 1842)** command. A separate **SPFREQ (p. 1828)** command must be used for each table defined. Frequencies must be in ascending order.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Repeat **SPFREQ (p. 1828)** command for additional frequency points. Values are added after the last nonzero frequency.

If all fields after **SPFREQ (p. 1828)** are blank, all input vs. frequency tables are erased. If *TBLNO* is the only non-blank field, all corresponding **SPVAL (p. 1842)** curves are erased.

Use the **SPTOPT (p. 1840)** and **STAT (p. 1861)** commands to list current frequency points.

This command is also valid in PREP7.

---

SPGRAPH, *TBLNO*, *CURVNO*, *CURVNOBeg*

Displays input spectrum curves for MPRS analysis.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLNO

Table number to display. Defaults to 1.

CURVNO

Curve number to display. Defaults to none.

CURVNOBeg

Beginning of the curve number range to display. Defaults to 1.

Notes

You can display up to 10 input spectrum curves (**SPVAL (p. 1842)** and **SPFREQ (p. 1828)** commands) with log X scale.

If the input spectrum curves are not associated with a damping value (**SPDAMP (p. 1827)** command), *CURVNO* and *CURVNOBeg* are not applicable and table *TBLNO* is displayed. Otherwise, specify *CURVNO* or *CURVNOBeg*:

- if *CURVNO* is used, one curve is displayed.
- if *CURVNOBeg* is used, up to 10 curves are displayed. *CURVNOBeg* is the beginning of the curve number range of interest.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

SPH4, *XCENTER*, *YCENTER*, *RAD1*, *RAD2*

Creates a spherical volume anywhere on the working plane.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XCENTER, YCENTER

Working plane X and Y coordinates of the center of the sphere.

RAD1, RAD2

Inner and outer radii (either order) of the sphere. A value of zero or blank for either *RAD1* or *RAD2* defines a solid sphere.

Notes

Defines either a solid or hollow spherical volume anywhere on the working plane. The sphere must have a spatial volume greater than zero. (that is, this volume primitive command cannot be used to create a degenerate volume as a means of creating an area.) A sphere of 360° will be defined with two areas, each consisting of a hemisphere. See the **SPHERE (p. 1831)** and **SPH5 (p. 1830)** commands for other ways to create spheres.

When working with a model imported from an IGES file (DEFAULT import option), you can create only solid spheres. If you enter a value for both *RAD1* and *RAD2* the command is ignored.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Primitives>Solid Sphere

Main Menu>Preprocessor>Modeling>Create>Volumes>Sphere>Hollow Sphere

Main Menu>Preprocessor>Modeling>Create>Volumes>Sphere>Solid Sphere

---

SPH5, *XEDGE1*, *YEDGE1*, *XEDGE2*, *YEDGE2*

Creates a spherical volume by diameter end points.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XEDGE1, YEDGE1

Working plane X and Y coordinates of one edge of the sphere.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

XEDGE2, YEDGE2

Working plane X and Y coordinates of the other edge of the sphere.

Notes

Defines a solid spherical volume anywhere on the working plane by specifying diameter end points. The sphere must have a spatial volume greater than zero. (that is, this volume primitive command cannot be used to create a degenerate volume as a means of creating an area.) A sphere of 360° will be defined with two areas, each consisting of a hemisphere. See the **SPHERE (p. 1831)** and **SPH4 (p. 1830)** commands for other ways to create spheres.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Volumes>Sphere>By End Points

---

SPHERE, *RAD1*, *RAD2*, *THETA1*, *THETA2*

Creates a spherical volume centered about the working plane origin.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RAD1, RAD2

Inner and outer radii (either order) of the sphere. A value of zero or blank for either *RAD1* or *RAD2* defines a solid sphere.

THETA1, THETA2

Starting and ending angles (either order) of the sphere. Used for creating a spherical sector. The sector begins at the algebraically smaller angle, extends in a positive angular direction, and ends at the larger angle. The starting angle defaults to 0.0° and the ending angle defaults to 360.0°. See the *Modeling and Meshing Guide* for an illustration.

Notes

Defines either a solid or hollow sphere or spherical sector centered about the working plane origin. The sphere must have a spatial volume greater than zero. (that is, this volume primitive command cannot be used to create a degenerate volume as a means of creating an area.) Inaccuracies can develop when the size of the object you create is much smaller than the relative coordinate system values (ratios near to or greater than 1000). If you require an exceptionally small sphere, create a larger object, and scale it down to the appropriate size.

For a solid sphere of 360°, you define it with two areas, each consisting of a hemisphere. See the **SPH4 (p. 1830)** and **SPH5 (p. 1830)** commands for the other ways to create spheres.

---

SPLINE, *P1*, *P2*, *P3*, *P4*, *P5*, *P6*, *XV1*, *YV1*, *ZV1*, *XV6*, *YV6*, *ZV6*

Generates a segmented spline through a series of keypoints.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

P1, P2, P3, . . . , P6

Keypoints through which the spline is fit. At least two must be defined. If *P1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

The following fields are used only if specified end slopes on the line are desired, otherwise zero curvature end slopes will be automatically calculated to produce a line which is "straight" in the active coordinate system. To specify end slopes, use the following fields to define a "slope vector" (one for each end of the line, if desired) that has its tail at the origin and its head at the point *XVn*,*YVn*, *ZVn* in the active coordinate system (**CSYS (p. 441)**). The corresponding end slope of the line will then be parallel to this "slope vector."

XV1, YV1, ZV1

Location (in the active coordinate system) of the head of the "slope vector" corresponding to the slope at the *P1* end of the spline. The tail of the vector is at the origin of the coordinate system.

XV6, YV6, ZV6

Location of the head of the "slope vector" corresponding to the slope at the *P6* (or the last keypoint if fewer than six specified) end of the spline.

Notes

The output from this command is a series of connected lines (one line between each pair of keypoints) that together form a spline. Note that solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Lines>Splines>Segmented Spline

Main Menu>Preprocessor>Modeling>Create>Lines>Splines>With Options>Segmented Spline

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPLOT, *NA1*, *NA2*, *NINC*, *MESH*

Displays the selected areas and a faceted view of their underlying surfaces

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1

Starting area for display of areas and underlying surfaces. If *NA1* = ALL (default), *NA2* and *NINC* are ignored and all selected areas are displayed (**ASEL (p. 192)** command).

NA2

Last area to be displayed.

NINC

Numeric value setting steps between NA1 and NA2 for display. Default value is (1).

MESH

Specifies a rectangular mesh density used to display the underlying surface (default 4, i.e. 4 x 4).

Notes

This command is valid in any processor. The plot output displays the external and internal trim curves and underlying surface. You cannot obtain a faceted view of your surface areas when you are using the **/EXPAND (p. 712)** command to create larger graphics displays.

Use **APLOT (p. 169)** for trimmed surface display.

Menu Paths

This command cannot be accessed from a menu.

SPMWRITE, *Method*, *NMODE*, *Inputs*, *InputLabels*, *Outputs*, *OutputLabels*, *NIC*, *VelAccKey*, *FileFormat*

Calculates the state-space matrices and writes them to the SPM file.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Method

Reduction method for the calculation of the state-space matrices.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MODAL

Method based on modal analysis results from LANB, LANPCG, SNODE, or SUBSP eigensolver (default).

NMODE

Number of modes to be used. Defaults to all modes.

Inputs

Definition of the inputs. Defaults to all load vectors on the MODE file.

If an integer is entered, it specifies the number of load vectors from the MODE file used for the definition of the inputs. The first *Inputs* load vectors are used.

If *Inputs* is an array parameter, the first column is the node number and the second column is the structural degree of freedom (1=UX, 2=UY, 3=UZ, 4=ROTX, 5=ROTY, 6=ROTZ) indicating input points. The number of rows in the array parameter is equal to the number of inputs.

InputLabels

Definition of the input labels. Defaults to the load vector numbers or input definition (node and degree of freedom array parameter), depending on the *Inputs* specification.

If a character array parameter is entered (Type=CHAR in the ***DIM (p. 530)** command), each 8 character string represents an input label. Only valid when *Inputs* is an array parameter

Outputs

Definition of the outputs. Defaults to the inputs.

If an array parameter is entered, the first column is the node number and the second column is the structural degree of freedom (1=UX, 2=UY, 3=UZ, 4=ROTX, 5=ROTY, 6=ROTZ) of the output points. The number of rows in the array parameter is equal to the number of outputs.

OutputLabels

Definition of the output labels. Defaults to the output definition (node and degree of freedom) if used, else defaults to the *InputLabels*.

If a character array parameter is entered (Type=CHAR in the *DIM command), each 8 character string represents an output label.

NIC

Load vector on the *MODE* file used for the calculation of the initial conditions. Defaults to no initial condition.

VelAccKey

Output velocities and accelerations key.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

Output displacements only (default).

ON

Output displacements, velocities and accelerations.

FileFormat

The format of the SPM file.

0

Dense format.

1

Matrix Market Exchange format (non-zero terms only).

2

Twin Builder SML format without reference (default).

3

Twin Builder SML format with common reference.

4

Twin Builder SML format with independent references.

Notes

The SPMWRITE generates the file `Jobname.spm` containing the state-space matrices and other information.

The following applies to the SML formats (FileFormat = 2, 3, and 4):

- For conservative systems where the outputs are equal to the inputs (*`Outputs`* is left blank):
  - The labels for the inputs (*`InputLabels`*) are required.
  - The *`Inputs`* must use the array parameter option so that the input degrees of freedom (DOFs) are known.
- For non-conservative systems where the outputs are not equal to the inputs:
  - The labels for the outputs (*`OutputLabels`*) are required.
  - The file formats with references (*`FileFormat`* = 3 and 4) do not apply.
- Velocity and acceleration results are not included in the state-space matrices calculation (VelAccKey = OFF)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- File format with common reference (FileFormat = 3) does not apply if the inputs are based on DOFs of a different nature. All input DOFs must be either all rotational or all translational and not a mix of the two.
- A graphics file (`Jobname_SPM.png`) is generated. It contains an element plot of the model.

For more details about the reduction method and the generation of the state-space matrices, see Reduced-Order Modeling for State-Space Matrices Export in the *Mechanical APDL Theory Reference*.

For examples of the command usage, see State-Space Matrices Export.

Menu Paths

This command cannot be accessed from a menu.

SPOINT, *NODE*, *X*, *Y*, *Z*, *InertiaKey*

Defines a point for force/moment summations or inertia calculation

POST1 (p. 51): Special Purpose (p. 56)
SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Node number of the desired point. If zero, use *X*,*Y*,*Z* to describe point.

X*, *Y*, *Z

Global Cartesian coordinates of the desired summation point. Used if *NODE* is 0. Defaults to (0,0,0).

InertiaKey

Inertia key:

OFF

Point or node is used for the force/moment summations (default).

ON

Point or node is used for the calculation of total inertia.

Command Default

No point is defined by default; you must either specify a node or coordinates.

Notes

By default (*InertiaKey* = OFF), defines a point (any point other than the origin) about which the tabular moment summations are computed. If force summations are desired in other than the global

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cartesian directions, a node number must be specified on the *NODE* field, *and* the desired coordinate system must be activated with **RSYS (p. 1639)**. The command must be issued in the **/POST1 (p. 1461)** module.

When the inertia key is activated (*InertiaKey* = ON), the total inertia printed in the precise mass summary is calculated with respect to the point or node in the global Cartesian system. In this case, the command must be issued during the first load step in the **/SOLU (p. 1821)** module.

Menu Paths

Main Menu>General Postproc>Nodal Calcs>Summation Pt>At XYZ Loc

---

SPOPT,*Spectype*,*NMODE*,*Elcalc*,*ModeReuseKey*,*SpecCum*

Selects the spectrum type and other spectrum options.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Spectype

Spectrum type:

SPRS

Single point excitation response spectrum (default). See also **SVTYP (p. 1887)**.

MPRS

Multiple point excitation response spectrum.

DDAM

Dynamic design analysis method.

PSD

Power spectral density.

NMODE

Use the first *NMODE* modes from the modal analysis. Defaults to all extracted modes, as specified by the **MODOPT (p. 1140)** and **BUCOPT (p. 280)** commands. *NMODE* cannot be larger than 10000.

Elcalc

Element results calculation key:

NO

Do not calculate element results and reaction forces (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

YES

Calculate element results and reaction forces, as well as the nodal degree of freedom solution.

ModeReuseKey

Key for existing *MODE* file reuse when running multiple spectrum analyses:

NO

No spectrum analysis has been performed yet (default).

YES

This is not the first spectrum analysis. The *MODE* file will be reused and the necessary files will be cleaned up for the new spectrum analysis.

SpecCum

Key to cumulate all response spectra solutions in `Jobname.rst` when multiple response spectra are calculated (only supported for SPRS and DDAM analyses with *Elcalc* = YES):

NO

Do not cumulate the response spectra solutions (default).

YES

Cumulate the response spectra solutions.

Notes

Valid only for a spectrum analysis (**ANTYPE (p. 162)**,SPECTR). This operation must be preceded by a modal solution (**ANTYPE (p. 162)**,MODAL) with the appropriate files available. Both the spectrum analysis and the preceding modal analysis must be performed under the same Mechanical APDL version number.

If used in SOLUTION, this command is valid only within the first load step.

Element results are calculated (*Elcalc* = YES) only if the element modal results are available (written to the `Jobname.mode` file with *MSUPkey* = YES on the **MXPAND (p. 1203)** command). For *Sptype* = SPRS, MPRS, and DDAM, if the element results calculation is activated (*Elcalc* = YES) and element modal results are not available, it is deactivated automatically.

For SPRS, DDAM or MPRS analyses, when *Elcalc* = YES, the modal responses can be combined and stored directly in the `Jobname.rst` file during spectrum solution according to the mode combination method command issued (**SRSS (p. 1845)**, **CQC (p. 433)**, etc.). This can save significant time compared to the method for *Elcalc* = NO, which requires generating the file of POST1 commands (`Jobname.mcom` file) to be read in POST1 to perform the mode combinations. For details and example usage, see Spectrum Analysis in the *Structural Analysis Guide*, Example 6.2: Calculating the Velocity Solution in Addition to the Displacement Solution with *Elcalc* = YES on **SPOPT** command, and Example: Multi-Point Response Spectrum (MPRS) Analysis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When multiple response spectra solutions are calculated in SPRS or DDAM analyses with *Elcalc* = YES on the **SPOPT (p. 1837)** command:

- When missing mass is disabled (**MMASS (p. 1131)**):
  - If *SpecCum* = NO, each new response spectrum set overwrites the previous one at each solve in `Jobname.rst`.
  - If *SpecCum* = YES, all response spectra are cumulated in `Jobname.rst`.
- When missing mass is activated (**MMASS (p. 1131)**,ON) in a SPRS analysis:
  - If *SpecCum* = NO, the missing mass response (loadstep 2) and the response spectrum sets are cumulated in `Jobname.rst` until the **FINISH (p. 758)** command is issued, which activates the deletion of any response spectrum set between two missing mass response sets. Only the last response spectrum set is kept in `Jobname.rst`. See Single-Point Response Spectrum Analysis on a Piping Structure with Excitation Along X, Y, and Z Directions, missing mass effect, *Elcalc* = YES and *SpecCum* = NO on **SPOPT** command in the *Structural Analysis Guide*.

This command is also valid in PREP7.

Example Usage

Example 6.1: Calculating the Velocity Solution in Addition to the Displacement Solution

Example 6.2: Calculating the Velocity Solution in Addition to the Displacement Solution with *Elcalc* = YES on **SPOPT** command

6.4.1: Single-Point Response Spectrum Analysis on a Beam Structure

6.4.2: Single-Point Response Spectrum Analysis on a Piping Structure with Excitation Along X, Y, and Z Directions

6.4.3: Single-Point Response Spectrum Analysis on a Piping Structure with Excitation along X, Y, and Z Directions Separately by Reusing the Existing Mode File

6.4.4: Single-Point Response Spectrum Analysis on a Piping Structure with Excitation Along X, Y, and Z Directions, missing mass effect, *Elcalc* = YES and *SpecCum* = NO on **SPOPT** command

6.4.5: Single-Point Response Spectrum Analysis on a Piping Structure with Excitation Along X, Y, and Z Directions, missing mass effect, Elcalc = YES and *SpecCum* = YES on **SPOPT** command: method 1

6.4.6: Single-Point Response Spectrum Analysis on a Piping Structure with Excitation Along X, Y, and Z Directions, missing mass effect, *Elcalc* = YES on **SPOPT** command: method 2

Example: Random Vibration (PSD) Analysis

Example: DDAM Spectrum Analysis

Example: Multi-Point Response Spectrum (MPRS) Analysis

Where to Find Other Examples

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>Analysis Options

SPREAD, *VALUE*

Turns on a dashed tolerance curve for the subsequent curve plots.

POST26 (p. 58): Display (p. 60)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VALUE

Amount of tolerance. For example, 0.1 is ± 10%.

Command Default

No tolerance curve.

Menu Paths

Main Menu>TimeHist Postpro>Settings>Graph

SPTOPT

Specifies "Spectrum analysis options" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>SinglePt>Show Status

Main Menu>Solution>Load Step Opts>Spectrum>SinglePt>Show Status

Utility Menu>List>Status>Solution>Spectrum Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPUNIT, *TBLNO*, *Type*, *GVALUE*, *KeyInterp*

Defines the type of multi-point response spectrum.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLNO

Input table number.

Type

Label identifying the type of spectrum:

DISP

Displacement spectrum (**SPVAL (p. 1842)** values interpreted as displacements with units of length).

VELO

Velocity spectrum (**SPVAL (p. 1842)** values interpreted as velocities with units of length/time).

ACEL

Acceleration spectrum (**SPVAL (p. 1842)** values interpreted as accelerations with units of length/time^2).

ACCG

Acceleration spectrum (**SPVAL (p. 1842)** values interpreted as accelerations with units of g/time^2).

FORC

Force spectrum.

PRES

Pressure spectrum.

GVALUE

Value of acceleration due to gravity in any arbitrary units for Type=ACCG table. Default is 386.4 in/sec^2.

KeyInterp

Key to activate or deactivate the linear interpolation between input response spectrum points and input response spectrum curves:

0 (OFF or NO)

Deactivate linear and use logarithmic interpolation. This value is the default.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1 (ON or YES)

Activate linear interpolation.

Command Default

Acceleration (ACEL) spectrum (length/time^2).

Notes

Defines the type of multi-point response spectrum defined by the **SPFREQ (p. 1828)** and **SPVAL (p. 1842)** commands.

Force (**FORC**) and pressure (**PRES**) type spectra can be used only as a nodal excitation.

GVALUE is valid only when *Type* = ACCG is specified. A zero or negative value cannot be used. A parameter substitution can also be performed.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>MultiPt>Settings

Main Menu>Solution>Load Step Opts>Spectrum>MultiPt>Settings

SPVAL, *TBLNO*, *CURVNO*, *SV1*, *SV2*, *SV3*, *SV4*, *SV5*, *SV6*, *SV7*

Defines multi-point response spectrum values.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLNO

Input table number. It corresponds to *TBLNO* on the **SPFREQ (p. 1828)** command.

CURVNO

Input curve number. It corresponds to *CURVNO* on the **SPDAMP (p. 1827)** command (optional).

SV1, SV2, SV3, , , . . . , SV7

Spectral values corresponding to the frequency points (**SPFREQ (p. 1828)**) and damping ratio (**SPDAMP (p. 1827)**). Values are interpreted as defined with the **SPUNIT (p. 1841)** command.

Notes

Defines multi-point response spectrum values to be associated with the previously defined frequency points (**SPFREQ (p. 1828)**). It can also be associated with the previously defined damping value (**SPDAMP (p. 1827)**). If *CURVNO* is not specified, the input spectrum is not associated with a damping value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Repeat **SPVAL (p. 1842)** command for additional values, up to the number of frequency points (**SPFREQ (p. 1828)**). Values are added after the last nonzero value.

The interpolation method between response spectrum points and curves is specified using *KeyInterp* on the **SPUNIT (p. 1841)** command. It is logarithmic by default.

Use the **SPTOPT (p. 1840)** and **STAT (p. 1861)** commands to list current spectrum curve values.

This command is also valid in PREP7.

Main Menu>Solution>Load Step Opts>Spectrum>MultiPt>Spect vs Freq

---

SQRT, *IR*, *IA*, - - , - - , *Name*, - - , - - , *FACTA*

Forms the square root of a variable.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to *NV* (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA

Reference number of the variable to be operated on.

- -, - -

Unused fields.

Name

Thirty-two character name identifying the variable on printouts and displays. Embedded blanks are compressed for output.

- -, - -

Unused fields.

FACTA

Scaling factor (positive or negative) applied to variable *IA* (defaults to 1.0).

Notes

Forms the square root of a variable according to the operation:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$IR = \sqrt{FACTA \times IA}$$

*SREAD,*StrArray*,*Fname*,*Ext*,*--*,*nChar*,*nSkip*,*nRead*

Reads a file into a string array parameter.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

StrArray

Name of the "string array" parameter which will hold the read file. String array parameters are similar to character arrays, but each array element can be as long as 248 characters. If the string parameter does not exist, it will be created. The array will be created as: *DIM,StrArray,STRING,nChar,nRead

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Ext

Filename extension (eight-character maximum).

--

Unused field.

nChar

Number of characters per line to read (default is length of the longest line in the file).

nSkip

Number of lines to skip at the start of the file (default is 0).

nRead

Number of lines to read from the file (default is the entire file).

Notes

The ***SREAD (p. 1844)** command reads from a file into a string array parameter. The file must be an ASCII text file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

SRSS,*SIGNIF*,*Label*,*AbsSumKey*,*ForceType*

Specifies the square root of sum of squares mode combination method.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SIGNIF

Combine only those modes whose significance level exceeds the *SIGNIF* threshold. For single-point, multi-point, or DDAM response spectrum (*Spectype* = SPRS, MPRS, or DDAM on **SPOPT (p. 1837)**), the significance level of a mode is defined as the mode coefficient divided by the maximum mode coefficient of all modes. Any mode whose significance level is less than *SIGNIF* is considered insignificant and is not contributed to the mode combinations. The higher the *SIGNIF* threshold, the fewer the number of modes combined. *SIGNIF* defaults to 0.001. If *SIGNIF* is specified as 0.0, it is taken as 0.0. (This mode combination method is not valid for **SPOPT (p. 1837)**,PSD.)

Label

Label identifying the combined mode solution output.

DISP

Displacement solution (default). Displacements, stresses, forces, etc., are available.

VELO

Velocity solution. Velocities, "stress velocities," "force velocities," etc., are available.

ACEL

Acceleration solution. Accelerations, "stress accelerations," "force accelerations," etc., are available.

AbsSumKey

Absolute Sum combination key (for **SPOPT (p. 1837)**,MPRS only):

NO

Do not use the Absolute Sum method (default).

YES

Combine the modes per excitation direction using the Absolute Sum method, then combine the resulting quantities using the square root of sum of squares method.

When using Absolute Sum combination, the excitation direction must be specified using the **SED (p. 1704)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ForceType

Label identifying the forces to be combined:

STATIC

Combine the modal static forces (default).

TOTAL

Combine the modal static plus inertial forces.

Notes

This command is also valid for PREP7.

---

SSBT, B^T_{11}, B^T_{22}, B^T_{12}, T

Specifies preintegrated bending thermal effects for shell sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

B^T_{11}, B^T_{22}, B^T_{12}

Bending thermal effects component [B^T].

T

Temperature.

Notes

The behavior of shell elements is governed by the generalized-stress/generalized-strain relationship of the form:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$\begin{Bmatrix} N \\ M \end{Bmatrix} = \begin{bmatrix} A & B \\ B^T & D \end{bmatrix} \begin{Bmatrix} \varepsilon \\ \kappa \end{Bmatrix} - (T - T^I) \begin{Bmatrix} M^T \\ B^T \end{Bmatrix}$$
$$[S] = [E]\{\gamma\}$$

The **SSBT (p. 1846)** command, one of several preintegrated shell section commands, specifies the bending thermal effects quantity (submatrix [$\boldsymbol{B}^T$] data) for a preintegrated shell section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

The [$\boldsymbol{B}^T$] quantity represents bending stress resultants caused by a unit raise in temperature on a fully constrained model. For a layered composite shell, it is usually necessary to specify both the [$\boldsymbol{B}^T$] and [$\boldsymbol{M}^T$] quantities (by issuing the **SSBT (p. 1846)** and **SSMT (p. 1849)** commands, respectively).

Unspecified values default to zero.

Related commands are **SSPA (p. 1851)**, **SSPB (p. 1852)**, **SSPD (p. 1853)**, **SSPE (p. 1854)**, **SSMT (p. 1849)**, and **SSPM (p. 1855)**.

If you are using the SHELL181 or SHELL281 element's Membrane option (KEYOPT(1) = 1), it is not necessary to issue this command.

For complete information, see Creating a Preintegrated General Shell Section.

Menu Paths

Main Menu>Preprocessor>Sections>Shell>Pre-integrated

/SSCALE, *WN*, *SMULT*

Sets the contour multiplier for topographic displays.

GRAPHICS (p. 16): Scaling (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

SMULT

Contour multiplier that factors in results based on the product of the multiplier and the result being plotted. Defaults to 0.0 (no topographic effects).

Command Default

No topographic contour effects.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Use this command to scale values to the geometry when the contours are shown elevated. For section displays (**/TYPE (p. 2034)**), the elevation is performed perpendicular to the section face.

Nonzero contour multipliers factoring in large results (stresses or displacements) can produce very large distortion, causing images to disappear. To bring a distorted image back into view, reduce the contour multiplier value.

Portions of this command are not supported by PowerGraphics (**/GRAPHICS (p. 866)**,POWER).

Menu Paths

Utility Menu>PlotCtrls>Style>Contours>Contour Style

SSLN, *FACT*, *SIZE*

Selects and displays small lines in the model.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FACT

Factor used to determine small lines. *FACT* times the average line length in the model is used as the line length limit below which lines will be selected.

SIZE

Line length limit for line selection. Lines that have a length less than or equal to *SIZE* will be selected. Used only if *FACT* is blank.

Notes

SSLN (p. 1848) invokes a predefined Mechanical APDL macro for selecting small lines in a model. Lines that are smaller than or equal to the specified limit (*FACT* or *SIZE*) are selected and line numbers are displayed. This command macro is useful for detecting very small lines in a model that may cause problems (that is, poorly shaped elements or a meshing failure) during meshing. All lines that are not "small" will be unselected and can be reselected with the **LSEL (p. 1074)** command.

Menu Paths

Main Menu>Preprocessor>Modeling>Check Geom>Sel Small Lines

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SSMT, M^T_{11}, M^T_{22}, M^T_{12}, T

Specifies preintegrated membrane thermal effects for shell sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

M^T_{11}, M^T_{22}, M^T_{12}

Membrane thermal effects component [***M^T***].

T

Temperature.

Notes

The behavior of shell elements is governed by the generalized-stress/generalized-strain relationship of the form:

$$\begin{Bmatrix} N \\ M \end{Bmatrix} = \begin{bmatrix} A & B \\ B^T & D \end{bmatrix} \begin{Bmatrix} \varepsilon \\ \kappa \end{Bmatrix} - (T - T^I) \begin{Bmatrix} M^T \\ B^T \end{Bmatrix}$$

$$[S] = [E]\{\gamma\}$$

The **SSMT (p. 1849)** command, one of several preintegrated shell section commands, specifies the membrane thermal effects quantity (submatrix [***M^T***] data) for a preintegrated shell section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

The [***M^T***] quantity represents membrane stress resultants caused by a unit raise in temperature on a fully constrained model. For a layered composite shell, it is usually necessary to specify both the [***M^T***] and [***B^T***] quantities (by issuing the **SSMT (p. 1849)** and **SSBT (p. 1846)** commands, respectively).

Unspecified values default to zero.

Related commands are **SSPA (p. 1851)**, **SSPB (p. 1852)**, **SSPD (p. 1853)**, **SSPE (p. 1854)**, **SSBT (p. 1846)**, and **SSPM (p. 1855)**.

For complete information, see Creating a Preintegrated General Shell Section.

Menu Paths

Main Menu>Preprocessor>Sections>Shell>Pre-integrated

SSOPT,*Option*,*Par1*,*Par2*,*Par3*,*Par4*,*Par5*

Defines a solution option for soil analysis.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Solution option to define:

GEOSTATIC

Geostatic equilibrium step for soil analysis.

CONSOLIDATION

Consolidation step for soil analysis.

STOP

Stop condition for soil consolidation analysis.

SFSW

Specific weight load.

Par1, ... , Par5

Parameters for the specified *Option*.

Valid *Par* Values for Each *Option*

Option = GEOSTATIC

No parameter values required.

Option = CONSOLIDATION

No parameter values required.

Option = STOP

Par1:

SSTATE -- The steady-state solution threshold of incremental pore pressure in a step.

OFF -- Deactivate steady-state solution check.

Par2:

Valid only when *Par1* = SSTATE.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A positive value to define the maximum pore pressure increment in a step, or a negative value to define the percentage of incremental pore pressure in a step to maximum pore pressure in the solution.

Option **= SFSW**

Par1, Par2, Par3:

The specific weight load direction. (*Default*: The -Y axis in the global coordinate system.)

Par4:

OFF -- Ignore the specific bulk weight (default).

ON -- Account for the specific bulk weight load.

Par5:

OFF -- Ignores the fluid specific weight (default).

ON -- Account for the fluid specific weight.

Notes

The **SSOPT (p. 1850)** command defines solution options for soil analysis (**ANTYPE (p. 162)**,SOIL) only.

Menu Paths

This command cannot be accessed from a menu.

SSPA,A_{11} ,A_{21} ,A_{31} ,A_{22} ,A_{32} ,A_{33} ,T

Specifies a preintegrated membrane stiffness for shell sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

A_{11} ,A_{21} ,A_{31} ,A_{22} ,A_{32} ,A_{33}

Membrane stiffness component (symmetric lower part of submatrix [***A***]).

T

Temperature.

Notes

The behavior of shell elements is governed by the generalized-stress/generalized-strain relationship of the form:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$\begin{Bmatrix} N \\ M \end{Bmatrix} = \begin{bmatrix} A & B \\ B^T & D \end{bmatrix} \begin{Bmatrix} \varepsilon \\ \kappa \end{Bmatrix} - (T - T^I) \begin{Bmatrix} M^T \\ B^T \end{Bmatrix}$$
$$[S] = [E]\{\gamma\}$$

The **SSPA (p. 1851)** command, one of several preintegrated shell section commands, specifies the membrane stiffness quantity (submatrix [***A***]) for a preintegrated shell section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

Unspecified values default to zero.

Related commands are **SSPB (p. 1852)**, **SSPD (p. 1853)**, **SSPE (p. 1854)**, **SSMT (p. 1849)**, **SSBT (p. 1846)**, and **SSPM (p. 1855)**.

For complete information, see Creating a Preintegrated General Shell Section.

Menu Paths

Main Menu>Preprocessor>Sections>Shell>Pre-integrated

SSPB, B_{11} , B_{21} , B_{31} , B_{22} , B_{32} , B_{33} , T, B_{12} , B_{13} , B_{23}

Specifies a preintegrated coupling stiffness for shell sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

B_{11} , B_{21} , B_{31} , B_{22} , B_{32} , B_{33}

Coupling stiffness component (symmetric lower part of submatrix [***B***]).

T

Temperature.

B_{12} , B_{13} , B_{23}

Upper part of submatrix [***B***]

Notes

The behavior of shell elements is governed by the generalized-stress/generalized-strain relationship of the form:

$$\begin{Bmatrix} N \\ M \end{Bmatrix} = \begin{bmatrix} A & B \\ B^T & D \end{bmatrix} \begin{Bmatrix} \varepsilon \\ \kappa \end{Bmatrix} - (T - T^I) \begin{Bmatrix} M^T \\ B^T \end{Bmatrix}$$
$$[S] = [E]\{\gamma\}$$

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If the coefficients B_{12} , B_{13} , B_{23} are undefined, the program uses a symmetric form of submatrix [***B***]. If any one of the coefficients B_{12} , B_{13} , B_{23} is nonzero, the program considers submatrix [***B***] to be unsymmetric.

The **SSPB (p. 1852)** command, one of several preintegrated shell section commands, specifies the coupling stiffness quantity (submatrix [***B***] data) for a preintegrated shell section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

Unspecified values default to zero.

Related commands are **SSPA (p. 1851)**, **SSPD (p. 1853)**, **SSPE (p. 1854)**, **SSMT (p. 1849)**, **SSBT (p. 1846)**, and **SSPM (p. 1855)**.

If you are using the SHELL181 or SHELL281 element's Membrane option (KEYOPT(1) = 1), it is not necessary to issue this command.

For complete information, see Creating a Preintegrated General Shell Section.

Menu Paths

Main Menu>Preprocessor>Sections>Shell>Pre-integrated

SSPD, D_{11} , D_{21} , D_{31} , D_{22} , D_{32} , D_{33} , T

Specifies a preintegrated bending stiffness for shell sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

D_{11} , D_{21} , D_{31} , D_{22} , D_{32} , D_{33}

Bending stiffness component (symmetric lower part of submatrix [***D***]).

T

Temperature.

Notes

The behavior of shell elements is governed by the generalized-stress/generalized-strain relationship of the form:

$$\begin{Bmatrix} N \\ M \end{Bmatrix} = \begin{bmatrix} A & B \\ B^T & D \end{bmatrix} \begin{Bmatrix} \varepsilon \\ \kappa \end{Bmatrix} - (T - T^I) \begin{Bmatrix} M^T \\ B^T \end{Bmatrix}$$

$$[S] = [E]\{\gamma\}$$

The **SSPD (p. 1853)** command, one of several preintegrated shell section commands , specifies the bending stiffness quantity (submatrix [***D***] data) for a preintegrated shell section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Unspecified commands default to zero.

Related commands are **SSPA (p. 1851)**, **SSPB (p. 1852)**, **SSPE (p. 1854)**, **SSMT (p. 1849)**, **SSBT (p. 1846)**, and **SSPM (p. 1855)**.

If you are using the SHELL181 or SHELL281 element's Membrane option (KEYOPT(1) = 1), it is not necessary to issue this command.

For complete information, see Creating a Preintegrated General Shell Section.

Menu Paths

Main Menu>Preprocessor>Sections>Shell>Pre-integrated

SSPE, E_{11} , E_{21} , E_{22} , T

Specifies a preintegrated transverse shear stiffness for shell sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

E_{11} , E_{21} , E_{22}

Transverse shear stiffness component (symmetric lower part of submatrix [***E***]).

T

Temperature.

Notes

The behavior of shell elements is governed by the generalized-stress/generalized-strain relationship of the form:

$$\begin{Bmatrix} N \\ M \end{Bmatrix} = \begin{bmatrix} A & B \\ B^T & D \end{bmatrix} \begin{Bmatrix} \varepsilon \\ \kappa \end{Bmatrix} - (T - T^I) \begin{Bmatrix} M^T \\ B^T \end{Bmatrix}$$

$$[S] = [E]\{\gamma\}$$

The **SSPE (p. 1854)** command, one of several preintegrated shell section commands, specifies the transverse shear stiffness quantity (submatrix [***E***] data) for a preintegrated shell section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

Unspecified values default to zero.

Related commands are **SSPA (p. 1851)**, **SSPB (p. 1852)**, **SSPD (p. 1853)**, **SSMT (p. 1849)**, **SSBT (p. 1846)**, and **SSPM (p. 1855)**.

If you are using the SHELL181 or SHELL281 element's Membrane option (KEYOPT(1) = 1), it is not necessary to issue this command.

For complete information, see Creating a Preintegrated General Shell Section .

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Sections>Shell>Pre-integrated

SSPM,*DENS*,*T*

Specifies mass density for a preintegrated shell section.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DENS

Mass density.

T

Temperature.

Notes

The **SSPM (p. 1855)** command, one of several preintegrated shell section commands, specifies the mass density (assuming a unit thickness) for a preintegrated shell section. The value specified is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

Related commands are **SSPA (p. 1851)**, **SSPB (p. 1852)**, **SSPD (p. 1853)**, **SSPE (p. 1854)**, **SSMT (p. 1849)**, and **SSBT (p. 1846)**.

For complete information, see Creating a Preintegrated General Shell Section.

Menu Paths

Main Menu>Preprocessor>Sections>Shell>Pre-integrated

SSTATE,*Action*,*CM_Name*,*Val1*,*Val2*,*Val3*,*Val4*,*Val5*,*Val6*,*Val7*,*Val8*,*Val9*

Defines a steady-state rolling analysis.

PREP7 (p. 22): Special Purpose (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Action to perform for defining or manipulating steady-state rolling analysis data:

DEFINE

Define steady-state rolling analysis data

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LIST

List current steady-state rolling analysis data

DELETE

Delete steady-state rolling analysis data

CM_Name

Element component name

VAL1, ..., VAL9

Input values (based on the *Action* type)

Notes

The **SSTATE (p. 1855)** command specifies steady-state rolling analysis parameters for the given element component. The program runs the steady-state rolling analysis if the corresponding element key option is enabled for that element component.

The command supports the following elements:

Supported Element	Description
SOLID185	3D 8-Node Structural Solid
SOLID186	3D 20-Node Structural Solid
SOLID187	3D 10-Node Tetrahedral Structural Solid
SOLSH190	3D 8-Node Structural Solid Shell Degenerated shape (prism) option not supported.
SOLID285	3D 4-Node Tetrahedral Structural Solid with Nodal Pressures

For information about steady-state rolling for rebar and solid elements, see Steady-State Rolling in the *Mechanical APDL Theory Reference*.

Command Specification for *Action* = DEFINE

The following data types can be defined:

- SPIN -- Spinning motion
- TRANSLATE -- Rigid body motion (velocity) that the spinning component is undergoing

Define the steady-state spinning motion:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SSTATE (p. 1855), DEFINE, *CM_Name*, SPIN, *OMEGA*, *Method*, *Val4*, *Val5*, *Val6*, *Val7*, *Val8*, *Val9*

OMEGA

Spin velocity

Method

Method to use for defining the spin axis:

POINTS --

Define the spin axis using two points:

Val4, *Val5*, *Val6* -- Coordinates of the first point

Val7, *Val8*, *Val9* -- Coordinates of the second point

This definition method is currently the only option.

Example 18: Defining Steady-State Spinning Motion

This command defines a steady-state spinning motion of 120 rad/s around the spin axis:

```
SSTATE,DEFINE,CM_Name,SPIN,120,POINTS,0,0,0,0,1,0
```

In this case, two points with coordinates (0,0,0) and (0,1,0) define the spin axis in the global Y direction.

Define the rigid body motion (velocity):

SSTATE (p. 1855), DEFINE, *CM_Name*, TRANSLATE, *Val2*, *Val3*, *Val4*

Val2, *Val3*, *Val4* -- Rigid body velocity components

Command Specification for *Action* = LIST

SSTATE (p. 1855), LIST, *CM_Name*

Lists all steady-state rolling analysis data defined on the specified element component. All data is listed if no component (*CM_Name*) is specified.

Command Specification for *Action* = DELETE

SSTATE (p. 1855), DELETE, *CM_Name*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Deletes all steady-state rolling analysis data defined on the specified element component. All data is deleted if no component (*CM_Name*) is specified.

Menu Paths

This command cannot be accessed from a menu.

SSUM

Calculates and prints the sum of element table items.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Calculates and prints the tabular sum of each existing labeled result item (**ETABLE (p. 687)**) for the selected elements. If absolute values are requested (**SABS (p. 1643)**,1), absolute values are used.

Menu Paths

Main Menu>General Postproc>Element Table>Sum of Each Item

STABILIZE,*Key*,*Method*,*VALUE*,*SubStpOpt*,*FORCELIMIT*,*RECALCDAMP*

Activates stabilization for all elements that support nonlinear stabilization.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Key for controlling nonlinear stabilization:

OFF

Deactivate stabilization (default).

CONSTANT

Activate stabilization. The energy-dissipation ratio or damping factor remains constant during the load step.

REDUCE

Activate stabilization. The energy-dissipation ratio or damping factor is reduced linearly to zero at the end of the load step from the specified or calculated value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Method

The stabilization-control method:

ENERGY

Use the energy-dissipation ratio as the control. This value is the default when *Key* ≠ OFF.

DAMPING

Use the damping factor as the control.

VALUE

The energy-dissipation ratio (*Method* = ENERGY) or damping factor (*Method* = DAMPING). This value must be greater than 0 when *Method* = ENERGY or *Method* = DAMPING. When *Method* = ENERGY, this value is usually a number between 0 and 1.

SubStpOpt

Option for the first substep of the load step:

NO

Stabilization is not activated for the first substep even when it does not converge after the minimal allowed time increment is reached. This value is the default when *Key* ≠ OFF.

MINTIME

Stabilization is activated for the first substep if it still does not converge after the minimal allowed time increment is reached.

ANYTIME

Stabilization is activated for the first substep. Use this option if stabilization was active for the previous load step via *Key* = CONSTANT.

FORCELIMIT

The stabilization force limit coefficient, such that 0 < *FORCELIMIT* < 1. The default value is 0.2. To omit a stabilization force check, set this value to 0.

RECALCDAMP

Key for controlling damping recalculation:

0 – No recalculation of the damping factor (default).

1 – Recalculate the damping factor for the energy-based stabilization-control method.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Once issued, the stabilization effects of the command remain until you issue either a **STABILIZE (p. 1858)** command (with no arguments) or a **STABILIZE (p. 1858)**,OFF command. If you issue the command with no arguments, the effect is to deactivate stabilization.

Notes

Once issued, a **STABILIZE (p. 1858)** command remains in effect until you reissue the command.

For the energy dissipation ratio, specify *VALUE* = 1.0e-4 if you have no prior experience with the current model; if convergence problems are still an issue, increase the value gradually. The damping factor is mesh-, material-, and time-step-dependent; an initial reference value from the previous run (such as a run with the energy-dissipation ratio as input) should suggest itself.

Exercise caution when specifying *SubStpOpt* = MINTIME or ANYTIME for the first load step; Ansys, Inc. recommends this option only for experienced users. If stabilization was active for the previous load step via *Key* = CONSTANT and convergence is an issue for the first substep, specify *SubStpOpt* = ANYTIME.

When the L2-norm of the stabilization force (CSRSS value) exceeds the L2-norm of the internal force multiplied by the stabilization force coefficient, the program issues a message displaying both the stabilization force norm and the internal force norm. The *FORCELIMIT* argument enables you to change the default stabilization force coefficient (normally 20 percent).

When using the energy-based stabilization-control method and *RECALCDAMP* = 1, the damping factor is recalculated in the following cases:

- In an analysis restart.
- In a nonlinear adaptivity analysis in the substep following the remeshing substep.

This command stabilizes the degrees of freedom for current-technology elements only. Other elements can be included in the FE model, but their degrees of freedom are not stabilized.

For more information about nonlinear stabilization, see Unstable Structures in the *Structural Analysis Guide*. For additional tips that can help you to achieve a stable final model, see Simplify Your Model in the *Structural Analysis Guide*.

STAT

Displays the status of database settings.

DATABASE (p. 13): Set Up (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

STAT (p. 1861) is a command generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. Generally, **STAT (p. 1861)** will be preceded by one of the commands listed below, which specifies the particular topic that status was requested for.

If entered directly into the program, the **STAT (p. 1861)** command should be immediately preceded by the desired topic command listed below. In processors other than those listed below (for example, AUX12), no topic command should proceed **STAT (p. 1861)**.

This command is valid in any processor.

PREP7 topic commands (and their corresponding topics) are:

Topic Command	Topic
ETYPE (p. 703)	Element types
RCON (p. 1574)	Real constants
MATER (p. 1112)	Material properties
TBLE (p. 1988)	Data table properties
PRIM (p. 1495)	Solid model primitives
KEYPTS (p. 980)	Keypoints
LINE (p. 1051)	Lines
AREAS (p. 178)	Areas
VOLUMES (p. 2141)	Volumes
GEOMETRY (p. 797)	Solid model information
MESHING (p. 1124)	Meshing
BOOL (p. 268)	Booleans
NODES (p. 1248)	Nodes
ELEM (p. 618)	Elements
SELM (p. 1709)	Superelements
COUPLE (p. 420)	Node coupling
CEQN (p. 310)	Constraint equations

SOLUTION topic commands (and their corresponding topics) are:

Topic Command	Topic
ATYPE (p. 206)	Analysis types

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Topic Command	Topic
MASTER (p. 1111)	Master DOF
DEACT (p. 510)	Element birth and death (deactivation)

---

*STATUS, *Par*, *IMIN*, *IMAX*, *JMIN*, *JMAX*, *KMIN*, *KMAX*, *LMIN*, *LMAX*, *MMIN*, *MMAX*, *KPRI*

Lists the current parameters and abbreviations.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Par

Specifies the parameter or sets of parameters listed. For array parameters, use *IMIN*, *IMAX*, etc. to specify ranges. Use ***DIM (p. 530)** to define array parameters. Use ***VEDIT (p. 2089)** to review array parameters interactively. Use ***VWRITE (p. 2174)** to print array values in a formatted output. If *Par* is blank, list all scalar parameter values, array parameter dimensions, and abbreviations. If *ARGX*, list the active set of local macro parameters (ARG1 to ARG9 and AR10 to AR99) (***USE (p. 2059)**).

The following are possible values for *Par*

ALL or blank --

Lists all parameters (except local macro parameters and those with names beginning or ending with an underbar) and toolbar abbreviations.

_PRM --

Lists only parameters with names beginning with an underbar (_). These are Mechanical APDL internal parameters.

PRM_ --

Lists only parameters with names ending with an underbar (_). A good APDL programming convention is to ensure that all parameters created by your system programmer are named with a trailing underbar.

ABBR --

Lists all toolbar abbreviations.

PARM --

Lists all parameters (except local macro parameters and those with names beginning or ending with an underbar).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MATH --

Lists all APDL Math parameters, including vectors, matrices, and linear solvers.

***PARNAME* --**

Lists only the parameter specified. *PARNAME* cannot be a local macro parameter name.

***ARGX* --**

Lists all local macro parameter values (ARG1- AR99) that are non-zero or non-blank.

IMIN*, *IMAX*, *JMIN*, *JMAX*, *KMIN*, *KMAX*, *LMIN*, *LMAX*, *MMIN*, *MMAX

Range of array elements to display (in terms of the dimensions (row, column, plane, book, and shelf). Minimum values default to 1. Maximum values default to the maximum dimension values. Zero may be input for *IMIN*, *JMIN*, and *KMIN* to display the index numbers. See ***TAXIS (p. 1898)** command to list index numbers of 4- and 5-D tables.

KPRI

Use this field to list your primary variable labels (X, Y, Z, TIME, etc.).

1

List the labels (default). *YES*, *Y*, or *ON* are also valid entries.

0

Do not list the labels. *NO*, *N*, or *OFF* are also valid entries.

Notes

You cannot obtain the value for a single local parameter (for example, ***STATUS (p. 1863)**,ARG2). You can only request all local parameters simultaneously using ***STATUS (p. 1863)**,ARGX.

This command is valid in any processor.

Utility Menu>List>Status>Parameters>All Parameters

Utility Menu>List>Status>Parameters>Named Parameters

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/STATUS, *Lab*

Lists the status of items for the run.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Items to list status for:

ALL

List all below (default).

TITLE

List only titles, Jobname, and revision number.

UNITS

List only units.

MEM

List only memory data statistics.

DB

List only database statistics

CONFIG

List only configuration parameters.

GLOBAL

Provides a global status summary.

SOLU

Provides a solution status summary.

PROD

Provides a product summary.

Notes

Displays various items active for the run (such as the Mechanical APDL revision number, Jobname, titles, units, configuration parameters, database statistics, etc.).

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

STEF, *VALUE*

Specifies Stefan-Boltzmann radiation constant.

AUX12 (p. 62): General Radiation (p. 62)
SOLUTION (p. 38): Radiosity (p. 50)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VALUE

Stefan-Boltzmann constant (defaults to 0.119E-10 Btu/hr/in^2/ °R^4).

Command Default

0.119E-10 Btu/hr/in^2/ °R^4.

Notes

You can use this command in the general preprocessor (PREP7) and in the Solution processor to specify the Stefan-Boltzmann constant in analyses using the radiation matrix method or the radiosity solver to model radiation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/STITLE, *NLINE*, *Title*

Defines subtitles.

DATABASE (p. 13): Set Up (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NLINE

Subtitle line number (1 to 4). Defaults to 1.

Title

Input up to 70 alphanumeric characters. Parameter substitution may be forced within the title by enclosing the parameter name or parametric expression within percent (%) signs. If *Title* is blank, this subtitle is deleted.

Notes

Up to four subtitles are displayed in the output along with the main title (**/TITLE (p. 2007)**).

Subtitles do not appear in GUI windows or in plot displays.

The first subtitle is also written to various Mechanical APDL files along with the main title.

Previous subtitles can be overwritten or deleted.

Issue **/STATUS (p. 1865)** to display titles.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

STORE, *Lab*, *NPTS*, *--*, *FREQ*, *Toler*, *Cluster*

Stores data in the database for the defined variables.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid labels:

MERGE

Merge data from results file for the time points in memory with the existing data using current specifications (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NEW

Store a new set of data, replacing any previously stored data with current result file specifications and deleting any previously-calculated variables (see Table 2.88: Operations (p. 59)).

Variables defined using the **ANSOL (p. 149)** command are also deleted if they represent element-based results. Variables created using nodal-averaged results are not deleted.

APPEN

Append data from results file to the existing data.

ALLOC

Allocate (and zero) space for *NPTS* data points.

PSD

Create a new set of frequency points for PSD calculations (replacing any previously stored data and erasing any previously calculated data).

NPTS

The number of time points (or frequency points) for storage (used only with *Lab* = ALLOC or PSD). The value may be input when using POST26 with data supplied from other than a results file. This value is automatically determined from the results file data with the NEW, APPEN, and MERGE options. For the PSD option, *NPTS* determines the resolution of the frequency vector (valid numbers are between 1 and 10, defaults to 5).

--

Unused field.

FREQ

A frequency value, or an array containing frequency values (Hz). Use ***DIM (p. 530)** to define the array and enclose the array name in percent signs (for example, **STORE (p. 1867)**,,,,%*arrayname*%). A default value of 1% of damping is considered for clustering around the user-input frequency values. Supported for *Lab* = PSD only.

Toler

Tolerance to determine if a user-input frequency value (*FREQ*) is a duplicate and can be ignored. Two frequency values are considered duplicates if their difference is smaller than the frequency range multiplied by the tolerance. The default value is 10^{-5}. Supported for *Lab* = PSD and *Cluster* = YES only.

Cluster

Key to control whether or not to consider the clustering frequencies around each of the user-input array values. Available only when a user-defined frequency array is used (*FREQ*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

YES

Merge the clustering frequencies around both the natural frequencies and the frequency values entered in the user-defined array (*FREQ*) (default).

NO

Do not include clustering frequencies, and use only natural frequencies and the frequencies in the user-defined array (*FREQ*).

Command Default

Merge newly-defined variables with previously stored variables for the time points stored in memory using the current specifications. If **STORE (p. 1867)** is preceded by **TIMERANGE (p. 2001)** or **NSTORE (p. 1287)**, the default is **STORE (p. 1867)**,NEW.

Notes

This command stores data from the results file in the database for the defined variables (**ANSOL (p. 149)**, **NSOL (p. 1281)**, **ESOL (p. 672)**, **SOLU (p. 1819)**, **JSOL (p. 966)**) per specification (**AVPRIN (p. 210)**, **FORCE (p. 772)**, **LAYERP26 (p. 1016)**, **SHELL (p. 1784)**). See Storing the Variable in the *Basic Analysis Guide* for more information.

The **STORE (p. 1867)**,PSD command creates a new frequency vector (variable 1) for response PSD calculations (**RPSD (p. 1619)**). This command should first be issued before defining variables (**NSOL (p. 1281)**, **ESOL (p. 672)**, **RFORCE (p. 1607)**) for which response PSD's are to be calculated.

If the frequencies in the user-defined array are relevant, turning off clustering (*Cluster* = NO) reduces calculation costs without significant loss of accuracy. You can check the frequencies by initially issuing a default **RPSD (p. 1619)** (with clustering) to obtain a reference plot of the response.

Menu Paths

Main Menu>TimeHist Postpro>Store Data

SUBOPT,*Option*,*Value1*

Specifies Subspace (SUBSP) eigensolver options.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

One of the following options:

STRMCK

Controls whether a Sturm sequence check is performed.

Valid input for *Value1* when *Option* = STRMCK:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

Do not perform Sturm sequence check (default).

ON

Perform Sturm sequence check.

MEMORY

Controls the memory allocation strategy for the Subspace eigensolver.

Valid input for *Value1* when *Option* = MEMORY:

DEFAULT

Default memory configuration (default). Everything is determined dynamically with respect to current machine resources.

INCORE

Fully in-core memory configuration.

MIX1

First level of mixed in-core / out-of-core configuration.

MIX2

Second level of mixed in-core / out-of-core configuration.

OUTOFCORE

Fully out-of-core memory configuration.

Value1

Assigned value for the specified *Option* (as described above).

Command Default

The Sturm sequence check is off for the Supspace eigensolver.

The default memory allocation strategy is used. Mechanical APDL evaluates the resources of the machine to choose the in-core or out-of-core mode.

Notes

SUBOPT (p. 1869) specifies options to be used with the Subspace eigensolver (**MODOPT (p. 1140)**,SUBSP) during a modal analysis.

Memory Allocation Option (*Option* = MEMORY)

The Subspace eigensolver algorithm allocates two main pools of memory:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Memory for the internal subspace eigensolver iterations.
2. Memory for the specific subspace eigensolver working arrays.

The following table shows how memory is allocated for each option.

Value1 **(*Option* = MEMORY)**	**Subspace Eigensolver**	**Working Arrays**
INCORE	In-Core	In-Core
MIX1	In-Core	Out-of-Core
MIX2	Out-of-Core	In-Core
OUTOFCORE	Out-of-Core	Out-of-Core

The MIX1 configuration typically uses more memory than the MIX2 configuration, except when a large number of modes are requested for a small model.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>Analysis Options

SUBSET,*Lstep*,*SBSTEP*,*FACT*,*KIMG*,*TIME*,*ANGLE*,*NSET*

Reads results for the selected portions of the model.

POST1 (p. 51): Set Up (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lstep

Load step number of the data set to be read (defaults to 1):

N

Read load step *N*.

FIRST

Read the first data set (*SBSTEP* and *TIME* are ignored).

LAST

Read the last data set (*SBSTEP* and *TIME* are ignored).

NEXT

Read the next data set (*SBSTEP* and *TIME* are ignored). If at the last data set, the first data set will be read as the next.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NEAR

Read the data set nearest to *TIME* (*SBSTEP* is ignored). If *TIME* is blank, read the first data set.

LIST

Scan the results file and list a summary of each load step. (*FACT*, *KIMG*, *TIME* and *ANGLE* are ignored.)

SBSTEP

Substep number (within *Lstep*). For the buckling (**ANTYPE (p. 162)**,BUCKLE) analysis or the modal (**ANTYPE (p. 162)**,MODAL) analysis, the substep corresponds to the mode number. Defaults to last substep of load step (except for **ANTYPE (p. 162)**,BUCKLE or MODAL). If *Lstep* = LIST, *SBSTEP* = 0 or 1 lists the basic step information, whereas *SBSTEP* = 2 also lists the load step title, and labels imaginary data sets if they exist.

FACT

Scale factor applied to data read from the file. If zero (or blank), a value of 1.0 is used. Harmonic velocities or accelerations may be calculated from the displacement results from a modal (**ANTYPE (p. 162)**,MODAL) or harmonic (**ANTYPE (p. 162)**,HARMIC) analyses. If *FACT* = VELO, the harmonic velocities (v) are calculated from the displacements (d) at a particular frequency (f) according to the relationship $v = 2 \pi f d$. Similarly, if *FACT* = ACEL, the harmonic accelerations (a) are calculated as $a = (2 \pi f)^2 d$.

KIMG

Used only with results from complex analyses:

0

Store real part of complex solution

1

Store imaginary part.

TIME

Time-point identifying the data set to be read. For harmonic analyses, time corresponds to the frequency. For the buckling analysis, time corresponds to the load factor. Used only in the following cases: If *Lstep* is NEAR, read the data set nearest to *TIME*. If both *Lstep* and *SBSTEP* are zero (or blank), read data set at time = *TIME*. If *TIME* is between two solution time points on the results file, a linear interpolation is done between the two data sets. Solution items not written to the results file (**OUTRES (p. 1336)**) for either data set will result in a null item after data set interpolation. If *TIME* is beyond the last time point on the file, use the last time point.

ANGLE

Circumferential location (0.0 to 360°). Defines the circumferential location for the harmonic calculations used when reading from the results file. The harmonic factor (based on the circumferential angle) is applied to the harmonic elements (PLANE25, PLANE75, PLANE78, PLANE83, and SHELL61)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

of the load case. See the *Mechanical APDL Theory Reference* for details. Note that factored values of applied constraints and loads will overwrite any values existing in the database.

NSET

Data set number of the data set to be read. If a positive value for *NSET* is entered, *Lstep*, *SBSTEP*, *KIMG*, and *TIME* are ignored. Available set numbers can be determined by **SET (p. 1724)**,LIST.

Notes

Reads a data set from the results file into the database for the selected portions of the model only. Data that has not been specified for retrieval from the results file by the **INRES (p. 953)** command will be listed as having a zero value. Each time that the **SUBSET (p. 1871)** command is issued, the data currently in the database will be overwritten with a new set of data. Various operations may also be performed during the read operation. The database must have the model geometry available (or used the **RESUME (p. 1601)** command before the **SUBSET (p. 1871)** command to restore the geometry from File.db).

---

SUCR,*SurfName*,*SurfType*,*nRefine*,*Radius*,*blank*,*blank*,*TolOut*

Create a surface.

POST1 (p. 51): Surface Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SurfName

Eight character surface name.

SurfType

Surface type.

CPLANE

Surface is defined by the cutting plane in window one (controlled by the working plane (/CPLANE,1), NOT the view settings (/CPLANE,0)).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPHERE

Surface is defined by a spherical surface centered about the working plane origin.

INFC

Surface is defined by a cylindrical surface centered about the working plane origin and extending indefinitely in the positive and negative Z directions.

nRefine

Refinement level.

For SurfType = CPLANE

The refinement level of the surface "mesh". This will be an integer between 0 and 3 (default = 0). See Notes below.

For SurfType = SPHERE

The number of divisions along a 90° arc (minimum = 9). The default is 9.

For SurfType = INFC

The number of divisions along a 90° arc (minimum = 9). The default is 9.

Radius

Appropriate radius value (for INFC or SPHERE).

TolOut

Tolerance value for inclusion of element facets within a prescribed volume. (for INFC)

Notes

This command creates a new surface and stores the following data for that surface:

GCX, GCY, GCZ - global Cartesian coordinates at each point on the surface.

NORMX, NORMY, NORMZ - components of the unit normal at each point on the surface.

DA - the contributory area of each point.

For *SurfType* = CPLANE, *nRefine* refers to the number of points that define the surface. An *nRefine* value of zero is used for points where the element face intersects the cutting plane.

If *SurfType* = CPLANE and *nRefine* = 0, the points reside at the section cuts where the element intersects the cutting plane. Increasing *nRefine* from 0 to 1 will subdivide each surface facet into 4 subfacets, and increase the number of points at which results can be interpolated.

For *SurfType* = CPLANE, the setting from the **/EFACET (p. 602)** command will affect the creation of surface facets and the quality of the fit of the surface in the model. **SUCR (p. 1875)** employs geometry data from PowerGraphics to aid in determining where the surface intersects the model. If **/EFACET (p. 602)**,1 is in effect when the **SUCR (p. 1875)** command is issued, then the curvature of high order

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

elements (that is, elements with midside nodes) will be ignored. If your model contains high order elements, you can see a better fit for your surface if /EFACET,2 is in effect when the **SUCR (p. 1875)** command is issued. Currently, the **SUCR (p. 1875)** command interprets **/EFACET (p. 602)**,4 to mean **/EFACET (p. 602)**,2.

For *SurfType* = INFC, a default tolerance of 0.01 will be applied to include the vertices of any facets that fall out of the cylinder definition. This tolerance increases the facet size by one percent to check for inclusion. Excluding facets under such a small tolerance may yield unacceptable (aesthetically) results. Increasing the tolerance by a larger amount (0.1 or 10%) will sometimes yield smother edges along the surface you create.

Menu Paths

SurfName

Eight character surface name.

SurfName = ALL will delete all surface geometry and result infromation.

Menu Paths

Main Menu>General Postproc>Surface Operations>Delete Surfaces

---

SUEVAL, *Parm*, *lab1*, *Oper*

Perform operations on a mapped item and store result in a scalar parameter.

POST1 (p. 51): Surface Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Parm

APDL parameter name.

lab1

Eight character set name for the first set used in calculation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Oper

Operation to perform:

SUM

Sum of *lab1* result values.

INTG

Integral of *lab1* over surface.

AVG

Area-weighted average of a result item [Σ(*lab1**DA) / Σ(DA)]

Notes

The result of this operation is a scalar APDL parameter value. If multiple surfaces are selected when this command is issued, then the operation is carried out on each surface individually and the parameter reperesents the culmulative value of the operation on all selected surfaces.

Menu Paths

Main Menu>General Postproc>Surface Operations>Math Operations>Average Result

Main Menu>General Postproc>Surface Operations>Math Operations>Integrate Results

Main Menu>General Postproc>Surface Operations>Math Operations>Sum of Results

---

SUGET,*SurfName*,*RSetName*,*Parm*,*Geom*

Moves surface geometry and mapped results to an array parameter.

POST1 (p. 51): Surface Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SurfName

Eight character surface name.

RSetName

Eight character result name.

Parm

APDL array parameter name (up to 32 characters).

Geom

Switch controlling how data is written.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON (or 1 or YES)

Writes geometry data and interpolated results information to the parameter.

OFF (or 0 or NO)

Writes only interpolated results information to the parameter. (Default)

Notes

For *Geom* = OFF (or 0 or NO), only results information is written to this parameter.

For *Geom* = ON (or 1 or YES), both geometry data and results information are written to this parameter. Geometry data includes 7 data items: (GCX, GCY, GCZ, NORMX, NORMY, NORMZ, and DA). Results information is then written to the 8th column of the parameter. SetNames of GCX, GCY, GCZ, NORMX, NORMY, NORMZ, and DA are predefined and computed when **SUCR (p. 1875)** is issued.

Menu Paths

Main Menu>General Postproc>Surface Operations>Results to Array

---

SUMAP,*RSetName*,*Item*,*Comp*

Map results onto selected surface(s).

POST1 (p. 51): Surface Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RSetName

Eight-character name for the result being mapped.

Item

Label identifying the item.

Valid item labels are defined via **PLNSOL (p. 1425)**. Some items also require a component label.

If *Item* = CLEAR, the specified result set is deleted from all selected surfaces

Comp

Component label of item (if required).

Notes

The **SUMAP (p. 1879)** command maps results in the current coordinate system (**RSYS (p. 1639)**) using the selected set of elements.

The command interpolates and stores the results data on to each of the selected surfaces.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SUMAP (p. 1879),ALL,CLEAR deletes all results sets from all selected surfaces.

Menu Paths

Main Menu>General Postproc>Surface Operations>Clear Results

SUMTYPE, *Label*

Sets the type of summation to be used in the following load case operations.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Summation type

COMP

Combine element component stresses only. Stresses such as average nodal stresses, principal stresses, equivalent stresses, and stress intensities are derived from the combined element component stresses. Default.

PRIN

Combine principal stress, equivalent stress, and stress intensity directly as stored on the results file. Component stresses are not available with this option.

Notes

Issue **SUMTYPE (p. 1880)**,PRIN when you want to have a load case operation (**LCOPER (p. 1026)**) act on the principal / equivalent stresses instead of the component stresses. Also issue **SUMTYPE (p. 1880)**,PRIN when you want to read in load cases (**LCASE (p. 1019)**). Note that the **SUMTYPE (p. 1880)** setting is not maintained between /POST1 sessions.

SUMTYPE (p. 1880),PRIN also causes principal nodal values to be the average of the contibuting principal element nodal values (see **AVPRIN (p. 210)**,1).

BEAM188 and BEAM189 elements compute principal stress, equivalent stress, and stress intensity values on request instead of storing them on the results file; **SUMTYPE (p. 1880)**,PRIN does not apply for these elements.

Menu Paths

Main Menu>General Postproc>Load Case>Calc Options>Stress Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SUPL,*SurfName*,*RSetName*,*KWIRE*

Plot result data on all selected surfaces or on a specified surface.

POST1 (p. 51): Surface Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SurfName

Eight-character surface name. *ALL* plots all selected surfaces.

RSetName

Eight-character result name.

KWIRE

Plot in context of model.

0

Plot results without the outline of selected elements.

1

Plot results with the outline of selected elements.

Notes

If *RSetName* is not specified, the surface geometry is plotted. If the Setname portion of the argument is a vector prefix (that is, if result sets of name SetNameX, SetNameY, and SetNameZ exist), Mechanical APDL plots the vectors on the surface as arrows. For example, **SUPL (p. 1881)**,ALL,NORM plots the surface normals as vectors on all selected surfaces, as NORMX, NORMY, and NORMZ are predefined geometry items.

Menu Paths

Main Menu>General Postproc>Surface Operations>Plot Results

Main Menu>General Postproc>Surface Operations>Plot Vectors

SUPR,*SurfName*,*RSetName*

Print global status, geometry information and/or result information.

POST1 (p. 51): Surface Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SurfName

Eight character surface name. If *SurfName* = ALL, repeat printout for all selected surfaces.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RSetName

Eight character result set name.

Notes

When no arguments are specified, **SUPR (p. 1881)** generates a global status summary of all defined surfaces. If only *SurfName* is specified, the geometry information for that surface is printed. If both *SurfName* and *RSetName* are specified, the value of the results set at each point, in addition to the geometry information, is printed.

Menu Paths

Main Menu>General Postproc>Surface Operations>Print Results

Main Menu>General Postproc>Surface Operations>Status>Global

SURESU, --,*Fname*,*Fext*,*Fdir*

Read a set of surface definitions and result items from a file and make them the current set.

POST1 (p. 51): Surface Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

--

Unused field.

Fname

Eight character name.

Fext

Extension name.

Fdir

Optional path specification.

Notes

Reading (and therefore resuming) surface and result definitions from a file overwritea any existing surface definitions.

Reading surfaces back into the postprocessor (**/POST1 (p. 1461)**) does *not* insure that the surfaces (and their results) are appropriate for the model currently residing in **/POST1 (p. 1461)**.

Menu Paths

Main Menu>General Postproc>Surface Operations>Resume Surfaces

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SUSAVE, *Lab*, *Fname*, *Fext*, *Fdir*

Saves surface definitions to a file.

POST1 (p. 51): Surface Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Eight-character surface name.

If *Lab* = ALL (default), then all surfaces are saved to the file.

If *Lab* = S, only currently selected surfaces are saved to the file.

Fname

File name and directory path (248 character maximum, including directory). If you do not specify a directory path, the default is your working directory and you can use all 248 characters for the file name. The file name defaults to the jobname.

Fext

File name extension (eight-character maximum). The extension defaults to "surf".

Fdir

Optional path specification.

Notes

The **SUSAVE (p. 1883)** command saves surface definitions (geometry information)--and any result items mapped onto the surfaces--to a file.

Issuing the **SUSAVE (p. 1883)** command has no effect on the database. The database remains unchanged.

Subsequent executions of the **SUSAVE (p. 1883)** command overwrite previous data in the file.

To read the contents of the file created via the **SUSAVE (p. 1883)** command, issue the **SURESU (p. 1882)** command.

Menu Paths

Main Menu>General Postproc>Surface Operations>Save Surfaces

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SUSEL, *Type*, *Name1*, *Name2*, *Name3*, *Name4*, *Name5*, *Name6*, *Name7*, *Name8*

Selects a subset of surfaces

POST1 (p. 51): Surface Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Selects a new set (default).

R

Reselects a set from the current set.

A

Additionally selects a set and extends the current set.

U

Unselects a set from the current set.

ALL

Also selects all surfaces.

NONE

Unselects all surfaces.

Name1*, *Name2*, *Name3*, . . . , *Name8

Eight character surface names

Notes

The selected set of surfaces is used in the following operations: **SUMAP (p. 1879)**, **SUDEL (p. 1877)**, **SUCALC (p. 1873)**, **SUEVAL (p. 1877)**, and **SUVECT (p. 1885)**.

Menu Paths

Main Menu>General Postproc>Surface Operations>Select Surfaces

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SUVECT, *RSetName*, *lab1*, *Oper*, *lab2*, *Offset*

Create new result data by operating on two existing result vectors on a given surface.

POST1 (p. 51): Surface Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RSetName

Eight character name of the result data output. There will be one or three *RSetName* values depending on the operation specified in *Oper*.

lab1

Eight character name of the mapped data that forms vector 1. Specified sets must exist on all selected surfaces for this operation to take place. The names NORM and GC will be reserved for normals and for global (x, y, z).

Oper

DOT

Computes dot product between *lab1* and *lab2* vectors. The result is a scalar parameter (*RSetName*) and each value within the set can be modified (incremented) via *Offset*.

CROSS

Computes cross product between *lab1* and *lab2* vectors. Each X, Y, Z value in the result can be modified (incremented) via *Offset*.

SMULT

Scales (lab1x, lab1y, lab1z) vector by scalar *lab2*. Each X,Y,Z value in the result can be modified (incremented) via *Offset*.

lab2

Eight character name of the mapped data that forms vector 2. Sets with names Lab2X, Lab2Y, and Lab2Z must exist on all selected surfaces for operation to take place. For *Oper* = SMULT a scalar value or another predefined scalar item (for example, DA) can be supplied.

Offset

An offset value to be applied to the resultant *RSetName*. One value is specified for *Oper* = DOT, and three values are specified for *Oper* = SMULT.

SV,*DAMP*,*SV1*,*SV2*,*SV3*,*SV4*,*SV5*,*SV6*,*SV7*,*SV8*,*SV9*

Defines spectrum values to be associated with frequency points.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DAMP

Damping ratio for this response spectrum curve. If the same as a previously defined curve, the SV values are added to the previous curve. Up to four different curves may be defined, each with a different damping ratio. Damping values must be input in ascending order.

SV1, SV2, SV3, . . . , SV9

Spectrum values corresponding to the frequency points (**FREQ (p. 776)**). Values are interpreted as defined with the **SVTYP (p. 1887)** command. SV values should not be zero. Values required outside the frequency range use the extreme input values.

Notes

Defines the spectrum values to be associated with the previously defined frequency points (**FREQ (p. 776)**). Applies only to the single-point response spectrum. Damping has no effect on the frequency solution. Damping values are used only to identify SV curves for the mode combinations calculation. Only the curve with the lowest damping value is used in the initial mode coefficient calculation. Use **STAT (p. 1861)** command to list current spectrum curve values.

Repeat **SV (p. 1886)** command for additional SV points (100 maximum per *DAMP* curve). SV values are added to the *DAMP* curve after the last nonzero SV value.

The interpolation method between response spectrum points and curves is specified using *KeyInterp* in the **SVTYP (p. 1887)** command. It is logarithmic by default.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>SinglePt>Spectr Values

Main Menu>Solution>Load Step Opts>Spectrum>SinglePt>Spectr Values

SVPLOT,*OptionScale*,*damp1*,*damp2*,*damp3*,*damp4*

Displays input spectrum curves.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

OptionScale

Flag to activate or deactivate input spectrum value scaling:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

Do not scale the input spectrum values with scale factor FACT (**SVTYP (p. 1887)** command). This is the default value.

ON

Scale the input spectrum values with scale factor FACT (**SVTYP (p. 1887)** command)

damp1

Damping ratio corresponding to DAMP (**SV (p. 1886)** command) defining the first spectrum curve.

damp2

Damping ratio corresponding to DAMP (**SV (p. 1886)** command) defining the second spectrum curve.

damp3

Damping ratio corresponding to DAMP (**SV (p. 1886)** command) defining the third spectrum curve.

damp4

Damping ratio corresponding to DAMP (**SV (p. 1886)** command) defining the fourth spectrum curve.

Notes

You can display up to four input spectrum tables (**SV (p. 1886)** and **FREQ (p. 776)** commands) with log X scale. If no damping ratio is specified, all spectrum tables are displayed.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

SVTYP,*KSV*,*FACT*,*KeyInterp*

Defines the type of single-point response spectrum.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KSV

Response spectrum type:

0

Seismic velocity response spectrum loading (SV values interpreted as velocities with units of length/time).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Force response spectrum loading (SV values interpreted as force amplitude multipliers).

2

Seismic acceleration response spectrum loading (SV values interpreted as accelerations with units of length/time^2).

3

Seismic displacement response spectrum loading (SV values interpreted as displacements with units of length).

FACT

Scale factor applied to spectrum values (defaults to 1.0). Values are scaled when the solution is initiated (**SOLVE (p. 1822)**). Database values remain the same.

KeyInterp

Key to activate or deactivate the linear interpolation between input response spectrum points and input response spectrum curves:

0 (OFF *or* NO)

Deactivate linear and use logarithmic interpolation. This value is the default.

1 (ON *or* YES)

Activate linear interpolation.

Command Default

Seismic velocity response spectrum.

Notes

Defines the type of single-point response spectrum (**SPOPT (p. 1837)**). The seismic excitation direction is defined with the **SED (p. 1704)** command.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>SinglePt>Settings

Main Menu>Solution>Load Step Opts>Spectrum>SinglePt>Settings

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SWADD, *Ecomp*, *SHRD*, *NCM1*, *NCM2*, *NCM3*, *NCM4*, *NCM5*, *NCM6*, *NCM7*, *NCM8*, *NCM9*

Adds more surfaces to an existing spot weld set.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ecomp

Name of an existing spot weld set that was previously defined using **SWGEN (p. 1890)**.

SHRD

Search radius. Defaults to 4 times the spot weld radius defined for the spot weld set (*SWRD* on **SWGEN (p. 1890)**).

NCM1, NCM2, NCM3, . . . , NCM9

Surfaces to be added to the spot weld set. Each surface can be input as a predefined node component or a meshed area number.

Notes

This command adds surfaces to an existing spot weld set defined by the **SWGEN (p. 1890)** command. You can add additional surfaces by repeating the **SWADD (p. 1889)** command. However, the maximum number of allowable surfaces (including the 2 surfaces used for the original set defined by **SWGEN (p. 1890)**) for each spot weld set is 11. See Adding Surfaces to a Basic Set for more information.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>SpotWeld>Add More Surfaces>By Areas

SWDEL, *Ecomp*

Deletes spot weld sets.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ecomp

Name of an existing spot weld set that was previously defined using **SWGEN (p. 1890)**. If *Ecomp* = ALL (default) all spot welds are deleted.

Notes

This command deletes spot weld sets previously defined by the **SWGEN (p. 1890)** command.

SWDEL (p. 1889) does not support deleting spot welds that have the node-to-surface configuration.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>SpotWeld>Delete

---

SWGEN,*Ecomp*,*SWRD*,*NCM1*,*NCM2*,*SND1*,*SND2*,*SHRD*,*DIRX*,*DIRY*,*DIRZ*,*ITTY*,*ICTY*

Creates a new spot weld set.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ecomp

Name to identify the new spot weld, used for the element component containing the new contact, target, and beam elements generated for the spot weld set.

START

Initiate the spot weld generation process.

END

Finish the spot weld generation process.

When using *Ecomp* to define the component name of the spot weld element, do not begin the name with *STAR* or *END* . Those values are reserved for starting and finishing a block of multiple **SWGEN (p. 1890)** commands.

SWRD

Spot weld radius.

NCM1

Name of a component containing nodes on the first spot weld surface, a meshed area number for the surface, or the name of a component group containing nodal components of multiple surfaces to be weld.

NCM2

Name of a component containing nodes on the second spot weld surface, or a meshed area number for the surface.

SND1

Node number of the first spot weld node corresponding to the first surface (*NCM1*). This node can be on or close to the first surface. For this use of *SND1*, you must also input a node number for *SND2*.

To define multiple spot welds between two surfaces, use the *SND1* field in one of these ways:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- To input the name of a table array parameter containing the node information for each spot weld. The node information should be presented as node numbers, geometric coordinates, or both. The table name must be enclosed in "%" signs (for example, %*tabname*%).
- To input the name of a nodal component group of predefined nodes. This use is only supported for node-to-surface configuration of spot welds.
- To input the name of an element component group of predefined joints or beam elements. This use is only supported for node-to-surface configuration of spot welds.

When generating multiple spot welds, *SND2* is ignored.

SND2

Node number of the second spot weld node corresponding to the second surface (*NCM2*). This node can be on or close to the second surface. Mechanical APDL creates the node if not specified.

SHRD

Search radius. Defaults to 4 times the spot weld radius *SWRD*.

DIRX*, *DIRY*, *DIRZ

Spot weld projection direction in terms of normal X, Y, and Z components.

ITTY

Target element type ID.

ICTY

Contact element type ID.

NTOS

Generate the node-to-surface configuration of the spot welds with force-distributed constraints.

NTS2

Generate the node-to-surface configuration of the spot welds with rigid surface constraints.

Notes

This command creates a new spot weld set. You can add more surfaces to the set using **SWADD (p. 1889)** after the initial **SWGEN (p. 1890)** command. However, the maximum number of allowable surfaces (including the two surfaces used for the original set) for each spot weld set is 11.

Ecomp, *SWRD*, *NCM1*, *NCM2*, and *SND1* must be specified. *SND2*, *SHRD*, *DIRX*, *DIRY*, *DIRZ*, *ITTY*, *ICTY* are optional inputs. If the second spot weld node (*SND2*) is specified, that node is used to determine the spot weld projection direction, and *DIRX*, *DIRY* and *DIRZ* are ignored.

To reduce the spot weld generation time of large assembly models where multiple **SWGEN (p. 1890)** commands are issued, define the multiple **SWGEN (p. 1890)** commands within a block initiated with **SWGEN (p. 1890)**,*START* and finished with **SWGEN (p. 1890)**,*END*. The block must be ended with **SWGEN (p. 1890)**,*END* if it is started with **SWGEN (p. 1890)**,*START*. Do not use any commands other than

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SWGEN (p. 1890) and **CMGRP (p. 365)** within the block. Select all elements and nodes, and create all components prior to the **SWGEN (p. 1890)**,*START* command.

If *NCM1* is defined as a component group name to add multiple surfaces to the node-to-surface configuration of the spot weld, no **SWADD (p. 1889)** command is needed. *NCM2* is ignored. The component group of multiple surfaces must be defined using the **CMGRP (p. 365)** command prior to the **SWGEN (p. 1890)**. The maximum allowed number of surfaces for each spot weld set is 8. Using **SWGEN (p. 1890)** to generate multiple spot welds is only supported for node-to-surface configuration of spot welds

If *ITTY* (target element ID) is specified, the following corresponding target element key option must be set: KEYOPT(2) = 1.

If *ICTY* (contact element ID) is specified (only valid for pilot node configuration), the following corresponding contact element key options must be set: KEYOPT(2) = 2, KEYOPT(4) = 1, KEYOPT(12) = 5.

If *ICTY* (contact element ID) is specified as **NTOS** or **NTS2**, node-to-surface configuration of spot-welds is defined. In this configuration, each spot weld consists of a beam element and two node-to-surface MPC contact pairs. Each contact pair has contact element (CONTA175) which is defined by the associated spot-weld node. The target elements (TARGE170) are formed by a group of surface nodes lying within the region of the search radius on the spot weld surfaces. The program creates real constant IDs for each layer, and proper contact and target element type IDs. The following corresponding contact element key options are set: KEYOPT(2) = 2, KEYOPT(12) = 5. For*ICTY*=**NTOS**, target elements KEYOPT(5) = 4 is set for defining the force-distributed constraint type. For *ICTY*=**NTS2**, target elements KEYOPT(5) = 7 is set for defining the rigid surface constraint type.

After *SND1* and *SND2* are projected onto surface 1 and surface 2, respectively, two new pilot-nodes (which represent the spot weld nodes) are generated at the locations of *SND1* and *SND2* and meshed with TARGE170 target elements (**TSHAP (p. 2023)**,PILO).

By default, the contact pair created at each spot weld surface is an MPC-based force-distributed constraint. To use force-distributed constraints based on the Lagrange multiplier method, you must set KEYOPT(2) = 3 for the contact elements after **SWGEN (p. 1890)** is issued. To use rigid constraints instead of force-distributed constraints, you must set KEYOPT(4) = 0 for the contact elements after **SWGEN (p. 1890)** is issued.

To automatically define multiple spot welds between two surfaces, use tabular input in the *SND1* field. The table array that you input must be a 2D array parameter. For more information, see Generation of Multiple Spot Welds in the *Contact Technology Guide*.

To use the relaxation method to eliminate overconstraint, you must set KEYOPT(11) = 1 for the target elements after **SWGEN (p. 1890)** is issued.

Issue **SWLIST (p. 1893)** and **SWDEL (p. 1889)** to list or delete spot welds, respectively. **SWLIST (p. 1893)** and **SWDEL (p. 1889)** are not supported for node-to-surface configuration. For more information about defining spot welds, see Creating a Basic Spot Weld Set with SWGEN.

Main Menu>Preprocessor>Modeling>Create>Elements>SpotWeld>Create New Set>By Node Component

---

SWLIST, *Ecomp*

Lists spot weld sets.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ecomp

Name of an existing spot weld set that was previously defined using **SWGEN (p. 1890)**. If *Ecomp* = ALL (default), all spot weld sets are listed.

Notes

This command lists spot weld node, beam, and contact pair information for all defined spot weld sets, or for the specified set. To ensure that all defined spotwelds are listed, issue **CMSEL (p. 374)**,ALL (to select all components) before issuing the **SWLIST (p. 1893)** command.

When **SWLIST (p. 1893)** is issued in POST1, the beam forces and moments are output. For the case of a deformable spot weld, the stresses are also output in the beam local coordinate system.

SWLIST (p. 1893) does not support listing spot welds that have the node-to-surface (NTOS) configuration.

Menu Paths

Main Menu>General Postproc>List Results>SpotWeld Solution

Utility Menu>List>Results>SpotWeld Solution

SYNCHRO, *RATIO*, *Cname*

Specifies whether the excitation frequency is synchronous or asynchronous with the rotational velocity of a structure.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RATIO

In a stationary reference frame (**CORIOLIS (p. 417)** with *RefFrame* = ON), *RATIO* is the ratio between the frequency of excitation and the frequency of the rotational velocity of the structure. This value must be greater than 0. The default is an unbalance excitation.

In a rotating reference frame (**CORIOLIS (p. 417)** with *RefFrame* = OFF), *RATIO* is the ratio between the frequency of excitation and the frequency of the rotational velocity of the structure minus 1. This value must be greater than 0. There is no default.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cname

The name of the rotating component on which to apply the harmonic excitation.

Notes

The **SYNCHRO (p. 1893)** command specifies whether the excitation frequency is synchronous or asynchronous with the rotational velocity of a structure in a harmonic analysis. Use the command to take into account rotating harmonic forces on rotating structures.

Mechanical APDL calculates the rotational velocity Ω of the structure from the excitation frequency *f*, defined (via the **HARFRQ (p. 885)** command) as $\Omega = 2\pi f$ / *RATIO*. The rotational velocity is applied along the direction cosines of the rotation axis (specified via an **OMEGA (p. 1324)** or **CMOMEGA (p. 368)** command).

In a stationary reference frame, specifying any value for *RATIO* causes a general rotational force excitation and not an unbalance force. To define an unbalance excitation force (F = Ω^2 * Unb), *RATIO* should be left blank (the nodal unbalance Unb is specified via the **F (p. 729)** command).

In a rotating reference frame (**CORIOLIS (p. 417)** with *RefFrame* = OFF), an unbalance excitation is a static load; therefore, a value must be supplied for *RATIO*.

The **SYNCHRO (p. 1893)** command is valid only for the full harmonic analysis method (**HROPT (p. 912)**,FULL) and the frequency-sweep harmonic analysis method (**HROPT (p. 912)**,VT) involving a rotating structure (**OMEGA (p. 1324)** or **CMOMEGA (p. 368)**) with Coriolis enabled (**CORIOLIS (p. 417)**).

Main Menu>Solution>Define Loads>Apply>Structural>Inertia>Angular Veloc>Synchronous

---

/SYP,*String*,*ARG1*,*ARG2*,*ARG3*,*ARG4*,*ARG5*,*ARG6*,*ARG7*,*ARG8*

Passes a command string and arguments to the operating system.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

String

Command string (cannot include commas). See also the **/SYS (p. 1895)** command.

ARG1, ARG2, ARG3, . . . , ARG8

Arguments to be appended to the command string, separated by blanks, commas, or other delimiter characters (see the *Operations Guide*). The arguments may be numbers, parameters, or parametric expressions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Passes a command string to the operating system for execution, along with arguments to be appended to the command string. See the *Operations Guide* for details. Mechanical APDL may not be aware of your specific user environment. For example, on Linux this command may not recognize aliases, depending on the hardware platform and user environment.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

/SYS,*String*

Passes a command string to the operating system.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

String

Command string, up to 639 characters (including blanks, commas, etc.). The specified string is passed verbatim to the operating system, that is, no parameter substitution is performed.

Notes

Passes a command string to the operating system for execution (see the *Operations Guide*). Typical strings are system commands such as list, copy, rename, etc. Control returns to Mechanical APDL after the system procedure is completed. Mechanical APDL may not be aware of your specific user environment. For example, on Linux this command may not recognize aliases, depending on the hardware platform and user environment.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

T Commands

TALLOW, *TEMP1*, *TEMP2*, *TEMP3*, *TEMP4*, *TEMP5*, *TEMP6*

Defines the temperature table for safety factor calculations.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TEMP1, TEMP2, TEMP3, . . . , TEMP6

Input up to six temperatures covering the range of nodal temperatures. Temperatures must be input in ascending order.

Notes

Defines the temperature table for safety factor calculations (**SFACT (p. 1743)**, **SALLOW (p. 1644)**). Use **STAT (p. 1861)** command to list current temperature table. Repeat **TALLOW (p. 1897)** command to zero table and redefine points (6 maximum).

Safety factor calculations are not supported by PowerGraphics. Both the **SALLOW (p. 1644)** and **TALLOW (p. 1897)** commands must be used with the Full Model Graphics display method active.

Menu Paths

Main Menu>General Postproc>Safety Factor>Allowable Strs>Reset Temps

Main Menu>General Postproc>Safety Factor>Allowable Strs>Temp-depend

TARGET, *Nlist*

Specifies the target nodes for mapping pressures onto surface effect elements.

/MAP (p. 63): Pressure Mapping (p. 63)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Nlist

Nodes defining the surface upon which the pressures will be mapped. Use the label ALL or specify a nodal component name. If ALL, all selected nodes (**NSEL (p. 1266)**) are used (default). Individual nodes may not be entered.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The node list specified by *Nlist* must contain a sufficient number of nodes to define an element surface. The surface must be meshed (**ESURF (p. 682)** command) with SURF154 elements prior to issuing this command.

Menu Paths

This command cannot be accessed from a menu.

***TAXIS**,*ParmLoc*,*nAxis*,*Val1*,*Val2*,*Val3*,*Val4*,*Val5*,*Val6*,*Val7*,*Val8*,*Val9*,*Val10*

Defines table index numbers.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParmLoc

Name and starting location in the table array parameter for indexing. Indexing occurs along the axis defined with *nAxis*.

nAxis

Axis along which indexing occurs. Valid labels are:

1 --

Corresponds to Row. Default.

2 --

Corresponds to Column.

3 --

Corresponds to Plane.

4 --

Corresponds to Book.

5 --

Corresponds to Shelf.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL --

Lists all index numbers. Valid only if *Val1* = LIST.

Val1*, *Val2*, *Val3*, ..., *Val10

Values of the index numbers for the axis *nAxis*, starting from the table array parameter location *ParmLoc*. You can define up to ten values.

To list the index values specified with *nAxis*, issue *Val1* = LIST. If *Val1* = LIST, *Val2* - *Val10* are ignored.

Notes

***TAXIS (p. 1898)** is a convenient method to define table index values. These values reside in the zero column, row, etc. Instead of filling values in these zero location spots, use the ***TAXIS (p. 1898)** command. For example,

```
*TAXIS,longtable(1,4,1,1),2,1.0,2.2,3.5,4.7,5.9
```

would fill index values 1.0, 2.2, 3.5, 4.7, and 5.9 in *nAxis* 2 (column location), starting at location 4.

To list index numbers, issue ***TAXIS (p. 1898)**,*ParmLoc*, *nAxis*, LIST, where *nAxis* = 1 through 5 or ALL.

Menu Paths

This command cannot be accessed from a menu.

TB, *Lab*, *MATID*, *NTEMP*, *NPTS*, *TBOPT*, *--*, *FuncName*

Activates a data table for material properties or special element input.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 1955)

For a list of *elements* and the material models they support (*Lab* value), see Element Support for Material Models in the *Element Reference*.

For a list of *material models* and the elements that support them, see Material Model Support for Elements in the *Material Reference*.

Lab

Material model data table type:

AFDM

Acoustic frequency-dependent material. (p. 1905)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AHYPER

Anisotropic hyperelasticity (p. 1906).

ANEL

Anisotropic elasticity (p. 1907).

ANISO

Generalized Hill anisotropy (p. 1908).

AVIS

Anisotropic viscosity (p. 1908).

BB

Bergstrom-Boyce (p. 1908).

BH

Magnetic field (p. 1909).

CAST

Cast iron (p. 1910).

CDM

Damage (p. 1910).

CFOAM

Crushable foam (p. 1912).

CGCR

Crack-growth (p. 1912) fracture criterion (**CGROW (p. 321)**).

CHABOCHE

Chaboche nonlinear kinematic hardening (p. 1913) using von Mises or Hill plasticity.

CONCR

Concrete (p. 1914) element or material data.

CREEP

Creep (p. 1915). Pure creep, creep with isotropic hardening plasticity, or creep with kinematic hardening plasticity using both von Mises or Hill potentials.

CRKI

– Material criterion for adaptive-crack initiation (p. 1916) (**ADPCI (p. 98)**)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CTE

Coefficient of thermal expansion (p. 1916).

CZM

Cohesive zone (p. 1917).

DENS

Mass Density (p. 1919).

DLST

Anisotropic dielectric loss tangent (p. 1919).

DMGE

Damage evolution law (p. 1919).

DMGI

Damage initiation criteria (p. 1920).

DPER

Anisotropic electric permittivity (p. 1920).

EDP

Extended Drucker-Prager (p. 1921) (for granular materials such as rock, concrete, soil, ceramics and other pressure-dependent materials).

ELASTIC

Elasticity (p. 1922).

ELST

Anisotropic elastic loss tangent (p. 1923).

EXPE

Experimental data (p. 1923).

FCON

Fluid conductance data (p. 1924).

FCLI

Material strength limits (p. 1925) for calculating failure criteria.

FLUID

Fluid (p. 1925).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FRIC

Coefficient of friction (p. 1926) based on Coulomb's Law or user-defined friction.

GASKET

Gasket (p. 1927).

GURSON

Gurson pressure-dependent plasticity (p. 1928) for porous metals.

HFLM

Film coefficient data (p. 1928).

HILL

Hill anisotropy (p. 1929). When combined with other material options, simulates plasticity, viscoplasticity, and creep -- all with the Hill potential.

HYPER

Hyperelasticity (p. 1929) material models (Arruda-Boyce, Blatz-Ko, Extended Tube, Gent, Hencky, Mooney-Rivlin [default], Neo-Hookean, Ogden, Ogden Foam, Polynomial Form, Response Function, Yeoh, and user-defined).

INTER

Contact interaction (p. 1931).

JOIN

Joint (p. 1932) (linear and nonlinear elastic stiffness, linear and nonlinear damping, and frictional behavior).

JROCK

Jointed rock (p. 1936).

MC

Mohr-Coulomb (p. 1936).

MELAS

Multilinear elasticity (p. 1937).

MIGR

Migration (p. 1938).

MPLANE

Microplane (p. 1938).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NLISO

Voce isotropic hardening law (p. 1939) (or power law) for modeling nonlinear isotropic hardening using von Mises or Hill plasticity.

PELAS

Porous elasticity (p. 1942).

PERF

Perforated material (p. 1939) for acoustics; equivalent fluid model of perforated media, poroelastic material model, and transfer admittance matrix.

PIEZ

Piezoelectric matrix (p. 1941).

PLASTIC

Nonlinear plasticity (p. 1941).

PM

Porous media (p. 1942). Coupled pore-fluid diffusion and structural model of porous media.

PRONY

Prony series (p. 1943) constants for viscoelastic materials.

PZRS

Piezoresistivity (p. 1944).

RATE

Rate-dependent plasticity (p. 1945) (viscoplasticity) when combined with the BISO, NLISO or PLASTIC material options, or rate-dependent anisotropic plasticity (anisotropic viscoplasticity) when combined with the HILL and BISO, NLISO or PLASTIC material options.

The exponential visco-hardening option includes an explicit function for directly defining static yield stresses of materials.

The Anand unified plasticity option requires no combination with other material models.

RO

Ramberg-Osgood (p. 1945).

SDAMP

Material damping coefficients (p. 1946).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SHIFT

Shift function (p. 1946) for viscoelastic materials.

SINT

Sintering (p. 1947). Available with the Additive Suite license.

SMA

Shape memory alloy (p. 1948) for simulating superelasticity, shape memory effect, or shape memory effect with plasticity.

SOIL

Soil (p. 1949) models.

STATE

User-defined state variables (p. 1949). Valid with **TB (p. 1899)**,USER and used with either the `UserMat` or `UserMatTh` subroutine. Also valid with **TB (p. 1899)**,CREEP when *TBOPT* = 100 (implicit creep) and used with the `UserCreep` subroutine, or when real constant C6 = 100 (explicit creep) and used with the UserCr subroutine.

SWELL

Swelling (p. 1950) strain function.

TNM

Three-network model (p. 1951) for viscoplastic materials.

THERM

Thermal properties (p. 1950).

USER

User-defined (p. 1952) material or thermal material model (general-purpose except for incompressible material models) or thermal material model.

WEAR

Contact surface wear (p. 1953).

XTAL

Crystal plasticity (p. 1954) for elasto-viscoplastic crystalline materials.

MATID

Material reference identification number. Valid value is any number n, where $0 < n < 100{,}000$. Default = 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NTEMP

The number of temperatures for which data will be provided (if applicable). Specify temperatures via the **TBTEMP (p. 1993)** command.

NPTS

For most labels where *NPTS* is defined, the number of data points to be specified for a given temperature. Define data points via the **TBDATA (p. 1960)** or **TBPT (p. 1992)** commands.

- -

Unused field.

FuncName

The name of the function to be used (entered as %*tabname*%, where *tabname* is the name of the table created by the Function Tool). Valid only when *Lab* = JOIN (joint element material) and nonlinear stiffness or damping are specified on the *TBOPT* field (see "JOIN -- Joint Element Specifications" (p. 1932)). The function must be predefined via the Function Tool. To learn more about how to create a function, see Using the Function Tool in the *Basic Analysis Guide*.

Data Table Specifications

Following are input requirements (*NTEMP*, *NPTS*, and *TBOPT* values) and links to detailed documentation for each data table type (**TB (p. 1899)**,*Lab* value):

AFDM -- Acoustic Frequency-Dependent Material Specifications

NTEMP:

Not used.

***NPTS*:**

Not used.

TBOPT:

Acoustic material options:

MAT

Material properties

THIN

Thin layer

RECT

Rectangular cross-section

CGCR -- Crack-Growth Fracture Criterion

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1.

***NPTS*:**

Number of data points to be specified for a given temperature.

***TB0PT*:**

Fracture-criterion option.

LINEAR -- Linear fracture criterion. Valid when *NPTS* = 3.

BILINEAR -- Bilinear fracture criterion. Valid when *NPTS* = 4.

BK -- B-K fracture criterion. Valid when *NPTS* = 3.

MBK -- Modified B-K (Reeder) fracture criterion. Valid when *NPTS* = 4.

POWERLAW -- Wu's Power Law fracture criterion. Valid when *NPTS* = 6.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

USER -- User-defined fracture criterion. Valid when *NPTS* = 20.

PSMAX -- Circumferential stress criterion based on $\sigma_{r\theta}= 0$ when sweeping around the crack tip at a given radius. Valid when *NPTS* = 1. Used in an XFEM-based crack-growth analysis only.

STTMAX -- Maximum circumferential stress criterion. Valid when *NPTS* = 1. Used in an XFEM-based crack-growth analysis only.

RLIN -- Rigid linear evolution law for the decay of stress. Valid when *NPTS* = 4. Used in an XFEM-based crack-growth analysis only.

PARIS -- Paris' Law for fatigue crack-growth. Valid when *NPTS* = 2. Used in a SMART- *or* XFEM-based fatigue crack-growth analysis only.

WALK -- Walker equation for fatigue crack-growth. Valid when *NPTS* = 3. Used in a SMART-based fatigue crack-growth analysis only.

FORM -- Forman equation for fatigue crack-growth. Valid when *NPTS* = 3. Used in a SMART-based fatigue crack-growth analysis only.

TFDK -- Tabular fatigue law for fatigue crack-growth. Used in a SMART-based fatigue crack-growth analysis only.

NG03 -- NASGRO equation v. 3 for fatigue crack-growth. Valid when *NPTS* = 9. Used in a SMART-based fatigue crack-growth analysis only.

NG04 -- NASGRO equation v. 4 for fatigue crack-growth. Valid when *NPTS* = 10. Used in a SMART-based fatigue crack-growth analysis only.

KIC -- Critical stress-intensity factor for static crack-growth. Valid when *NPTS* = 1. Valid in a SMART-based static crack-growth analysis only.

JIC -- Critical J-integral for static crack-growth. Valid when *NPTS* = 1. Valid in a SMART-based static crack-growth analysis only.

Fatigue crack-closure option. Valid in a SMART-based fatigue crack-growth analysis only, with crack-growth based on Paris' law or tabular fatigue law.

ELBER – Elber closure function.

SCHIJVE – Schijve closure function.

NEWMAN – Newman closure function.

UPOLY – Polynomial closure function.

Fracture Analysis Guide

CGROW (p. 321) command

CHABOCHE -- Chaboche Nonlinear Kinematic Hardening Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1. The maximum value of *NTEMP* is such that *NTEMP* x (1 + 2*NPTS*) = 1000.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***NPTS*:**

Number of kinematic models to be superposed. Default = 1. Maximum = 5.

***TB0PT*:**

(blank) --

Default option for nonlinear kinematic hardening.

TRATE --

Include temperature-rate term in back-stress evolution.

SHDR --

Strain-hardening of dynamic recovery properties. To use this option, *TB0PT* = TRATE is also required.

References:

Nonlinear Kinematic Hardening in the *Material Reference*

CONCR -- Concrete Plasticity Specifications

***NTEMP*:**

Number of temperatures for which data will be provided (used only if *TB0PT* = 0 or 1). Default = 6. Maximum = 6.

***NPTS*:**

Not used.

***TB0PT*:**

Concrete material options.

DP --

Drucker-Prager concrete strength parameters.

RCUT --

Rankine tension failure parameter.

DILA --

Drucker-Prager concrete dilatation.

HSD2 --

Drucker-Prager concrete exponential hardening/softening/dilitation (HSD) behavior.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HSD4 --

Drucker-Prager concrete steel reinforcement HSD behavior.

HSD5 --

Drucker-Prager concrete fracture energy HSD behavior.

HSD6 --

Drucker-Prager concrete linear HSD behavior.

FPLANE --

Drucker-Prager concrete joint parameters.

FTCUT --

Drucker-Prager concrete joint tension cutoff.

FORIE --

Drucker-Prager concrete joint orientation.

MW --

Menetrey-Willam constitutive model.

MSOL --

Material solution option.

References:

Drucker-Prager Concrete in the *Material Reference*

Hardening, Softening and Dilatation (HSD) Behavior in the *Material Reference*

CREEP -- Creep Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1.

***NPTS*:**

Number of data points to be specified for a given temperature.

***TB0PT*:**

Creep model options:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Explicit creep option. See Explicit Creep Equations for available equations.

1 through 13 --

Implicit creep option. See Implicit Creep Equations for available equations.

100 --

User-defined creep option (implicit). Define the creep law via the UserCreep subroutine.

References:

Creep Option in the *Material Reference*

Creep Model in the *Structural Analysis Guide*

See also Combining Material Models in the *Material Reference*.

CRKI -- Adaptive Crack-Initiation Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 6. Maximum = 6.

***NPTS*:**

Not used.

***TBOPT*:**

Adaptive crack-initiation options:

PSMAX --

Maximum principal stress (default).

References:

SMART Method for Crack-Initiation Simulation in the *Fracture Analysis Guide*

CTE -- Coefficient of Thermal Expansion Specifications

***NTEMP*:**

No limit.

***NPTS*:**

Not used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TB0PT :

(blank) --

Enter the secant coefficients of thermal expansion (CTEX,CTEY,CTEZ) (default).

USER --

User-defined thermal strain.

FLUID --

Fluid thermal-expansion coefficient for porous media.

UFSTRAIN --

User-defined free strain in porous media.

References:

Thermal Expansion in the *Material Reference*

Porous Media Mechanics in the *Material Reference*

CZM -- Cohesive Zone Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1.

***NPTS*:**

Number of data points to be specified for a given temperature.

***TB0PT*:**

Cohesive zone material options.

EXPO --

Exponential material behavior. Valid for interface elements and contact elements.

BILI --

Bilinear material behavior. Valid for interface elements, contact elements, and in an XFEM-based crack-growth analysis when cohesive behavior on the initial crack is desired.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CBDD --

Bilinear material behavior with linear softening characterized by maximum traction and maximum separation. Valid for contact elements only.

CBDE --

Bilinear material behavior with linear softening characterized by maximum traction and critical energy release rate. Valid for contact elements only.

CEXP --

Exponential material behavior for preventing surface penetration on the cohesive interface. Valid for SMART-based crack-growth only.

CLIN --

Linear material behavior with a penalty slope for preventing surface penetration on the cohesive interface. Valid for SMART-based crack-growth only.

FRIC --

Isotropic Coulomb's frictional law on the cohesive interface. Valid for SMART-based crack-growth with *TB0PT* = CLIN or *TB0PT* = CEXP only.

REXP --

Rigid exponential material behavior on the cohesive interface. Valid for SMART-based crack-growth only.

VREG --

Viscous regularization. Valid for interface elements and contact elements. Also valid in an XFEM-based crack-growth analysis when cohesive behavior is specified for the initial crack.

USER --

User-defined option. Valid for interface elements only.

DMGE -- Damage Evolution Law Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1.

***NPTS*:**

Number of data points to be specified for a given temperature. Default = 4 when *TB0PT* = MPDG

***TB0PT*:**

Damage initiation definition:

1 *or* MPDG --

Progressive damage evolution based on simple instant material stiffness reduction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2 *or* CDM --

Progressive damage evolution based on continuum damage mechanics.

Reference:

Damage-Evolution Law in the *Material Reference*

DMGI -- Damage Initiation Criteria Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1.

***NPTS*:**

Number of data points to be specified for a given temperature. Default = 4 when *TB0PT* = FCRT.

***TB0PT*:**

Damage initiation definition:

1 or FCRT --

Define failure criteria as the damage initiation criteria.

Reference:

Damage Initiation Criteria

DPER -- Anisotropic Electric Permittivity Specifications

NTEMP :

Not used.

NPTS :

Not used.

TB0PT :

Permittivity matrix options for PLANE222, PLANE223, SOLID225, SOLID226, and SOLID227:

0 --

Permittivity matrix at constant strain $[\varepsilon^S]$ (used as supplied)

1 --

Permittivity matrix at constant stress $[\varepsilon^T]$ (converted to $[\varepsilon^S]$ form before use)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

References:

Anisotropic Electric Permittivity in the *Material Reference*

EDP -- Extended Drucker-Prager Plasticity Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1. Maximum = 40.

***NPTS*:**

Number of data points to be specified for a given temperature.

***TB0PT*:**

EDP material options.

LYFUN --

Linear yield function.

PYFUN --

Power law yield function.

HYFUN --

Hyperbolic yield function.

LFPOT --

Linear flow potential function.

PFPOT --

Power law flow potential function.

HFPOT --

Hyperbolic flow potential function.

CYFUN --

Cap yield function.

CFPOT --

Cap flow potential function.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ELASTIC -- Elasticity Specifications

NTEMP :

Number of temperatures for which data will be provided.

NPTS :

Number of properties to be defined for the material option. This value is set automatically according to the elasticity option (*TB0PT*) selected. If *TB0PT* is not specified, default settings become *NPTS* = 2 and *TB0PT* = ISOT.

TB0PT :

Elasticity options:

ISOT --

Isotropic property (EX, NUXY) (default). Setting *NPTS* = 2 also selects this option automatically.

OELN --

Orthotropic option with minor Poisson's ratio (EX, EY, EZ, GXY, GYZ, GXZ, NUXY, NUYZ, NUXZ). *NPTS* = 9. Setting *NPTS* = 9 selects this option automatically. All nine parameters must be set, even for the 2D case.

OELM --

Orthotropic option with major Poisson's ratio (EX, EY, EZ, GXY, GYZ, GXZ, PRXY, PRYZ, PRXZ). *NPTS* = 9. All nine parameters must be set, even for the 2D case.

AELS --

Anisotropic option in stiffness form (D11, D21, D31, D41, D51, D61, D22, D32, D42, D52, D62, D33, D43, ... D66). *NPTS* = 21. Setting *NPTS* = 21 selects this option automatically.

AELF --

Anisotropic option in compliance form (C11, C21, C31, C41, C51, C61, C22, C32, C42, C52, C62, C33, C43, ... C66). *NPTS* = 21.

FIB1 --

Fiber parameters in fiber direction 1.

FIB2 --

Fiber parameters in fiber direction 2.

FIB3 --

Fiber parameters in fiber direction 3.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

USER --

User-defined linear elastic properties. For more information on the `user_tbelastic` subroutine, see the Guide to User-Programmable Features in the *Programmer's Reference*.

References:

See **TBFIELD (p. 1966)** for more information about defining temperature- and/or frequency-dependent properties.

ELST -- Anisotropic Elastic Loss Tangent Specifications

NTEMP :

Not used.

***NPTS*:**

Not used.

TB0PT :

Not used.

References:

Anisotropic Elastic Loss Tangent in the *Material Reference*

EXPE -- Experimental Data Specifications

***NTEMP*:**

Number of temperatures for which data will be provided.

***NPTS*:**

Number of data points to be specified for a given temperature.

***TB0PT*:**

Experimental data type:

UNITENSION --

Uniaxial tension experimental data.

UNICOMPRESSION --

Uniaxial compression experimental data.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UNIAXIAL --

Uniaxial experimental data (combined uniaxial tension and compression).

BIAXIAL --

Equibiaxial experimental data.

SHEAR --

Pure shear experimental data (also known as planar tension).

SSHEAR --

Simple shear experimental data.

VOLUME --

Volumetric experimental data.

GMODULUS --

Shear modulus experimental data.

KMODULUS --

Bulk modulus experimental data.

EMODULUS --

Tensile modulus experimental data.

NUXY --

Poisson's ratio experimental data.

References:

Experimental Response Functions in the *Theory Reference*

Viscoelasticity in the *Material Reference*

See also **TBFIELD (p. 1966)** for information about defining field-dependent experimental data.

FCON -- Fluid Conductance Data Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1. Maximum = 20.

***NPTS*:**

Number of data points to be specified for a given temperature. Default = 1. Maximum = 100.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***TB0PT*:**

Not used.

References:

FLUID116

FCLI -- Material Strength Limits Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1.

***NPTS*:**

Number of data points to be specified for a given temperature. Default = 20 when *TB0PT* = 1. Default = 9 when *TB0PT* = 2.

***TB0PT*:**

Material strength limit definition:

1 --

Define stress-strength limits.

2 --

Define strain-strength limits.

References:

Material Strength Limits in the *Material Reference*

FLUID -- Fluid Specifications

NTEMP :

Number of temperatures for which data will be provided. Default = 1.

NPTS :

Number of data points to be specified for a given temperature.

TB0PT :

Fluid material options:

LIQUID --

Define material constants for a liquid material.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

GAS --

Define material constants for a gas material.

PVDATA --

Define pressure-volume data for a fluid material.

References:

Fluids in the *Material Reference*

Fluid Material Models in the *Theory Reference*

FRIC -- Coefficient of Friction Specifications

NTEMP :

Number of temperatures for which data will be provided. Default = 1. No maximum limit.

NTEMP is not used for the following situations:

- Isotropic or orthotropic friction defined in terms of field data (**TBFIELD (p. 1966)** command)
- User-defined friction (*TB0PT* = USER)

NPTS :

Number of data points to be specified for user-defined friction (*TB0PT* = USER). Not used for *TB0PT* = ISO or *TB0PT* = ORTHO.

TB0PT :

Friction options:

ISO --

Isotropic friction (one coefficient of friction, MU) (default). This option is valid for all 2D and 3D contact elements.

ORTHO --

Orthotropic friction (two coefficients of friction, MU1 and MU2). This option is valid for the following 3D contact elements: CONTA174, CONTA175, and CONTA177.

FORTHO --

Orthotropic friction (two coefficients of friction, MU1 and Mu2) with a friction coordinate system fixed in space. This option is valid for the following 3D contact elements: CONTA174, CONTA175, and CONTA177.

EORTHO --

Equivalent orthotropic friction (two coefficients of friction, MU1 and MU2). This option differs from *TB0PT* = ORTHO only in the way the friction coefficients are interpolated when they

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

are dependent upon the following field variables: sliding distance and/or sliding velocity. In this case, the total magnitude of the field variable is used to do the interpolation.

USER --

User defined friction. This option is valid for all 2D and 3D contact elements.

References:

Contact Friction in the *Material Reference*

See also **TBFIELD (p. 1966)** for more information about defining a coefficient of friction that is dependent on temperature, time, normal pressure, sliding distance, or sliding relative velocity.

GASKET -- Gasket Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1. The maximum number of temperatures specified is such that *NTEMP* * *NPTS* < 2000.

***NPTS*:**

Number of data points to be specified for a given temperature. Default = 5 for *TBOPT* = PARA. Default = 1 for all other values of *TBOPT*.

***TBOPT*:**

Gasket material options.

PARA --

Gasket material general parameters.

COMP --

Gasket material compression data.

LUNL --

Gasket linear unloading data.

NUNL --

Gasket nonlinear unloading data.

TSS --

Transverse shear data.

TSMS --

Transverse shear and membrane stiffness data. (If selected, this option takes precedence over TSS.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

References:

Gasket in the *Material Reference*

Gasket Joints Simulation in the *Structural Analysis Guide*

GURSON -- Gurson Plasticity Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1. Maximum = 40.

***NPTS*:**

Number of data points to be specified for a given temperature.

***TB0PT*:**

GURSON material options.

BASE --

Basic model without nucleation or coalescence (default).

SNNU --

Strain controlled nucleation.

SSNU --

Stress controlled nucleation.

COAL --

Coalescence.

References:

Gurson in the *Material Reference*

Gurson's Model in the *Theory Reference*

HFLM -- Film Coefficient Data Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1. Maximum = 20.

***NPTS*:**

Number of data points to be specified for a given temperature. Default = 1. Maximum = 100.

***TB0PT*:**

Not used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

References:

FLUID116

HILL -- Hill Plasticity Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1. Maximum = 40.

***NPTS*:**

Not used.

***TB0PT* :**

Hill plasticity option:

(blank) --

Use one set of Hill parameters (default).

PC --

Enter separate Hill parameters for plasticity and creep. This option is valid for material combinations of creep and Chaboche nonlinear kinematic hardening only.

References:

Hill Anisotropy in the *Material Reference*

Hill Yield Criterion in the *Material Reference*

See also Combining Material Models in the *Material Reference*.

HYPER -- Hyperelasticity Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1. The maximum value of *NTEMP* is such that *NTEMP* x *NPTS* = 1000.

***NPTS*:**

Number of material parameters to be specified for a given temperature. Exceptions are for *TB0PT* = FOAM, OGDEN, POLY and YEOH, where *NPTS* is the number of terms in the material model's energy function.

***TB0PT*:**

Hyperelastic material options.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BOYCE--

Arruda-Boyce model. For *NPTS*, default = 3 and maximum = 3.

BLATZ --

Blatz-Ko model. For *NPTS*, default = 1 and maximum = 1.

ETUBE --

Extended tube model. Five constants (*NPTS* = 5) are required.

EXF1 --

Embedded fiber directions. Three constants (*NPTS* = 3) define the direction for *each* fiber. Up to five fibers (*NPTS* = 15) are allowed.

EX1 --

Embedded fiber strain energy potential. Two constants (*NPTS* = 2) are used for *each* fiber corresponding to the defined fiber directions. Undefined values default to zero.

EXA1 --

Embedded fiber compression strain energy potential. Two constants (*NPTS* = 2) are used for *each* fiber corresponding to the defined fiber directions. If not defined, the values specified via EX1 are used for both tension and compression.

FOAM --

Hyperfoam (Ogden) model. For *NPTS*, default = 1 and maximum is the number of terms in the energy function

GENT --

Gent model. For *NPTS*, default = 3 and maximum = 3.

HENCKY --

Hencky model. For *NPTS*, default = 2 and maximum = 2.

MOONEY --

Mooney-Rivlin model (default). You can choose a two-parameter Mooney-Rivlin model with *NPTS* = 2 (default), or a three-, five-, or nine-parameter model by setting *NPTS* equal to one of these values.

NEO --

Neo-Hookean model. For *NPTS*, default = 2 and maximum = 2.

OGDEN --

Ogden model. For *NPTS*, default = 1 and maximum is the number of terms in the energy function.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

POLY --

Polynomial form model. For *NPTS*, default = 1 and maximum is the number of terms in the energy function.

RESPONSE --

Experimental response function model. For *NPTS*, default = 0 and maximum is such that *NTEMP* x *NPTS* + 2 = 1000.

YEOH --

Yeoh model. For *NPTS*, default = 1 and maximum is the number of terms in the energy function.

USER --

User-defined hyperelastic model.

References:

Hyperelasticity in the *Material Reference*

INTER -- Contact Interaction Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1. No maximum limit. *NTEMP* is used only for user-defined contact interaction (*TBOPT* = USER).

***NPTS*:**

Number of data points to be specified. *NPTS* is used only for user-defined contact interaction (*TBOPT* = USER).

***TBOPT*:**

Contact interaction options.

The following options are valid only for general contact interactions specified via the GCDEF (p. 788) command:

STANDARD --

Standard unilateral contact (default).

ROUGH --

Rough, no sliding.

NOSEPE --

No separation (sliding permitted).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BONDED --

Bonded contact (no separation, no sliding).

ANOSEP--

No separation (always).

ABOND --

Bonded (always).

IBOND --

Bonded (initial contact).

The following option is valid for all 2D and 3D contact elements:

USER --

User-defined contact interaction.

References:

Contact Interaction in the *Material Reference*

Defining Your Own Contact Interaction (USERINTER) in the *Contact Technology Guide*

JOIN -- Joint Element Specifications

NTEMP:

Number of temperatures for which data will be provided. Default = 1.

NPTS:

Number of data points to be specified for a given temperature. *NPTS* is ignored if *TBOPT* = STIF or DAMP.

If Coulomb friction is specified, *NPTS* is used only for *TBOPT* = MUS1, MUS4, and MUS6.

TBOPT:

Joint element material options.

Linear stiffness behavior:

STIF --

Linear stiffness.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Nonlinear stiffness behavior:

JNSA --

Nonlinear stiffness behavior in all available components of relative motion for the joint element.

JNS1 --

Nonlinear stiffness behavior in local UX direction only.

JNS2 --

Nonlinear stiffness behavior in local UY direction only.

JNS3 --

Nonlinear stiffness behavior in local UZ direction only.

JNS4 --

Nonlinear stiffness behavior in local ROTX direction only.

JNS5 --

Nonlinear stiffness behavior in local ROTY direction only.

JNS6 --

Nonlinear stiffness behavior in local ROTZ direction only.

Linear damping behavior:

DAMP --

Linear damping.

Nonlinear damping behavior:

JNDA --

Nonlinear damping behavior in all available components of relative motion for the joint element.

JND1 --

Nonlinear damping behavior in local UX direction only.

JND2 --

Nonlinear damping behavior in local UY direction only.

JND3 --

Nonlinear damping behavior in local UZ direction only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

JND4 --

Nonlinear damping behavior in local ROTX direction only.

JND5 --

Nonlinear damping behavior in local ROTY direction only.

JND6 --

Nonlinear damping behavior in local ROTZ direction only.

Friction Behavior:

Coulomb friction coefficient -

The values can be specified using either **TBDATA (p. 1960)** (*NPTS* = 0) or **TBPT (p. 1992)** (*NPTS* is nonzero).

MUS1 --

Coulomb friction coefficient (stiction) in local UX direction only.

MUS4 --

Coulomb friction coefficient (stiction) in local ROTX direction only.

MUS6 --

Coulomb friction coefficient (stiction) in local ROTZ direction only, *or*

Coulomb friction coefficient (stiction) for Spherical Joint.

Coulomb friction coefficient - Exponential Law -

Use **TBDATA (p. 1960)** to specify μ_s, μ_d, and c for the exponential law.

EXP1 --

Exponential law for friction in local UX direction only.

EXP4 --

Exponential law for friction in local ROTX direction only.

EXP6 --

Exponential law for friction in local ROTZ direction only.

Elastic slip:

SL1 --

Elastic slip in local UX direction only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SL4 --

Elastic slip in local ROTX direction only.

SL6 --

Elastic slip in local ROTZ direction only, *or*

Elastic slip for Spherical Joint.

TMX1 --

Critical force in local UX direction only.

TMX4 --

Critical moment in local ROTX direction only.

TMX6 --

Critical moment in local ROTZ direction only.

Stick-stiffness:

SK1 --

Stick-stiffness in local UX direction only.

SK4 --

Stick-stiffness in local ROTX direction only.

SK6 --

Stick-stiffness in local ROTZ direction only, *or*

Stick-stiffness for Spherical Joint.

Interference fit force/moment:

FI1 --

Interference fit force in local UX direction only.

FI4 --

Interference fit moment in local ROTX direction only.

FI6 --

Interference fit moment in local ROTZ direction only.

PERF -- Perforated Material Specifications

NTEMP :

Not used.

NPTS :

Not used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TB0PT :

Equivalent fluid model options:

JCA

Johnson-Champoux-Allard model

DLB

Delaney-Bazley model

MIKI

Miki model

ZPRO

Complex impedance and propagating constant model

CDV

Complex density and velocity model

Poroelastic acoustic material:

PORO

Poroelastic material model

Transfer admittance matrix options:

YMAT

General transfer admittance matrix model

SGYM

Transfer admittance matrix model of square grid structure

HGYM

Transfer admittance matrix model of hexagonal grid structure

PLASTIC -- Nonlinear Plasticity Specifications

NTEMP :

Not used.

NPTS :

Not used.

TB0PT :

Plasticity option:

BISO --

Bilinear isotropic hardening plasticity.

BKIN –

Bilinear kinematic hardening plasticity.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MISO –

Multilinear isotropic hardening plasticity.

KINH --

Multilinear kinematic hardening plasticity.

The number of points (**TBPT (p. 1992)** commands issued) is limited to 100 for this option.

KSR2 --

Kinematic static recovery.

ISR --

Isotropic static recovery.

PM -- Coupled Pore-Fluid Diffusion and Structural Model of Porous Media Specifications

***NTEMP*:**

The number of temperatures. Default = 1. The maximum must be a value such that (*NTEMP* x *NPTS*) <= 1000.

***NPTS*:**

The number of material constants. Default = 4. The maximum must be a value such that (*NTEMP* x *NPTS*) <= 1000.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***TB0PT*:**

Porous media options:

PERM --

Permeability

BIOT --

Biot coefficient

SP --

Solid property

FP --

Fluid property

DSAT --

Degree-of-saturation table

RPER --

Relative-permeability table

GRAV --

Gravity magnitude

PRONY -- Prony Series Constant Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1.

Unused for *TB0PT* = EXPERIMENTAL.

***NPTS*:**

Defines the number of Prony series pairs for *TB0PT* = SHEAR or *TB0PT* = BULK. Default = 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Unused for *TB0PT* = INTEGRATION and *TB0PT* = EXPERIMENTAL.

TB0PT :

Defines the behavior for viscoelasticity.

SHEAR--

Shear Prony series.

BULK --

Bulk Prony series.

INTEGRATION --

Stress update algorithm.

EXPERIMENTAL --

Complex modulus from experimental data.

References:

Viscoelasticity in the *Material Reference*

PZRS -- Piezoresistivity Specifications

NTEMP :

Not used.

NPTS :

Not used.

TB0PT :

Piezoresistive matrix options

0 --

Piezoresistive stress matrix (used as supplied)

1 --

Piezoresistive strain matrix (used as supplied)

RATE -- Rate-Dependent Plasticity Specifications

***NTEMP*:**

The number of temperatures for which data will be provided. Default is 1. Maximum is such that *NTEMP* x *NPTS* = 1000.

***NPTS*:**

The number of data points to be specified for a given temperature. Default = 2. Maximum is such that *NTEMP* x *NPTS* = 1000.

***TB0PT*:**

Rate-dependent viscoplasticity options.

PERZYNA --

Perzyna option (default).

PEIRCE --

Peirce option.

EVH --

Exponential visco-hardening option.

ANAND --

Anand option.

RO -- Ramberg-Osgood Specifications

NTEMP :

Number of temperatures for which data will be provided. Default = 1.

NPTS :

Number of properties to be defined for the material option: 3 (required).

TB0PT :

Not used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

References:

Ramberg-Osgood Model in the *Material Reference*

SDAMP -- Material Damping Coefficient Specifications

NTEMP :

Number of temperatures for which data will be provided. Default = 1.

NPTS :

Number of properties to be defined for the material option. Default = 1 for each material damping option (*TB0PT*) selected.

TB0PT :

Material damping options:

STRU or 1 --

Structural damping coefficient (default).

ALPD or 2--

Rayleigh mass proportional material damping.

BETD or 3--

Rayleigh stiffness proportional material damping.

References:

Material Damping in the *Material Reference*

Full Harmonic Analysis in the *Structural Analysis Guide*

Damping Matrices in the *Theory Reference*

SHIFT -- Shift Function Specifications

NTEMP :

Allows one temperature for which data will be provided.

NPTS :

Number of material constants to be entered as determined by the shift function specified via *TB0PT*. Not used for *TB0PT* = PLIN.

3 --

for *TB0PT* = WLF

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2 --

for *TB0PT* = TN

n $_f$ **--**

for *TB0PT* = FICT, where n_f is the number of partial fictive temperatures

TB0PT :

Shift function:

WLF --

Williams-Landel-Ferry.

TN --

Tool-Narayanaswamy.

FICT --

Tool-Narayanaswamy with fictive temperature.

PLIN --

Piecewise linear.

USER --

User-defined.

References:

Viscoelasticity in the *Material Reference*

SINT -- Sintering Specifications

NTEMP :

Not used.

NPTS :

Not used.

TB0PT :

Sintering options:

INIT --

Initial conditions: relative density, particle diameter, and grain-size diameter. The initial relative density can alternatively be specified as a location-varying initial state (**INISTATE (p. 938)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PARAM --

Sintering activation temperature and mode specification.

STRESS --

Sintering stress coefficients.

VSCOEF --

Viscosity coefficients. Mutually exclusive with VSTABLE.

VSTABLE --

Table of viscosity values. Mutually exclusive with VSCOEF.

GROWTH --

Grain-growth parameters.

RIEDEL --

Selects the Riedel sintering model (default) and defines the viscous moduli coefficients.

SOVS --

Selects the Skorohold-Olevsky sintering model and defines the viscous moduli coefficients.

ANICONST --

Orthotropic factors to be applied to the viscous bulk and shear moduli. The factors remain constant throughout densification.

References:

Sintering in the *Material Reference*

SMA -- Shape Memory Alloy Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1.

***NPTS*:**

Number of data points to be specified for a given temperature. Default = 7 if *TB0PT* = SUPE or MEFF, 2 if *TB0PT* = METE, 6 if *TB0PT* = METL or METH, and 7 if *TB0PT* = MEPD.

***TB0PT*:**

Shape memory model option:

SUPE -- Superelasticity option (default).

MEFF -- Shape memory effect option.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

METE – Shape memory effect with plasticity option: elastic phase-dependent and thermal expansion.

METL – Shape memory effect with plasticity option: limits of transformation in strain-stress-temperature space.

METH – Shape memory effect with plasticity option: transformation hardening.

MEPD – Shape memory effect with plasticity option: plastic response.

METC – Shape memory effect with plasticity option: tension-compression asymmetry response and hysteresis response.

Reference:

Shape Memory Alloy (SMA) in the *Material Reference*

SOIL -- Soil Specifications

***NTEMP*:**

Not used.

***NPTS*:**

Not used.

***TB0PT*:**

CAMCLAY --

Modified Cam-clay material model.

MSOL --

Material solution option.

References:

Cam-clay in the *Material Reference*

STATE -- User-Defined State Variable Specifications

When *Lab* = STATE, state variable specifications affect user-defined material models. The subroutine in use depends on the element type used when *Lab* = USER is specified.

***NTEMP*:**

Not used.

***NPTS*:**

Number of state variables.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***TB0PT*:**

Not used.

References:

Customizing Material Behavior in the *Material Reference*

SWELL -- Swelling Specifications

***NTEMP*:**

Number of temperatures for which data will be provided. The maximum value of *NTEMP* is such that *NTEMP* x *NPTS* = 1000

***NPTS*:**

Number of data points to be specified for a given temperature. The maximum value of *NPTS* is such that *NPTS* x *NTEMP* = 1000.

***TB0PT*:**

Swelling model options:

LINEAR --

Linear swelling function.

EXPT --

Exponential swelling function.

USER --

User-defined swelling function. Define the swelling function via subroutine `userswstrain` (described in the *Programmer's Reference*). Define temperature-dependent constants via the **TBTEMP (p. 1993)** and **TBDATA (p. 1960)** commands. For solution-dependent variables, define the number of variables via the **TB (p. 1899)**,STATE command.

Swelling in the *Material Reference*

Swelling Model in the *Structural Analysis Guide*

THERM -- Thermal Properties Specifications

***NTEMP*:**

Not used.

***NPTS*:**

Not used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***TB0PT*:**

Thermal properties:

COND --

Thermal conductivity.

ENTH --

Enthalpy. Enthalpy must be a function of temperature only (see Considerations for Enthalpy (p. 1955)).

SPHT --

Specific heat. For porous media, solid-skeleton specific heat.

FLSPHT --

Fluid-specific heat for porous media.

References:

Thermal Properties in the *Material Reference*

Porous Media Mechanics in the *Material Reference*

TNM -- Three-Network Model Properties Specifications

***NTEMP*:**

Not used.

***NPTS*:**

Not used.

***TB0PT*:**

Three-network model material options:

NETA --

Network A properties.

NETB --

Network B properties.

NETC --

Network C properties.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FLOW --

Network flow properties.

TDEP --

Temperature-dependence factors.

LOCK --

Chain-locking stretch.

BULK --

Bulk modulus.

References:

Three-Network Model (**TB**,TNM) in the *Material Reference*

USER -- User-Defined Material Model or Thermal Material Model Specifications

When *Lab* = USER, the **TB (p. 1899)** command activates either the `UserMat` (user-defined material) or the `UserMatTh` (user-defined thermal material) subroutine automatically. The subroutine activated depends on the element type used and the *TB0PT* setting. For a detailed list of elements that support **TB (p. 1899)**,USER, see Material Model Support for Elements in the *Material Reference*..

***NTEMP*:**

Number of temperatures for which data will be provided. Default = 1.

***NPTS*:**

Number of data points to be specified for a given temperature. Default = 48.

***TB0PT*:**

User-defined material model (`UserMat`) or thermal material model (`UserMatTh`) options:

NONLINEAR

Nonlinear iterations are applied (default except for thermal elements).

LINEAR

Nonlinear iterations are not applied. This option is ignored if there is any other nonlinearity involved, such as contact, geometric nonlinearity, etc.

MXUP

This option indicates a UserMat material model to be used with mixed u-P element formulation for material exhibiting incompressible or nearly incompressible behavior.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

THERM

Invokes the thermal material model (UserMatTh) for a coupled-field analysis using elements SOLID225, SOLID226, and SOLID227 with thermal degrees of freedom. Use this option in a coupled structural-thermal analysis to specify a user-defined thermal material model (UserMatTh) independently of the user-defined structural material model (UserMat).

Invokes the thermal material model (UserMatTh) for thermal elements SOLID278, SOLID279, SOLID291, PLANE292, and PLANE293. For thermal elements, this is the only option (no default).

Customizing Material Behavior in the *Material Reference*

Subroutine UserMat (Creating Your Own Material Model) in the *Programmer's Reference*

Subroutine UserMatTh (Creating Your Own Thermal Material Model) in the *Programmer's Reference*

WEAR -- Contact Surface Wear Specifications

NTEMP :

Number of temperatures for which data will be provided.

NPTS :

Number of data points to be specified for the wear option. This value is set automatically based on the selected wear option (*TB0PT*). If *TB0PT* is not specified, the default becomes *NPTS* = 5 and *TB0PT* = ARCD.

TB0PT :

Wear model options:

ARCD --

Archard wear model (default).

USER --

User-defined wear model.

AUTS --

Automatic scaling of wear increment. Must be used in conjunction with one of the wear models (*TB0PT* = ARCD or USER).

CBCS --

Autoscaling of wear increment over each simulation cycle. Must be used along with one of the wear models (*TB0PT* = ARCD or USER)..

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

References:

Contact Surface Wear in the *Material Reference*

Contact Surface Wear in the *Contact Technology Guide*

See also **TBFIELD (p. 1966)** for more information about defining temperature and/or time-dependent properties.

XTAL -- Crystal Plasticity Model Specifications

NTEMP :

Unused.

NPTS :

Unused.

TB0PT :

Crystal plasticity material options:

ORIE --

Crystal orientation.

NSLFAM --

Number of slip families.

FORM --

Formulation number.

XPARAM --

Crystal characteristic parameters.

HARD --

Slip system hardness properties.

FLFCC --

Face-centered cubic (FCC) flow parameters.

FLHCP --

Hexagonal closed packed (HCP) flow parameters.

FLBCC --

Body-centered cubic (BCC) flow parameters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reference:

Crystal Plasticity in the *Material Reference*

Notes

TB (p. 1899) activates a data table for use by subsequent **TBDATA (p. 1960)** or **TBPT (p. 1992)** commands. The table space is initialized to zero values. Data from this table are used for most nonlinear material descriptions as well as for special input for some elements.

For a list of elements supporting each material model (*Lab* value), see Material Model Support for Elements in the *Material Reference*.

For information about linear material property input, see **MP (p. 1160)**.

This command is also valid in SOLUTION.

Considerations for Enthalpy (*TBOPT* = ENTH)

- To ensure correct results, you must define enthalpy over a large enough temperature range to span all computed temperatures during the solution. The **TB (p. 1899)** command does not extrapolate enthalpy values beyond the specified temp range like the **MP (p. 1160)** command does.
- If both the **TB (p. 1899)** and **MP (p. 1160)** commands are used to specify enthalpy values, enthalpy values defined via the **TB (p. 1899)** command are used and those defined via the **MP (p. 1160)** command are ignored.

Product Restrictions

---

TBCOPY, *Lab*, *MATF*, *MATT*

Copies a data table from one material to another.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Data table label. See the **TB (p. 1899)** command for valid labels, and see "Notes" (p. 1959) for *Lab* = ALL.

MATF

Material reference number where data table is to be copied from.

MATT

Material reference number where data table is to be copied to.

Notes

The **TBCOPY (p. 1959)** command, with *Lab* = ALL, copies all of the nonlinear data defined by the **TB (p. 1899)** command. If you copy a model that includes both yield behavior constants and linear constants (for example, a BKIN model), **TBCOPY (p. 1959)**,ALL and **MPCOPY (p. 1167)** are used together to copy the entire model. All input data associated with the model is copied, that is, all data defined through the **TB (p. 1899)** and **MP (p. 1160)** commands.

Also, if you copy a material model using the Material Model Interface (**Edit> Copy**), both the commands **TBCOPY (p. 1959)**,ALL and **MPCOPY (p. 1167)** are issued, regardless of whether the model includes linear constants only, or if it includes a combination of linear and yield behavior constants.

This command is also valid in SOLUTION.

TBDATA, *STLOC*, *C1*, *C2*, *C3*, *C4*, *C5*, *C6*

Defines data for the material data table.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

STLOC

Starting location in table for entering data. For example, if *STLOC* = 1, data input in the *C1* field applies to the first table constant, *C2* applies to the second table constant, etc. If *STLOC*=5, data input in the *C1* field applies to the fifth table constant, etc. Defaults to the last location filled + 1. The last location is reset to 1 with each **TB (p. 1899)**, **TBTEMP (p. 1993)**, or **TBFIELD (p. 1966)** command.

C1, C2, C3, . . . , C6

Data values assigned to six locations starting with *STLOC*. If a value is already in this location, it is redefined. A blank value leaves the existing value unchanged.

Notes

Defines data for the table specified via the most recent **TB (p. 1899)** command (at the temperature specified via the most recent **TBTEMP (p. 1993)** or **TBFIELD (p. 1966)** command, if applicable).

The type of data table specified determines the number of data values needed in **TBDATA (p. 1960)**. Data values are interpolated for temperatures or other specified field variables that fall between user-defined **TBTEMP (p. 1993)** or **TBFIELD (p. 1966)** values.

You can specify values for up to six constants per **TBDATA (p. 1960)** command. Issue the command multiple times if needed.

Some elements (for example, SOLID226) support tabular input for some linear materials. For a list of elements supporting tabular material properties and associated primary variables, see Defining Linear Material Properties Using Tabular Input in the *Material Reference*.

This command is also valid in SOLUTION.

TBDELE, *Lab*, *MAT1*, *MAT2*, *INC*, *TBOPT*

Deletes previously defined material data tables.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Material data table label to delete. (See **TB (p. 1899)** for valid *Lab* values.)

MAT1*, *MAT2*, *INC

Deletes data tables for materials *MAT1* to *MAT2* (default = *MAT1*) in steps of *INC* (default = 1).

TBOPT

Material data table option. (See **TB (p. 1899)** for valid *TBOPT* values for the given *Lab*.)

Notes

If *Lab* = ALL, delete *all* material data tables.

If *MAT1*= ALL, *MAT2* and *INC* are ignored and all material data tables are deleted.

If *TBOPT* is specified, the material data table corresponding to *Lab* is deleted if it also has the specified table option. If *TBOPT* is not specified, all material data tables corresponding to *Lab* are deleted. *TBOPT* is ignored when *Lab* = ALL.

This command is also valid in SOLUTION, but is not intended for changing material behaviors between load steps.

Main Menu>Solution>Load Step Opts>Other>Change Mat Props>Material Models

TBEO, *Par*, *Value*

Sets special options or parameters for material data tables.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Par

Parameter name:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CAPCREEPREG

Available for the viscoplasticity/creep model (**TB (p. 1899)**,CREEP (p. 1915)), allows two creep models to be specified via the same material ID when used with the Extended Drucker-Prager model (**TB (p. 1899)**,EDP (p. 1921)).

FDCS

Coordinate system to use with location (XCOR, YCOR, ZCOR) or displacement (UX, UY, UZ) field variables.

NEGSLOPE

Controls whether negative tangent slopes of the stress-strain curve are allowed for multi-linear kinematic or isotropic hardening in a rate-independent plasticity analysis.

Value

Parameter value:

When *Par* = CAPCREEPREG --

SHEA

Use the shear stress-state creep model with the Extended Drucker-Prager model.

COMP

Use the compaction stress-state creep model with the Extended Drucker-Prager model.

When *Par* = FDCS --

Any predefined, user-defined, or custom (**LOCAL (p. 1059)** or **CS (p. 435)**) Cartesian coordinate system number.

When *Par* = NEGSLOPE --

0

Error-trap negative tangent slopes of the stress-strain curve (default).

1

Allow negative tangent slopes of the stress-strain curve.

Notes

Issue the **TBEO (p. 1961)** command *after* activating the material data table (**TB (p. 1899)**) but *before* defining data for the table (**TBDATA (p. 1960)**) or a point on a nonlinear data curve (**TBPT (p. 1992)**).

If the defined material data table has subtables, issue the **TBEO (p. 1961)** command for *each* desired subtable.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

TBIN,*Oper*,*Par1*,*Par2*,*Par3*,*Par4*

Sets parameters used for interpolation of the material data tables.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Oper

Operation to perform:

ALGO (p. 1963)

Specifies the interpolation algorithm to use for the subtable (or table if the material data table has only one subtable) being defined.

BNDS (p. 1964)

Specifies the maximum and minimum bounds for individual field variables.

CACH (p. 1964)

Enables or disables caching of interpolated data for better performance.

DEFA (p. 1964)

Specifies the default value of the user-defined field variable used for interpolation (if no value was specified).

EXTR (p. 1964)

Controls extrapolation options.

NORM (p. 1965)

Scales the field variables before interpolation.

SCALE (p. 1965)

Interpolates **TB (p. 1899)**-based material parameters in the linear- or natural-log scale.

Interpolation Parameters for *Oper* = ALGO

Par1

Interpolation algorithm:

LINEAR – Linear 1D / 2D (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LMUL – Linear-multivariate interpolation (multidimensional).

Par1 = LINEAR is available for all material models. The remaining options are limited to a subset of material models. For more information, see Material Model Support for Interpolation in the *Material Reference*.

Interpolation Parameters for *Oper* = BNDS

Par1

The field variable on which the operation is being applied.

Par2

Lower bound of the field variable.

Par3

Upper bound of the field variable.

Interpolation Parameters for *Oper* = CACH

Par1

Reserved for future use.

Par2

Enable or disable caching of interpolated material parameters. Enable for better performance.

OFF – Disable (default).

ON – Enable.

Interpolation Parameters for *Oper* = DEFA

Par1

The field variable on which the operation is being applied.

Par2

Default value of the field variable for which an initial value was not specified.

Interpolation Parameters for *Oper* = EXTR

Par1

Reserved for future use.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Par2

Set extrapolation/projection options for interpolating material parameters.

OFF / BBOX– Projects to the hyper-rectangular bounding box (default). An error occurs if query points exist outside the convex hull of points but inside the hyper-rectangular bounding box.

PHULL – Projects to the convex hull of points if a point is located outside the convex hull surface.

TBIN (p. 1963),EXTR is supported for the linear multivariate interpolation algorithm only.

Interpolation Parameters for *Oper* = NORM

Par1

Reserved for future use.

Par2

Enable or disables field-variable normalization for interpolation.

OFF – Disable.

ON – Enable (default).

Interpolation Parameters for *Oper* = SCALE

Par1

Independent variable, which can be any field variable specified via the **TBFIELD (p. 1966)** command.

Par2

Index of any material parameter specified via the **TBDATA (p. 1960)** command.

Par3

Scale to use for the independent variable. Valid options are LINEAR (linear) or LOG (logarithmic).

Par4

Scale to use for the dependent variable (the material parameter specified via *Par2*). Valid options are LINEAR (linear) or LOG (logarithmic).

Notes

For a list of the supported material data tables (**TB (p. 1899)**), see Logarithmic Interpolation and Scaling in the *Material Reference*.

Oper = DEFA, BNDS, NORM and CACH are supported for the linear multivariate (**TBIN (p. 1963)**,ALGO,LMUL) interpolation algorithm only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

TBFIELD, *Type*, *Value*

Defines values of field variables for material data tables.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Field variable type:

CYCLE

A healing cycle number is to be specified in *Value*.

FREQ

A frequency is to be specified in *Value*.

NPRES

A normal pressure is to be specified in *Value*.

PLSR

An equivalent plastic strain rate is to be specified in *Value*.

PPRE

Pressure degree of freedom is to be specified in *Value*.

SLDA

A total sliding distance (algebraic) is to be specified in *Value*.

SLDI

A total sliding distance (absolute) is to be specified in *Value*.

SLRV

A sliding velocity is to be specified in *Value*.

SRAT

Stress ratio of fatigue load cycle is to be specified in *Value*.

TEMP

A temperature is to be specified in *Value*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TIME

A time is to be specified in *Value*.

UFXX

User-defined field variable (UF01,UF02, ..., UF09).

UX / UY / UZ

Displacements in the global/local X, Y, or Z coordinate system, respectively, are to be specified in *Value*.

XCOR / YCOR / ZCOR

X, Y and Z locations, respectively, are to be specified in *Value*..

Value

The field value to be referenced.

Notes

Define your data tables as field-variable-dependent (via the appropriate **TB (p. 1899)** command), then issue **TBFIELD (p. 1966)** to define the field values.

Issue this command multiple times to enter values for different field variables.

Define data values in ascending order for all field quantities. If a field value is to be held constant, define it only once; subsequent definitions are ignored.

No limit exists on the number of values that you can specify. The specified field value remains active until the next **TBFIELD (p. 1966)** command is input.

Field variables associated with **TB (p. 1899)** commands are supported only for current-technology structural and thermal elements.

After you have defined the field value(s), define your data for the data tables (**TBDATA (p. 1960)**).

For more information about the interpolation scheme used for field-dependent material properties, see Understanding Field Variables in the *Material Reference*.

For more information about using **TBFIELD (p. 1966)** with **TB (p. 1899)**,ELASTIC or **TB (p. 1899)**,SDAMP, see Full Harmonic Analysis in the *Structural Analysis Guide*.

Material Model Support for Field Variables

The TEMP (temperature) predefined field variable is available for all material models defined via **TB (p. 1899)**,*Lab*.

Several other field variables are available for use with some material models (when used with specific element types), such as TIME (time), PPRE (pore-pressure), XCOR / YCOR / ZCOR (location), UX / UY / UZ (displacement), and UF01 - UF09 (user-defined).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The field variables can be defined in the global coordinate system or in any local or user-defined coordinate system.

For more information, see Predefined Field Variables in the *Material Reference*.

Menu Paths

This command cannot be accessed from a menu.

TBFPLOT,*MATID*,*CurveFitName*,*EXPDATID*,*ColX*,*ColY1*,*ColY2*

Plots material curve-fitting data.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MATID

Material reference identification number.

'CurveFitName'

Material curve-fitting model name (obtainable via **TBFT (p. 1969)**,LIST). Enclose the name within single quotes.

EXPDATID

Experimental data ID.

ColX

Experimental data column to use in the X axis.

ColY1

Experimental data column to use in the Y axis.

ColY2

Fitted-data column to use in the Y axis.

Notes

This command plots the fitted data specified via *ColY2* (the number of experimental data columns + 1) and the data specified via *ColY1* as a function of the X-axis data specified via *ColX*.

Issue this command *after* curve-fitting has been completed (**TBFT (p. 1969)**,SOLVE).

Material curve-fitting does not support saving to (**SAVE (p. 1645)**) and resuming from (**RESUME (p. 1601)**) the database file. You must therefore rerun the curve-fitting analysis, then issue **TBFPLOT (p. 1968)** again to replot.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Material Props>Material Models

TBFT,*Oper*,*MATID*,*Option1*,*Option2*,*Option3*,*Option4*,*Option5*,*Option6*,*Option7*,–,–,*Option10*

Performs material curve-fitting operations.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Use material curve-fitting to evaluate your experimental data and correlate it to the program's built-in nonlinear material models. You apply coefficients to your curve data, determine a fit with existing model, and write the data according to the table configurations described in the **TB (p. 1899)** command. Curve-fitting is available for nonlinear models associated with:

- Hyperelastic material behavior (p. 1969)
- Viscoelastic material behavior (p. 1972)
- Chaboche plasticity material behavior (p. 1976)
- Creep material behavior (p. 1980)
- Thermomechanical fatigue (TMF) and plasticity combinations (p. 1984)

TBFT Specifications for **Hyperelastic Models**

TBFT (p. 1969), *Oper*, *MATID*, *Option1*, *Option2*, *Option3*, *Option4*, *Option5*, *Option6*, *Option7*

Oper

The operation to perform:

Operation Set 1 (Curve-Fitting)

- - - - - - - - - - - - - - - - - - -

FADD --

Define a constitutive model for parameter-fitting and import all parameters (defined previously via **TB (p. 1899)** and **TBDATA (p. 1960)**).

FDEL --

Delete a constitutive model.

FSET --

Write data related to a constitutive model to the database (same as **TB (p. 1899)** command).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SET --

Initialize coefficients of a constitutive model for nonlinear curve-fitting procedure.

CDEL --

Deletes coefficients at current reference temperature. Applicable only for temperature dependent coefficients.

SOLVE --

Solve for coefficients.

FIX --

Fix (hold constant) the coefficient you specify in *Option4*.

Operation Set 2 (Experimental Data)

- - - - - - - - - - - - - - - - - - - -

EADD --

Add experimental data.

EDEL --

Delete experimental data.

Other Operations

- - - - - - - - - - - - - - - - - - - -

LIST --

List all data associated with the material model represented by the material ID number (*MATID*)

PSCA

Activate parameter-scaling to improve optimization performance. Valid for the UserMat curve-fitting method only (**TB (p. 1899)**,USER,,,,MXUP and TB,USER,,,,NONLINEAR [default]).

MATID

Material reference identification number (same as *MAT* argument used in the **TB (p. 1899)** command). Valid value is any number *n*, where 0 < *n* < 100,000. Default = 1.

Option1

For curve-fit function operations (*Oper* = FADD, FDEL, FSET, SET, CDEL, SOLVE or FIX) this value specifies the category (AML).

For adding or deleting your experiment (*Oper* = EADD *or* EDEL), this value specifies the experimental data type. **Valid options:** UNIA (default), BIAX, SHEA, SSHE,and VOLU.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Option2

For curve-fit function operations (*Oper* = FADD, FDEL, FSET, SET, CDEL, SOLVE, or FIX), set this value to GENR.

When you need to specify a file name from which to get experimental data (*Oper* = EADD), place that string here. Valid value is any file name string. You can enter the entire `path\filename.extension` string and leave the next two values (*Option3* and *Option4*) blank, or you can specify the name here, the extension in the next value, and the path following.

Option3

For *Oper* = FADD, FDEL, FSET, CDEL, SET, SOLVE or FIX, set this value to a user-defined name (to be used consistently in the curve-fitting process).

If a file name for experimental data is being specified in *Option2* (*Oper* = EADD), this value will contain the file extension.

Option4

When you are working on a specific coefficient (*Oper* = FIX), this value specifies the index of that coefficient. Valid values vary from 1 to *n*, where *n* is the total number of coefficients. Default = 1.

For *Oper* = SET, see Table 227: Set Operations (p. 1971), below.

If a file name for experimental data is being specified in *Option2* (*Oper* = EADD), this value will contain the directory/path specification.

If *Oper* = SOLVE, this value specifies the curve-fitting procedure. Valid values are 0 for non-normalized least squares curve-fitting procedure, and 1 for normalized least squares curve-fitting procedure.

Option5

When you are working on a specific coefficient (*Oper* = FIX), this value specifies the index of that coefficient. Valid values vary from 1 to N, where N is the total number of coefficients. Default = 1.

For *Oper* = SET, see Table 227: Set Operations (p. 1971), below.

Table 227: Set Operations

Purpose	Option4	Option5
Set the value of the coefficient.	Index of coefficient	Value of that coefficient
Set temperature dependency ON/OFF[a]	TDEP	1 -- ON 0 -- OFF
Set reference temperature	TREF	Temperature value

[a] Specify temperature data in the same specified via **TREF (p. 2013)**.

If *Oper* = PSCA, use this value to specify the scaling option to be used in the parameter-fitting process. Options are LINE (default), EXPO (exponential), SQRD (squared) or LOG (logarthmic). Use with the UserMat curve-fitting method.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If *Oper* = SOLVE, use this value to specify the number of iterations to be used in the calculation of the coefficients. Valid value is any positive integer. Default = 1000.

Option6

If *Oper* = SOLVE, specifies the allowed tolerance in residual change to stop an iteration. Valid value is 0.0 to 1.0. Default = 0.0.

Option7

If *Oper* = SOLVE, specifies the allowed tolerance in coefficient change to stop an iteration. Valid value is 0 to 1. Default = 0.

For the supported list of material models, see Valid Hyperelastic Curve-Fitting Model Types in the *Material Reference*.

This table summarizes the format for hyperelastic curve-fitting operations via **TBFT (p. 1969)**:

Hyperelastic Model Command Summary

Oper	MATID	Option1	Option2	Option3	Option4	Option5	Option6	Option7
FADD	*MATID*	AML	GENR	*UserDefName*	-	-	-	-
FDEL	*MATID*	AML	GENR	*UserDefName*	-	-	-	-
FSET	*MATID*	AML	GENR	*UserDefName*	-	-	-	-
SET	*MATID*	AML	GENR	*UserDefName*	*Index*	*Value*	-	-
SOLVE	*MATID*	AML	GENR	*UserDefName*	*NormFlag*	*NumIter*	RTOL	CTOL
FIX	*MATID*	AML	GENR	*UserDefName*	*Index*	-	-	-
EADD	*MATID*	*ExpTyp*	*File*	*UserDefName*	*Directory*	-	-	-
EDEL	*MATID*	*ExpType / Index*	-	*UserDefName*	-	-	-	-

TBFT Specifications for Viscoelastic Models

Add experimental data.

EDEL --

Delete experimental data.

Other Operations

- - - - - - - - - - - - - - - - - - -

LIST --

List all data associated with the material model represented by the material ID number (*MATID*)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MATID

Material reference identification number (same as *MAT* argument used in the **TB (p. 1899)** command). Valid value is any number *n*, where 0 < *n* < 100,000. Default = 1.

Option1

For curve-fitting function operations (*Oper* = FADD, FDEL, FSET, SET, CDEL, SOLVE, or FIX), this value is set to AML.

For adding or deleting your experiment (*Oper* = EADD *or* EDEL), this value specifies the experiment type. **Valid options:** SDEC (Shear Modulus vs. Time/Freq) or BDEC (Bulk Modulus vs. Time/Freq).

Option2

For curve-fitting function operations (*Oper* = FADD, FDEL, FSET, SET, CDEL, SOLVE, or FIX), this value is set to GENR.

When you need to specify a file name from which to get experimental data (*Oper* = EADD), place that string here. Valid value is any file name string. You can enter the entire `path\filename.extension` string and leave the next two values (*Option3* and *Option4*) blank, or you can specify the name here, the extension in the next value, and the path following.

Option3

For *Oper* = FADD, FDEL, FSET, CDEL, SET, SOLVE, or FIX, set this value to any user-defined name (to be used consistently during the curve-fitting process).

If a file name for experimental data is being specified in *Option2* (*Oper* = EADD), this value will contain the file extension.

Option4

When you are working on a specific coefficient (*Oper* = FIX), this value specifies the index of that coefficient. Valid values vary from 1 to *n*, where *n* is the total number of coefficients. Default = 1.

For *Oper* = SET, see Table 228: Set Operations (p. 1974) below.

You can also specify *TREF* to indicate the reference temperature.

If a file name for experimental data is being specified in *Option2* (*Oper* = EADD), this value will contain the directory/path specification.

If *Oper* = SOLVE, this value specifies the curve-fitting procedure. Valid values are 0 for non-normalized least squares curve-fitting procedure, and 1 for normalized least squares curve-fitting procedure.

Option5

For *Oper* = SET, see Table 228: Set Operations (p. 1974) below.

Table 228: Set Operations

Purpose	Option4	Option5
Set the value of the coefficient	Index of coefficient	Value of coefficient

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Purpose	Option4	Option5
Set temperature dependency ON/OFF	TDEP	1 for ON and 0 for OFF
Set reference temperature	TREF	Temperature value

If *Oper* = SOLVE, use this value to specify the number of iterations to be used in the calculation of the coefficients. Valid value is any positive integer. Default = 1000.

If you are specifying a coefficient to be held constant (*Oper* = FIX):

1 – Fix the specified coefficient.

0 – Allow the specified coefficient to vary (disable fixing).

Option6

If *Oper* = SOLVE, specifies the allowed tolerance in residual change to stop an iteration. Valid value is 0.0 to 1.0. Default = 0.0.

Option7

If *Oper* = SOLVE, specifies the allowed tolerance in coefficient change to stop an iteration. Valid value is 0 to 1. Default = 0.

This table summarizes the format for viscoelastic curve-fitting operations via **TBFT (p. 1969)**:

Viscoelastic Model Command Summary

Oper	**MAT-ID**	**Option1**	**Option2**	**Option3**	**Option4**	**Option5**	**Option6**	**Option7**
FADD	*MAT-ID*	AML	GENR	*UserDef-Name*	-	-	-	-

TBFT Specifications for Chaboche Kinematic Hardening Plasticity Models

TBFT (p. 1969), *Oper*, *MATID*, *Option1*, *Option2*, *Option3*, *Option4*, *Option5*, *Option6*, *Option7*, –, –, *Option10*

Oper

The operation to perform:

Operation Set 1 (Curve-Fitting)

- - - - - - - - - - - - - - - - - - -

FCASE --

Define a case/constitutive model for plasticity.

FADD --

Define a constitutive model.

FDEL --

Delete a constitutive model.

FSET --

Write data related to a constitutive model to the database (same as **TB (p. 1899)** command).

SET --

Initialize coefficients of a constitutive model for nonlinear curve-fitting procedure.

CDEL --

Deletes coefficients at current reference temperature. Applicable only for temperature-dependent coefficients.

SOLVE --

Solve for coefficients.

FIX --

Fix (hold constant) the coefficient you specify in *Option4*.

Operation Set 2 (Experimental Data)

- - - - - - - - - - - - - - - - - - -

EADD --

Add experimental data.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EDEL --

Delete experimental data.

Other Operations

- - - - - - - - - - - - - - - - - - -

LIST --

List all data associated with the material model represented by the material ID number (*MATID*).

MATID

Material reference identification number (same as *MAT* argument used in the **TB (p. 1899)** command). Valid value is any number greater than zero (default = 1) but less than 100,000.

Option1

For *Oper* = FCASE, set to either NEW or FINI. The command **TBFT (p. 1969)**,FCASE,*MATID*,NEW initializes a new curve-fitting case. (The **TBFT (p. 1969)**,FADD commands described next are always issued between **TBFT (p. 1969)**,FCASE,*MATID*,NEW and **TBFT (p. 1969)**,FCASE,*MATID*,FINI commands.) After issuing **TBFT (p. 1969)**,FCASE,*MATID*,FINI, the Chaboche model is created and is ready to be used to perform other curve-fitting operations. For more information, see Material Curve-Fitting in the *Material Reference*.

For *Oper* = FADD, set to PLAS to add options/parameters for the new case being created (via **TBFT (p. 1969)**,FCASE,*MATID*,NEW, which must be issued *before* the **TBFT (p. 1969)**,FADD command). This operation specifies the order of the Chaboche kinematic model.

For other curve-fitting function operations (*Oper* = FDEL, FSET, SET, CDEL, SOLVE or FIX), set to CASE.

For adding or deleting your experiment (*Oper* = EADD *or* EDEL), this option specifies the experiment type. The only valid option is UNIA (plastic strain vs. true stress).

Option2

For *Oper* = FCASE (defining your Chaboche case), set to CPLA.

For *Oper* = FDEL, FSET, SET, CDEL, SOLVE, or FIX (curve-fitting function operations), this value specifies the case name being operated on.

For *Oper* = FADD (specifying options for the plasticity model), valid options are:

CHAB -- Chaboche kinematic hardening (required for any defined curve-fitting case)

BISO -- Bilinear isotropic hardening (optional)

MISO -- Multilinear isotropic hardening (optional)

VOCE -- Nonlinear isotropic hardening, Voce model (optional)

The **TBFT (p. 1969)**,FADD command can be issued twice, once to specify the order of the Chaboche model, and again to specify the isotropic hardening option.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(Only *one* of the options BISO, MISO or VOCE can be used in a single curve-fitting case, and none of those options are required.)

For *Oper* = EADD (specifying a file name from which to get experimental data), place that string here. A valid entry is any file name string. You can either:

- Enter the entire `path\filename.extension` string and leave the next two values (*Option3* and *Option4*) blank, *or*
- Specify the name here, the extension in the next value, and the path in the following value.

Option3

For *Oper* = FCASE, this value specifies the case name.

For *Oper* = FADD, this value specifies either:

- The order of the Chaboche kinematic hardening model (*Option2* = CHAB), *or*
- The number of terms in the MISO model (*Option2* = MISO).

If a file name for experimental data is being specified in *Option2* (*Oper* = EADD), this value contains the file extension.

Option4

When fixing a specific coefficient to a desired value (*Oper* = FIX), this value specifies the index of that coefficient. Valid values vary from 1 to *n*, where *n* is the total number of coefficients. Default = 1.

For *Oper* = SET, see Table 228: Set Operations (p. 1974).

You can also specify *TREF* to indicate the reference temperature, or *COMP* for a partial/complete solution (only for bulk, only for shear, or all coefficients).

If a file name for experimental data is being specified in *Option2* (*Oper* = EADD), this value contains the directory/path specification.

If *Oper* = SOLVE, this value specifies the normalized/non-normalized option. This option is not available for Chaboche curve-fitting.

Option5

For *Oper* = SET, refer to the following table.

Table 229: Set Operations

Purpose	Option4	Option5
Set the value of the coefficient	Index of coefficient	Value of coefficient
Set temperature dependency ON/OFF	TDEP	1 for ON and 0 for OFF
Set reference temperature	TREF	Temperature value

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If *Oper* = SOLVE, use this value to specify the number of iterations to be used in the calculation of the coefficients. Valid value is any positive integer. Default = 1000.

If you are specifying a coefficient to be held constant (*Oper* = FIX):

1 – Fix the specified coefficient.

0 – Allow the specified coefficient to vary (disable fixing).

Option6

If *Oper* = SOLVE, specifies the allowed tolerance in residual change to stop an iteration. Valid value is 0.0 to 1.0. Default = 0.0.

Option7

If *Oper* = SOLVE, specifies the allowed tolerance in coefficient change to stop an iteration. Valid value is 0 to 1. Default = 0.

–

Reserved for future use.

–

Reserved for future use.

Option10

If *Oper* = SOLVE, enables parameter-scaling when set to 1. Default = 0. Used for Chaboche material curve-fitting.

This table summarizes the format for Chaboche curve-fitting operations via **TBFT (p. 1969)**:

Chaboche Model Command Summary

Oper	*MAT-ID*	*Option1*	*Option2*	*Option3*	*Option4*	*Option5*	*Option6*	*Option7*
FCASE	*MAT-ID*	NEW	CPLA	Case Name				
FCASE	*MAT-ID*	FINI						
FADD	*MAT-ID*	PLAS	Option	Order

TBFT Specifications for Creep Models

TBFT (p. 1969), *Oper*, *MATID*, *Option1*, *Option2*, *Option3*, *Option4*, *Option5*, *Option6*, *Option7*, –, –, *Option10*

Oper

The operation to perform:

Operation Set 1 (Curve-Fitting)

- - - - - - - - - - - - - - - - - - -

FADD --

Define a constitutive model.

FDEL --

Delete a constitutive model.

FSET --

Write data related to a constitutive model to the database (same as **TB (p. 1899)** command).

SET --

Initialize coefficients of a constitutive model for nonlinear curve-fitting procedure.

CDEL --

Deletes coefficients at current reference temperature. Applicable only for temperature dependent coefficients.

SOLVE --

Solve for coefficients.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FIX --

Fix (hold constant) the coefficient you specify in *Option4*.

Operation Set 2 (Experimental Data)

- - - - - - - - - - - - - - - - - - -

EADD --

Add experimental data.

EDEL --

Delete experimental data.

Other Operations

- - - - - - - - - - - - - - - - - - -

LIST --

List all data associated with the material model represented by the material ID number (*MATID*)

MATID

Material reference identification number (same as *MAT* argument used in the **TB (p. 1899)** command). Valid value is any number *n*, where 0 < *n* < 100,000. Default = 1.

Option1

For curve-fit function operations (*Oper* = FADD, FDEL, FSET, SET, CDEL, SOLVE or FIX) this value specifies the category (CREEP).

For adding or deleting your experiment (*Oper* = EADD *or* EDEL), this value specifies the experimental data type (CREEP).

Option2

For curve-fit function operations (*Oper* = FADD, FDEL, FSET, SET, CDEL, SOLVE, or FIX), this value specifies constitutive model type. The valid values are listed in Table 231: Creep Options (p. 1983) below.

When you need to specify a file name from which to get experimental data (*Oper* = EADD), place that string here. Valid value is any file name string. You can enter the entire `path\filename.extension` string and leave the next two values (*Option3* and *Option4*) blank, or you can specify the name here, the extension in the next value, and the path following.

Option3

If a file name for experimental data is being specified in *Option2* (*Oper* = EADD), this value will contain the file extension.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Option4

When you are working on a specific coefficient (*Oper* = FIX), this value, specifies the index of that coefficient. Valid values vary from 1 to *n*, where *n* is the total number of coefficients. Default = 1.

For *Oper* = SET, see Table 230: Set Operations (p. 1982), below.

If a file name for experimental data is being specified in *Option2* (*Oper* = EADD), this value will contain the directory/path specification.

If *Oper* = SOLVE, this value specifies the curve-fitting procedure. Valid values are 0 for non-normalized least squares curve-fitting procedure, and 1 for normalized least squares curve-fitting procedure.

Option5

If *Oper* = SOLVE, use this value to specify the number of iterations to be used in the calculation of the coefficients. Valid value is any positive integer. Default = 1000.

If you are specifying a coefficient to be held constant (*Oper* = FIX):

1 – Fix the specified coefficient.

0 – Allow the specified coefficient to vary (disable fixing).

For *Oper* = SET, see Table 230: Set Operations (p. 1982), below.

Table 230: Set Operations

Purpose	Option4	Option5
Set the value of the coefficient	Index of coefficient	Value of coefficient
Set temperature dependency ON[a]/OFF[b]	TDEP	1 -- ON 0 -- OFF
Set reference temperature	TREF	Temperature value

[a] When TDEP is OFF, the Arrhenius term (C4) in the strain-hardening creep equation is calculated. Because **TBTEMP (p. 1993)** is not included in the curve-fitting, the experimental data (in absolute temperature) must be provided via **/TEMP**.

[b] When TDEP is ON, the Arrhenius term is set to 0 and the constants are calculated separately for each temperature. The curve-fitting process uses **TBTEMP (p. 1993)**. You must provide the experimental data using the same units as specified via **TREF (p. 2013)**.

Option6

If *Oper* = SOLVE, specifies the allowed tolerance in residual change to stop an iteration. Valid value is 0.0 to 1.0. Default = 0.0.

Option7

If *Oper* = SOLVE, specifies the allowed tolerance in coefficient change to stop an iteration. Valid value is 0 to 1. Default = 0.

–

Reserved for future use.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

–

Reserved for future use.

Option10

If *Oper* = SOLVE, enables parameter-scaling when set to 1. Default = 0. Used for creep material curve-fitting.

Table 231: Creep Options

Category	Name	Option
CREEP	SHAR	NA
CREEP	THAR	NA
CREEP	GEXP	NA
CREEP	GGRA	NA
CREEP	GBLA	NA
CREEP	MTHA	NA
CREEP	MSHA	NA
CREEP	GGAR	NA
CREEP	EXPO	NA
CREEP	NORT	NA
CREEP	PSTH	NA
CREEP	PSRP	NA
CREEP	GTHA	NA

This table summarizes the format for creep curve-fitting operations via **TBFT (p. 1969)**:

Creep Model Command Summary

Oper	***MAT ID***	***Option1***	***Option2***	***Option3***	***Option4***	***Option5***	***Option6***	***Option7***
FADD	*MAT ID*	CREEP	Option	NA

TBFT Specifications for Thermomechanical Fatigue (TMF) and Plasticity Model Combinations

TBFT (p. 1969), *Oper*, *MATID*, *Option1*, *Option2*, *Option3*, *Option4*, *Option5*, *Option6*, *Option7*

Oper

The operation to perform:

Operation Set 1 (Curve-Fitting)

- - - - - - - - - - - - - - - - - - -

FADD --

Define a constitutive model.

FDEL --

Delete a constitutive model.

FSET --

Write data related to a constitutive model to the database (same as **TB (p. 1899)** command).

SET --

Initialize coefficients of a constitutive model for nonlinear curve-fitting procedure.

CDEL --

Deletes coefficients at current reference temperature. Applicable only for temperature-dependent coefficients.

AINI --

Automatically initialize coefficients based on elastic properties and experimental data. (See "Notes" (p. 1987).)

SOLVE --

Solve for coefficients.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PSOLVE --

Custom multistep solve for coefficients.

FIX --

Fix (hold constant) the coefficient you specify in *Option4*.

Operation Set 2 (Experimental Data)

- - - - - - - - - - - - - - - - - - -

EADD --

Add experimental data.

EDEL --

Delete experimental data.

Other Operations

- - - - - - - - - - - - - - - - - - -

LIST --

List all data associated with the material model represented by the material ID number (*MATID*).

PSCA

Activate parameter-scaling to improve optimization performance. Valid for the UserMat curve-fitting method only (**TB (p. 1899)**,USER,,,,MXUP).

MATID

Material reference identification number. (Same as **TB (p. 1899)**,,*MATID*.) Valid value is any number *n*, where 0 < *n* < 100,000. Default = 1.

Option1

AML – For curve-fitting function operations (*Oper* = Operation Set 1), this value specifies the category.

UNIA – For adding or deleting your experiment (Operation Set 2), this value specifies the experimental data type.

Option2

For curve-fitting function operations (*Oper* = Operation Set 1), this value specifies the constitutive model type. The only valid value is GENR (generic).

To obtain experimental data (*Oper* = EADD in Operation Set 2) from a file, specify any valid file name. (You can either specify the entire *path**filename*.*extension* string here and leave *Option3* and *Option4* blank, or specify *filename* here, *extension* in *Option3*, and *path* in *Option4*.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Option3

For curve-fitting function operations (*Oper* = Operation Set 1), specify a unique name for your curve-fitting model.

For obtaining experimental data (*Oper* = EADD in Operation Set 2) from a file specified in *Option2*, specify the file extension.

Option4

When fixing a specific coefficient to a desired value (*Oper* = FIX), this value specifies the index of that coefficient. Valid values vary from 1 to *n*, where *n* is the total number of coefficients. Default = 1.

For *Oper* = SET, see Table 232: Set Operations (p. 1986).

You can also specify *TREF* to indicate the reference temperature, or *COMP* for a partial/complete solution (only for bulk, only for shear, or all coefficients).

If *Oper* = SOLVE, this value specifies the curve-fitting procedure. Valid values are 0 for non-normalized least squares curve-fitting procedure, and 1 for normalized least squares curve-fitting procedure.

For obtaining experimental data (*Oper* = EADD) from a file specified in *Option2*, specify the path in which the file resides.

Option5

For *Oper* = SET, refer to the following table:

Table 232: Set Operations

Purpose	Option4	Option5
Set the value of the coefficient	Index of coefficient	Value of coefficient
Set temperature dependency ON/OFF	TDEP	1 -- ON 0 -- OFF
Set reference temperature	TREF	Temperature value

If *Oper* = PSCA, use this value to specify the scaling option to be used in the parameter-fitting process. Options are LINE (default), EXPO (exponential), SQRD (squared) or LOG (logarthmic). Use with the UserMat curve-fitting method.

If *Oper* = SOLVE, use this value to specify the number of iterations to be used in the calculation of the coefficients. Valid value is any positive integer. Default = 1000.

If you are specifying a coefficient to be held constant (*Oper* = FIX):

1 – Fix the specified coefficient.

0 – Allow the specified coefficient to vary (disable fixing).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Option6

If *Oper* = SOLVE, specify the allowed tolerance in residual change to stop an iteration. Valid value is 0.0 to 1.0. Default = 0.0.

Option7

If *Oper* = SOLVE, specify the allowed tolerance in coefficient change to stop an iteration. Valid value is 0 to 1. Default = 0.

Supported Material Models

Material Model	TB Command[a]
Elastic Isotropic (p. 1922)	**TB (p. 1899)**,ELASTIC
Isotropic Hardening (p. 1941)	**TB (p. 1899)**,PLASTIC,,,,BISO
Kinematic Hardening (p. 1913)	**TB (p. 1899)**,CHABOCHE
Rate-Dependent Plasticity (p. 1945)	**TB (p. 1899)**,RATE
Kinematic Static Recovery (p. 1941)	**TB (p. 1899)**,PLASTIC,,,,KSR2
Isotropic Static Recovery (p. 1941)	**TB (p. 1899)**,PLASTIC,,,,ISR

[a] Issue **TB (p. 1899)** to define the material model *before* issuing **TBFT (p. 1969)**,FADD.

Notes

The **TBFT (p. 1969)** command provides tools for comparing experimental material data to the program-provided calculated data for various nonlinear material options. Based on curve-fitting comparisons and error norms, choose the model to use during the solution phase of the analysis according to the best fit. All of the capabilities of the **TBFT (p. 1969)** command are accessible interactively via the standard material GUI. For more information, see Material Curve-Fitting in the *Material Reference*.

Display material model data associated with both the **TB (p. 1899)** command and the **TBFT (p. 1969)**,FSET command via **TBLIST (p. 1988)**,ALL,ALL.

Material model data associated with the *most recent* **TB (p. 1899)** or **TBFT (p. 1969)**,FSET command overwrites previous data.

Display material model data associated with both the **TB (p. 1899)** command and the **TBFT (p. 1969)**,FSET command via **TBLIST (p. 1988)**,ALL,ALL.

The capability to fix coefficients (*Option4* = FIX) applies only to nonlinear curve-fitting (as listed in Table 6.4: Valid Hyperelastic Curve-Fitting Model Types.

The uniaxial, biaxial, and shear experimental data use *engineering* stress. The volumetric data uses *true* stress. See the *Material Reference* for details about experimental data for creep and viscoelasticity.

The hyperelastic option AML,GENR is a generalized framework where the parameters (defined *prior* to issuing **TBFT (p. 1969)**) are imported directly from **TB (p. 1899)** and **TBDATA (p. 1960)**. Parameter-fitting uses this framework for the thermomechanical fatigue, geomechanical, and TNM material models.

TBFT (p. 1969),AINI (p. 1984) calls a Python script that predicts initial coefficient values for some hyperelasticity material models. To ensure that the necessary Python libraries are installed, Mechanical APDL in-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

stallation includes a Python version that has been tested and known to work with this feature. Therefore, you cannot use the feature with any other installed version of Python. Delete the PYTHONHOME environment variable if it exists.

TBFT (p. 1969) does not support saving to (**SAVE (p. 1645)**) and resuming from (**RESUME (p. 1601)**) the database file. You must therefore rerun the curve-fitting analysis and then replot (**TBFPLOT (p. 1968)**).

Menu Paths

Main Menu> Preprocessor> Material Props> Material Models

TBLE

Specifies "Data table properties" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname`.LOG) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Data Tables

TBLIST, *Lab*, *MAT*

Lists the material data tables.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Data table label. (See the **TB (p. 1899)** command for valid labels.) Defaults to the active table. If ALL, list data for all labels.

MAT

Material number to be listed (defaults to the active material). If ALL, list data tables for all materials.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command is a utility command, valid anywhere.

Menu Paths

Utility Menu>List>Properties>Data Tables

TBMODIF, *ROW*, *COL*, *VALUE*

Modifies data for the material data table (GUI).

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ROW, COL

The row and column numbers of the table entry to be modified.

VALUE

The new value to be used in the *ROW*, *COL* location.

Notes

The **TBMODIF (p. 1989)** command modifies data for the table specified on the last **TB (p. 1899)** command.

For temperature-dependent data, the command uses the temperature specified via the last **TBTEMP (p. 1993)** command.

The command is generated by the program's Graphical User Interface (GUI). It appears in the log file (`Jobname`.LOG) if a **TB (p. 1899)** material data table is graphically edited in spreadsheet fashion. The command is *not* intended to be typed in directly during an analysis session (although it can be included in an input file for batch input or for use with **/INPUT (p. 948)**).

The command supports the following material data tables (**TB (p. 1899)**,*Lab* values):

ANEL (p. 1907) – Anisotropic elasticity
AVIS (p. 1908) – Anisotropic viscosity
CFOAM (p. 1912) – Crushable foam
DLST (p. 1919) – Anisotropic dielectric loss tangent
DPER (p. 1920) – Anisotropic electric permittivity
ELST (p. 1923) – Anisotropic elastic loss tangent
FCON (p. 1924) – Fluid conductance data
GASKET (p. 1927) – Gasket
GURSON (p. 1928) – Gurson pressure-dependent plasticity
HFLM (p. 1928) – Film coefficient data

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HILL (p. 1929) – Hill anisotropy

JOIN (p. 1932) – Joint

MIGR (p. 1938) – Migration

NLISO (p. 1939) – Voce isotropic hardening law

PIEZ (p. 1941) – Piezoelectric matrix

PLASTIC (p. 1941) (*TB0PT* = BISO) – Bilinear isotropic hardening

PLASTIC (p. 1941) (*TB0PT* = BKIN) – Bilinear kinematic hardening

PRONY (p. 1943) – Prony series

PZRS (p. 1944) – Piezoresistivity

SHIFT (p. 1946) – Shift function for viscoelastic materials

SMA (p. 1948) – Shape memory alloy

STATE (p. 1949) – User-defined state variables

This command is also valid in SOLUTION.

Displays the material data table.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Data table label. Valid labels are: MELAS, BKIN, BISO, BH, GASKET, and JOIN. Defaults to the active table label. For B-H data, also valid are: NB to display NU-B^2, MH to display MU vs. H, and SBH, SNB, SMH to display the slopes of the corresponding data.

MAT

Material number to be displayed (defaults to the active material).

TB0PT

Gasket material or joint element material option to be plotted.

The following gasket material options are valid only when *Lab* = GASKET:

ALL

Plots all gasket data.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

COMP

Plots gasket compression data only.

LUNL

Plots gasket linear unloading data with compression curve.

NUNL

Plots gasket nonlinear unloading data only.

The following joint element material options are valid only when *Lab* = JOIN:

JNSA

Plots nonlinear stiffness data that is applicable to all relevant directions.

JNS*n*

Plots only the specified nonlinear stiffness data. The "*n*" can be 1, 4, or 6. For example, JNS4 plots only the nonlinear stiffness data specified in the local direction 4 (ROTX).

JNDA

Plots nonlinear damping data that is applicable to all relevant directions.

JND*n*

Plots only the specified nonlinear damping data. The "*n*" can be 1, 4, or 6. For example, JND4 plots only the nonlinear damping data specified in the local direction 4 (ROTX).

JNFA

Plots nonlinear hysteretic friction data that is applicable to all relevant directions.

JNF*n*

Plots only the specified nonlinear hysteretic friction data. The "*n*" can be 1, 4, or 6. For example, JNF4 plots only the nonlinear hysteretic friction data specified in local direction 4 (ROTX).

TEMP

Specific temperature at which gasket data or joint element material data will be plotted (used only when *Lab* = GASKET or JOIN). Use *TEMP* = ALL to plot gasket data or joint element material data at all temperatures.

SEGN

Segment number of plotted curve (valid only when *Lab* = GASKET):

NO

Segment number is not added to plotted curve (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

YES

Segment number is added to plotted curve. This option is ignored if the number of data points in a curve exceeds 20.

Notes

Only data for stress-strain, B-H, gasket curves, or joint element nonlinear material model curves can be displayed.

The *TBOPT* and *TEMP* values are valid only when *Lab* = GASKET or JOIN.

The *SEGN* value is valid only when *Lab* = GASKET.

This command is valid in any processor.

Menu Paths

Utility Menu>Plot>Data Tables

TBPT,*Oper*,*X1*,*X2*,*X3*,...,*XN*

Defines a point on a nonlinear data curve.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Oper

Operation to perform:

DEFI

Defines a new data point (default). The point is inserted into the table in ascending order of *X1*. If a point already exists with the same *X1* value, it is replaced.

DELE

Deletes an existing point. The *X1* value must match the *X1* value of the point to be deleted (*XN* is ignored).

X1, X2, ..., XN

The N components of the point. N depends on the type of data table. Except for **TB (p. 1899)**,EXPE all other **TB (p. 1899)** Tables support only 2 components.

Notes

TBPT (p. 1992) defines a point on a nonlinear data curve (such as a stress-strain curve, B-H curve, etc.) at the temperature specified on the last **TBTEMP (p. 1993)** command. The meaning of the values depends on the type of data table specified on the last **TB (p. 1899)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Material Props>Material Models

Main Menu>Solution>Load Step Opts>Other>Change Mat Props>Material Models

---

TBTEMP, *TEMP*, *KMOD*

Defines a temperature for a material data table.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TEMP

Temperature value (defaults to 0.0 if *KMOD* is blank).

KMOD

If blank, *TEMP* defines a new temperature. (Issue **TBLIST (p. 1988)** to list temperatures and data.)

Notes

The **TBTEMP (p. 1993)** command defines a temperature to be associated with the data on subsequent **TBPT (p. 1992)** or **TBDATA (p. 1960)** commands.

The defined temperature remains active until the next **TBTEMP (p. 1993)** command is issued.

Data values must be defined with the temperatures in ascending order.

This command is also valid in SOLUTION.

Main Menu>Solution>Load Step Opts>Other>Change Mat Props>Material Models

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TCHG, *ENAME1*, *ENAME2*, *ETYPE2*

Converts 20-node degenerate tetrahedral elements to their 10-node non-degenerate counterparts.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ENAME1

Name (or the number) of the 20-node tetrahedron element that you want to convert. This argument is required.

ENAME2

Name (or the number) of the 10-node tetrahedron element to which you want to convert the *ENAME* elements. This argument is required.

ETYPE2

Element TYPE reference number for *ENAME2*. If *ETYPE2* is 0 or is not specified, the program selects the element TYPE reference number for *ENAME2*. See the "Notes" (p. 1994) section for details. This argument is optional.

Notes

The **TCHG (p. 1994)** command allows you to specify conversion of *any* selected 20-node brick that is degenerated into a tetrahedron to a 10-node tetrahedron.

The **TCHG (p. 1994)** command is useful when used in with the **MOPT (p. 1151)**,PYRA command. Twenty-node pyramid shaped elements may be used in the same volume with 10-node tetrahedra.

Performing a conversion is likely to create circumstances in which more than one element type is defined for a single volume.

If specified, *ETYPE2* will usually be the same as the local element TYPE number (**ET (p. 686)**,*ITYPE*) that was assigned to *ENAME2* with the **ET (p. 686)** command. You can specify a unique number for *ETYPE2* if you prefer. Although *ETYPE2* is optional, it may be useful when two or more *ITYPE*s have been assigned to the same element (for example, if two SOLID187 elements have been established in the element attribute tables for the current model, use the *ETYPE2* argument to distinguish between them). If *ETYPE2* is nonzero and it has *not* already been assigned to an element via **ET (p. 686)**, the program assigns the *ETYPE2* value to *ENAME2* as its element TYPE reference number.

If *ETYPE2* is 0 or is not specified, the program determines the element TYPE reference number for *ENAME2* in one of these ways:

- If *ETYPE2* is 0 or is not specified, and *ENAME2 does not appear* in the element attribute tables, the program uses the next available (unused) location in the element attribute tables to determine the element TYPE reference number for *ENAME2*.
- If *ETYPE2* is 0 or is not specified, and *ENAME2 appears* in the element attribute tables, the program uses *ENAME2*'s existing element TYPE reference number for *ETYPE2*. (If there is more

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

than one occurrence of *ENAME2* in the element attribute tables (each with its own TYPE reference number), the program uses the first *ENAME2* reference number for *ETYPE2* .)

You cannot use element conversion if boundary conditions or loads are applied directly to any selected elements.

For more information about converting degenerate tetrahedral elements, see Meshing Your Solid Model in the *Modeling and Meshing Guide*

Menu Paths

Main Menu>Preprocessor>Meshing>Modify Mesh>Change Tets

/**TEE**, *Label*, *Fname*, *Ext*, - -

Writes a list of commands to a specified file at the same time that the commands are being executed.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Label

Specifies how Mechanical APDL is to interpret this **/TEE (p. 1995)** command:

NEW --

Signals the beginning of the command text that is to be written to *Fname*. If *Fname* already exists, specifying NEW causes the contents of *Fname* to be overwritten.

APPEND --

Indicates that you want to append to *Fname* the command text that follows.

END --

Signals the end of the command text that is to be written to or appended to *Fname*.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Ext

Filename extension (eight-character maximum).

If you plan to execute the file as if it were a Mechanical APDL command, use the extension *.mac*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- -

Unused field.

Notes

You can use the **/TEE (p. 1995)** command to record a macro to a specified file at the same time that the macro is being executed. It is similar to the Linux **tee** command.

For more information about the **/TEE (p. 1995)** command, see the Introducing APDL of the *Ansys Parametric Design Language Guide*.

The following example illustrates the use of the **/TEE (p. 1995)** command. If you issue these commands:

```
/tee,new,myfile,mac
et,1,42,0,0,1
ex,1,3e7
/tee,end
/tee,append,myfile,mac
n,1,8
n,5,11
fill
ngen,5,5,1,5,1,0,1
/tee,end
```

the content of **myfile.mac** is:

```
et,1,42,0,0,1
ex,1,3e7
n,1,8
n,5,11
fill
ngen,5,5,1,5,1,0,1
```

This command is valid in any processor, but only during an interactive run.

THEXPAND, *KEY*

Enables or disables thermal loading

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Activation key:

ON

Thermal loading is included in the load vector (default).

OFF

Thermal loading is not included in the load vector.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Temperatures applied in the analysis are used by default to evaluate material properties and contribute to the load vector if the temperature does not equal the reference temperature and a coefficient of thermal expansion is specified.

Use **THEXPAND (p. 1996)**,OFF to evaluate the material properties but not contribute to the load vector. This capability is particularly useful when performing a harmonic analysis where you do not want to include harmonically varying thermal loads. It is also useful in a modal analysis when computing a modal load vector but excluding the thermal load.

This command is valid for all analysis types except linear perturbation modal and linear perturbation harmonic analyses. For these two linear perturbation analysis types, the program internally sets **THEXPAND (p. 1996)**,OFF, and it cannot be set to ON by using this command (**THEXPAND (p. 1996)**,ON is ignored).

Menu Paths

This command cannot be accessed from a menu.

THOPT,*Refopt*,*REFORMTOL*,*NTABPOINTS*,*TEMPMIN*,*TEMPMAX*,--,*ALGO*

Specifies nonlinear transient thermal solution options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Refopt

Matrix reform option.

FULL

Use the full Newton-Raphson solution option (default). All subsequent input values are ignored.

QUASI

Use a selective reform solution option based on *REFORMTOL*.

REFORMTOL

Property change tolerance for Matrix Reformation (.05 default). The thermal matrices are reformed if the maximum material property change in an element (from the previous reform time) is greater than the reform tolerance. Valid only when *Refopt* = QUASI.

NTABPOINTS

Number of points in Fast Material Table (64 default). Valid only when *Refopt* = QUASI.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TEMPMIN

Minimum temperature for Fast Material Table. Defaults to the minimum temperature defined by the **MPTEMP (p. 1178)** command for any material property defined. Valid only when *Refopt* = QUASI.

TEMPMAX

Maximum temperature for Fast Material Table. Defaults to the maximum temperature defined by the **MPTEMP (p. 1178)** command for any material property defined. Valid only when *Refopt* = QUASI.

--

Reserved field.

ALGO

Specifies which solution algorithm to apply:

0

Multipass (default).

1

Iterative.

Valid only when *Refopt* = QUASI.

Notes

The QUASI matrix reform option is supported by the ICCG, JCG, PCG, and sparse solvers only (**EQSLV (p. 648)**). The Quasi method is an approximation to the FULL method and will not be as accurate when the nonlinearity is strong. However, you can control the inaccuracy by using small time steps.

For *Refopt* = QUASI:

- Results from a restart may be different than results from a single run because the stiffness matrices are always recreated in a restart run, but may or may not be in a single run (depending on the behavior resulting from the *REFORMTOL* setting). Additionally, results may differ between two single runs as well, if the matrices are reformed as a result of the *REFORMTOL* setting.

For more information, see Solution Algorithms Used in Transient Thermal Analysis in the *Thermal Analysis Guide*.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>Analysis Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TIFF, *Keyword*, *OPT*

Provides TIFF file export for Mechanical APDL displays.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Keyword

Specifies various TIFF file export options.

COMP

If *Keyword* = COMP, then *OPT* controls data compression for the output file. If COMP = 0, then compression is off. If COMP = 1 (default), then compression is on.

ORIENT

If *Keyword* = ORIENT, then *OPT* will determine the orientation of the entire plot. *OPT* can be either Horizontal (default) or Vertical.

COLOR

If *Keyword* = COLOR, then *OPT* will determine the color attribute of the saved file. *OPT* can be 0, 1, or 2, corresponding to Black and White, Grayscale, and Color (default), respectively.

TMOD

If *Keyword* = TMOD, then *OPT* will determine the text method. *OPT* can be either 1 or 0, corresponding to bitmap text (default) or line stroke text, respectively.

DEFAULT

If *Keyword* = DEFAULT, then all of the default values, for all of the Keyword parameters listed above, are active.

OPT

OPT can have the following names or values, depending on the value for *Keyword* (see above).

1 or 0

If *Keyword* = COMP, a value or 1 (on) or 0 (off) will control compression for the TIFF file.

Horizontal, Vertical

If *Keyword* = ORIENT, the terms Horizontal or Vertical determine the orientation of the plot.

0, 1, 2

If *Keyword* = COLOR, the numbers 0, 1, and 2 correspond to Black and White, Grayscale and Color, respectively.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1, 0

If *Keyword* = TMOD, the values 1 and 0 determine whether bitmap (1) or stroke text (0) fonts will be used

Menu Paths

Utility Menu>PlotCtrls>HardCopy>ToFile

TIME, *TIME*

Sets the time for a load step.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TIME

Time at the end of the load step.

Command Default

Previous *TIME* + 1.0 (at each load step), corresponding to the load step number.

Notes

Associates the boundary conditions at the end of the load step with a particular *TIME* value.

TIME must be a positive, nonzero, monotonically increasing quantity that "tracks" the input history. Units of time should be consistent with those used elsewhere (for properties, creep equations, etc.).

Typically, for the first load step *TIME* defaults to 1. However, for the first load step of a mode-superposition transient analysis (**ANTYPE (p. 162)**,TRANS *and* **TRNOPT (p. 2017)**,MSUP), the **TIME (p. 2000)** command is ignored and a static solution is performed at *TIME* = 0.

For a full transient analyses, the command's default behavior does not apply. You must specify a time for each load step and it must be greater than the time at the end of the prior load step.

TIME does not apply to modal (**ANTYPE (p. 162)**,MODAL), harmonic (**ANTYPE (p. 162)**,HARMIC), or substructure (**ANTYPE (p. 162)**,SUBSTR) analyses.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Main Menu>Solution>Load Step Opts>Time/Frequenc>Time - Time Step

Main Menu>Solution>Load Step Opts>Time/Frequenc>Time and Substeps

---

TIMERANGE, *TMIN*, *TMAX*

Specifies the time range for which data are to be stored.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TMIN

Minimum time (defaults to first time (or frequency) point on the file).

TMAX

Maximum time (defaults to last time (or frequency) point on the file).

Command Default

Include all time (or frequency) points in the range.

Notes

Defines the time (or frequency) range for which data are to be read from the file and stored in memory. Use the **NSTORE (p. 1287)** command to define the time increment.

Use **PRTIME (p. 1522)** or **PLTIME (p. 1441)** to specify the time (frequency) range for cyclic mode-superposition harmonic analyses.

Menu Paths

Main Menu>TimeHist Postpro>Settings>Data

TIMINT, *Key*, *Lab*

Turns on transient effects.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Transient effects key:

OFF

No transient effects (static or steady-state).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON

Include transient (mass or inertia) effects.

Lab

Degree of freedom label:

ALL

Apply this key to all appropriate labels (default).

STRUC

Apply this key to structural DOFs.

THERM

Apply this key to thermal DOFs.

ELECT

Apply this key to electric DOFs.

MAG

Apply this key to magnetic DOFs.

FLUID

Apply this key to fluid DOFs.

DIFFU

Apply this key to concentration of DOFs.

Command Default

Include transient effects (ON) (**ANTYPE (p. 162)**,TRANS).

Notes

Indicates whether this load step in a full transient analysis should use time integration, that is, whether it includes transient effects (e.g. structural inertia, thermal capacitance) or whether it is a static (steady-state) load step for the indicated DOFs. Transient initial conditions are introduced at the load step having *Key* = ON. Initial conditions are then determined from the previous two substeps. Zero initial velocity and acceleration are assumed if no previous substeps exist. See the *Structural Analysis Guide*, the *Thermal Analysis Guide*, and the *Low-Frequency Electromagnetic Analysis Guide* for details.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

---

TIMP, *ELEM*, *CHGBND*, *IMPLEVEL*

Improves the quality of tetrahedral elements that are not associated with a volume.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Identifies the tetrahedral elements to be improved. Valid values are ALL and P. If *ELEM* = ALL (default), improve all selected tetrahedral elements. If *ELEM* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

CHGBND

Specifies whether to allow boundary modification. Boundary modification includes such things as changes in the connectivity of the element faces on the boundary and the addition of boundary nodes. (Also see the Notes section below for important usage information for *CHGBND*.)

0

Do not allow boundary modification.

1

Allow boundary modification (default).

IMPLEVEL

Identifies the level of improvement to be performed on the elements. (Improvement occurs primarily through the use of face swapping and node smoothing techniques.)

0

Perform the least amount of swapping/smoothing.

1

Perform an intermediate amount of swapping/smoothing.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2

Perform the greatest amount of swapping/smoothing.

3

Perform the greatest amount of swapping/smoothing, plus additional improvement techniques (default).

Notes

The **TIMP (p. 2003)** command enables you to improve a given tetrahedral mesh by reducing the number of poorly-shaped tetrahedral elements (in particular, the number of sliver tetrahedral elements)--as well as the overall number of elements--in the mesh. It also improves the overall quality of the mesh.

TIMP (p. 2003) is particularly useful for an imported tetrahedral mesh for which no geometry information is attached.

Regardless of the value of the *CHGBND* argument, boundary mid-nodes can be moved.

When loads or constraints have been placed on boundary nodes or mid-nodes, and boundary mid-nodes are later moved, the program issues a warning message to let you know that it will not update the loads or constraints.

No boundary modification is performed if shell or beam elements are present in the mesh, even when *CHGBND* = 1.

Menu Paths

Main Menu>Preprocessor>Meshing>Modify Mesh>Improve Tets>Detached Elems

---

TINTP, *GAMMA*, *ALPHA*, *DELTA*, *THETA*, *OSLM*, *TOL*, *OSLM2*, - - , *AVSMOOTH*, *ALPHAF*, *ALPHAM*

Defines transient integration parameters.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

GAMMA

Amplitude decay factor for 2nd order transient integration, for example, structural dynamics (used only if *ALPHA*, *DELTA*, *ALPHAF*, and *ALPHAM* are blank, see "Notes" (p. 2006)). Defaults to 0.005.

Alternatively, you can input the application type for the analysis using one of the following labels. In this case, the program automatically sets the transient dynamic solver algorithm and settings based on the intended application. For more information, see Transient Dynamic Analysis Settings Based on Application in the *Structural Analysis Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IMPA

Impact application.

HISP

High speed dynamic application.

MOSP

Moderate speed dynamic application.

LOSP

Low speed dynamic application.

QUAS

Quasi-static application.

ALPHA

2nd order transient integration parameter (used only if *GAMMA* is blank). Defaults to 0.2525.

DELTA

2nd order transient integration parameter (used only if *GAMMA* is blank). Defaults to 0.5050.

THETA

1st order transient (for example, thermal transient) integration parameter. Defaults to 1.0.

OSLM

Specifies the oscillation limit criterion for automatic time stepping of 1st order transients (for example, thermal transients). Defaults to 0.5 with a tolerance of *TOL*.

TOL

Tolerance applied to *OSLM*. Defaults to 0.0.

OSLM2

Specifies the oscillation limit for automatic time stepping of second order transients (for example, structural transients). The automatic time stepping algorithm will adjust to have approximately the specified number of points per cycle. You can specify a negative number (for example, -1) to define a time increment that is independent of the oscillation limit.

- -

Unused field.

AVSMOOTH

Smoothing flag option:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Include smoothing of the velocity (1st order system) or the acceleration (2nd order system) (default).

1

Do not include smoothing.

ALPHAF

Interpolation factor in HHT algorithm for force and damping terms (used only if *GAMMA* is blank). Defaults to 0.005.

ALPHAM

Interpolation factor in HHT algorithm for inertial term (used only if *GAMMA* is blank). Defaults to 0.0.

Command Default

GAMMA defaults to 0.005, which is the same as choosing the High Speed application (*GAMMA* = HISP). All other fields default as described above.

Notes

Used to define the transient integration parameters. For more information on transient integration parameters, refer to Transient Analysis in the *Theory Reference*.

For a full structural transient analysis, you may choose between the Newmark and HHT time integration methods (see the **TRNOPT (p. 2017)** command). In this case, if *GAMMA* is input and the integration parameters *ALPHA*, *DELTA*, *ALPHAF*, and *ALPHAM* are left blank, the program calculates the integration parameters, according to Equation 15.14 and Equation 15.18. Alternatively, you can input these integration parameters directly on this command. However, for the unconditional stability and second order accuracy of the time integration, these parameters should satisfy a specific relationship, as described in Description of Structural and Other Second Order Systems of the *Mechanical APDL Theory Reference*.

For mode-superposition transient analysis, the integration parameters *ALPHA* and *DELTA* are always calculated by the program from the *GAMMA* value, according to Equation 15.14. If an *ALPHA*, *DELTA* pair has been specified with *GAMMA* left blank, the input values are ignored, and integration parameters *ALPHA*, *DELTA* are calculated with *GAMMA* = 0.

This command is also valid in PREP7.

---

/TITLE, *Title*

Defines a main title.

DATABASE (p. 13): Set Up (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Title

Input up to 72 alphanumeric characters. Parameter substitution may be forced within the title by enclosing the parameter name or parametric expression within percent (%) signs.

Notes

The title is carried through the printout and written on various files. The title written to a file is the title defined at that time. Special characters may be used within the title text. Subtitles may also be defined (**/STITLE (p. 1867)**).

This command is valid in any processor.

Menu Paths

Utility Menu>File>Change Title

/TLABEL, *XLOC*, *YLOC*, *Text*

Creates annotation text (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XLOC

Text *X* starting location (-1.0 < *X* < 1.6).

YLOC

Text Y starting location (-1.0 < *Y* < 1.0).

Text

Text string (60 characters maximum). Parameter substitution may be forced within the text by enclosing the parameter name or parametric expression within percent (%) signs.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Defines annotation text to be written directly onto the display at a specified location. This command is generated by the Graphical User Interface (GUI) and appears in the log file (`Jobname.log`) if annotation is used.

The command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with **/INPUT (p. 948)**).

All text is shown on subsequent displays unless the annotation is disabled or deleted. Issue **/TSPEC (p. 2024)** to set the attributes of the text.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

TOFFST, *VALUE*

Specifies the temperature offset from absolute zero to zero.

SOLUTION (p. 38): Analysis Options (p. 38)
AUX12 (p. 62): General Radiation (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VALUE

Degrees between absolute zero and zero of temperature system used (should be positive).

Notes

Specifies the difference (in degrees) between absolute zero and the zero of the temperature system used. Absolute temperature values are required in evaluating certain expressions, such as for creep, swelling, radiation heat transfer, MASS71, etc. (The offset temperature is not used in evaluating emissivity.) Examples are 460° for the Fahrenheit system and 273° for the Celsius system. The offset temperature is internally included in the element calculations and does not affect the temperature input or output. If used in SOLUTION, this command is valid only within the first load step.

This command is also valid in PREP7.

***TOPER**,*ParR*,*Par1*,*Oper*,*Par2*,*FACT1*,*FACT2*,*CON1*

Operates on table parameters.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

Name of the resulting table parameter. The command will create a table array parameter with this name. Any existing parameter with this name will be overwritten.

Par1

Name of the first table parameter.

Oper

The operation to be performed: ADD. The operation is: ParR(i,j,k) = FACT1*Par1(i,j,k) + FACT2 *Par2(i,j,k) +CON1

Par2

Name of the second table parameter.

FACT1

The first table parameter multiplying constant. Defaults to 1.

FACT2

The second table parameter multiplying constant. Defaults to 1.

CON1

The constant increment for offset. Defaults to 0.

Notes

***TOPER (p. 2009)** operates on table parameters according to: ParR(i,j,k) = FACT1*Par1(i,j,k) + FACT2 *Par2(i,j,k) +CON1

Par1 and Par2 must have the same dimensions and the same variable names corresponding to those dimensions. Par1 and Par2 must also have identical index values for rows, columns, etc.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If you want a local coordinate system for the resulting array, you must dimension it as such using the ***DIM (p. 530)** command before issuing ***TOPER (p. 2009)**.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Table Operations

TORUS, *RAD1*, *RAD2*, *RAD3*, *THETA1*, *THETA2*

Creates a toroidal volume.

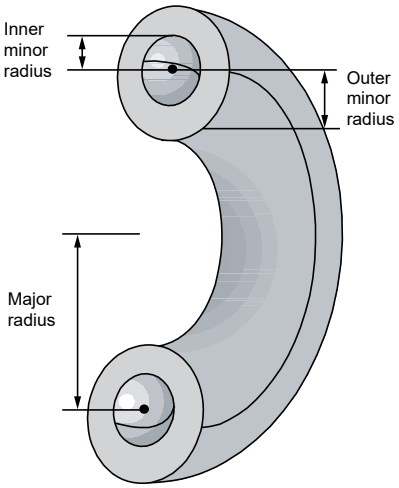
PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RAD1, RAD2, RAD3

Three values that define the radii of the torus. You can specify the radii in any order. The smallest of the values is the inner minor radius, the intermediate value is the outer minor radius, and the largest value is the major radius. (There is one exception regarding the order of the radii values--if you want to create a solid torus, specify zero or blank for the inner minor radius, in which case the zero or blank *must* occupy either the *RAD1* or *RAD2* position.) At least two of the values that you specify must be positive values; they will be used to define the outer minor radius and the major radius. See the diagram in the Notes section for a view of a toroidal sector showing all radii.

THETA1, THETA2



Starting and ending angles (either order) of the torus. Used for creating a toroidal sector. The sector begins at the algebraically smaller angle, extends in a positive angular direction, and ends at the larger angle. The starting angle defaults to 0° and the ending angle defaults to 360°.

Notes

Defines a toroidal volume centered about the working plane origin. A solid torus of 360° will be defined with four areas, each area spanning 180° around the major and minor circumference.

To create the toroidal sector shown below, the command **TORUS (p. 2010)**,5,1,2,0,180 was issued. Since "1" was the smallest radii value specified, it defined the inner minor radius; since "2" was the intermediate radii value specified, it defined the outer minor radius; and since "5" was the largest radii value specified, it defined the major radius. The values "0" and "180" defined the starting and ending angles of the torus.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Volumes>Torus

TRANSFER, *KCNTO*, *INC*, *NODE1*, *NODE2*, *NINC*

Transfers a pattern of nodes to another coordinate system.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCNTO

Reference number of coordinate system where the pattern is to be transferred. Transfer occurs from the active coordinate system.

INC

Increment all nodes in the given pattern by *INC* to form the transferred node pattern.

NODE1*, *NODE2*, *NINC

Transfer nodes from pattern beginning with *NODE1* to *NODE2* (defaults to *NODE1*) in steps of *NINC* (defaults to 1). If *NODE1* = ALL, *NODE2* and *NINC* are ignored and the pattern is all selected nodes (**NSEL (p. 1266)**). If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component may be substituted for *NODE1* (*NODE2* and *NINC* are ignored).

Notes

Transfers a pattern of nodes from one coordinate system to another. Coordinate systems may be translated and rotated relative to each other. Initial pattern may be generated in any coordinate system. Coordinate values are interpreted in the active coordinate system and are transferred directly.

A model generated in one coordinate system may be transferred to another coordinate system. The user may define several coordinate systems (translated and rotated from each other), generate a model

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

in one coordinate system, and then repeatedly transfer the model to other coordinate systems. The model may be generated in any type of coordinate system (Cartesian, cylindrical, etc.) and transferred to any other type of coordinate system. Coordinate values (X, Y, Z, or R, θ, Z, or etc.) of the model being transferred are interpreted in the *active* coordinate system type, regardless of how they were generated. Values are transferred directly and are interpreted according to the type of coordinate system being transferred to. For example, transferring from a Cartesian coordinate system to a cylindrical coordinate system (not recommended) would cause X = 2.0 and Y = 3.0 values to be directly interpreted as R = 2.0 and θ = 3.0 values, respectively.

This command is also valid in the **/MAP (p. 1107)** processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Transfer Coord>Nodes

---

***TREAD**,*Par*,*Fname*,*Ext*,--,*NSKIP*

Reads data from an external file into a table array parameter.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Par

Table array parameter name as defined by the ***DIM (p. 530)** command.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

File name has no default.

Ext

Filename extension (eight-character maximum).

Extension has no default.

--

Unused field.

NSKIP

Number of comment lines at the beginning of the file being read that will be skipped during the reading. Default = 0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Use this command to read in a table of data from an external file into a table array parameter. The external file may be created using a text editor or by an external application or program. To be used by ***TREAD (p. 2012)**, the external file's encoding format must be UTF-8, and the file must be in tab-delimited, blank-delimited, or comma-delimited format. The TABLE type array parameter must be defined before you can read in an external file. See ***DIM (p. 530)** for more information.

This command is not applicable to 4- or 5-D tables.

Menu Paths

Utility Menu>Parameters>Array Parameters>Read from File

TREF, *TREF*

Defines the reference temperature for thermal strain calculations.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TREF

Reference temperature for thermal expansion.

Note:

If the uniform temperature (**TUNIF (p. 2027)**) is not specified, it is also set to this value.

Command Default

Reference temperature is 0.0 degrees.

Notes

Defines the reference temperature for the thermal strain calculations in structural analyses. Thermal strains are given by α * (T - TREF), where α is the coefficient of thermal expansion. Input the strain via ALPX, ALPY, ALPZ (the secant or mean coefficient value), or CTEX, CTEY, CTEZ (the instantaneous coefficient value), or the thermal strain value (THSX, THSY, THSZ). T is the element temperature. If α is temperature-dependent, *TREF* should be in the range of temperatures you define using the **MPTEMP (p. 1178)** command.

Reference temperatures may also be input *per material* by specifying a value on the **MP (p. 1160)** material property command:

MP (p. 1160),REFT,*MAT*,*C0*.

Only a constant (non-temperature-dependent) value is valid. The value input on the **TREF (p. 2013)** command applies to all materials not having a specified material property definition.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To convert temperature-dependent secant coefficients of thermal expansion (SCTE) data (properties ALPX, ALPY, ALPZ) from the definition temperature to the reference temperature defined via a **TREF (p. 2013)** (or **MP (p. 1160)**,REFT) command, issue the **MPAMOD (p. 1166)** command.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Settings>Reference Temp

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Reference Temp

Main Menu>Solution>Define Loads>Settings>Reference Temp

Main Menu>Solution>Load Step Opts>Other>Reference Temp

/TRIAD, *Lab*

Shows the global XYZ coordinate triad on displays.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Display triad as follows:

ORIG

Display triad at global origin (default).

OFF

Turn off triad display.

LBOT

Display triad in lower left screen corner.

RBOT

Display triad in lower right screen corner.

LTOP

Display triad in upper left screen corner.

RTOP

Display triad in upper right screen corner.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

For efficiency, Mechanical APDL maintains a single data structure (segment) which includes the triad as a 3D data object.

If a 3D device is involved (**/SHOW (p. 1785)**,3D) and the graphics are not being displayed as multi-plots, the triad location is determined by the view settings for window #1.

A request for triad display anywhere except for the origin may yield an improper display in windows 2 through 5.

The program displays the same segment in all windows. The view settings of each window constitute the only difference in the display in the active windows.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Window Controls>Reset Window Options

Utility Menu>PlotCtrls>Window Controls>Window Options

/**TRLCY**, *Lab*, *TLEVEL*, *N1*, *N2*, *NINC*

Specifies the level of translucency.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Apply translucency level to the items specified by the following labels:

ELEM

Elements. Use *N1*, *N2*, *NINC* fields for element numbers.

AREA

Solid model areas. Use *N1*, *N2*, *NINC* fields for area numbers.

VOLU

Solid model volumes. Use *N1*, *N2*, *NINC* fields for volume numbers.

ISURF

Isosurfaces (surfaces of constant stress, etc., value). Translucency varies with result value, to a maximum of the specified translucency level.

CM

Component group. Use *N1* for component name, ignore *N2* and *NINC*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CURVE

Filled areas under curves of line graphs. Use *N1*, *N2*, *NINC* fields for curve numbers.

ZCAP

If **/TYPE (p. 2034)**,*WN*,ZCAP is the current display type, then **/TRLCY (p. 2015)**,ZCAP,*TLEVEL* will display the model in window *WN* with the portion of the model in front of the section plane displayed at the translucency level *TLEVEL*.

ON, OFF

Sets the specified translucency display on or off. All other fields are ignored.

TLEVEL

Translucency level: 0.0 (opaque) to 1.0 (transparent).

N1, N2, NINC

Used only with labels as noted above. Apply translucency level to *Lab* items numbered *N1* to *N2* (defaults to *N1*) in steps of *NINC* (defaults to 1). If *N1* is blank or ALL, apply specified translucency level to entire selected range. If *Lab* is CM, use component name for *N1* and ignore *N2* and *NINC*. A value of *N1* = P allows you to graphically pick elements, areas, and volumes. You can then assign translucency levels to the entities via the picker. The *Lab* and *TLEVEL* fields are ignored when translucency is applied by picking.

Command Default

Zero translucency (opaque) level.

Notes

Specifies the level of translucency for various items. Issue **/TRLCY (p. 2015)**,DEFA to reset the default (0) translucency levels. This command is valid only on selected 2D and 3D graphics devices; see in the *Basic Analysis Guide* for more information on applying translucency.

For 2D devices, the program displays only the visible faces of the items being displayed. The information behind the facing planes is not displayed. Issuing the **/SHRINK (p. 1794)** command will force the hardware to display information behind the translucent items.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Translucency

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TRNOPT,*Method*,*MAXMODE*,*InitialAcc*,*MINMODE*,*MCFwrite*,*TINTOPT*,*VAout*,*DMPSFreq*,*EngCalc*,*MCkey*

Specifies transient analysis options.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 2019)

Method

Solution method for the transient analysis:

FULL

Full method (default).

MSUP

Mode-superposition method.

MAXMODE

Largest mode number to be used to calculate the response (for *Method* = MSUP). Defaults to the highest mode calculated in the preceding modal analysis.

InitialAcc

Key to activate calculation of initial acceleration:

(blank)

Initial accelerations are not calculated (default).

INIL

Calculate initial acceleration for a full transient analysis using the lumped mass matrix.

MINMODE

Smallest mode number to be used (for *Method* = MSUP). Defaults to 1.

MCFwrite

Modal coordinates output key to the Jobname.mcf file (valid only for the mode-superposition method). To control how Jobname.mcf is written, specify options on the **MCFOPT (p. 1116)** command.

NO

Modal coordinates are not written to Jobname.mcf.

YES

Modal coordinates are written to the text file Jobname.mcf (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TINTOPT

Time integration method for the transient analysis:

NMK or 0

Newmark algorithm (default).

HHT or 1

HHT algorithm (valid only for the full transient method).

VAout

Velocities and accelerations output key (valid only for mode-superposition transient analysis):

NO

No output of velocities and accelerations (default).

YES

Write velocities and accelerations to the reduced displacement file, `Jobname.rdsp`.

DMPSFreq

Average excitation frequency (Hz) for the calculation of equivalent viscous damping from structural damping input (**DMPSTR (p. 563)** and **MP (p. 1160)**,DMPS). See Damping for more details. Defaults to zero. If an excitation frequency is not specified, structural damping is ignored. If tabular excitation frequency data is provided in a full transient analysis (*DMPSFreqTab* on **DMPSTR (p. 563)**), it supersedes this value.

EngCalc

Additional element energies calculation key:

NO

Do not calculate additional element energies (default).

YES

Calculate damping energy and work done by external loads.

MCkey

Modal coordinates output key to the `.rdsp` file (valid only for the mode-superposition method):

AUTO

Writing depends on the modal analysis settings of the **MXPAND (p. 1203)** command (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

YES

Always write the modal coordinates to the file `Jobname.rdsp`. A subsequent expansion pass (**EXPASS (p. 714)**) is not supported.

Notes

Specifies transient analysis (**ANTYPE (p. 162)**,TRANS) options. If used in SOLUTION, this command is valid only within the first load step. Use the **TINTP (p. 2004)** command to set transient integration parameters.

To include residual vectors in your mode-superposition transient analysis (*Method* = MSUP), specify **RESVEC (p. 1603)**,ON.

For *Method* = MSUP, *MAXMODE* and *MINMODE* are ignored after a modal restart analysis where remote modal files usage (**MODDIR (p. 1134)**) and residual vector calculation (**RESVEC (p. 1603)**,ON) have been activated.

Method = MSUP is not available for ocean loading.

By default in a mode-superposition transient analysis, reaction force and other force output contains only static contributions. If you want to postprocess the velocities, accelerations, and derived results (*Lab* = TOTAL, DAMP, or INERT on the **FORCE (p. 772)** command), set *VAout* = YES to activate velocity and acceleration output.

The calculation of additional energies (*EngCalc* = YES) is valid only for the full solution method (*Method* = FULL). The `Jobname.ESAV` file is always saved in this case. The numerical integration for damping energy and work are consistent only if solution data are written to the database for every substep (**OUTRES (p. 1336)**,ALL,ALL, **OUTRES (p. 1336)**,ESOL,ALL, or **OUTRES (p. 1336)**,VENG, ALL). For more information, see Damping Energy and Work Done by External Loads in the *Mechanical APDL Theory Reference*.

This command is also valid in PREP7.

Product Restrictions

Additional product restrictions for the **TRNOPT (p. 2017)** command are shown in the table below.

Command Option Method	**Available Products**
FULL (DOF = Structural)	Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
FULL (DOF = Temp)	**Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
MSUP	Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TRPDEL, *NTRP1*, *NTRP2*, *TRPINC*

Deletes charged particle trace points.

POST1 (p. 51): Trace Points (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NTRP1*, *NTRP2*, *TRPINC

Delete points from *NTRP1* to *NTRP2* (defaults to *NTRP1*) in steps of *TRPINC* (defaults to 1). If *NTRP1* = ALL, *NTRP2* and *TRPINC* are ignored and all trace points are deleted. If *NTRP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Notes

Deletes charged particle trace points defined with the **TRPOIN (p. 2021)** command.

Menu Paths

Main Menu>General Postproc>Plot Results>Dele Trace Pt

TRPLIS, *NTRP1*, *NTRP2*, *TRPINC*, *Opt*

Lists charged particle trace points.

POST1 (p. 51): Trace Points (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NTRP1*, *NTRP2*, *TRPINC

List points from *NTRP1* to *NTRP2* (defaults to *NTRP1*) in steps of *TRPINC* (defaults to 1). If *NTRP1* = ALL, *NTRP2* and *TRPINC* are ignored and all trace points are listed. If *NTRP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Opt

Opt = LOC lists the trace point number location (X, Y, Z). Default.

Opt = PART lists the trace point number particle settings (velocity, charge, mass).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Lists the charged particle trace points in the active display coordinate system (**DSYS (p. 582)**). Trace points are defined with the **TRPOIN (p. 2021)** command.

Menu Paths

Main Menu>General Postproc>Plot Results>List Trace Pt

TRPOIN, *X*, *Y*, *Z*, *VX*, *VY*, *VZ*, *CHRG*, *MASS*

Defines a point through which a charged particle trace will travel.

POST1 (p. 51): Trace Points (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

X, Y, Z

Coordinate location of the trace point (in the active coordinate system). If *X* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

VX, VY, VZ

Particle velocities in the X, Y and Z directions (in the active coordinate system).

CHRG

Particle charge.

MASS

Particle mass.

Notes

Defines a point through which a charged particle trace (**PLTRAC (p. 1442)**) will travel. Multiple points (50 maximum) may be defined which will result in multiple particle traces. Use **TRPLIS (p. 2020)** to list the currently defined trace points and **TRPDEL (p. 2020)** to delete trace points.

The VX, VY, VZ, CHRG, and MASS arguments only apply to charged particles.

Menu Paths

Main Menu>General Postproc>Plot Results>Defi Trace Pt

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TRTIME, *TIME*, *SPACING*, *OFFSET*, *SIZE*, *LENGTH*

Defines the options used for the PLTRAC (p. 1442) (charged particle trace) command.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TIME

Total Trace Time (seconds) (defaults to 0, which is the full particle trace).

SPACING

Particle spacing in seconds (defaults to 0).

OFFSET

Particle offset in seconds (defaults to 0). It is used internally in the **ANFLOW (p. 139)** macro to produce an animation of charged particle motion in an electric or magnetic field.

SIZE

Particle size (defaults to 0, which is a line).

LENGTH

Particle length fraction (defaults to .1).

Command Default

Full charged particle trace.

Notes

The **TRTIME (p. 2022)** command varies the type of **PLTRAC (p. 1442)** display produced. Charged particle traces follow a particle's path in the forward and backward direction of travel. The DOF selected determines the color of the particle trace. *SPACING* defines the particle spacing in seconds from adjacent particles in the stream line. *OFFSET* defines the offset in seconds from the spacing set by the *SPACING* argument.

LENGTH defines the particle length fraction. The default value (.1), means the particle occupies 10% of the trace region, and the other 90% is a color-coded line.

SIZE sets the radius of the particle. Use *SPACING*, *OFFSET* and *LENGTH* only when *SIZE* is nonzero (that is, the particle is bigger than the line).

Menu Paths

Main Menu>General Postproc>Plot Results>Time Interval

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TSHAP,*Shape*

Defines simple 2D and 3D geometric surfaces for target segment elements.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Shape

Specifies the geometric shapes for target segment elements TARGE169 and TARGE170.

LINE

Straight line (2D, 3D) (Default for 2D)

PARA

Parabola (2D, 3D)

ARC

Clockwise arc (2D)

CARC

Counterclockwise arc (2D)

CIRC

Complete circle (2D)

TRIA

Three-node triangle (3D) (Default for 3D)

TRI6

Six-node triangle (3D)

QUAD

Four-node quadrilateral (3D)

QUA8

Eight-node quadrilateral (3D)

CYLI

Cylinder (3D)

CONE

Cone (3D)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPHE

Sphere (3D)

PILO

Pilot node (2D, 3D)

POINT

Point (rigid surface node) (2D, 3D)

Notes

Use this command to specify the target segment shapes for the rigid target surface associated with surface-to-surface contact (TARGE169, CONTA172 (2D) and TARGE170, CONTA174 (3D)), 3D beam-to-beam contact (TARGE170 and CONTA177), and 3D line-to-surface contact (TARGE170 and CONTA177). Once you issue **TSHAP (p. 2023)**, all subsequent target elements generated via the direct element generation technique will have the same shape, until you issue **TSHAP (p. 2023)** again with a different *Shape* value.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>Elem Attributes

---

/**TSPEC**, *TCOLOR*, *TSIZE*, *TXTHIC*, *PANGLE*, *IANGLE*

Creates annotation text attributes (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TCOLOR

Text color (0 ≤ *TCOLOR* ≤ 15):

0

Black.

1

Red-Magenta.

2

Magenta.

3

Blue-Magenta.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TSIZE

Text size factor.

TXTHIC

Text thickness key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

normal.

2

twice as thick.

3

three times as thick.

4

four times as thick.

PANGLE

Text path angle (0.0 < *angle* < 360.0).

IANGLE

Text italic angle (0.0 < *angle* < 45.0).

Notes

This command defines annotation text attributes to control certain characteristics of the text created via **/TLABEL (p. 2007)**. This command is generated by the Graphical User Interface (GUI) and appears in the log file (`Jobname.log`) if annotation is used.

The command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with **/INPUT (p. 948)**).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

TSRES,*Array*

Defines an array of key times at which the time-stepping strategy changes.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Array

Identifies an *N*x1x1 array parameter containing the key times at which the heat transfer time-stepping strategy changes (the time step is reset to the initial time step based on **DELTIM (p. 515)** or **NSUBST (p. 1287)** settings). The array name must be enclosed by % signs (for example, %*array*%). See ***DIM (p. 530)** for more information on array parameters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Time values in the array parameter must be in ascending order and must not exceed the time at the end of the load step as defined on the **TIME (p. 2000)** command. The time increment between time points in the array list must be larger than the initial time step defined on the **DELTIM (p. 515)** or **NSUBST (p. 1287)** command. Time values must also fall between the beginning and ending time values of the load step. For multiple load step problems, you must either change the parameter values to fall between the beginning and ending time values of the load step or reissue the command with a new array parameter. To clear the array parameter specification, issue **TSRES (p. 2026)**,ERASE. Results can be output at the requested time points if the array or time values in the array are also specified in the **OUTRES (p. 1336)** command using *FREQ*=%`array`%. Use this command to reset the time-stepping strategy within a load step. You may need to reset the time-stepping strategy when using tabular time-varying boundary conditions.

See Steady-State Thermal Analysis of the *Thermal Analysis Guide* for more information on applying boundary conditions via tabular input. See Transient Thermal Analysis of the *Thermal Analysis Guide* for more information on defining the key time array.

Menu Paths

---

TUNIF, *TEMP*

Assigns a uniform temperature to all nodes.

`SOLUTION` (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TEMP

Uniform temperature assigned to the nodes. If a *TEMP* value is not specified, the uniform temperature is set to zero.

Command Default

Set the uniform temperature to the reference temperature (defined via the **TREF (p. 2013)** command).

Notes

TUNIF (p. 2027) is a convenient form of the more general **BFUNIF (p. 259)** command.

In a transient or nonlinear thermal analysis, the uniform temperature is used during the first iteration of a solution as follows:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- as the starting nodal temperature, except where temperatures are explicitly specified (**D (p. 483)**, **DK (p. 541)**)
- to evaluate temperature-dependent material properties.

In a structural analysis, the uniform temperature is used as the *default* temperature for thermal strain calculations and material property evaluation, except where body load temperatures are specified (**BF (p. 221)**, **BFE (p. 237)**, **BFK (p. 248)**, **LDREAD (p. 1036)**). In other scalar field analyses, the uniform temperature is used for material property evaluation.

Because **TUNIF (p. 2027)** (or **BFUNIF (p. 259)**,TEMP) is step-applied in the first iteration, issue a **BF (p. 221)**,ALL,TEMP,*Value* command to ramp on a uniform temperature load.

The command default sets the uniform temperature to the reference temperature defined via the **TREF (p. 2013)** command only (and *not* the **MP (p. 1160)**,REFT command).

If using the command default to set the uniform temperature (to the reference temperature set via **TREF (p. 2013)**), you can convert temperature-dependent secant coefficients of thermal expansion (SCTEs) from the definition temperature to the uniform temperature. To do so, issue the **MPAMOD (p. 1166)** command.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in PREP7.

Menu Paths

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TVAR, *KEY*

Changes time to the cumulative iteration number.

POST26 (p. 58): Controls (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Time key:

0

Time is used for the variable *TIME*.

1

NCUMIT is used for the variable *TIME*.

Command Default

TIME is the variable *TIME*.

Notes

Changes the meaning of the time variable to the cumulative iteration number (NCUMIT) variable. Data can be read from the file, printed, and displayed as a function of NCUMIT rather than time. All POST26 descriptions applying to TIME then apply to NCUMIT.

Menu Paths

Main Menu>TimeHist Postpro>Settings>Data

/TXTRE, *Lab*, *NUM*, *N1*, *N2*, *NINC*

Controls application of texture to selected items.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

You can apply texture according to the following labels:

ELEM

Apply texture to elements *N1* through *N2* in steps of *NINC*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AREA

Apply texture to areas *N1* through *N2* in steps of *NINC*.

VOLU

Apply texture to volumes *N1* through *N2* in steps of *NINC*.

CM

Apply texture to the component named in *N1*. *N2* and *NINC* are ignored.

ON, OFF

Sets the specified texture display on or off. All other fields are ignored.

File

If Lab = File, the command format is **/TXTRE (p. 2029)**, File, *Key_Index*, *Fname*, *Fext*, --, *Format* (This variant of the command is applicable to 2D drivers).

Key_Index

The texture index associated with the file. If the number fifty-one (51) is used, the imported bitmap will be used as the window's logo.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Fext

Filename extension (eight-character maximum).

--

Unused field.

Format

The file format. If *Format* = 0, the file is a pixmap (Linux) or Bitmap (PC). The file cannot contain a compressed image, and the PC file must be 8 or 24 bit BI_RGB format. If *Format* = 1 or JPEG, then the file is in JPEG (Joint Photographic Experts Group) format. If *Format* = 2 or PNG, then the file is in PNG (Portable Network Graphics) format.

NUM

Select the texture index number from the following list:

0

No Texturing

N1*, *N2*, *NINC

Apply texture to *Lab* items numbered *N1* through *N2* in steps of *NINC* (defaults to 1). If *Lab* = CM, then N1 is used to for the component name and *N2* and *NINC* are ignored. If *Lab* = ELEM, AREA, or VOLU and *N1* = blank or ALL, then the specified texture will be applied to all entities of type *Lab*. If *N1* = P, then graphical picking is enabled.

Command Default

No texture (**/TXTRE (p. 2029)**,DEFA)

Notes

This command is available for 3D Open GL devices. 2D devices are supported **only** for the *Lab* = *File* variation of the command, allowing imported bitmaps to be used for texturing and annotation. Textures can affect the speed of many of your display operations. You can increase the speed by temporarily turning the textures off (**Utility Menu> PlotCtrls> Style> Texturing(3D)> Display Texturing**). This menu selection toggles your textures on and off. When textures are toggled off, all of the texture information is retained and reapplied when texturing is toggled back on.

For some displays, the texture will appear distorted because of a technique used to enhance 3D displays (**/DV3D (p. 584)**,TRIS,1). Disabling this function (**/DV3D (p. 584)**,TRIS,0) will improve the quality of some texture displays. Disabling the TRIS option of the **/DV3D (p. 584)** command will slow down 3D displays significantly. Be sure to reapply the TRIS option after you obtain a satisfactory output.

Specifying **/TXTRE (p. 2029)**,DEFA removes all texturing.

Menu Paths

Utility Menu>PlotCtrls>Style>Texturing(3D)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/TYPE, *WN*, *Type*

Defines the type of display.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

Type

Display type. Defaults to ZBUF for raster mode displays or BASIC for vector mode displays:

BASIC or 0

Basic display (no hidden or section operations).

SECT or 1

Section display (plane view). Use the **/CPLANE (p. 426)** command to define the cutting plane.

HIDC or 2

Centroid hidden display (based on item centroid sort).

HIDD or 3

Face hidden display (based on face centroid sort).

HIDP or 4

Precise hidden display (like HIDD but with more precise checking). Because all facets are sorted, this mode can be extremely slow, especially for large models.

CAP or 5

Capped hidden display (same as combined SECT and HIDD with model in front of section plane removed).

ZBUF or 6

Z-buffered display (like HIDD but using software Z-buffering).

ZCAP or 7

Capped Z-buffered display (same as combined SECT and ZBUF with model in front of section plane removed).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ZQSL or 8

QSLICE Z-buffered display (same as SECT but the edge lines of the remaining 3D model are shown).

HQSL or 9

QSLICE precise hidden display (like ZQSL but using precise hidden).

Command Default

ZBUF for raster mode displays; BASIC for vector mode displays.

Notes

Defines the type of display, such as section display or hidden-line display. Use the **/DEVICE (p. 523)** command to specify either raster or vector mode.

The SECT, CAP, ZCAP, ZQSL, and HQSL options produce section displays. The section or "cutting" plane is specified on the **/CPLANE (p. 426)** command as either normal to the viewing vector at the focus point (default), or as the working plane.

When you use PowerGraphics, the section display options (Section, Slice, and Capped) use different averaging techniques for the interior and exterior results. Because of the different averaging schemes, anomalies may appear at the transition areas. In many cases, the automatically computed MIN and MAX values will differ from the full range of interior values. You can lessen the effect of these anomalies by issuing **AVRES (p. 212)**,,FULL (**Main Menu> General Post Proc> Options for Outp**). This command sets your legend's automatic contour interval range according to the minimum and maximum results found throughout the entire model.

With PowerGraphics active (**/GRAPHICS (p. 866)**,POWER), the averaging scheme for surface data with interior element data included (**AVRES (p. 212)**,,FULL) and multiple facets per edge (**/EFACET (p. 602)**,2 or **/EFACET (p. 602)**,4) will yield differing minimum and maximum contour values depending on the Z-Buffering options (**/TYPE (p. 2034)**,,6 or **/TYPE (p. 2034)**,,7). When the Section data is not included in the averaging schemes (**/TYPE (p. 2034)**,,7), the resulting absolute value for the midside node is significantly smaller.

The HIDC, HIDD, HIDP, ZBUF, ZQSL, and HQSL options produce displays with "hidden" lines removed. Hidden lines are lines obscured from view by another element, area, etc. The choice of non-Z-buffered hidden-line procedure types is available only for raster mode (**/DEVICE (p. 523)**) displays. For vector mode displays, all non-Z-buffered "hidden-line" options use the same procedure (which is slightly different from the raster procedures). Both geometry and postprocessing displays may be of the hidden-line type. Interior stress contour lines within solid elements can also be removed as hidden lines, leaving only the stress contour lines and element outlines on the visible surfaces. Midside nodes of elements are ignored on postprocessing displays. Overlapping elements will not be displayed.

The ZBUF, ZCAP, and ZQSL options use a specific hidden-line technique called software Z-buffering. This technique allows a more accurate display of overlapping surfaces (common when using Boolean operations or **/ESHAPE (p. 665)** on element displays), and allows smooth shaded displays on all interactive graphics displays. Z-buffered displays can be performed faster than HIDP and CAP type displays for large models. See also the **/LIGHT (p. 1049)**, **/SHADE (p. 1783)**, and **/GFILE (p. 858)** commands for additional options when Z-buffering is used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Hidden-Line Options

TYPE, *ITYPE*

Sets the element type attribute pointer.

PREP7 (p. 22): Meshing (p. 29)
PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITYPE

Assign a type number to the elements (defaults to 1).

Command Default

ITYPE = 1.

Notes

Assigns an element-type number to subsequently defined elements. The number refers to the element-type number (*ITYPE*) defined with via **ET (p. 686)**. You can display type numbers (**/PNUM (p. 1457)**).

In some cases, the program can proceed with a meshing operation even when no logical element type has been assigned via **TYPE (p. 2036)** or ***X*ATT**,,,*TYPE*. For more information, see the discussion for setting element attributes in Meshing Your Solid Model.

Menu Paths

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

U Commands

/UCMD, *Cmd*, *SRNUM*

Assigns a user-defined command name.

APDL (p. 19): Abbreviations (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Cmd

User-defined command name. Only the first four characters are significant. Must not conflict with any Mechanical APDL command name or any user unknown-command macro name.

SRNUM

User subroutine number (1 to 10) programmed for this command. For example, the command **/UCMD (p. 2037)**,MYCMD,3 will execute subroutine USER03 whenever the command **MYCMD** is entered. Use a blank command name to disassociate *SRNUM* from its command. For example, **/UCMD (p. 2037)**,,3 removes **MYCMD** as a command.

Notes

Assigns a user-defined command name to a user-programmable (system-dependent) subroutine. This feature allows user-defined commands to be programmed into Mechanical APDL. Once programmed, this command can be input to the program like other commands, and can also be included in the Mechanical APDL start-up file.

Up to 10 subroutines are available for user-defined commands (USER01 to USER10). You must have system permission, system access, and knowledge to write, compile, and link the appropriate subprocessors into Mechanical APDL at your site.

All routines should be written in FORTRAN. For more information about FORTRAN compilers, refer to either the Ansys, Inc. Windows Installation Guide or the Ansys, Inc. Linux Installation Guide for details specific to your platform or operating system.

The USER01 routine is commented and should be listed from the distribution media (system dependent) for more details.

Issue **/UCMD (p. 2037)**,STAT to list all user-defined command names.

Because a user-programmed command is a nonstandard use of the program, the verification of any Mechanical APDL run incorporating these commands is your responsibility. In any contact with Mech-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

anical APDL customer support regarding the performance of a custom version of Mechanical APDL, explicitly state that a user-programmable feature has been used.

See User-Programmable Features (UPFs) in the *Advanced Analysis Guide* for a general description of user-programmable features and the Guide to User-Programmable Features in the *Programmer's Reference* for a detailed description of these features.

See ***ULIB (p. 2051)** for another way of defining user commands.

This command is valid only at the Begin Level.

Menu Paths

This command cannot be accessed from a menu.

/UDOC,*WIND*,*Class*,*Key*,

Determines position and content for the multi-legend options.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WIND

The window number to which the command applies. (defaults to 1)

Class

The type (and relative importance) of legend item being displayed:

CNTR

Contour legend. This legend item is controlled separately from the other legend items (see note below).

DATE

The items in the DATE class include the date and time, or the Mechanical APDL graphical logo (**/PLOPTS (p. 1435)**,LOGO,1). This item is shown by default in all plots.

GWIN

The items in the GWIN class include the entity acronyms that appear in the legend of a multiplot of entities (Nodes, Elements, Keypoints, Lines, Areas, Volumes). GWIN items are shown by default for all **GPLOT (p. 866)** displays.

TYPE

Items in the TYPE class include the plot type (e.g. ELEMENTS, MATERIALS, NODAL SOLUTIONS, etc.). TYPE items are shown by default in all plots.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TYP2

Items in the TYP2 class include supplementary type information, such as DMAX and SMAX for nodal solutions. TYP2 items are shown by default in all plots.

INUM

Items in the INUM class include the number labels generated by the **/PNUM (p. 1457)** command. This class is displayed by default in all plots that contain **/PNUM (p. 1457)** information.

BCDC

The items in the BCDC class include labels created by the **/PBC (p. 1356)** command. This class is shown by default in all plots which contain **/PBC (p. 1356)** information.

VECT

Items in the VECT class include labels created by the **PLVECT (p. 1445)** command. This class is shown by default for all **PLVECT (p. 1445)** plots.

SURF

The items in the SURF class include labels from the **/PSF (p. 1537)** legend. This class is shown by default on all plots of surface boundary conditions.

BODY

Items from the BODY class include labels from the **/PBF (p. 1360)** legend. This class is shown by default in all plots of body forces.

PSTA

Items from the PSTA class include stress scaling statistics, such as the **/SSCALE (p. 1847)** setting. This class is not shown as the default for any type of plot, and must be specifically referenced to display the included data.

VIEW

The items in the VIEW class include view statistics. This class is not shown as the default for any type of plot, and must be specifically referenced to display the included data.

MISC

The items in the MISC class include supplementary labels like /EXPANDED and Stress Section Cross Section. This class is not shown as the default for any type of plot, and must be specifically referenced to display the included data.

KEY

Switch:

OFF or 0 --	Do not display the legend.
LEFT, RIGHT, TOP or BOTTOM --	If the value for *Class* is CNTR, these are the four acceptable values for the contour legend position.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LEFT or RIGHT -- If any value other than CNTR is used for *Class*, these are the two acceptable values for the text data.

Notes

The legend classes conform to the controls specified in the window options panel (**PlotCtrls> Window Controls> Window Options**). In many instances, the legend controls specified with the **/PLOPTS (p. 1435)** command will take precedence and override **/UDOC (p. 2038)** specifications. For instance:

/PLOPTS (p. 1435),LEG1,OFF will disable the TYPE, TYP2, INUM, and MISC classes, regardless of the **/UDOC (p. 2038)** settings.

/PLOPTS (p. 1435),LEG2,OFF will disable the VIEW class, regardless of the **/UDOC (p. 2038)** settings.

/PLOPTS (p. 1435),LEG3,OFF will disable the PSTA class, regardless of the **/UDOC (p. 2038)** settings.

All items in a class are listed with the same X coordinate (except for contours). The contents of the text classes are dumped onto the display window from top to bottom, in order of class importance.

The font specification for text items that are included in the user-specified legends are controlled with the **/DEVICE (p. 523)** command (**PlotCtrls> Font Controls> Anno/Graph Font**).

The floating point values for the data presented in the legend(s) are controlled by the **/GFORMAT (p. 859)** command.

Menu Paths

/UI,*Func*,*Type*,*Format*,*Screen*,*Color*,*Krev*,*Orient*,*Compress*,*Quality*

Activates specified GUI dialog boxes.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Func

Label identifying the dialog box to be activated:

HELP

Activates the online help system.

VIEW

Activates the Pan, Zoom, Rotate dialog box

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

WPSE

Activates the Working Plane Settings dialog box.

WPVI

Activates the Offset Working Plane dialog box.

RESULT

Activates the Query Picking Menu for reviewing results.

QUERY

Activates the Query Picked Entities (preprocess) dialog box.

COPY

Activates the Hard Copy dialog box.

ANNO

Activates the 2D Annotation dialog box.

AN3D

Activates the 3D Annotation dialog box.

SELECT

Activates the Select Entities dialog box.

NSEL

Activates a picking menu to select nodes.

ESEL

Activates a picking menu to select elements.

KSEL

Activates a picking menu to select keypoints.

LSEL

Activates a picking menu to select lines.

ASEL

Activates a picking menu to select areas.

VSEL

Activates a picking menu to select volumes.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

REFRESH

Refreshes the graphics window (non-UI mode only).

COLL

Controls the collapse of the Mechanical APDL main menu when a **FINISH (p. 758)** command is issued. See *Type* below for a discussion of the arguments.

Type

Label identifying the type of select operation. Valid only for the following *Func* labels; NSEL, ESEL, KSEL, LSEL, ASEL, and VSEL:

S

Select a new set.

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Label identifying the type of results data to be queried. Valid only for *Func* = RESULT:

NODE

Nodal solution data (h-elements only).

ELEMENT

Element solution data.

Label specifying the behavior of the Mechanical APDL main menu after a **FINISH (p. 758)** command is issued. User interaction with the main menu is unaffected. Valid only for *Func* = COLL:

YES, 1 or blank

Allows the Main Menu to collapse after **FINISH (p. 758)** command.

NO or 0

Prevents Main Menu collapse after **FINISH (p. 758)** command.

If *Func* = **COPY**, and *Type* = **SAVE,** command format is **/UI (p. 2040)**,*Func*,*Type*,*Format*,*Screen*,*Color*,*Krev*,*Orient*,*Compress*,*Quality*. The remaining fields (after *Type*) identify the portion of the screen, the type of file, and the method of display that the portion of the screen is to be saved as.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Format

TIFF

Tagged Image File Format.

BMP

(PC only) Bitmap (Windows) file format.

WMF

(PC only) Windows Metafile format.

EMF

(PC only) Enhanced Metafile format.

JPEG

JPEG (Joint Photographic Experts Group) file format.

Screen

FULL

Saves the entire screen in the specified format.

GRAPH

Saves only the Mechanical APDL graphic window.

Color

MONO

A two color (black and white) file is saved.

GRAY

The specified file format is saved in gray scale.

COLOR

The file is saved at the specified color depth.

Krev

NORM

Saves file as shown on the screen.

REVERSE

Saves file with the background color reversed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Orient

LANDSCAPE

Saves file in landscape mode.

PORTRAIT

Saves file in portrait mode.

Compress

YES

Compresses TIFF files and EPS files with TIFF preview (default).

NO

Saves files with no compression.

Quality

1,2,,,100

JPEG quality index, with 100 being the maximum quality level.

Notes

Allows you to activate specified GUI dialog boxes directly in either GUI or non-GUI mode.

The **/UI (p. 2040)** command itself is valid in any processor, however certain dialog boxes are accessible only in a particular processor (for example, **/UI (p. 2040)**,RESULT,... is valid only in the General Postprocessor).

Mechanical APDL JPEG software is based in part on the work of the Independent JPEG Group, Copyright 1998, Thomas G. Lane.

Menu Paths

This command cannot be accessed from a menu.

UIMP,*MAT*,*Lab1*,*Lab2*,*Lab3*,*VAL1*,*VAL2*,*VAL3*

Defines constant material properties (GUI).

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT

Material number.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Lab1, Lab2, Lab3

Material property labels (see **MP (p. 1160)** for valid labels).

VAL1, VAL2, VAL3

Values corresponding to three labels.

Notes

UIMP (p. 2044) is generated by the Graphical User Interface (GUI) and appears in the log file (`Jobname.log`) if material properties are specified via the **Material Properties** dialog. The command is *not* intended to be typed in directly during an analysis (although it can be included in an input file for batch input or for use with **/INPUT (p. 948)**).

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Change Mat Props>Material Models

Main Menu>Preprocessor>Material Props>Material Models

Main Menu>Solution>Load Step Opts>Other>Change Mat Props>Material Models

---

/**UIS**, *Label*, *VALUE*

Controls the GUI behavior.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Behavior control key:

BORD

Controls the functionality of the mouse buttons for dynamic viewing mode only. When *Label* = BORD, the three values that follow control the functionality of the LEFT, MIDDLE and RIGHT buttons, respectively (see below).

MSGPOP

Controls which messages from the Mechanical APDL error-message subroutine are displayed in a message dialog box.

REPLOT

Controls whether or not an automatic replot occurs after functions affecting the model are executed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ABORT

Controls whether or not the program displays dialog boxes to show the status of an operation in progress and to cancel that operation.

DYNA

Controls whether the dynamic mode preview is a bounding box or the edge outline of the model. This label only applies to 2D display devices (that is, **/SHOW (p. 1785)**,XII or **/SHOW (p. 1785)**,WIN32). This "model edge outline" mode is only supported in PowerGraphics (**/GRAPHICS (p. 866)**,POWER) and is intended for element, line, results, area, or volume displays.

PICK

Controls how graphical entities are highlighted from within the the **Select** menu.

POWER

Controls whether or not PowerGraphics is active when the GUI is initiated. Mechanical APDL default status is PowerGraphics "ON"; this command is used (placed in the `start.ans` file) when full graphics is desired on start up.

DPRO

Controls whether or not the input window displays a dynamic prompt. The dynamic prompt shows the correct command syntax for the command, as you are entering it.

UNDO

Controls whether or not the session editor includes nonessential commands or comments in the file it creates. You can use this option to include comments and other materials in the session editor file.

LEGE

Controls whether or not the multi-legend is activated when you start the GUI. The multi-legend enables you to specify the location of your legend items in each of the five graphics windows. You can place this option in your `start.ans` file and have the GUI start with the legend items in a pre-specified location.

PBAK

Controls whether or not the background shading is activated when you start the GUI. You can place this option in your `start.ans` file.

ZPIC

Controls the sorting order for entities that are coincident (directly in front of or behind each other) to a picked spot on your model. When you pick a spot on your model that could indicate two or more entities, a message warns you of this condition, and a list of the coincident entities can be generated. The *VALUE* term (below) will determine the sort order.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HPOP

Controls the prioritization of your GUI windows when the contents are ported to a plot or print file (**/UI (p. 2040)**,COPY,SAVE). OpenGL (3D) graphics devices require that the Mechanical APDL graphics window contents be set in front of all overlying windows in order to port them to a printer or a file. This operation can sometimes conflict with **/NOERASE (p. 1249)** settings. See the *VALUE* term (below) to determine the available control options.

VALUE

Values controlling behavior if *Label* = BORD:

(These values control the operation according to syntax : **/UIS (p. 2045)**,BORD,*LEFT*,*MIDDLE*,*RIGHT*)

1

PAN, controls dynamic translations.

2

ZOOM, controls zoom, and dynamic rotation about the view vector.

3

ROTATE, controls dynamic rotation about the screen X and Y axes.

Note:

You can designate any value for any button, or designate the same value for all three buttons. If no value is specified, default is LEFT = PAN, MIDDLE = ZOOM and RIGHT = ROTATE.

Values controlling behavior if *Label* = MSGPOP:

0

All messages displayed.

1

Only notes, warnings, and errors displayed.

2

Only warnings and errors displayed (default).

3

Only errors displayed.

Values controlling behavior if *Label* = REPLOT:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

No automatic replot.

1

Automatic replot (default).

Values controlling behavior if *Label* = ABORT:

ON

Display status and cancellation dialog boxes (default).

OFF

Do not display status and cancellation dialog boxes.

1

Same as ON.

0

Same as OFF.

Values controlling behavior if *Label* = DYNA:

0

Use model edge outline when possible (default).

1

Use bounding box preview.

Values controlling behavior if *Label* = PICK:

0

Picked keypoints and nodes are enclosed by a square. Picked lines are overlaid by a thicker line. Picked areas, volumes, and elements (non-point/non-line) are redrawn with highlighting colors. However, if the pick is a box, circle, or polygon pick, the highlighting for all entitles consists only of a square placed around the entity's centroid.

1

Picked entities are not highlighted.

2

5.1 highlighting (that is, no XOR).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3

Picked entities are highlighted as in *VALUE* = 0, except that, for a box, circle, or polygon pick, the picked areas, volumes, and elements (non-point/non-line) are redrawn with highlighting colors. This technique is slower than the *VALUE* = 0 technique.

Values controlling behavior if *Label* = POWER:

0

Start GUI in Full Graphics mode.

1

Start GUI in PowerGraphics mode (default).

Values controlling behavior if *Label* = DPRO:

0 or OFF

Do not display the dynamic prompt.

1 or ON

Display the dynamic prompt (default).

Values controlling behavior if *Label* = UNDO:

0 or None

Do not suppress any commands (default).

1 or Comment

Write the nonessential commands to the session editor file as comments (with a ! at the beginning).

2 or Remove

Do not write nonessential commands or comments.

Values controlling behavior if *Label* = LEGE:

0 or OFF

Start GUI with the enhanced legend off (default).

1 or ON

Start GUI with the enhanced legend capability activated.

Values controlling behavior if *Label* = PBAK:

0 or OFF

Start the GUI with the no background shading (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1 or ON

Start the GUI with background shading activated.

Values controlling behavior if *Label* = HPOP:

0 or OFF

No rewrite operations are performed to compensate for items that obscure or overlay the graphics window (default).

1 or ON

The Graphics screen contents are replotted to ensure that they are situated in front of all other windows. If **/NOERASE (p. 1249)** is detected, this operation is suppressed.

Notes

Controls certain features of the Graphical User Interface (GUI), including whether Mechanical APDL displays dialog boxes to show you the status of an operation (such as meshing or solution) in progress and to enable you to cancel that operation. Issue **/UIS (p. 2045)**,STAT for current status. Issue **/UIS (p. 2045)**,DEFA to reset default values for all labels. Issue **/UIS (p. 2045)**,*Label*,STAT and **/UIS (p. 2045)**,*Label*,DEFA for status and to reset a specific *Label* item.

A **/UIS (p. 2045)**,HPOP,1 command employs a fast redraw method which does not allow entering the legend logic for a **/PLOPTS (p. 1435)**,INFO,1 or **/PLOPTS (p. 1435)**,INFO,2 command. However, the legend *is* redrawn for **/PLOPTS (p. 1435)**,INFO,3 because that command also allows a fast redraw.

This command is valid in any processor.

Menu Paths

Utility Menu>MenuCtrls>Message Controls

Utility Menu>PlotCtrls>Device Options

/UPF, *RoutineName*

Links a user-programmable routine into Mechanical APDL.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RoutineName

Name of a user-programmable routine (`filename.ext`) to link.

Notes

For more information, see Using the /UPF Command for Linux Systems and Using the /UPF Command for Windows Systems, both found in the *Guide to User-Programmable Features*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

---

*ULIB,*Fname*,*Ext*,--

Identifies a macro library file.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Ext

Filename extension (eight-character maximum).

--

Unused field.

Command Default

No macro library file.

Notes

Identifies a macro library file for the ***USE (p. 2059)** command.

A library of macros allows blocks of often-used commands to be stacked and executed from a single file. The macro blocks must be enclosed within block identifier and terminator lines as shown in this example:

Example 19: Macro Blocks

```
ABC! Any valid alphanumeric name (32 characters maximum)
!  identifying this data block
---! Mechanical APDL data-input commands
---
---
/EOF! Terminator for this data block
XYZ! Identify another data block (if desired)
---! Mechanical APDL data-input commands
---
---
/EOF! Terminator for this data block
(etc.)
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To add comment lines to a macro block, place them anywhere *within* the macro block, including directly on the lines where the macro block identifier and the macro block terminator appear as shown in the example. Do not place comment lines (or any other lines) outside of a macro block.

The name of the macro library file is identified for reading via ***ULIB (p. 2051)**. The name of the macro block is identified via ***USE (p. 2059)**.

Commands within the macro block are copied to a temporary file (of the macro block name) during the ***USE (p. 2059)** operation and executed as if a macro file of that name had been created. The temporary file is deleted after it has been used.

Macro block names should be acceptable file names (system-dependent) and should not match user-created macro file names, as the user-created macro file is used first (if it exists) before the library file is searched.

Macro blocks may be stacked in any order. Branching (***GO (p. 864)** or ***IF (p. 927)**) external to the macro block is not allowed.

This command is valid in any processor.

Menu Paths

Utility Menu>Macro>Execute Data Block

UNDELETE,*Option*,*Nstart*,*Nend*

Removes results sets from the group of sets selected for editing.

AUX3 (p. 61): Results Files (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Specifies which sets are to be removed from the selected sets.

SET

Specifies one or more particular sets in the results file that are to be removed from the group of sets selected for deletion.

ALL

Removes all selected sets that are currently selected for deletion.

Nstart

The first set to be removed from the set selected for deletion.

Nend

The final set to be removed from the set selected for deletion. This field is used only if operating on more than one sequential set.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Use this command if you have previously marked a set for deletion (with the **DELETE (p. 513)** command) and now wish to keep that set instead of deleting it.

The **UNDELETE (p. 2052)** command is valid only in the results file editing processor (auxiliary processor AUX3), and, like the other AUX3 commands, it only affects the data steps index (DSI), time (TIM), loadstep, substep and cumulative step iteration (LSP) records in the results file.

Menu Paths

This command cannot be accessed from a menu.

UNDO, *Keyword*

Enables the user to modify or save commands issued since the last RESUME or SAVE.

DATABASE (p. 13): Set Up (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Keyword

NEW

Create an editable GUI window that allows the user to alter the commands issued since the most recent **SAVE (p. 1645)** or **RESUME (p. 1601)** operations (GUI only).

Notes

This command invokes the session editor, a text window displaying all program operations since the last **SAVE (p. 1645)** or **RESUME (p. 1601)**.

You can modify command parameters, delete whole sections of text, and even save a portion of the command string to a separate file. The file is named `jobname000.cmds`, with each subsequent save operation incrementing the filename by one.

The session editor file can be changed only by the session editor. If you rename your database file outside of Mechanical APDL and then resume that database, the session editor displays the old filename.

For more information, see Using the Session Editor.

Menu Paths

Main Menu>Preprocessor>Session Editor

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/UNITS, *Label*, *LENFACT*, *MASSFACT*, *TIMEFACT*, *TEMPFACT*, *TOFFST*, *CHARGEFACT*, *FORCEFACT*, *HEATFACT*

Annotates the database with the system of units used.

DATABASE (p. 13): Set Up (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Label to denote the system of units used in this job:

USER

User-defined system (default).

SI

International system (m, kg, s, K).

MKS

MKS system (m, kg, s, °C).

uMKS

μMKS system (μm, kg, s, °C).

CGS

CGS system (cm, g, s, °C).

MPA

MPA system (mm, Mg, s, °C).

BFT

U. S. Customary system using feet (ft, slug, s, °F).

BIN

U. S. Customary system using inches (in, lbf*s^2/in, s, °F).

If *Label* = USER, the remaining fields on this command may be used to enter conversion factors that are appropriate for the user-defined system of units.

LENFACT

Conversion factor to meter (m). Default = 1.

MASSFACT

Conversion factor to kilogram (kg). Default = 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TIMEFACT

Conversion factor to second (s). Default = 1.

TEMPFACT

Conversion factor to kelvin (K). Default = 1.

TOFFST

Temperature offset from absolute zero in kelvin. Default = 0.

CHARGEFACT

Conversion factor to coulomb. Default = 1.

FORCEFACT

Conversion factor to newton (N). Default = 1.

HEATFACT

Conversion factor to joule (J). Default = 1.

Command Default

User-defined units.

Notes

Allows the user to set a marker in the database indicating the system of units used. The setting may be reviewed with the **/STATUS (p. 1865)** command at the Begin level. The units label and conversion factors on this command are for user convenience only and have no effect on the analysis or data. That is, **/UNITS (p. 2054)** *will not* convert database items from one system to another (for example, from U. S. Customary to SI, etc.). The units setting will be written to the file of IGES data [**IGESOUT (p. 932)** or **CDWRITE (p. 293)**], which can then be read by many programs that read IGES files. The user must still use consistent units for the results to be valid.

If you choose the MKS system of units, the EPZRO option for the **EMUNIT (p. 632)** command is set to 8.85 e-12 F/m. (EPZRO specifies alternate free-space permittivity.)

For micro-electromechanical systems (MEMS), where dimensions are on the order of microns, see the conversion factors in System of Units in the *Coupled-Field Analysis Guide*.

If you use the Mechanical APDL ADAMS Interface to export model information to the ADAMS program, the **/UNITS (p. 2054)** command is required to ensure the correct transfer of data between Mechanical APDL and ADAMS. You can choose a predefined unit system label (*Label* = SI, CGS, etc.) or you can select the user-defined system option (*Label* = USER) and input the appropriate conversion factors (*LENFACT*, *MASSFACT*, *TIMEFACT*, and *FORCEFACT*). The conversion factors are written to the ADAMS input file `Jobname.MNF` to correctly generate the load. For more information, see Export to ADAMS.

All differences between the base solution units used by the Mechanical APDL and CFX solvers are noted in the Mechanical APDL output file. Unit conversions are applied automatically to all loads transferred

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

unless *Label* = USER. Unit conversions are not applied to any of the loads transferred between the Mechanical APDL and CFX solvers if they use a user-defined unit system.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

UNPAUSE

Restores use of a temporarily released product license.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

The **UNPAUSE (p. 2056)** command restores use of a temporarily released (paused) product license. The command is valid only *after* a previously issued **PAUSE (p. 1356)** command.

When use of the product license is paused via the **PAUSE (p. 1356)** command, no other operation (other than **SAVE (p. 1645)** or **/EXIT (p. 708)**) is possible until you issue the **UNPAUSE (p. 2056)** command.

For more information, see the documentation for the **PAUSE (p. 1356)** command and the Ansys Licensing Guide.

Menu Paths

This command cannot be accessed from a menu.

UPCOORD, *FACTOR*, *Key*

Modifies the coordinates of the active set of nodes, based on the current displacements.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FACTOR

Scale factor for displacements being added to nodal coordinates. If *FACTOR* = 1.0, the full displacement value will be added to each node, 0.5, half the displacement value will be added, etc. If *FACTOR* = -1, the full displacement value will be subtracted from each node, etc.

Key

Key for zeroing displacements in the database:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

Do not zero the displacements (default).

ON

Zero the displacements.

Notes

The **UPCOORD (p. 2056)** command uses displacements stored in the Mechanical APDL database, and not those contained within the results file, `Jobname.rst`. Nodal coordinates are updated each time the command is issued. After updating, both the nodal displacements and rotations are set to zero if *Key* = ON.

For structural solutions with an updated mesh, unless the coefficient matrix is otherwise reformed (for example, a new analysis or **NLGEOM (p. 1231)**,ON) it should first be reformed by issuing a **KUSE (p. 1002)**,-1 command.

UPCOORD (p. 2056) should not be issued between load steps in structural analysis.

For a multiphysics simulation where a CFD or electromagnetic field is being coupled to a structure undergoing large displacements, all (or a portion) of the surrounding field mesh may take part in the structural solution to "move" with the displacing structure. You can use the **UPCOORD (p. 2056)** command with a suitable *FACTOR* to update the coordinates of the nodes using the newly computed displacements. The mesh will now conform with the displaced structure for subsequent field solutions. However, the mesh should always be restored to its original location by using an **UPCOORD (p. 2056)**,*FACTOR* command before performing any subsequent structural solutions. This is true for both repeated linear solutions, and for nonlinear restarts. (All saved displacements are relative to the original mesh location.)

Caution:

Orientation nodes for beams and pipes always have zero displacements. Therefore, although this command may alter the locations of other beam and pipe nodes, it has no effect on orientation nodes. Carefully inspect the element coordinate systems on the updated model.

This command is not intended to replace either the large-displacement or birth-and-death capability.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Updt Node Coord

Main Menu>Solution>Load Step Opts>Other>Updt Node Coord

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UPGEOM, *FACTOR*, *LSTEP*, *SBSTEP*, *Fname*, *Ext*, *--*, *UPESYS*

Adds displacements from a previous analysis and updates the geometry to the deformed configuration.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FACTOR

Multiplier for displacements being added to coordinates. The value 1.0 adds the full value of the displacements to the geometry of the finite element model. Defaults to 1.0.

LSTEP

Load step number of data to be imported. Defaults to the last load step.

SBSTEP

Substep number of data to be imported. Defaults to the last substep.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The field must be input (no default).

Ext

Filename extension (eight-character maximum).

The extension must be .RST.

--

Unused field.

UPESYS

Update behavior for the element coordinate system (**ESYS (p. 685)**):

0 -- Do not update the element coordinate system (default).

1 -- Update the element coordinate system to match the material orientation from a previous analysis.

Notes

This command updates the geometry of the finite element model according to the displacement results of the previous analysis and creates a revised geometry at the deformed configuration. This command works on all nodes (default) or on a selected set of nodes. If this command is issued repeatedly, it creates a revised geometry of the finite element model in a cumulative fashion, that is, it adds displacement

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

results on the previously generated deformed geometry. The solid model geometry is not updated by this command.

When **UPGEOM (p. 2058)** is issued, the current finite element model is overwritten by finite element information from the results file. For this reason, it is important that the finite element information in the results file matches the finite element model in which the nodal coordinates are being updated. No changes should be made to the model before the **UPGEOM (p. 2058)** command is issued.

UPESYS = 1 is available for homogeneous structural solid elements (SOLID185, SOLID186, and SOLID187) only and generates only Cartesian coordinate systems. The option is especially useful when conducting a loop test when orthotropic material is used. For more information, see Nonlinear Static Analysis with Inverse Solving in the *Structural Analysis Guide*.

Caution:

Orientation nodes for beams and pipes always have zero displacements. Therefore, although this command may alter the locations of other beam and pipe nodes, it has no effect on orientation nodes. Carefully inspect the element coordinate systems on the updated model.

Menu Paths

Main Menu>Preprocessor>Modeling>Update Geom

*USE,*Name*,*ARG1*,*ARG2*,*ARG3*,*ARG4*,*ARG5*,*ARG6*,*ARG7*,*ARG8*,*ARG9*,*AR10*,*AR11*,*AR12*,*AR13*,*AR14*,*AG15*,*AR16*,*AR17*,*AR18*

Executes a macro file.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Name

Name (32 characters maximum, beginning with a letter) identifying the macro file or a macro block on a macro library file.

ARG1, ARG2, ARG3, . . . , AR18

Values passed into the file or block where the parameters ARG1 through ARG9 and AR10 through AR18 are referenced. Values may be numbers, alphanumeric character strings (up to 32 characters enclosed in single quotes), parameters (numeric or character) or parametric expressions. See below for additional details.

Notes

Causes execution of a macro file called *Name*, or, if not found, a macro block "*Name*" on the macro library file (***ULIB (p. 2051)**). Argument values (numeric or character) are passed into the file or block and substi-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

tuted for local parameters ARG1, ARG2, ..., AR18. The file *Name* may also be executed as an "unknown command" (that is, without the ***USE (p. 2059)** command name) as described below.

A macro is a sequence of Mechanical APDL commands (as many as needed) recorded in a file or in a macro block in a library file (specified with the ***ULIB (p. 2051)** command). The file or block is typically executed via ***USE (p. 2059)**. In addition to command, numerical and alphanumeric data, the macro can include parameters which will be assigned numerical or alphanumerical character values when the macro is used. Use of the macro can be repeated (within a do-loop, for example) with the parameters incremented.

A macro is defined within a run by enclosing a sequence of data input commands between ***CREATE (p. 434)** and ***END (p. 635)** commands. The data input commands are passive (not executed) while being written to the macro file. The macro file (without ***CREATE (p. 434)** and ***END (p. 635)**) can also be created external to Mechanical APDL.

Up to 99 specially named scalar parameters, ARG1 to AR99, are *locally* available to each macro:

- The prefix for the first nine parameters is ARG, and the prefix for the remaining 90 parameters is AR.
- A local parameter is not affected by, nor does it affect, other parameters, even those of the same name, which are used outside of the macro. The only way a local parameter can affect, or be affected by, parameters outside the macro is if values are passed out of, or into, the macro by an argument list.
- Parameters ARG1 through AR18 can have their values (numeric or character) passed via the argument list on ***USE (p. 2059)**. (ARG1 through AR19 can be passed as arguments on the unknown-command macro.) Parameters AR19 through AR99 (AR20 through AR99 in the unknown-command macro) are available solely for use within the macro; they cannot be passed via an argument list.
- Local parameters are available to do-loops and to **/INPUT (p. 948)** files processed within the macro. In addition to an ARG1--AR99 set for each macro, another ARG1--AR99 set is available external to all macros, local to "non-macro" space.

A macro is exited after its last line is executed. Macros may be nested (such as a ***USE (p. 2059)** or an unknown command within a macro). Each nested macro has its own set of 99 local parameters. Only one set of local parameters can be active at a time and that is the set corresponding to the macro currently being executed or to the set external to all macros (if any). When a nested macro completes execution, the previous set of local parameters once again becomes available. Issue ***STATUS (p. 1863)**,ARGX to view current macro parameter values.

An alternate way of executing a macro file is via the unknown-command route. If a command unknown to Mechanical APDL is entered, a search for a file of that name (plus a `.mac` suffix) is made. If the file exists, it is executed, if not, the "unknown command" message is output. Thus, you can write your own commands in terms of other Mechanical APDL commands. The procedure is similar to issuing ***USE (p. 2059)** with the unknown command in the *Name* field. For example, the command **CMD**,10,20,30 is internally similar to ***USE (p. 2059)**,CMD,10,20,30. The macro file named `cmd.mac` is executed with the three parameters. The ***USE (p. 2059)** macro description also applies to the unknown-command macro, except that various directories are searched and a suffix (`.mac`) is assumed. Also, a macro library file is not searched.

A three-level directory search for the unknown-command macro file may be available. The search order may be: 1) a high-level system directory, 2) the log-in directory, and 3) the local (working) directory. Issue

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/PSEARCH (p. 1535) to change the directory search path. For an unknown command **CMD**, the first file named `cmd.mac` found to exist in the search order is executed. The command can be input in lower-, upper-, or mixed-case; however, it converts to uppercase automatically before the file name search occurs. On systems that preserve the case as it was input, a file matching the upper-case name is used first, followed by a file with the matching the lower-case name, and finally a file matching the mixed-case name. All macro files placed in the `apdl` directory must be upper-case.

Because undocumented commands exist in Mechanical APDL, you should issue the command intended for the macro file name to ensure that the unknown-command message is output in the processor where it is to be used. If the macro is to be used in other processors, the other processors must also be checked.

This command is valid in any processor.

Menu Paths

Utility Menu>Macro>Execute Data Block

/USER, *WN*

Conveniently resets /FOCUS (p. 771) and /DIST (p. 536) to USER.

GRAPHICS (p. 16): Views (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

Notes

Conveniently resets scale parameters to USER on the **/FOCUS (p. 771)** and **/DIST (p. 536)** commands. Scale parameters will be internally respecified to those used for the last display. Convenient when the last scale parameters were automatically calculated. User specified parameters hold until changed or removed (**/AUTO (p. 207)**). Parameters may be reset on the individual commands after this command has been issued.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>View Settings>Automatic Fit Mode

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

USRCAL, *Rnam1*, *Rnam2*, *Rnam3*, *Rnam4*, *Rnam5*, *Rnam6*, *Rnam7*, *Rnam8*, *Rnam9*

Allows user-solution subroutines to be activated or deactivated.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Rnam1, Rnam2, Rnam3, . . . , Rnam9

User-defined solution subroutine names to be activated. Up to nine may be defined on one command or multiple commands may be used. If *Rnam1* = ALL, activate all valid user subroutines. If *Rnam1* = NONE, deactivate all valid user subroutines. All characters are required:

USREFL

Allows user defined scalar field (body force) loads.

USERCV

Allows user defined convection (surface) loads.

USERPR

Allows user defined pressure (surface) loads.

USERFX

Allows user-defined heat flux (surface) loads.

USERCH

Allows user-defined charge density (surface) loads.

USERFD

Computes the complex load vector for the frequency domain logic.

USEROU

Allows user supplied element output.

USOLBEG

Allows user access before each solution.

ULDBEG

Allows user access before each load step.

USSBEG

Allows user access before each substep.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UITBEG

Allows user access before each equilibrium iteration.

UITFIN

Allows user access after each equilibrium iteration.

USSFIN

Allows user access after each substep.

ULDFIN

Allows user access after each load step.

USOLFIN

Allows user access after each solution.

UANFIN

Allows user access at end of run.

UELMATX

Allows user access to element matrices and load vectors.

UTIMEINC

Allows a user-defined time step, overriding the program-determined time step.

UCNVRG

Allows user-defined convergence checking, overriding the program-determined convergence.

Command Default

No user-solution subroutines are active (even if linked into the program).

Notes

Allows certain user-solution subroutines to be activated or deactivated (system-dependent). This command only affects the subroutines named. Other user subroutines (such as user elements, user creep, etc.) have their own activation controls described with the feature.

The UAnBeg subroutine that allows user access at the start of a run does not require activation by this command; it is automatically activated when the program is started.

The routines are commented and should be listed after performing a custom installation from the distribution media for more details. See also the *Advanced Analysis Guide* for a general description of user-programmable features.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You must have system permission, system access, and knowledge to write, compile, and link the appropriate subroutines into the program at your site.

All routines should be written in FORTRAN. (For more information about FORTRAN compilers, refer to either the Ansys, Inc. Windows Installation Guide or the Ansys, Inc. Linux Installation Guide for details specific to your platform or operating system.)

Issue **USRCAL (p. 2062)**,STAT to list the status of these user subroutines.

Because a user-programmed subroutine is a nonstandard use of the program, the verification of any Mechanical APDL run incorporating these commands is entirely your responsibility. In any contact with customer support regarding the performance of a custom version of Mechanical APDL, explicitly state that a user-programmable feature has been used.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>User Routines

Main Menu>Solution>Load Step Opts>Other>User Routines

USRDOF,*Action*,*DOF1*,*DOF2*,*DOF3*,*DOF4*,*DOF5*,*DOF6*,*DOF7*,*DOF8*,*DOF9*,*DOF10*

Specifies the degrees of freedom for the user-defined element USER300.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

One of the following command operations:

DEFINE

Specify the degrees of freedom (DOFs). This value is the default.

LIST

List all previously specified DOFs.

DELETE

Delete all previously specified DOFs.

DOF1*, *DOF2*, *DOF3*, . . . , *DOF10

The list of DOFs.

Notes

The **USRDOF (p. 2064)** command specifies the degrees of freedom for the user-defined element USER300.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Although you can intersperse other commands as necessary for your analysis, issue the **USRDOF (p. 2064)** command as part of the following *general sequence* of commands:

1. Issue the **ET (p. 686)** command for element USER300, followed by the related **TYPE (p. 2036)** command.
2. Issue both the **USRELEM (p. 2065)** and **USRDOF (p. 2064)** commands (in either order).
3. Define your element using USER300.

The DOF list (*DOF1* through *DOF10*) can consist of up to 10 DOFs. Use any valid and appropriate DOF (such as UX, UY, UZ, ROTX, ROTY, ROTZ, AX, AY, AZ, VX, VY, VZ, PRES, WARP, TEMP, VOLT, MAG, EMF, and CURR).

You can specify a maximum of 10 DOFs per **USRDOF (p. 2064)** command. To define additional DOFs, issue the command again.

The maximum number of DOFs for a user-defined element--the number of nodes times the number of DOFs per node--cannot exceed 480.

To learn more about user-defined elements, see Creating a New Element in the *Programmer's Reference*.

Menu Paths

This command cannot be accessed from a menu.

USRELEM,*NNODES*,*NDIM*,*KeyShape*,*NREAL*,*NSAVEVARS*,*NRSLTVAR*,*KEYANSMAT*,*NINTPNTS*,*KESTRESS*,*KEYSYM*

Specifies the characteristics of the user-defined element USER300.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NNODES

The number of nodes.

NDIM

The number of dimensions (of nodal coordinates). Valid values are 2 or 3.

KeyShape

One of the following element shape options:

ANYSHAPE

Any shape (that is, no specified shape). This value is the default.

POINT

Point.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LINE

Straight line.

TRIAN

Triangle.

QUAD

Quadrilateral. This shape can be degenerated to a triangle.

TET

Tetrahedron.

BRICK

Brick. This shape can be degenerated to a wedge, pyramid, or tetrahedron.

NREAL

The number of real constants.

NSAVEVARS

The number of saved variables.

NRSLTVAR

The number of variables saved in results files.

KEYANSMAT

Key for element formulation control:

0

Create your own material codes within the element formulation. In this case, the real constants are available to input material properties. You can also input linear material properties via **MP (p. 1160)** and **MPDATA (p. 1168)** commands .

1

Use standard material routines or the `UserMat` subroutine to form structural material data. Material properties must be input in the standard way (as you would for non-user-defined elements). This value is invalid when *KeyShape* = ANYSHAPE.

NINTPNTS

The maximum number of integration points (used when *KEYANSMAT* = 1).

KESTRESS

Key for the element stress state (used when *KEYANSMAT* = 1):

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Plane stress elements.

1

Axisymmetric elements.

2

Plane strain elements.

3

3D solid elements.

4

3D solid-shell elements.

5

Generalized plane strain elements.

6

Beam elements.

7

Link/truss elements.

8

3D shell elements.

9

Axisymmetric shell elements.

KEYSYM

Key for specifying whether element stiffness matrices are symmetric or unsymmetric:

0

Symmetric.

1

Unsymmetric.

Notes

The **USRELEM (p. 2065)** command specifies the characteristics of the user-defined element USER300.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Although you can intersperse other commands as necessary for your analysis, issue the **USRELEM (p. 2065)** command as part of the following *general sequence* of commands:

1. Issue the **ET (p. 686)** command for element USER300, followed by the related **TYPE (p. 2036)** command.
2. Issue both the **USRELEM (p. 2065)** and **USRDOF (p. 2064)** commands (in either order).
3. Define your element using USER300.

The number of real constants (*NREAL*) can refer to geometry quantities, material quantities, or any parameters for element formulation.

ANSYS saves variables in the `.esav` file to preserve element data when you specify a positive *NSAVEVARS* value. When *KEYANSMAT* = 0, all variables of both material and kinematic formulation are saved. When *KEYANSMAT* = 1, only the variables for kinematic formulation (such as deformation gradient tensor) are saved; in this case, the material routine saves all necessary material data automatically.

Element data saved in results files (*NRSLTVAR*) are accessible only as nonsummable miscellaneous data. ANSYS saves stress and total strain data for structural elements in the `.rst` file automatically (as it does for equivalent variables such as thermal gradient and thermal flux in thermal elements); therefore, *NRSLTVAR* does not need to include stress and total strain data.

To learn more about creating user-defined elements, see Creating a New Element in the *Programmer's Reference*.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

V Commands

V, *P1*, *P2*, *P3*, *P4*, *P5*, *P6*, *P7*, *P8*

Defines a volume through keypoints.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

P1

Keypoint defining starting corner of volume. If *P1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

P2

Keypoint defining second corner of volume.

P3

Keypoint defining third corner of volume.

P4

Keypoint defining fourth corner of volume.

P5

Keypoint defining fifth corner of volume.

P6

Keypoint defining sixth corner of volume.

P7

Keypoint defining seventh corner of volume.

P8

Keypoint defining eighth corner of volume.

Notes

Defines a volume (and its corresponding lines and areas) through eight (or fewer) existing keypoints. Keypoints must be input in a continuous order. The order of the keypoints should be around the bottom and then the top. Missing lines are generated "straight" in the active coordinate system and assigned

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the lowest available numbers (**NUMSTR (p. 1301)**). Missing areas are generated and assigned the lowest available numbers.

Solid modeling in a toroidal coordinate system is not recommended.

Certain faces may be condensed to a line or point by repeating keypoints. For example, use **V (p. 2069)**,*P1*,*P2*,*P3*,*P3*,*P5*,*P6*,*P7*,*P7* for a triangular prism or **V (p. 2069)**,*P1*,*P2*,*P3*,*P3*,*P5*,*P5*,*P5*,*P5* for a tetrahedron.

Using keypoints to produce partial sections in **CSYS (p. 441)** = 2 can generate anomalies; check the resulting volumes carefully.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Volumes>Arbitrary>Through KPs

---

V2DOPT, *GEOM*, *NDIV*, *HIDOPT*, *NZONE*

Specifies 2D/axisymmetric view factor calculation options.

SOLUTION (p. 38): Radiosity (p. 50)
AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

GEOM

Choice of geometry:

0

Planar (default).

1

Axisymmetric

NDIV

Number of divisions for axisymmetric geometry (that is, the number of circumferential segments). Default is 50. There is no maximum limit if *HIDOPT* = 0; the maximum is 90 if *HIDOPT* = 1. If *NDIV* is $\leq$ 6, it is reset to 50.

For more information, see View Factors of Axisymmetric Bodies in the *Mechanical APDL Theory Reference*.

HIDOPT

Viewing option:

0

Hidden (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Non-hidden

NZONE

Number of zones (that is, the number of rays emanating from a surface) for view factor calculation. This is used if *HIDOPT* = 0.

If *NZONE* is blank, it is set to 0 and the view factor algorithm sets the number of rays. (See Command Default below.)

If *NZONE* is < 0 or > 1000, it is set to 200.

Command Default

By default, a planar geometry is assumed (*GEOM* = 0) and the hidden viewing option is used (*HIDOPT* = 0).

The view factor algorithm sets the number of rays as follows, depending on whether a planar or axisymmetric geometry is specified:

- For *GEOM* = 0, *HIDOPT* = 0 and *NZONE* = 0, the number of zones used in view the factor calculation is 200.
- For *GEOM* = 1, *HIDOPT* = 0, and *NZONE* = 0, the number of zones used in the view factor calculation is 20.

Notes

V2DOPT (p. 2070) sets 2D view factor calculation options for the radiosity solver method. For 2D view factor calculations, the ray-emanation method is used.

The geometry type can be either 2D planar (default) or axisymmetric. For the axisymmetric case, you can define the number of circumferential segments (defaults to 20). You can also specify the hidden or non-hidden viewing option (defaults to hidden) and the number of zones for the view factor calculation. For more information, see Process for Using the Radiosity Solver Method in the *Thermal Analysis Guide* .

VA,*A1*,*A2*,*A3*,*A4*,*A5*,*A6*,*A7*,*A8*,*A9*,*A10*

Generates a volume bounded by existing areas.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

A1, A2, A3, . . . , A10

List of areas defining volume. The minimum number of areas is 4. If *A1* = ALL, use all selected (**ASEL (p. 192)**) areas and ignore *A2* to *A10*. If *A1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *A1*.

Notes

This command conveniently allows generating volumes from regions having more than eight keypoints (which is not allowed with the **V (p. 2069)** command). Areas may be input in any order. The exterior surface of a **VA (p. 2072)** volume must be continuous, but holes may pass completely through it.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Volume by Areas

Main Menu>Preprocessor>Modeling>Create>Volumes>Arbitrary>By Areas

***VABS**,*KABSR*,*KABS1*,*KABS2*,*KABS3*

Applies the absolute value function to array parameters.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

KABSR

Absolute value of results parameter:

0 --

Do not take absolute value of results parameter (ParR).

1 --

Take absolute value.

KABS1

Absolute value of first parameter:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0 --

Do not take absolute value of first parameter (Par1 or ParI).

1 --

Take absolute value.

KABS2

Absolute value of second parameter:

0 --

Do not take absolute value of second parameter (Par2 or ParJ).

1 --

Take absolute value.

KABS3

Absolute value of third parameter:

0 --

Do not take absolute value of third parameter (Par3 or ParK).

1 --

Take absolute value.

Command Default

Do not use absolute values.

Notes

Applies an absolute value to parameters used in certain ***V*XX** and ***M*XX** operations. Typical absolute value applications are of the form:

ParR = |f(|Par1|)|

or

ParR = |(|Par1| o |Par2|)|

The absolute values are applied to each input parameter value before the operation and to the result value after the operation. Absolute values are applied before the scale factors so that negative scale factors may be used. The absolute value settings are *reset* to the default (no absolute value) after each ***V*XX** or ***M*XX** operation. Use ***VSTAT (p. 2167)** to list settings.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>Parameters>Array Operations>Operation Settings

VADD, *NV1*, *NV2*, *NV3*, *NV4*, *NV5*, *NV6*, *NV7*, *NV8*, *NV9*

Adds separate volumes to create a single volume.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1, NV2, NV3, . . . , NV9

Numbers of volumes to be added. If *NV1* = ALL, add all selected volumes and ignore *NV2* to *NV9*. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1*.

Notes

Adds separate volumes to create a single volume. The original volumes (and their corresponding areas, lines and keypoints) will be deleted by default (**BOPTN (p. 269)**). See the **BOPTN (p. 269)** command for the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated. Concatenated entities are not valid with this command.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Add>Volumes

Main Menu>Preprocessor>Modeling>Operate>Booleans>Add>Volumes

VARDEL, *NVAR*

Deletes a variable (GUI).

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR

The reference number of the variable to be deleted. *NVAR* is as defined by **NSOL (p. 1281)**, **ESOL (p. 672)**, etc.

Notes

Deletes a POST26 solution results variable. This command is generated by the Graphical User Interface (GUI). It appears in the log file (`Jobname.log`) if a POST26 variable is deleted from the **Defined Time-History Variables** dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with **/INPUT (p. 948)**).

Menu Paths

Main Menu>TimeHist Postpro>Define Variables

Main Menu>TimeHist Postpro>Elec&Mag>Circuit>Define Variables

VARNAM, *IR*, *Name*

Names (or renames) a variable.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Reference number of the variable (2 to NV (**NUMVAR (p. 1302)**)).

Name

Thirty-two character name for identifying variable on printouts and displays. Embedded blanks are compressed for output.

Menu Paths

Main Menu>TimeHist Postpro>Settings>Graph

Main Menu>TimeHist Postpro>Settings>List

VATT, *MAT*, *REAL*, *TYPE*, *ESYS*, *SECNUM*

Associates element attributes with the selected, unmeshed volumes.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT*, *REAL*, *TYPE*, *ESYS*, *SECNUM

Material number, real constant set number, type number, coordinate system number, and section number to be associated with selected, unmeshed volumes.

Notes

These element attributes will be used when the volumes are meshed. If a volume does not have attributes associated with it (by this command) at the time it is meshed, the attributes are obtained from the then current **MAT (p. 1111)**, **REAL (p. 1579)**, **TYPE (p. 2036)**, **ESYS (p. 685)**, and **SECNUM (p. 1685)** command settings. Reissue the **VATT (p. 2075)** command (before volumes are meshed) to change the attributes. A zero (or blank) argument removes the corresponding association.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If any of the arguments *MAT*, *REAL*, *TYPE*, *ESYS* or *SECNUM* are defined as -1, then that value will be left unchanged in the selected set.

In some cases, the program can proceed with a volume meshing operation even when no logical element type has been assigned via **VATT (p. 2075)**,,,*TYPE* or **TYPE (p. 2036)**. For more information, see the discussion on setting element attributes in Meshing Your Solid Model of the *Modeling and Meshing Guide*.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh Attributes>All Volumes

Main Menu>Preprocessor>Meshing>Mesh Attributes>Picked Volumes

---

VCLEAR, *NV1*, *NV2*, *NINC*

Deletes nodes and volume elements associated with selected volumes.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1*, *NV2*, *NINC

Delete mesh for volumes *NV1* to *NV2* (defaults to *NV1*) in steps of *NINC* (defaults to 1). If *NV1* = ALL, *NV2* and *NINC* are ignored and mesh for all selected volumes (**VSEL (p. 2163)**) is deleted. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1* (*NV2* and *NINC* are ignored).

Notes

Deletes *all* nodes and volume elements associated with selected volumes (regardless of whether the nodes or elements are selected). Nodes shared by adjacent meshed volumes and nodes associated with non-volume elements will not be deleted. Attributes assigned as a result of **VATT (p. 2075)** are maintained. In the program's response to the command, if a volume, area, line, or keypoint is tallied as "cleared," it means either its node or element reference was deleted.

Menu Paths

Main Menu>Preprocessor>Meshing>Clear>Volumes

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*VCOL, *NCOL1*, *NCOL2*

Specifies the number of columns in matrix operations.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

NCOL1

Number of columns to be used for Par1 with ***MXX*** operations. Defaults to whatever is needed to fill the result array.

NCOL2

Number of columns to be used for Par2 with ***MXX*** operations. Defaults to whatever is needed to fill the result array.

Command Default

Fill all locations of the result array from the specified starting location.

Notes

Specifies the number of columns to be used in array parameter matrix operations. The size of the sub-matrix used is determined from the upper left starting array element (defined on the operation command) to the lower right array element (defined by the number of columns on this command and the number of rows on the ***VLEN (p. 2136)** command).

The default *NCOL* is calculated from the maximum number of columns of the result array (the ***DIM (p. 530)** column dimension) minus the starting location + 1. For example, ***DIM (p. 530)**,R,,1,10 and a starting location of R(1,7) gives a default of 4 columns (starting with R(1,7), R(1,8), R(1,9), and R(1,10)). Repeat operations automatically terminate at the last column of the result array. Existing values in the rows and columns of the results matrix remain unchanged where not overwritten by the requested input or operation values.

The column control settings are *reset* to the defaults after each ***MXX*** operation. Use ***VSTAT (p. 2167)** to list settings.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Operation Settings

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/VCONE, *WN*, *PHI*

Defines the view cone angle for perspective displays.

GRAPHICS (p. 16): Views (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

PHI

View cone angle (0.0 to 85.°) to define perspective. Use *PHI* = 45.0° for typical perspective. Increase angle for more perspective, decrease angle for less. If the distance (**/DIST (p. 536)**) is not specified, it will be automatically calculated to give full window magnification. If the distance is also specified, *PHI* controls both the perspective and the magnification. The larger the angle, the more the perspective and the less the magnification. Defaults to 0.0 (no perspective).

Command Default

0.0 degrees (no perspective (parallel projection)).

Notes

Perspective shows the true depth of the object in the display. A variable magnification results since the back plane of the object is further from the observer than the front plane. The largest magnification occurs at the front plane. With perspective, the magnification factor (MAGF) is not only a function of the distance from the object, but also the window shape and the perspective (or view cone) angle Φ as follows:

$$MAGF = \frac{\ell / 2}{(d)\ TAN\phi}$$

where ℓ, for square windows, is the largest in-plane vertical or horizontal dimension, d is the distance from the observer to the plane of ℓ (usually the front plane of the object), and Φ is the view cone angle (defined with the **/VCONE (p. 2078)** command). The bigger the cone angle, the more the perspective. The magnification factor proportionally decreases with increasing Φ. The distance can be defined with the **/DIST (p. 536)** or the **/FOCUS (p. 771)** command. Note, the distance input on the **/DIST (p. 536)** command is equal to d only if the focus point is located on the plane of ℓ. It is recommended that if a general perspective is desired (that is, not any specific cone angle), use Φ = 45.0 (since TAN(45.0) = 1.0) and let the d value be automatically calculated for full window magnification.

Note that any number of **/DIST (p. 536)**, **/FOCUS (p. 771)**, and **/VCONE (p. 2078)** combinations can be used to produce the same magnification. Distances less than the object depth will produce views from within the object.

A magnification factor of 1.0 just fills the window. If the automatic scaling option is used (**/AUTO (p. 207)**), the magnification factor is fixed at 0.91 (to allow a 10% margin around the object) and d is automatically calculated for the given **/VCONE (p. 2078)** and **/FOCUS (p. 771)** values. Any value of Φ between 0.0 and 85.0 (usually 45.0) may be used to activate the perspective. Views from inside the object are not possible

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

when d is automatically calculated (use manual scaling (**/USER (p. 2061)**) along with **/DIST (p. 536)** specification).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>View Settings>Perspective View

VCROSS, *LabXR, LabYR, LabZR, LabX1, LabY1, LabZ1, LabX2, LabY2, LabZ2*

Forms element table items from the cross product of two vectors.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabXR, LabYR, LabZR

Label assigned to X, Y, and Z-component of resultant vector.

LabX1, LabY1, LabZ1

X, Y, and Z-component of first vector label.

LabX2, LabY2, LabZ2

X, Y, and Z-component of second vector label.

Notes

Forms labeled result items for the selected element from the cross product of two vectors:

{*LabXR*, *LabYR*, *LabZR*} = {*LabX1*, *LabY1*, *LabZ1*} X {*LabX2*, *LabY2*, *LabZ2*}

Data must be in a consistent coordinate system. Labels are those associated with the **ETABLE (p. 687)** command.

Menu Paths

Main Menu>General Postproc>Element Table>Cross Product

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*VCUM, *KEY*

Allows array parameter results to add to existing results.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

KEY

Accumulation key:

0 --

Overwrite results.

1 --

Add results to the current value of the results parameter.

Command Default

Overwrite results.

Notes

Allows results from certain ***VXX*** and ***MXX*** operations to overwrite or add to existing results. The cumulative operation is of the form:

ParR = ParR + ParR(Previous)

The cumulative setting is *reset* to the default (overwrite) after each ***VXX*** or ***MXX*** operation. Use ***VSTAT (p. 2167)** to list settings.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Operation Settings

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VDDAM, *VF*, *VA*, *VB*, *VC*

Specifies the velocity spectrum computation constants for the analysis of shock resistance of shipboard structures.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VF

Direction-dependent velocity coefficient for elastic or elastic-plastic analysis option (Default = 0).

VA, VB, VC

Coefficients for the DDAM velocity spectrum equations. See Dynamic Design Analysis Method in the *Mechanical APDL Theory Reference*. Default for these coefficients is zero.

Notes

This command specifies velocity coefficients to analyze shock resistance of shipboard equipment. These coefficients are used to compute mode coefficients according to the equations given in Dynamic Design Analysis Method in the *Mechanical APDL Theory Reference*. The form of these equations is based on the Naval NRL Dynamic Design Analysis Method. This command, along with the **ADDAM (p. 96)** and **SED (p. 1704)** commands, is used with the spectrum (**ANTYPE (p. 162)**,SPECTR) analysis as a special purpose alternative to the **SV (p. 1886)**, **FREQ (p. 776)**, and **SVTYP (p. 1887)** commands.

In order to perform a DDAM spectrum analysis using a units system other than BIN (default), you must specify the units system complying with the mass and length units of the model using the **/UNITS (p. 2054)** command. Issue the **/UNITS (p. 2054)** command before defining the shock spectrum computation constants (**VDDAM (p. 2081)**). The **VDDAM (p. 2081)** command is not supported with the user-defined units system (*Label* = USER on the **/UNITS (p. 2054)** command).

DDASPEC (p. 503) may alternatively be used to calculate spectrum coefficients.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>DDAM Options

Main Menu>Solution>Load Step Opts>Spectrum>DDAM Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VDELE, *NV1*, *NV2*, *NINC*, *KSWP*

Deletes unmeshed volumes.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1*, *NV2*, *NINC

Delete volumes from *NV1* to *NV2* (defaults to *NV1*) in steps of *NINC* (defaults to 1). If *NV1* = ALL, *NV2* and *NINC* are ignored and all selected volumes (**VSEL (p. 2163)**) are deleted. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1* (*NV2* and *NINC* are ignored).

KSWP

Specifies whether keypoints, lines, and areas are also deleted:

0

Delete volumes only (default).

1

Delete volumes, as well as keypoints, lines, and areas attached to the specified volumes but not shared by other volumes.

Menu Paths

Main Menu>Preprocessor>Modeling>Delete>Volume and Below

Main Menu>Preprocessor>Modeling>Delete>Volumes Only

VDGL, *NV1*, *NV2*, *NINC*

Lists keypoints of a volume that lie on a parametric degeneracy.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1*, *NV2*, *NINC

List keypoints that lie on a parametric degeneracy on volumes from *NV1* to *NV2* (defaults to *NV1*) in steps of *NINC* (defaults to 1). If *NV1* = ALL (default), *NV2* and *NINC* will be ignored and keypoints on all selected volumes (**VSEL (p. 2163)**) will be listed. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). You may also substitute a component name for *NV1* (ignore *NV2* and *NINC*).

Notes

See the *Modeling and Meshing Guide* for details about parametric degeneracies.

---

VDOT, *LabR*, *LabX1*, *LabY1*, *LabZ1*, *LabX2*, *LabY2*, *LabZ2*

Forms an element table item from the dot product of two vectors.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabR

Label assigned to dot product result.

LabX1, LabY1, LabZ1

X, Y, and Z-component of first vector label.

LabX2, LabY2, LabZ2

X, Y, and Z-component of second vector label.

Notes

Forms labeled result items for the selected element from the dot product of two vectors:

$$LabR = \{LabX1, LabY1, LabZ1\} \cdot \{LabX2, LabY2, LabZ2\}$$

Data must be in a consistent coordinate system. Labels are those associated with the **ETABLE (p. 687)** command.

Menu Paths

Main Menu>General Postproc>Element Table>Dot Product

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VDRAG, *NA1*, *NA2*, *NA3*, *NA4*, *NA5*, *NA6*, *NLP1*, *NLP2*, *NLP3*, *NLP4*, *NLP5*, *NLP6*

Generates volumes by dragging an area pattern along a path.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1, NA2, NA3, . . . , NA6

List of areas in the pattern to be dragged (6 maximum if using keyboard entry). If *NA1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). If *NA1* = ALL, all selected areas will be swept along the path. A component name may also be substituted for *NA1*.

NLP1, NLP2, NLP3, . . . , NLP6

List of lines defining the path along which the pattern is to be dragged (6 maximum if using keyboard entry). Must be a continuous set of lines. To be continuous, adjacent lines must share the connecting keypoint (the end keypoint of one line must also be first keypoint of the next line).

Notes

Generates volumes (and their corresponding keypoints, lines, and areas) by sweeping a given area pattern along a characteristic drag path. If the drag path consists of multiple lines, the drag direction is determined by the sequence in which the path lines are input (*NLP1*, *NLP2*, etc.). If the drag path is a single line (*NLP1*), the drag direction is from the keypoint on the drag line that is closest to the first keypoint of the given area pattern to the other end of the drag line.

The magnitude of the vector between the keypoints of the given pattern and the first path keypoint remains constant for all generated keypoint patterns and the path keypoints. The direction of the vector relative to the path slope also remains constant so that patterns may be swept around curves. Lines are generated with the same shapes as the given pattern and the path lines.

Keypoint, line, area, and volume numbers are automatically assigned (beginning with the lowest available values (**NUMSTR (p. 1301)**)). Adjacent lines use a common keypoint, adjacent areas use a common line, and adjacent volumes use a common area. For best results, the entities to be dragged should be orthogonal to the start of the drag path. Drag operations that produce an error message may create some of the desired entities prior to terminating.

If element attributes have been associated with the input area via the **AATT (p. 85)** command, the opposite area generated by the **VDRAG (p. 2084)** operation will also have those attributes (that is, the element attributes from the input area are copied to the opposite area). Note that only the area opposite the input area will have the same attributes as the input area; the areas adjacent to the input area will not.

If the input areas are meshed or belong to a meshed volume, the area(s) can be extruded to a 3D mesh. Note that the *NDIV* argument of the **ESIZE (p. 668)** command should be set before extruding the meshed areas. Alternatively, mesh divisions can be specified directly on the drag line(s) (**LESIZE (p. 1041)**). See the *Modeling and Meshing Guide* for more information.

You can use the **VDRAG (p. 2084)** command to generate 3D interface element meshes for elements INTER194 and INTER195. When generating interface element meshes using **VDRAG (p. 2084)**, you must

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

specify the line divisions to generate one interface element directly on the drag line using the **LESIZE (p. 1041)** command. The source area to be extruded becomes the bottom surface of the interface element. Interface elements must be extruded in what will become the element's local x direction, that is, bottom to top.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Extrude>Areas>Along Lines

---

***VEC**,*Vector*,*Type*,*Method*,*Val1*,*Val2*,*Val3*,*Val4*

Creates a vector.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Vector

Name used to identify the vector. Must be specified.

Type

Vector type:

D --

Double precision real values (default).

Z --

Complex double precision values.

I --

Integer values.

Method

Method used to create the vector:

ALLOC --

Allocate space for a vector (default).

RESIZE --

Resize an existing vector to a new length. Values are kept from the original vector. If the length specified by *Val1* is greater than the original vector length, the additional rows are assigned a value of zero.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

COPY --

Copy an existing vector.

IMPORT --

Import the vector from a file.

LINK --

Link to a column of an existing dense ***DMAT (p. 551)** matrix and use it in subsequent vector calculations. Any changes to the vector are also made to the corresponding matrix column (memory is shared).

Val1*, *Val2*, *Val3*, *Val4*, *Val5

Additional input. The meaning of *Val1* through *Val5* will vary depending on the specified *Method*. See details below.

The following *Valx* field is used with *Method* = ALLOC or *Method* = RESIZE:

Val1

Number of rows in the vector.

The following *Valx* field is used with *Method* = COPY:

Val1

Name of the vector to copy.

Val2

Optional argument to specify either the real or the imaginary part of the values to be copied. This option only applies when copying a complex value vector to a real value vector.

REAL

Copy the real part of the vector to the output vector.

IMAG

Copy the imaginary part of the vector to the output vector.

The following table describes the *Valx* fields used with *Method* = IMPORT.

***Method* = IMPORT**					
Val1	***Val2***	***Val3***	***Val4***	***Val5***	**Description**
FULL	File name [a]	RHS - Load vector GVEC - Constraint equation constant terms	(not used)	(not used)	Import a load vector or nodal mapping vector from an existing FULL file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Method = IMPORT					
Val1	***Val2***	***Val3***	***Val4***	***Val5***	**Description**
		BACK - nodal mapping vector (internal to user) FORWARD - nodal mapping vector (user to internal)			
MODE	File name [a]	Mode number	(not used)	(not used)	Import a mode from an existing MODE file.
RST	File name [a]	Data set number	(not used)	Result Type: NSL - Nodal Solution VSL - Transient velocity solution ASL - Transient acceleration solution RF - Reaction Forces	Import degree of freedom results from an existing RST file.
RFRQ	File name [a]	FRQ - Frequencies of the modal analysis DSP - reduced complex displacement	- Iteration number	(not used)	Import the vector of frequencies of the modal analysis. Import a reduced complex displacement, at a given iteration number.
ANS	File name [a]	Loc - Location in the File	Base - base pointer	(not used)	Import a record in an Ansys File, specifying its location. If Base is not 0, Loc is a relative value from this base pointer.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Method = IMPORT					
Val1	***Val2***	***Val3***	***Val4***	***Val5***	**Description**
DMIG	File name [a]	- Separator character (default=blank) - or 'F' means formatted file (see ***DMAT (p. 551)** command notes (p. 556))	if Val3 == 'F', length of the fields.	(not used)	Import a vector (typically a load vector) from an existing Nastran DMIG file.
SUB	File name [a]	RHS - Load vector	(not used)	(not used)	Import a load vector from an existing SUB file.
EMAT	File name [a]	RHS - Load vector	Element number	(not used)	Import an element load vector from an existing EMAT file.
MAT	File name [a]	(not used)	(not used)	(not used)	Restore from a previous ***EXPORT (p. 716)** (*FORMAT* = MAT) command.
APDL	Array parameter name	(not used)	(not used)	(not used)	Import an existing array parameter.
HBMAT	File name [a]	File format: ASCII BINARY	(not used)	(not used)	Import a load vector from an existing Harwell-Boeing format file.

[a] File name is case-sensitive with a 32-character maximum.

The following *Valx* fields are used with *Method* = LINK:

Val1

Name of the ***DMAT (p. 551)** matrix.

Val2

Column number of the matrix to link to.

Notes

Use the ***DMAT (p. 551)** command to create a matrix.

For more information on the BACK and FORWARD nodal mapping vectors, see Degree of Freedom Ordering in the *Ansys Parametric Design Language Guide*.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*VEDIT, *Par*

Allows numerical array parameters to be graphically edited.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Par

Name of the array parameter to be edited.

Notes

Invokes a graphical editing system that displays array parameter values in matrix form, and allows the use of the mouse to edit individual values. The starting array subscripts must be defined, such as ***VEDIT (p. 2089)**,A(4,6,1), to indicate the section of the array to be edited. The array section starts at the specified array element and continues to the maximum extent of the array parameter. Row and column index values may be set or changed in any plane, and those values will be applied to all planes. The menu system must be on (**/MENU (p. 1121)**) when this command is issued. Graphical editing is not available for character array parameters. The ***VEDIT (p. 2089)** command can not be used in a macro or other secondary input file.

This command is not applicable to 4- or 5-D arrays.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Parameters>Define/Edit

VEORIENT, *VNUM*, *Option*, *VALUE1*, *VALUE2*

Specifies brick element orientation for volume mapped (hexahedron) meshing.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VNUM

Number identifying volume for which elements are to be oriented (no default).

Option

Option for defining element orientation:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KP

Orientation is determined by two keypoints on the volume. Input the keypoint numbers (KZ1 and KZ2) in fields *VALUE1* and *VALUE2*, respectively. The element z-axis points from KZ1 toward KZ2. Element x and y directions point away from KZ1 along edges of the volume to make a right-hand triad. (The element x- and y-axes are uniquely determined by this specification.)

LINE

Orientation is determined by one of the lines defining the volume. Input the line number in field *VALUE1*. The element z direction follows the direction of the line. Input a negative value if the desired z direction is opposite to the direction of the specified line. (The element x- and y-axes are uniquely determined by this specification.) (*VALUE2* is not used.)

AREA

Orientation is determined by one of the areas defining the volume. The area represents the desired element top surface. Input the area number as *VALUE1*. The shortest line in the volume connected to the area will be used to specify the element z direction. (If more than one shortest line exists, the lowest numbered of those is used.) Element x and y directions are not uniquely specified by this option. (*VALUE2* is not used.)

THIN

Align the element z normal to the thinnest dimension of the volume. The shortest line in the volume is used to specify the element z direction. (If more than one shortest line exists, the lowest numbered of those is used.) Element x and y directions are not uniquely specified by this option. (*VALUE1* and *VALUE2* are not used.)

DELE

Delete the previously defined volume orientation for the specified volume (*VNUM*). (*VALUE1* and *VALUE2* are not used.)

VALUE1, VALUE2

Parameters required for the element z-axis direction specification. The meaning of *VALUE1* and *VALUE2* will depend on the chosen *Option*. See the description of *Option* above for details.

Command Default

Elements are not oriented in any specific manner.

Notes

Use **VEORIENT (p. 2089)** before the **VMESH (p. 2140)** command to specify the desired orientation of brick elements in a mapped mesh. **VEORIENT (p. 2089)** has no effect on tetrahedron meshes, extruded meshes (**VROTAT (p. 2155)**, **VDRAG (p. 2084)**, **VEXT (p. 2091)**, etc.), or swept meshes (**VSWEEP (p. 2168)**).

Proper brick orientation is essential for certain element types such as SOLID185 Layered Solid, SOLID186 Layered Solid, and SOLSH190. In such cases, use **VEORIENT (p. 2089)** or **EORIENT (p. 646)** to achieve the desired orientation. For other brick element types, you may need to specify element orientation to

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

control orthotropic material property directions without concern for the element connectivity. For those cases, the **ESYS (p. 685)** command is the preferred method of specifying the material property directions.

For *Option* = LINE, AREA, and THIN, the orientation will be internally converted to an equivalent *Option* = KP specification (KP,KZ1,KZ2). Use the **VLIST (p. 2137)** command to view the element orientations (in terms of KZ1 and KZ2) associated with each volume.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh Attributes>Volume Brick Orient>Delete Specification

Main Menu>Preprocessor>Meshing>Mesh Attributes>Volume Brick Orient>Z Along Line

Main Menu>Preprocessor>Meshing>Mesh Attributes>Volume Brick Orient>Z by 2 Keypoints

Main Menu>Preprocessor>Meshing>Mesh Attributes>Volume Brick Orient>Z in Thin Direction

Main Menu>Preprocessor>Meshing>Mesh Attributes>Volume Brick Orient>Z Normal to Area

---

VEXT, *NA1*, *NA2*, *NINC*, *DX*, *DY*, *DZ*, *RX*, *RY*, *RZ*

Generates additional volumes by extruding areas.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1*, *NA2*, *NINC

Set of areas (*NA1* to *NA2* in steps of *NINC*) that defines the pattern to be extruded. *NA2* defaults to *NA1*, *NINC* defaults to 1. If *NA1* = ALL, *NA2* and *NINC* are ignored and the pattern is defined by all selected areas. If *NA1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NA1* (*NA2* and *NINC* are ignored).

DX*, *DY*, *DZ

Increments to be applied to the X, Y, and Z keypoint coordinates in the active coordinate system (*DR*, *D*θ, *DZ* for cylindrical; *DR*, *D*θ, *D*Φ for spherical).

RX*, *RY*, *RZ

Scale factors to be applied to the X, Y, and Z keypoint coordinates in the active coordinate system (*RR*, *R*θ, *RZ* for cylindrical; *RR*, *R*θ, *R*Φ for spherical). Note that the *R*θ and *R*Φ scale factors are interpreted as angular *offsets*. For example, if CSYS = 1, *RX*, *RY*, *RZ* input of (1.5,10,3) would scale the specified keypoints 1.5 times in the radial and 3 times in the Z direction, while adding an offset of 10 degrees to the keypoints. Zero, blank, or negative scale factor values are assumed to be 1.0. Zero or blank angular offsets have no effect.

Notes

Generates additional volumes (and their corresponding keypoints, lines, and areas) by extruding and scaling a pattern of areas in the active coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If element attributes have been associated with the input area via the **AATT (p. 85)** command, the opposite area generated by the **VEXT (p. 2091)** operation will also have those attributes (that is, the element attributes from the input area are copied to the opposite area). Note that only the area opposite the input area will have the same attributes as the input area; the areas adjacent to the input area will not.

If the areas are meshed or belong to meshed volumes, a 3D mesh can be extruded with this command. Note that the *NDIV* argument on the **ESIZE (p. 668)** command should be set before extruding the meshed areas.

Scaling of the input areas, if specified, is performed first, followed by the extrusion.

In a non-Cartesian coordinate system, the **VEXT (p. 2091)** command locates the end face of the volume based on the active coordinate system. However, the extrusion is made along a straight line between the end faces. Note that solid modeling in a toroidal coordinate system is not recommended.

Caution:

Use of the **VEXT (p. 2091)** command can produce unexpected results when operating in a non-Cartesian coordinate system. For a detailed description of the possible problems that may occur, see Solid Modeling in the *Modeling and Meshing Guide*.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Extrude>Areas>By XYZ Offset

*VFACT, *FACTR*, *FACT1*, *FACT2*, *FACT3*

Applies a scale factor to array parameters.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

FACTR

Scale factor applied to results (ParR) parameter. Defaults to 1.0.

FACT1

Scale factor applied to first parameter (Par1 or ParI). Defaults to 1.0.

FACT2

Scale factor applied to second parameter (Par2 or ParJ). Defaults to 1.0.

FACT3

Scale factor applied to third parameter (Par3 or ParK). Defaults to 1.0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Use 1.0 for all scale factors.

Notes

Applies a scale factor to parameters used in certain ***VXX*** and ***MXX*** operations. Typical scale factor applications are of the form:

ParR = *FACTR**f(*FACT1**Par1)

or

ParR = *FACTR**((*FACT1**Par1) o (*FACT2**Par2))

The factors are applied to each input parameter value before the operation and to the result value after the operation. The scale factor settings are *reset* to the default (1.0) after each ***VXX*** or ***MXX*** operation. Use ***VSTAT (p. 2167)** to list settings.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Operation Settings

VFCO,*Action*,*ENCL*,*LEVEL*

Controls the use and level of view factor condensation for symmetric radiation.

AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Action to be performed:

DEFINE

Defines the level of view factor condensation (default).

CLEAR

Resets the level of view factor condensation to 0 for all enclosures. All subsequent arguments are ignored.

STATUS

Outputs the *LEVEL* of view factor condensation for each enclosure in the model.

ENCL

Previously defined enclosure number for the view factor adjustment.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LEVEL

Key that controls the level of condensation used in calculating the view factor matrix for models with symmetry. Efficiency gains increase with increasing values of *LEVEL*.

0

View factor condensation is turned off (default). The view factor matrix is calculated for all facets, as described in View Factor Matrix: General in the *Theory Reference*.

1

View factor condensation is turned on. With condensation on, view factors for dependent facets are not calculated, which reduces solution time for models with symmetry. The view factor matrix is calculated only for independent facets as described in View Factor Matrix for a Model with Symmetry in the *Theory Reference*. This option achieves better efficiency than *LEVEL* = 0. Element NMISC data is written to the results file for both independent and dependent facets.***GET (p. 797)**,,RAD,,NETHF, which also uses element fluxes, is based on independent and dependent facets.

2

This option achieves even more efficiency gains than *LEVEL* = 1, but it requires more memory and loses some information. Note that when *LEVEL* = 2 is used, dependent facets are unselected, and no element NMISC data is written to the results file for dependent facets. The same is true for ***GET (p. 797)**,,RAD,,NETHF, which also uses element fluxes and is based on independent facets only.

Notes

If view factor condensation is turned on (**VFCO (p. 2093)**,,*ENCL*,1 or **VFCO (p. 2093)**,,*ENCL*,2):

- The dependent facets do not participate in the solution, and only the independent view factors are calculated as described in View Factor Matrix for a Model with Symmetry in the *Theory Reference*.
- The problem is reduced to solving only for the independent radiosity flux as described in Radiosity Equations Simplified for Models with Symmetry in the *Theory Reference*.
- The **VFSM (p. 2104)** command operates on the condensed view factor matrix.

VFCO (p. 2093) must be issued before the view factors are computed by issuing either **VFOPT (p. 2099)**,NEW or **SOLVE (p. 1822)**.

Example Usage

Example of a 3D Open Enclosure with Symmetry: Radiation Analysis with Condensed View Factor Calculation in the *Thermal Analysis Guide*

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VFDI, *Opt*, *ENCLOSURE*, *DIAGTYPE*, *REALDATA1*, *REALDATA2*

Specifies view factor diagnostic options.

SOLUTION (p. 38): Radiosity (p. 50)
AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Opt

Diagnostic option:

0

Do not write diagnostic information (default).

1

Write diagnostic information to the database file Jobname.db.

2

Write diagnostic information to a separate view factor diagnosis file Jobname.vfd.

3

Combine options 1 and 2 so that diagnostic information is written in both the Jobname.db and the Jobname.vfd files.

STAT

Print all specfied values for **VFDI (p. 2095)** command arguments (*Opt*, *ENCLOSURE*, *DIAGTYPE*,*REALDATA1*, *REALDATA2*)

ENCLOSURE

Specifies enclosure number to diagnose. (Enclosure number is set using the **SF (p. 1733)**, **SFA (p. 1739)**, **SFE (p. 1761)**, or **SFL (p. 1774)** command with *LAB* = RDSF.)

0

Diagnose all enclosures (default).

>0

Enclosure number to diagnose.

DIAGTYPE

Specifies diagnostic type.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

View factor sum diagnostic. Creates an element component to be written to `Jobname.db` and/or `Jobname.vfd` for rows that have a view factor sum equal to a value that is within the minimum and maximum view factor sum specified by *REALDATA1* and *REALDATA2*, respectively. If the sum is outside of this range, nothing is written. The element component name is "_ENCLOS_*n*", where *n* is the enclosure number.

REALDATA1

For the view factor sum diagnostic (*DIAGTYPE* = 1), this specifies the minimum view factor sum (default = -0.01).

REALDATA2

For the view factor sum diagnostic (*DIAGTYPE* = 1), this specifies the maximum view factor sum (default = 1.1).

Command Default

No diagnostic information is written.

Notes

The **VFDI (p. 2095)** command specifies a view factor diagnostic tool that is valid for radiation analyses using the radiosity solver method. It can be used to provide debugging information on the view factor matrix when you must restart an analysis after an unconverged solution. The command writes information to the `Jobname.db` and/or `Jobname.vfd` files in the working directory that help identify where view factors in a complex model may be causing a solution failure. For more information, see Troubleshooting with View Factor Diagnostics in the *Thermal Analysis Guide*.

Issue **VFDI (p. 2095)** to specify diagnostic information to be written the next time view factors are created and written to the database by a subsequent **VFOPT (p. 2099)**,NEW or **SOLVE (p. 1822)** command.

Example Usage

Using **VFDI** to Write View Factor Diagnostic Information in the *Thermal Analysis Guide*

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*VFILL,*ParR*,*Func*,*CON1*,*CON2*,*CON3*,*CON4*,*CON5*,*CON6*,*CON7*,*CON8*,*CON9*,*CON10*

Fills an array parameter.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the resulting numeric array parameter vector. See ***SET (p. 1720)** for name restrictions.

Func

Fill function:

DATA

Assign specified values *CON1*, *CON2*, etc. to successive array elements. Up to 10 assignments may be made at a time. Any *CON* values after a blank *CON* value are ignored.

RAMP

Assign ramp function values: *CON1*+((n-1)**CON2*), where n is the loop number (***VLEN (p. 2136)**). To specify a constant function (no ramp), set *CON2* to zero.

RAND

Assign random number values based on a uniform distribution RAND(*CON1*,*CON2*), where:

CON1 is the lower bound (defaults to 0.0)

CON2 is the upper bound (defaults to 1.0)

GDIS

Assign random sample of Gaussian distributions GDIS(*CON1*,*CON2*) where:

CON1 is the mean (defaults to 0.0)

CON2 is the standard deviation (defaults to 1.0)

TRIA

Assigns random number values based on a triangular distribution TRIA(*CON1*,*CON2*,*CON3*) where:

CON1 is the lower bound (defaults to 0.0)

CON2 is the location of the peak value (*CON1* $\leq$ *CON2* $\leq$*CON3*; *CON2* defaults to 0 if *CON1* $\leq$ 0 $\leq$ *CON3*, *CON1* if 0 $\leq$ *CON1*, or *CON3* if *CON3* $\leq$ 0)

CON3 is the upper bound (defaults to 1.0 + *CON1* if *CON1* $\geq$ 0 or 0.0 if *CON1* $\leq$ 0)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BETA

Assigns random number values based on a beta distribution BETA(*CON1*,*CON2*,*CON3*,*CON4*) where:

CON1 is the lower bound (defaults to 0.0)

CON2 is the upper bound (defaults to 1.0 + *CON1* if *CON1* $\geq$ 0 or 0.0 if *CON1* $\leq$ 0)

CON3 and *CON4* are the alpha and beta parameters, respectively, of the beta function. Alpha and beta must both be positive; they default to 1.0.

GAMM

Assigns random number values based on a gamma distribution: GAMM(*CON1*,*CON2*,*CON3*) where:

CON1 is the lower bound (defaults to 0.0)

CON2 and *CON3* are the alpha and beta parameters, respectively, of the gamma function. Alpha and beta must both be positive; they default to 1.0.

RIGID

Generates the rigid body modes with respect to the reference point coordinates (*CON1*, *CON2*, *CON3*). The dimensions of the array parameter *ParR* are (dim_1,dim_2) where dim_1 is the maximum node number (including internal nodes but excluding orientation nodes) multiplied by the number of degrees of freedom, and dim_2 is the number of rigid body modes (which corresponds to the number of structural degrees of freedom).

CLUSTER

Generates excitation frequencies with clustering option CLUSTER(*CON1*,*CON2*,*CON3*,*CON4*,*%CON5%*) where:

CON1 is the lower end of the frequency range in Hz (0 < *CON1*)

CON2 is the upper end of the frequency range in Hz (*CON1* < *CON2*)

CON3 is the number of points on each side of the natural frequency (4 $\leq$ *CON3* $\leq$ 20, defaults to 4)

CON4 is the constant damping ratio value or an array parameter (size NFR) specifying the damping ratios (if zero or blank, defaults to constant damping ratio of 0.005)

CON5 is an array parameter (size NFR) specifying the natural frequencies in Hz

The dimension of the resulting array parameter ParR is less than 2+NFR*(2**CON3*+1) where NFR is the number of natural frequencies defined in *CON5*.

CON1*, *CON2*, *CON3*, . . . , *CON10

Constants used with above functions.

Notes

Operates on input data and produces one output array parameter vector according to:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ParR = f(*CON1*, *CON2*, ...)

where the functions (f) are described above. Operations use successive array elements (***VLEN (p. 2136)**, ***VMASK (p. 2139)**) with the default being all successive elements. For example, ***VFILL (p. 2097)**,A,RAMP,1,10 assigns A(1) = 1.0, A(2) = 11.0, A(3) = 21.0, etc. ***VFILL (p. 2097)**,B(5,1),DATA,1.5,3.0 assigns B(5,1) = 1.5 and B(6,1) = 3.0. Absolute values and scale factors may be applied to the result parameter (***VABS (p. 2072)**, ***VFACT (p. 2092)**). Results may be cumulative (***VCUM (p. 2080)**). See the ***VOPER (p. 2142)** command for details.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Parameters>Fill

VFOPT,*Opt*,*Filename*,*Ext*,*Dir*,*Filetype*,*Fileformat*,*WRIO*

Specifies options for the view factor file and calculates view factors.

SOLUTION (p. 38): Radiosity (p. 50)
AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Opt

View factor option:

NEW

Calculate view factors, store them in the database, and write them to a file. This is an action option that is executed immediately when the command is issued. For a coupled-field analysis with **NLGEOM (p. 1231)**,ON, issue either the **UPGEOM (p. 2058)** or **UPCOORD (p. 2056)** command before issuing **VFOPT (p. 2099)**,NEW to calculate view factors based on the updated geometry.

OFF

Do not recalculate or read view factors if they already exist in the database; otherwise calculate them at the next **SOLVE (p. 1822)** command. Remaining arguments are ignored. This option is the default.

READ

If the command is issued in the solution processor (**/SOLU (p. 1821)**), this option reads view factors from the specified binary file when the next **SOLVE (p. 1822)** command is issued. *FileType* must be set to BINA (binary). For subsequent **SOLVE (p. 1822)** commands, the program switches back to the default option (OFF).

If the command is issued in the radiation processor (**/AUX12 (p. 209)**), this option immediately reads view factors from the specified binary file. *FileType* must be set to BINA (binary). The program switches back to the default option (OFF) after reading the view factors.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NONE

Do not write view factors to a file when the next **SOLVE (p. 1822)** command is issued. Remaining arguments are ignored.

Fname

File name for view factor matrix. Default = `Jobname`.

Ext

Filename extension for view factor matrix. Default = `.vf`.

Dir

Directory path for view factor matrix. If you do not specify a directory path, it will default to your working directory.

Filetype

View factor file type:

BINA

Binary (default).

ASCI

ASCII.

Fileformat

Format for the specified *Filetype*:

Binary files (*Filetype* = BINA):

0

No compression. (View factor file size may be very large.)

1

Zeroes are compressed out. (Useful for large models to reduce the view factor file size.)

ASCII files (*Filetype* = ASCI):

0

10F7.4 (low precision, lower accuracy).

1

7F11.8 (high precision, higher accuracy).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

WRIO

Write only the view factors of independent facets for symmetric models. This option is valid when view factor condensation is enabled (**VFCO (p. 2093)**,,,1 or **VFCO (p. 2093)**,,,2) and further increases efficiency by reducing read/write time; for more information, see Considerations for Symmetric Models Using View Factor Condensation (p. 2101) below.

ON

Writes only the independent view factors when view factor condensation has been enabled, providing additional efficiency gains. After view factors are computed and written to a file, *WRIO* is automatically reset to OFF.

OFF

Turns off option to write only the independent view factors (default).

Notes

The **VFOPT (p. 2099)** command allows you to deactivate the view factor computation (*Opt* = OFF) if the view factors already exist in the database. The default behavior is OFF upon encountering the second and subsequent **SOLVE (p. 1822)** commands in the solution processor.

The **VFOPT (p. 2099)** command controls view factor calculations and the reading/writing of view factors at the load step level only. It is not supported at the substep level. To update view factors for a coupled-field analysis with **NLGEOM (p. 1231)**,ON at the substep level, you must use the **VFUP (p. 2110)** command.

When *Opt* = READ, only a previously calculated view factor binary file is valid. View factors are read only and are not written after they are read in. Do not issue **VFOPT (p. 2099)**,OFF or **VFOPT (p. 2099)**,NONE until after the next **SOLVE (p. 1822)** command is executed.

If you want to read in view factors after restarting a radiation analysis, issue **VFOPT (p. 2099)**,READ after **ANTYPE (p. 162)**,,REST.

For 3D analyses, two options are available for calculating view factors when running a distributed-memory parallel solution:

- Issue a **SOLVE (p. 1822)** command -- View factors are calculated in parallel mode if no view factors were previously calculated.
- Issue a **VFOPT (p. 2099)**,NEW command -- View factors are calculated in serial mode.

For 2D analyses, view factors are calculated in serial mode.

Considerations for Symmetric Models Using View Factor Condensation

For symmetric models using view factor condensation (**VFCO (p. 2093)**,,,1 or **VFCO (p. 2093)**,,,2), read/write time can be reduced by writing only the independent view factors since they are the only non-zero values in the view factor matrix as described in View Factor Matrix for a Model with Symmetry in the *Theory Reference*.

When view factor condensation is turned off (**VFCO (p. 2093)**,,,0), the full matrix is written to the view factor file when **VFOPT (p. 2099)**,NEW is issued:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$\begin{bmatrix} \mathbf{F}_{II} & \mathbf{F}_{ID} \\ \mathbf{F}_{DI} & \mathbf{F}_{DD} \end{bmatrix}$ (full matrix) where the view factor matrix is decomposed, and the subscripts, I and D, denote independent and dependent. (See View Factor Matrix: General in the *Theory Reference* for details.)

When view factor condensation is turned on (**VFCO (p. 2093)**,,,1 or **VFCO (p. 2093)**,,,2), use *WRIO* to control what is written to the view factor file:

- When **VFOPT (p. 2099)**,NEW,,,,,OFF is issued, the lumped matrix and zeros are written:
  $\begin{bmatrix} \mathbf{F}^L & 0 \\ 0 & 0 \end{bmatrix}$ (lumped matrix and zeros) (For the definition of $\mathbf{F}^L$, see Equation 6.21 in the *Theory Reference*.)
- When **VFOPT (p. 2099)**,NEW,,,,,ON is issued, only the lumped matrix is written:
  $\mathbf{F}^L$ (lumped matrix only) .

Example Usage

2D Radiation Analysis Using the Radiosity Method with Decimation and Symmetry

3D Open Enclosure with Symmetry: Radiation Analysis with Condensed View Factor Calculation

Menu Paths

Main Menu>Preprocessor>Radiation Opts>View Factor

Main Menu>Radiation Opt>Radiosity Meth>Compute

Main Menu>Radiation Opt>Radiosity Meth>View Factor

Main Menu>Solution>Radiation Opts>View Factor

VFQUERY,*SRCELEM*,*TARELEM*,*--*,*WrOpt*

Queries and prints element Hemicube view factors and average view factor.

AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SRCELEM

Elements representing the source radiating surfaces used to query the view factor at the target element(s). If *SRCELEM* = P, graphical picking is enabled (valid only in the GUI). If *SRCELEM* = ALL, all selected elements will have their view factors queried. A component name may also be substituted for *SRCELEM*. Selected elements must be flagged for surface to surface radiation in order to query view factors (**SF (p. 1733)**, **SFA (p. 1739)**, or **SFE (p. 1761)** with Lab = RDSF). The view factors must have been previously computed.

TARELEM

Element for view factor query. If *TARELEM* = P, graphical picking is enabled (valid only in the GUI). If *TARELEM* = ALL, all selected elements will have their view factors queried. A component name may also be substituted for *TARELEM*. Selected elements must be flagged for surface to surface

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

radiation in order to query view factors (**SF (p. 1733)**, **SFA (p. 1739)**, or **SFE (p. 1761)** with Lab = RDSF). The view factors must have been previously computed.

--

Unused field.

WrOpt

Option to write view factors to the output file (`Jobname.out`).

WON

Write view factors to the output file (default).

WOFF

Do not write view factors to the output file. This is useful for reducing the size of the output file.

Notes

This is an action command that:

- Queries the view factors for the interactions between each selected source element with each selected target element and computes the average view factor.
- Writes the view factors for the interactions between each source element with each target element to the output file if *WrOpt* = WON.

To retrieve the calculated average view factor, issue ***GET (p. 797)**,*Par*,RAD,,VFAVG.

If you are only interested in the average view factor, set *WrOpt* = WOFF, and issue ***GET (p. 797)** to reduce the size of the output file and save time.

When resuming a database, issue the command **VFOPT (p. 2099)**,READ before issuing the **VFQUERY (p. 2102)** command.

Menu Paths

Main Menu>Radiation Opt>Radiosity Meth>Query

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VFSM,*Action*,*ENCL*,*OPT*,*MAXITER*,*CONV*

Adjusts view factor matrix to satisfy reciprocity and/or row sum properties (view factor smoothing).

SOLUTION (p. 38): Radiosity (p. 50)
AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Action to be performed:

DEFINE

Define a view factor summation (default)

CLEAR

Resets the scaling method to 0 for all enclosures. All subsequent arguments are ignored.

STATUS

Outputs the *OPT* value for each enclosure in the model.

ENCL

Previously defined enclosure number for the view factor adjustment.

OPT

Option key:

0

The view factor matrix values are not adjusted (default).

1

The view factor matrix values are adjusted so that the row sum equals 1.0.

2

The view factor matrix values are adjusted so that the row sum equals 1.0 and the reciprocity relationship is satisfied.

3

The view factor matrix values are adjusted so that the reciprocity relationship is satisfied.

4

The view factor matrix values are adjusted so that the original row sum is maintained and the reciprocity relationship is satisfied.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MAXITER

Maximum number of iterations to achieve convergence. Valid only when *OPT* = 2 or 4. Default is 100.

CONV

Convergence value for row sum. Iterations will continue (up to *MAXITER*) until the maximum residual over all the rows is less than this value. Valid only when *OPT* = 2 or 4. Default is 1E-3.

Command Default

Although the command is not required for solution, appropriate view factor smoothing settings on **VFSM (p. 2104)** are recommended to ensure a good energy balance. If the command is not issued, no view factor adjustments are made, and view factors might not satisfy the row sum and reciprocity relationships.

Notes

To have a good energy balance, it is important to satisfy both the row sum and reciprocity relationships. For more information, see View Factors in the Mechanical APDL Theory Reference.

OPT = 1 and 2 are suitable for perfect enclosures. *OPT* = 1 is less expensive than *OPT* = 2 because no iterations are involved. However, with *OPT* = 1, the reciprocity relationship is not satisfied.

OPT = 3 and 4 are suitable for leaky enclosures. *OPT* = 3 is less expensive than *OPT* = 4 because no iterations are involved. However, with *OPT* = 3, the original row sum is not maintained.

The **VFSM (p. 2104)** command must be used before **VFOPT (p. 2099)** is issued, or Solve is initiated.

Note:

While the primary purpose of the **VFSM (p. 2104)** command is to adjust the viewfactor matrix to satisfy reciprocity and rowsum properties, a side effect of this command is that the model could flip from being an imperfect to a perfect enclosure and the space node ignored if the rowsum becomes 1.0. The program's check for an imperfect enclosure is not based geometry, but rather on the value of the rowsum of all rows of the enclosure view factor matrix. A rowsum close to 1.0 is deemed a perfect enclosure; otherwise, it is an imperfect enclosure, which requires you to define a spacenode. It is important to be aware that the **VFSM (p. 2104)** command can affect the view factor rowsum and potentially also whether the enclosure is treated as an imperfect or perfect enclosure.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*VFUN,*ParR*,*Func*,*Par1*,*CON1*,*CON2*,*CON3*

Performs a function on a single array parameter.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the resulting numeric array parameter vector. See ***SET (p. 1720)** for name restrictions.

Func

Function to be performed:

ACOS --

Arccosine: ACOS(*Par1*).

ASIN --

Arcsine: ASIN(*Par1*).

ASORT --

Par1 is sorted in ascending order. ***VCOL (p. 2077)**, ***VMASK (p. 2139)**, ***VCUM (p. 2080)**, and ***VLEN (p. 2136)**,,NINC do not apply. ***VLEN (p. 2136)**,NROW does apply.

ATAN --

Arctangent: ATAN(*Par1*).

COMP --

Compress: Selectively compresses data set. "True" (***VMASK (p. 2139)**) values of *Par1* (or row positions to be considered according to the *NINC* value on the ***VLEN (p. 2136)** command) are written in compressed form to *ParR*, starting at the specified position.

COPY --

Copy: *Par1* copied to *ParR*.

COS --

Cosine: COS(*Par1*).

COSH --

Hyperbolic cosine: COSH(*Par1*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DIRCOS --

Direction cosines of the principal stresses (*n*X9). *Par1* contains the *n*X6 component stresses for the *n* locations of the calculations.

DSORT --

Par1 is sorted in descending order. ***VCOL (p. 2077)**, ***VMASK (p. 2139)**, ***VCUM (p. 2080)**, and ***VLEN (p. 2136)**,,NINC do not apply. ***VLEN (p. 2136)**,NROW does apply.

EULER --

Euler angles of the principal stresses (*n*X3). *Par1* contains the *n*X6 component stresses for the *n* locations of the calculations.

EXP --

Exponential: EXP(*Par1*).

EXPA --

Expand: Reverse of the COMP function. All elements of *Par1* (starting at the position specified) are written in expanded form to corresponding "true" (***VMASK (p. 2139)**) positions (or row positions to be considered according to the *NINC* value on the ***VLEN (p. 2136)** command) of *ParR*.

LOG --

Natural logarithm: LOG(*Par1*).

LOG10 --

Common logarithm: LOG10(*Par1*).

NINT --

Nearest integer: 2.783 becomes 3.0, -1.75 becomes -2.0.

NOT --

Logical complement: values ≤ 0.0 (false) become 1.0 (true). Values > 0.0 (true) become 0.0 (false).

PRIN --

Principal stresses (*n*X5). *Par1* contains the *n*X6 component stresses for the *n* locations of the calculations.

PWR --

Power function: *Par1****CON1*. Exponentiation of any negative number in the vector *Par1* to a non-integer power is performed by exponentiating the positive number and prepending the minus sign. For example, -4**2.3 is -(4**2.3).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SIN --

Sine: SIN(*Par1*).

SINH --

Hyperbolic sine: SINH(*Par1*).

SQRT --

Square root: SQRT(*Par1*).

TAN --

Tangent: TAN(*Par1*).

TANH --

Hyperbolic tangent: TANH(*Par1*).

TANG --

Tangent to a path at a point: the slope at a point is determined by linear interpolation half way between the previous and next points. Points are assumed to be in the global Cartesian coordinate system. Path points are specified in array *Par1* (having 3 consecutive columns of data, with the columns containing the x, y, and z coordinate locations, respectively, of the points). Only the starting row index and the column index for the x coordinates are specified, such as A(1,1). The y and z coordinates of the vector are assumed to begin in the corresponding next columns, such as A(1,2) and A(1,3). The tangent result, *ParR*, must also have 3 consecutive columns of data and will contain the tangent direction vector (normalized to 1.0); such as 1,0,0 for an x-direction vector.

NORM --

Normal to a path and an input vector at a point: determined from the cross-product of the calculated tangent vector (see TANG) and the input direction vector (with the i, j, and k components input as *CON1*, *CON2*, and *CON3*). Points are assumed to be in the global Cartesian coordinate system. Path points are specified in array *Par1* (having 3 consecutive columns of data, with the columns containing the x, y, and z coordinate locations, respectively, of the points). Only the starting row index and the column index for the x coordinates are specified, such as A(1,1). The y and z coordinates of the vector are assumed to begin in the corresponding next columns, such as A(1,2) and A(1,3). The normal result, *ParR*, must also have 3 consecutive columns of data and will contain the normal direction vector (normalized to 1.0); such as 1,0,0 for an x-direction vector.

LOCAL --

Transforms global Cartesian coordinates of a point to the coordinates of a specified system: points to be transformed are specified in array *Par1* (having 3 consecutive columns of data, with the columns containing the x, y, and z global Cartesian coordinate locations, respectively, of the points). Only the starting row index and the column index for the x coordinates are specified, such as A(1,1). The y and z coordinates of the vector are assumed to begin in the corresponding next columns, such as A(1,2) and A(1,3). Results are transformed to coordinate system *CON1* (which may be any valid coordinate system number,

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

such as 1,2,11,12, etc.). The transformed result, *ParR*, must also have 3 consecutive columns of data and will contain the corresponding transformed coordinate locations.

GLOBAL --

Transforms specified coordinates of a point to global Cartesian coordinates: points to be transformed are specified in array *Par1* (having 3 consecutive columns of data, with the columns containing the local coordinate locations (x, y, z or r, θ, z or etc.) of the points). Only the starting row index and the column index for the x coordinates are specified, such as A(1,1). The y and z coordinates (or θ and z, or etc.) of the vector are assumed to begin in the corresponding next columns, such as A(1,2) and A(1,3). Local coordinate locations are assumed to be in coordinate system *CON1* (which may be any valid coordinate system number, such as 1,2,11,12, etc.). The transformed result, *ParR*, must also have 3 consecutive columns of data, with the columns containing the global Cartesian x, y, and z coordinate locations, respectively.

Par1

Array parameter vector in the operation.

CON1*, *CON2*, *CON3

Constants (used only with the PWR, NORM, LOCAL, and GLOBAL functions).

Notes

Operates on one input array parameter vector and produces one output array parameter vector according to:

ParR = f(*Par1*)

where the functions (f) are described below. Functions are based on the standard FORTRAN definitions where possible. Out-of-range function results (or results with exponents whose magnitudes are approximately greater than 32 or less than -32) produce a zero value. Input and output for angular functions may be radians (default) or degrees (***AFUN (p. 83)**). *ParR* may be the same as *Par1*. Starting array element numbers must be defined for each array parameter vector if it does not start at the first location. For example, ***VFUN (p. 2106)**,A,SQRT,B(5) takes the square root of the fifth element of B and stores the result in the first element of A. Operations continue on successive array elements (***VLEN (p. 2136)**, ***VMASK (p. 2139)**) with the default being all successive elements. Absolute values and scale factors may be applied to all parameters (***VABS (p. 2072)**, ***VFACT (p. 2092)**). Results may be cumulative (***VCUM (p. 2080)**). Skipping array elements via ***VMASK (p. 2139)** or ***VLEN (p. 2136)** for the TANG and NORM functions skips only the writing of the results (skipped array element data are used in all calculations). See the ***VOPER (p. 2142)** command for details.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VFUP,*Action*,*Opt*,*OPT2*,*OPT3*

Controls view factor updating at the substep level for a coupled-field radiation analysis that includes large-deflection effects.

SOLUTION (p. 38): Radiosity (p. 50)
AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Action to be performed:

DEFINE

Define view factor updating parameters (default).

STAT

Print all specified values for **VFUP (p. 2110)** command arguments.

DEFA

Specifies default values for all arguments, equivalent to issuing **VFUP (p. 2110)**,DEFINE,OFF,1,0.

Opt

Option to enable view factor updates at the substep level or specify their frequency.

ON

Enable view factor updates at the substep *OPT2* and pass *OPT3* frequencies.

OFF

Do not update view factors at the substep level (default). *OPT2* and *OPT3* are ignored.

FRQU

Key to specify a desired value for the substep frequency (*OPT2*) and the pass frequency (*OPT3*). For guidelines on setting these values and example command usage, see Controlling the frequency of view factor updates (p. 2111).

OPT2

Valid only if *Opt* = FRQU. Substep frequency for view factor updates. This value must be a positive integer (defaults to 1). If *OPT2* = 3, view factors are updated every third substep.

OPT3

Valid only if *Opt* = FRQU. Valid values are -1, 0, or a positive integer (defaults to 0).

If *OPT3* = 0, view factors are not updated in the radiation multipass loop.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If *OPT3* is a positive integer, it specifies the pass frequency for view factor updates in the multipass loop.

If *OPT3* = -1, view factors are updated only in the first pass of the multipass loop in the substeps that view factors are being updated (specified by *OPT2*).

Command Default

Although the command is not required for solution, if you do not issue **VFUP (p. 2110)**, view factors are not updated at the substep level. Consequently, results of thermal radiation modeling may be inaccurate because they do not account for changes in the view factors of radiation surfaces as they deform or move.

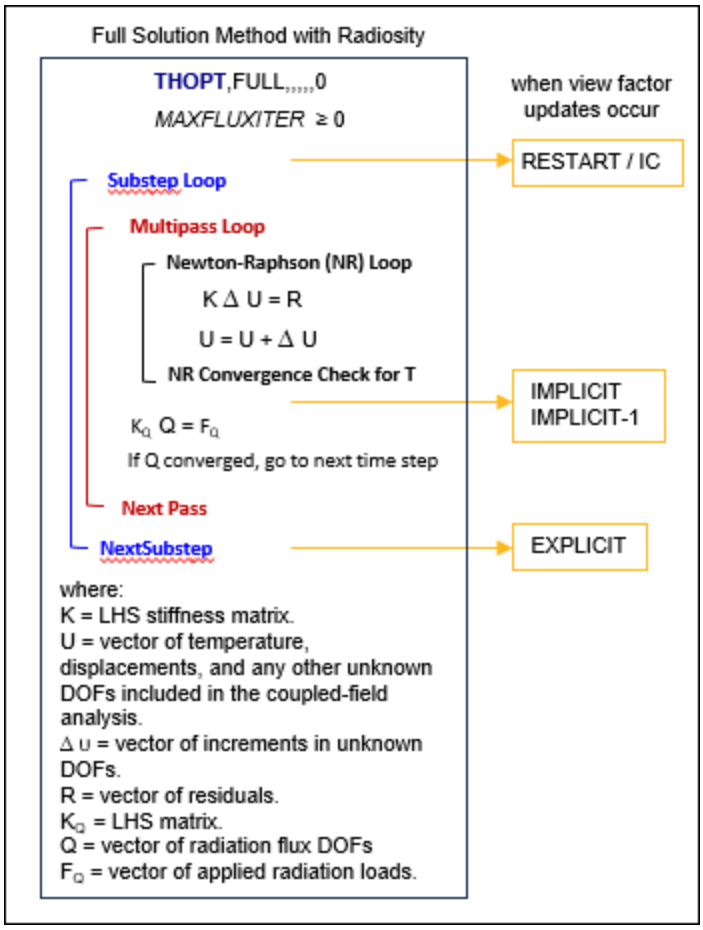
Notes

Deformation and/or motion of radiating surfaces during an anlysis can cause inaccuracies in radiation calculations if the view factors are not updated to account for these changes. Issue **VFUP (p. 2110)**,DEFINE,ON to enable view factor updates at the substep level and improve simulation accuracy for an analysis that includes all of the following conditions:

- Thermal radiation modeling using the radiosity solver method.
- Coupled-field elements (PLANE222, PLANE223, SOLID225, SOLID226, or SOLID227) having at least structural and thermal degrees of freedom (DOFs).
- Large-deflection effects (**NLGEOM (p. 1231)**,ON).

When view factor updating is activated (*Action* = ON), radiation facet areas are recalculated along with the view factors at the specified substep (*OPT2*) and multipass (*OPT3*) frequencies.

Updates occur only if all of these conditions are met:



- **VFUP (p. 2110)**,DEFINE,ON has been issued.
- **NLGEOM (p. 1231)**,ON has been issued.
- You have specified KEYOPT(1) = 1 for any surface elements (SURF251 or SURF252) that have been generated via the **RSURF (p. 1631)** command.

Controlling the frequency of view factor updates

The full solution method (**THOPT (p. 1997)**,FULL) with radiosity has three nested loops, which occur for each load step: the substep (or time step) loop, the multipass loop, and the Newton-Raphson (NR) loop. Displacements and temperatures, in addition to any other DOFs that may be included in your coupled-field analysis, are computed in the NR loop. The view factors / radiation areas can be recalculated at different points during the solution, as depicted in Figure 28: View Factor Update Timing (p. 2112) and described in the following discussion.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 28: View Factor Update Timing

As seen in the figure, implicit updates occur within the multipass loop, and updated view factors are used in the current substep. Instead, explicit updates occur at the end of the time step, and updated view factors are used in the next time step. An additional update occurs before entering the substep loop for a restart (**ANTYPE (p. 162)**,, RESTART) or if you have imposed initial conditions on the displacements (**IC (p. 921)**) as indicated.

There is a trade-off between accuracy and computational cost as updating the view factors more often improves accuracy but also increases the solution time. You can control the timing of view factor updates by specifying the substep (*OPT2*) and pass (*OPT3*) frequency, following one of these strategies:

- **Explicit** - View factors are updated at the end of a substep after a converged coupled-field solution is achieved, and the updated view factors are used in the next time step. The value specified for the substep frequency, *OPT2*, determines which substeps include view factor updating. By default, *OPT2* = 1, and view factors are updated at the end of every substep.

For example, if you issue:	View factors are updated
VFUP (p. 2110),DEFINE,FRQU,3,0	at the end of substeps 3,6,9,...

  This is the most stable strategy. If you have convergence difficulties, explicit updates are recommended. For an accurate solution, the substep size must be small. Explicit updates may lead to an energy imbalance in the radiosity solution since the view factor facet areas were calculated

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

in the preceding time step. For further details, see the discussion related to Figure 30: View Factor Updates and Reciprocity (p. 2115).

- **Implicit** - View factors are updated within the radiation multipass loop, after the Newton-Raphson (RP) loop has produced a converged coupled-field solution and are used in the current pass and substep. The value of the pass frequency, *OPT3*, determines which passes will update the view factors. To have implicit view factor updating, you must set *OPT3* to something other than its default value of zero.

For example, if you issue:	View factors are updated
VFUP (p. 2110),DEFINE,FRQU,5,3	in passes 3,6,9,... for substeps 5,10,15...

  Implicit updates are useful when you have strong nonlinearities, strong structural-thermal coupling, or rapid changes in surface geometry. However, implicit updates can be computationally expensive as view factors are recalculated multiple times within a single substep. Also, Implicit updates of view factors can lead to instabilities and convergence difficulties.

- **Implicit-1** - View factors are updated in the substeps prescribed by the value of the substep frequency, *OPT2*, but they are updated only in the first pass of the radiation multipass loop. To have implicit-1 view factor updating, specify -1 for *OPT3*.

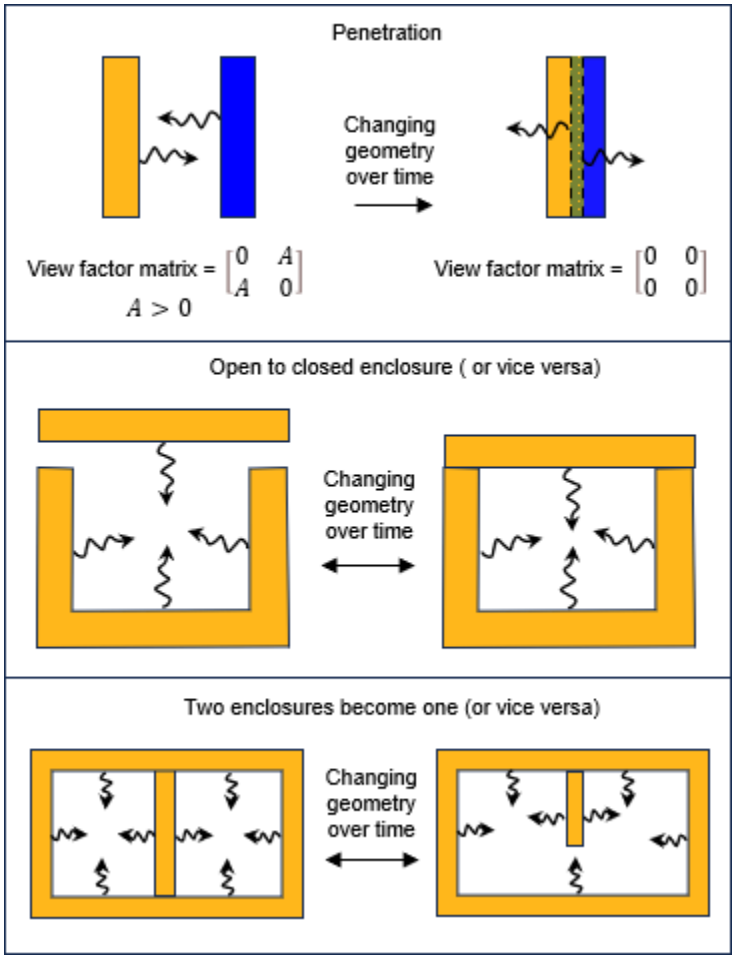
For example, if you issue:	View factors are updated
VFUP (p. 2110), DEFINE, FRQU, 5, -1	only in pass 1 for substeps 5,10,15...

  Use this strategy when the motion of bodies in your model is completely specified, as in rigid body motion (translation and rotation). It is most efficient and accurate to update the view factors in the first pass only when the NR loop achieves a converged structural solution in the first pass and the structural solution does not change for subsequent passes.

Restrictions/Limitations

Enclosure status change and penetration must be avoided

Simulations using the **VFUP (p. 2110)** to update view factors at the substep level are invalid if an enclosure status changes or the surface of a radiating body penetrates the surface of another radiating body. Figure 29: Examples of Radiation Problems that Undergo an Enclosure Status Change (p. 2114) illustrates some examples of enclosure status changes that must be avoided. For example, if two radiating bodies in close proximity penetrate each other due to thermal expansion during the analysis, their view factors become zero, and results using the **VFUP (p. 2110)** command to update view factors are unpredictable and inaccurate. It is better to model bodies within close proximity using thermal contact radiation (contact and target elements: CONTA172, CONTA174, CONTA175, CONTA178,TARGE169, and TARGE170).



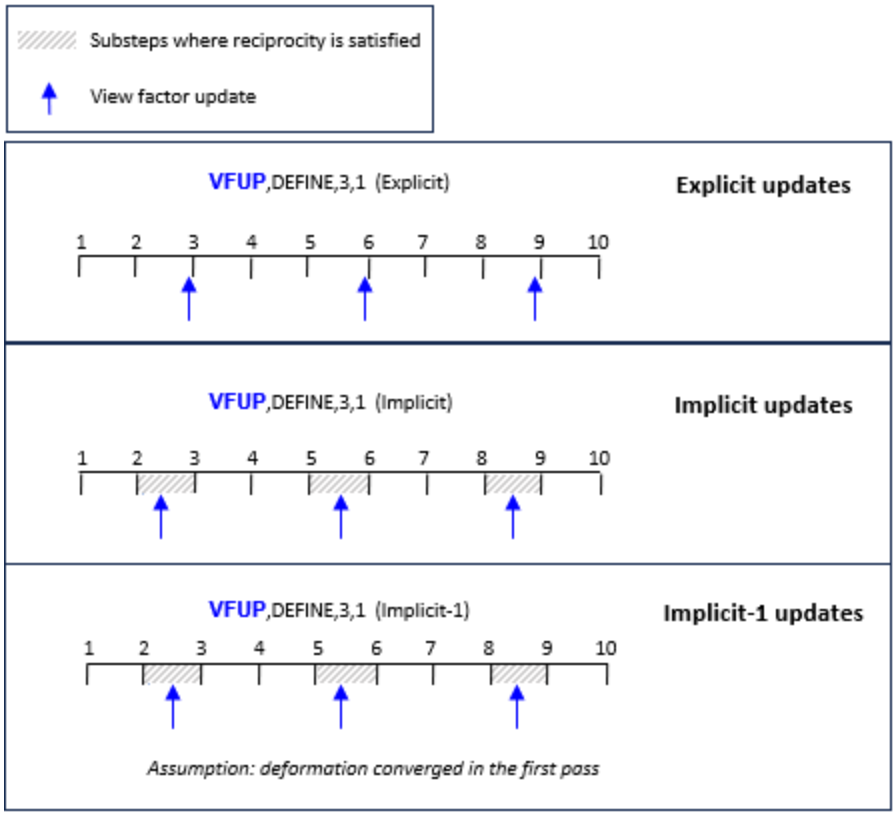
You must also be careful to avoid an enclosure status change, for example if movement or deformation in the analysis causes an open enclosure to become closed or vice versa. If an enclosure is undergoing a status change in your analysis, split the load step into multiple load steps such that:

- There is no status change in the individual load steps.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **VFSM (p. 2104)** settings are appropriate for the enclosure status in individual load steps.

Figure 29: Examples of Radiation Problems that Undergo an Enclosure Status Change



View factor Updates and Reciprocity

For explicit updates, view factors are recalculated at the end of the substep and applied in the next substep. Consequently, they violate the reciprocity rule in the next substep as the radiating areas change since the view factors were calculated from the areas of the previous substep. This may lead to energy imbalance issues. The same problem exists if you specify a substep (*OPT2*) or pass (*OPT3*) frequency other than one. Figure 30: View Factor Updates and Reciprocity (p. 2115) illustrates this issue for different updating strategies. Reciprocity / row sum properties are only satisfied in substeps where view factors are updated in every pass (*OPT3* = 1) provided you have used the **VFSM (p. 2104)** command appropriately (see View Factors in the *Theory Reference*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 30: View Factor Updates and Reciprocity

Supported/restricted commands at the substep level with VFUP (p. 2110),DEFINE,ON

The following commands are not supported at the substep level:

- **VFOPT (p. 2099)**
- **THOPT (p. 1997)**,QUASI
- **VFDI (p. 2095)**

The following commands may be used to query and print view factors or average view factors at the substep level:

- View factor queries (**VFQUERY (p. 2102)**) are based on the last update.
- Any ***GET (p. 797)** command with *Entity* = RAD is based on the last view factor update. To retrieve the latest average view factor, issue ***GET (p. 797)**,*Par*,RAD,0,VFAVG.
- To print view factors to the output file at the substep level, issue **MPRINT (p. 1178)** before **SOLVE (p. 1822)**.

The following radiation commands are valid at the substep level, and may be used with view factor updating enabled (**VFUP (p. 2110)**,DEFINE,ON):

- **HEMIOPT (p. 904)**, **RADOPT (p. 1567)**, **V2DOPT (p. 2070)**, **SPCTEMP (p. 1826)**, **SPCNOD (p. 1825)**, and **VFCO (p. 2093)**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Settings on the **VFSM (p. 2104)** command to adjust view factors (view factor smoothing) for different enclosures are valid for all substeps. However, if there is an enclosure status change during a load step, **VFSM (p. 2104)** settings may become inappropriate and results inaccurate. See earlier discussion on inaccurate results if motion or deformation causes an enclosure status change (Figure 29: Examples of Radiation Problems that Undergo an Enclosure Status Change (p. 2114)). To model a situation where deformation changes the enclosure status, you must solve the problem in multiple load steps and change **VFSM (p. 2104)** settings in each load step to accurately model the state of the enclosure.

Example Usage

Example of a Structural-Thermal Analysis with Substep-Level View Factor Updating in the *Thermal Analysis Guide*

VM321 in the *Ansys Mechanical APDL Verification Manual*

Menu Paths

This command cannot be accessed from a menu.

VGEN, *ITIME*, *NV1*, *NV2*, *NINC*, *DX*, *DY*, *DZ*, *KINC*, *NOELEM*, *IMOVE*

Generates additional volumes from a pattern of volumes.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITIME

Do this generation operation a total of *ITIME*s, incrementing all keypoints in the given pattern automatically (or by *KINC*) each time after the first. *ITIME* must be > 1 for generation to occur.

NV1*, *NV2*, *NINC

Generate volumes from pattern beginning with *NV1* to *NV2* (defaults to *NV1*) in steps of *NINC* (defaults to 1). If *NV1* = ALL, *NV2* and *NINC* are ignored and the pattern is all selected volumes (**VSEL (p. 2163)**). If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1* (*NV2* and *NINC* are ignored).

DX*, *DY*, *DZ

Keypoint location increments in the active coordinate system (--, Dθ, DZ for cylindrical, --, Dθ, -- for spherical).

KINC

Keypoint increment between generated sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NOELEM

Specifies if elements and nodes are also to be generated:

0

Generate nodes and elements associated with the original volumes, if they exist.

1

Do not generate nodes and elements.

IMOVE

Specifies whether to redefine the existing volumes:

0

Generate additional volumes as requested with the *ITIME* argument.

1

Move original volumes to new position retaining the same keypoint line, and area numbers (*ITIME*, *KINC*, and *NOELEM* are ignored). Corresponding meshed items are also moved if not needed at their original position.

Notes

Generates additional volumes (and their corresponding keypoints, lines, areas and mesh) from a given volume pattern. The MAT, TYPE, REAL, and ESYS attributes are based upon the volumes in the pattern and not upon the current settings of the pointers. End slopes of the generated lines remain the same (in the active coordinate system) as those of the given pattern. For example, radial slopes remain radial, etc. Generations which produce volumes of a size or shape different from the pattern (that is, radial generations in cylindrical systems, radial and phi generations in spherical systems, and theta generations in elliptical systems) are not allowed. Note that solid modeling in a toroidal coordinate system is not recommended. Volume, area, and line numbers are automatically assigned (beginning with the lowest available values (**NUMSTR (p. 1301)**)).

Menu Paths

*VGET,*ParR*,*Entity*,*ENTNUM*,*Item1*,*IT1NUM*,*Item2*,*IT2NUM*,*KLOOP*

Retrieves values and stores them into an array parameter.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the resulting vector array parameter. See ***SET (p. 1720)** for name restrictions. The program creates the array parameter if it does not exist.

Entity

Entity keyword. Valid keywords are NODE, ELEM, KP, LINE, AREA, VOLU, etc. as shown for *Entity* = in the tables below.

ENTNUM

The number of the entity (as shown for *ENTNUM* = in the tables below).

Item1

The name of a particular item for the given entity. Valid items are as shown in the *Item1* columns of the tables below.

IT1NUM

The number (or label) for the specified *Item1* (if any). Valid *IT1NUM* values are as shown in the *IT1NUM* columns of the tables below. Some *Item1* labels do not require an *IT1NUM* value.

Item2,IT2NUM

A second set of item labels and numbers to further qualify the item for which data is to be retrieved. Most items do not require this level of information.

KLOOP

Field to be looped on:

0 or 2 --

Loop on the *ENTNUM* field (default).

3 --

Loop on the *Item1* field.

4 --

Loop on the *IT1NUM* field. Successive items are as shown with *IT1NUM*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5 --

Loop on the *Item2* field.

6 --

Loop on the *IT2NUM* field. Successive items are as shown with *IT2NUM*.

Notes

Retrieves values for specified items and stores the values in an output vector of a user-named array parameter according to:

ParR = f(*Entity*, *ENTNUM*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*)

where (f) is the ***GET (p. 797)** function; *Entity*, *Item1*, and *Item2* are keywords; and *ENTNUM*, *IT1NUM*, and *IT2NUM* are numbers or labels corresponding to the keywords. Looping continues over successive entity numbers (*ENTNUM*) for the *KLOOP* default. For example, ***VGET (p. 2118)**,A(1),ELEM,5,CENT,X returns the centroid x-location of element 5 and stores the result in the first location of A. Retrieving continues with element 6, 7, 8, etc., regardless of whether the element exists or is selected, until successive array locations are filled. Use ***VLEN (p. 2136)** or ***VMASK (p. 2139)** to skip locations. Absolute values and scale factors may be applied to the result parameter (***VABS (p. 2072)**, ***VFACT (p. 2092)**). Results may be cumulative (***VCUM (p. 2080)**). See the ***VOPER (p. 2142)** command for general details. Results can be put back into an analysis by writing a file of the desired input commands with the ***VWRITE (p. 2174)** command. See also the ***VPUT (p. 2149)** command.

Both ***GET (p. 797)** and ***VGET (p. 2118)** retrieve information from the active data stored in memory. The database is often the source, and sometimes the information is retrieved from common memory blocks that Mechanical APDL uses to manipulate information. Although POST1 and POST26 operations use a `*.rst` file, GET data is accessed from the database or from the common blocks. Get operations do not access the `*.rst` file directly.

The ***VGET (p. 2118)** command retrieves both the unprocessed real and the imaginary parts (original and duplicate sector nodes and elements) of a cyclic symmetry solution.

Each of the sections for accessing *VGET parameters are shown in the following order:

- *VGET PREP7 Items (p. 2119)
- *VGET POST1 Items (p. 2123)

This command is valid in any processor.

*VGET PREP7 Items

- Table 233: *VGET PREP7 Items, Entity = NODE (p. 2120)
- Table 234: *VGET PREP7 Items, Entity = ELEM (p. 2120)
- Table 235: *VGET PREP7 Items, Entity = KP (p. 2121)
- Table 236: *VGET PREP7 Items, Entity = LINE (p. 2121)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Table 237: *VGET PREP7 Items, Entity = AREA (p. 2121)
- Table 238: *VGET PREP7 Items, Entity = VOLU (p. 2122)
- Table 239: *VGET PREP7 Items, Entity = CDSY (p. 2122)
- Table 240: *VGET PREP7 Items, Entity = RCON (p. 2123)
- Table 241: *VGET PREP7 Items, Entity = TLAB (p. 2123)

Table 233: *VGET PREP7 Items, Entity = NODE

***Entity* = NODE, *ENTNUM* = *n* (node number)**		
VGET (p. 2118)*, *ParR*, NODE, *n*, *Item1*, *IT1NUM*, , , *KLOOP		
Item1	**IT1NUM**	**Description**
LOC	X, Y, Z	X, Y, or Z location in the active coordinate system
ANG	XY, YZ, ZX	THXY, THYZ, THZX rotation angle
NSEL		Select status of node *n*: -1 = unselected, 0 = undefined, 1 = selected
NLIST		Returns the list of selected nodes (*ENTNUM* is ignored)

Table 234: *VGET PREP7 Items, Entity = ELEM

***Entity* = ELEM, *ENTNUM* = *n* (element number)**		
VGET (p. 2118)*, *ParR*, ELEM, *n*, *Item1*, *IT1NUM*, , , *KLOOP		
Item1	**IT1NUM**	**Description**
NODE	1, 2, ... 20	Node number at position 1, 2, ... 20 of element *n*
CENT	X, Y, Z	Centroid X, Y, or Z location (based on shape function) in the active coordinate system
ADJ	1, 2, ... 6	Number of elements adjacent to face 1, 2, ... 6
ATTR	*name*	Number assigned to specified attribute; *name* = MAT, TYPE, REAL, ESYS, ENAM, or SECN
GEOM		Characteristic element geometry. Length of line element (straight line between ends), area of area element, or volume of volume element. Issuing ***VGET (p. 2118)** for an element returns a signed value. To always get a positive value, issue ***VABS (p. 2072)**,1 prior to issuing the ***VGET (p. 2118)** command.
ESEL		Select status of element *n*: -1 = unselected, 0 = undefined, 1 = selected
SHPAR	*Test*	Element shape test result for selected element *n*, where *Test* = ASPE (aspect ratio), JACR (Jacobian ratio), MAXA (maximum corner angle), PARA (deviation from parallelism of opposite edges), or WARP (warping factor)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = ELEM, *ENTNUM* = *n* (element number)		
VGET (p. 2118), *ParR*, ELEM, *n*, *Item1*, *IT1NUM*, , , *KLOOP		
Item1	**IT1NUM**	**Description**
ELIST		Returns the list of selected elements (*ENTNUM* is ignored)

Table 235: *VGET PREP7 Items, Entity = KP

Entity = KP, *ENTNUM* = *n* (keypoint number)		
VGET (p. 2118), *ParR*, KP, *n*, *Item1*, *IT1NUM*, , , *KLOOP		
Item1	**IT1NUM**	**Description**
LOC	X, Y, Z	X, Y, or Z location in the active coordinate system
ATTR	*name*	Number assigned to specified attribute; *name* = MAT, TYPE, REAL, ESYS, NODE, or ELEM
DIV		Divisions (element size setting) from **KESIZE (p. 978)**
KSEL		Select status of keypoint *n*: -1 = unselected, 0 = undefined, 1 = selected
KLIST		Returns the list of selected keypoints (*ENTNUM* is ignored)

Table 236: *VGET PREP7 Items, Entity = LINE

Entity = LINE, *ENTNUM* = *n* (line number)		
VGET (p. 2118), *ParR*, LINE, *n*, *Item1*, *IT1NUM*, , , *KLOOP		
Item1	**IT1NUM**	**Description**
KP	1, 2	Keypoint number at position 1 or 2
ATTR	*name*	Number assigned to specified attribute; *name* = MAT, TYPE, REAL, ESYS, NNOD, NELM, or NDIV (NNOD = number of nodes, NELM = number of elements, NDIV = number of divisions)
LENG		Length
LSEL		Select status of line *n*: -1 = unselected, 0 = undefined, 1 = selected
LLIST		Returns the list of selected lines (*ENTNUM* is ignored)

Table 237: *VGET PREP7 Items, Entity = AREA

Entity = AREA, *ENTNUM* = *n* (area number)				
VGET (p. 2118), *ParR*, AREA, *n*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*, *KLOOP				
Item1	**IT1NUM**	**Item2**	**IT2NUM**	**Description**
LOOP	1,2, ...	LINE	1, 2, ... *p*	IT1NUM is the loop number, and must be input if LINE is to be retrieved. IT2NUM is line number at position 1, 2, ... *p*
ATTR	*name*			Number assigned to specified attribute; *name* = MAT, TYPE, REAL, ESYS, SECN, NNOD, or NELM (NNOD = number of nodes, NELM = number of elements)
AREA	-			Area (after last **ASUM (p. 203)**)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = AREA, *ENTNUM* = *n* (area number)				
VGET (p. 2118), *ParR*, AREA, *n*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*, *KLOOP				
Item1	**IT1NUM**	**Item2**	**IT2NUM**	**Description**
ASEL	-			Select status of area *n*: -1 = unselected, 0 = undefined, 1 = selected
ALIST	-			Returns the list of selected areas (*ENTNUM* is ignored)

Table 238: *VGET PREP7 Items, Entity = VOLU

Entity = VOLU, *ENTNUM* = *n* (volume number)				
VGET (p. 2118), *ParR*, VOLU, *n*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*, *KLOOP				
Item1	**IT1NUM**	**Item2**	**IT2NUM**	**Description**
SHELL	1, 2, ...	AREA	1, 2, ... *p*	IT1NUM is the shell number, and must be input if AREA is to be retrieved. IT2NUM is area number at position 1, 2 ... *p*
ATTR	*name*			Number assigned to specified attribute; *name* = MAT, TYPE, REAL, ESYS, NNOD, or NELM (NNOD = number of nodes, NELM = number of elements)
VOLU	-			Volume (after last **VSUM (p. 2167)**)
VSEL	-			Select status of volume *n*: -1 = unselected, 0 = undefined, 1 = selected
VLIST	-			Returns the list of selected volumes (*ENTNUM* is ignored)

Table 239: *VGET PREP7 Items, Entity = CDSY

Entity = CDSY, *ENTNUM* = *n* (coordinate system number)		
VGET (p. 2118), *ParR*, CDSY, *n*, *Item1*, *IT1NUM*, , , *KLOOP		
Item1	**IT1NUM**	**Description**
LOC	X, Y, Z	X, Y, or Z origin location (global Cartesian coordinate)
ANG	XY, YZ, ZX	THXY, THYZ, or THZX rotation angle (°) relative to the global Cartesian coordinate system

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = CDSY, *ENTNUM* = *n* (coordinate system number)		
VGET (p. 2118), *ParR*, CDSY, *n*, *Item1*, *IT1NUM*, , , *KLOOP		
Item1	**IT1NUM**	**Description**
ATTR	*name*	Number assigned to specified attribute; *name* = KCS, KTHET, KPHI, PAR1, or PAR2. If the coordinate system is undefined, KCS returns as -1.0

Table 240: *VGET PREP7 Items, Entity = RCON

Entity = RCON, *ENTNUM* = *n* (real constant set number)		
VGET (p. 2118), *ParR*, RCON, *n*, *Item1*, *IT1NUM*, , , *KLOOP		
Item1	**IT1NUM**	**Description**
CONST	1, 2, ... *m*	Real constant value for constant 1, 2, ... *m*

Table 241: *VGET PREP7 Items, Entity = TLAB

Entity = *TLAB*, *ENTNUM* = *n* (*TLAB* is the *Lab* data table label on the TB (p. 1899) command. *n* is the material number.)				
VGET (p. 2118), *ParR*, *TLAB*, *n*, *Item1*, *IT1NUM*, , , *KLOOP				
Item1	**IT1NUM**	**Item2**	**IT2NUM**	**Description**
TEMP	*val*	CONST	*num*	*value* is the temperature value at which to retrieve table data. *num* is the constant number whose value is to be retrieved. For constants input as X, Y points, the constant numbers are consecutive with the X constants being the odd numbers, beginning with one.

*VGET POST1 Items

- Table 242: *VGET POST1 Items, Entity = CYCCALC (p. 2124)
- Table 243: *VGET POST1 Items, Entity = ELEM (p. 2125)
- Table 244: *VGET POST1 Items, Entity = MEMBER (p. 2125)
- Table 245: *VGET POST1 Items, Entity = NODE, Element Nodal Results (p. 2125)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Table 246: *VGET POST1 Items, Entity = NODE, Nodal Degree of Freedom Results (p. 2129)

Note:

Vector items are in the active results coordinate system unless otherwise specified.

Table 242: *VGET POST1 Items, Entity = CYCCALC

***Entity* = CYCCALC, *ENTNUM* = *n* (CYCSPEC (p. 475) specification number)**				
VGET (p. 2118), *ParR*, CYCCALC, *n*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*, *KLOOP				
Item1	**IT1NUM**	**Item2**	**IT2NUm**	**Description**
FREQ	*Frequency point*	SECTOR	*sector*	**CYCSPEC (p. 475)** results at the IT1NUM frequency or sector (depending on *KLOOP*)
		SECMAX		**CYCSPEC (p. 475)** maximum results
The frequency point refers to the harmonic solution data set number (*NSET* on the **SET (p. 1724)** command). For *KLOOP* = 4 or SECMAX, returns the requested sector results for all frequencies and *IT1NUM* is ignored. For *KLOOP* = 6, returns the requested frequency results for all sectors and *IT2NUM* is ignored.				

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = CYCCALC, *ENTNUM* = *n* (CYCSPEC (p. 475) specification number)				
*VGET (p. 2118), *ParR*, CYCCALC, *n*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*, *KLOOP*				
Item1	**IT1NUM**	**Item2**	**IT2NUm**	**Description**
All other *KLOOP* options are invalid.				

Table 243: *VGET POST1 Items, Entity = ELEM

Entity = ELEM, *ENTNUM* = *n* (element number)		
*VGET (p. 2118), *ParR*, ELEM, *n*, *Item1*, *IT1NUM*, , , *KLOOP*		
Item1	**IT1NUM**	**Description**
ETAB	*Label*	Any user-defined element table label (see **ETABLE (p. 687)** command)

Table 244: *VGET POST1 Items, Entity = MEMBER

Entity = MEMBER, *ENTNUM* = *N* (GroupID)		
*VGET (p. 2118),*Par*,MEMBER,*N*, *Item1*, *IT1NUM*, , , *KLOOP*		
Item1	**IT1NUM**	**Description**
TEMP	MIN, MAX	Minimum or maximum temperature of members (individual reinforcings) with GroupID = *N* in the selected set of reinforcing elements

Table 245: *VGET POST1 Items, Entity = NODE, Element Nodal Results

Entity = NODE, *ENTNUM* = *n* (node number)			
*VGET (p. 2118), *ParR*, NODE, *n*, *Item1*, *IT1NUM*, , , *KLOOP*			
Item1	**IT1NUM**	**Description**	**Item2**
S	X, Y, Z, XY, YZ, XZ	Component stress	*Item2* controls whether nodal-averaged results are used. Valid labels are: AUTO - Use nodal-averaged results, if available. Otherwise use element-based results. ESOL- Use element-based results only. NAR - Use nodal-averaged results only.
	1, 2, 3	Principal stress	
	INT, EQV	Stress intensity or equivalent stress	
EPTO	X, Y, Z, XY, YZ, XZ	Component total strain (EPEL + EPPL + EPCR)	
	1, 2, 3	Principal total strain

Entity = NODE, *ENTNUM* = *n* (node number)			
VGET (p. 2118), *ParR*, NODE, *n*, *Item1*, *IT1NUM*, , , *KLOOP			
Item1	**IT1NUM**	**Description**	**Item2**
	CNOS	Total number of contact status changes during substep	
	FPRS	Actual applied fluid penetration pressure	
Element nodal results are the average nodal value of the selected elements			

Table 246: *VGET POST1 Items, Entity = NODE, Nodal Degree of Freedom Results

Entity = NODE, *ENTNUM* = *n* (node number)		
VGET (p. 2118), *ParR*, NODE, *n*, *Item1*, *IT1NUM*, , , *KLOOP		
Item1	**IT1NUM**	**Description**
U	X, Y, Z	X, Y, or Z structural displacement
ROT	X, Y, Z	X, Y, or Z structural rotation
TEMP		Temperature. For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use TBOT, TE2, TE3, ..., TTOP instead of TEMP. Alternative get functions: TEMP(N), TBOT(N), TE2(N), etc.
PRES		Pressure
VOLT		Electric potential
MAG		Magnetic scalar potential
V	X, Y, Z	X, Y, or Z fluid velocity; X, Y, or Z nodal velocity in a transient structural analysis (analysis with **ANTYPE (p. 162)**,TRANS)
A	X, Y, Z	X, Y, or Z magnetic vector potential; X, Y or Z nodal acceleration in a transient structural analysis (analysis with **ANTYPE (p. 162)**,TRANS)
CURR		Current
EMF		Electromotive force drop

Menu Paths

Utility Menu>Parameters>Get Array Data

VGET,*Par*,*IR*,*TSTRT*,*KCPLX*

Moves a variable into an array parameter vector.

POST26 (p. 58): Special Purpose (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Par

Array parameter vector in the operation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IR

Reference number of the variable (1 to NV (**NUMVAR (p. 1302)**)).

TSTRT

Time (or frequency) corresponding to start of *IR* data. If between values, the nearer value is used.

KCPLX

Complex number key:

0

Use the real part of the *IR* data.

1

Use the imaginary part of the *IR* data.

Notes

Moves a variable into an array parameter vector. The starting array element number must be defined. For example, **VGET (p. 2129)**,A(1),2 moves variable 2 (starting at time 0.0) to array parameter A. Looping continues from array element A(1) with the index number incremented by one until the variable is filled. The number of loops may be controlled with the ***VLEN (p. 2136)** (p. 2136) command (except that loop skipping (*NINC*) is not allowed). For multi-dimensioned array parameters, only the first (row) subscript is incremented.

Menu Paths

Main Menu>TimeHist Postpro>Table Operations>Variable to Par

VGLUE, *NV1*, *NV2*, *NV3*, *NV4*, *NV5*, *NV6*, *NV7*, *NV8*, *NV9*

Generates new volumes by "gluing" volumes.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1, NV2, NV3, . . . , NV9

Numbers of the volumes to be glued. If *NV1* = ALL, all selected volumes will be glued (*NV2* to *NV9* will be ignored). If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1*.

Notes

Use of the **VGLUE (p. 2130)** command generates new volumes by "gluing" input volumes. The glue operation redefines the input volumes so that they share areas along their common boundaries. The new volumes encompass the same geometry as the original volumes. This operation is only valid if the inter-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

sections of the input volumes are areas along the boundaries of those volumes. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

The **VGLUE (p. 2130)** command results in the merging of areas, lines, and keypoints at the common volume boundaries. The areas, lines, and keypoints of the lower numbered volume will be kept. This means one must be aware of volume numbering when multiple **VGLUE (p. 2130)** commands are applied to avoid any "ungluing" of geometry.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Glue>Volumes

---

/VIEW, *WN*, *XV*, *YV*, *ZV*

Defines the viewing direction for the display.

GRAPHICS (p. 16): Views (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

XV, YV, ZV

The object is viewed along the line from point *XV*,*YV*,*ZV* (in the global coordinate system) to the global coordinate system origin. For section displays, the cutting plane is assumed to be perpendicular to this line. If *XV* = WP, modify view to be normal to the currently defined working plane. Defaults to (0,0,1).

Command Default

0,0,1 view. The default reference orientation is X-axis horizontal to the right, Y-axis vertical upward, and Z-axis out from the screen (normal). See **/VUP (p. 2173)** command to change reference orientation.

Notes

The view line is always normal to the screen. The view is selected by defining a point (in the global Cartesian coordinate system) representing a point along the viewing line. This point, and the global Cartesian coordinate system origin, define the line along which the object is viewed while looking toward the origin. Any point along the view line may be used, that is, (1,1,1) and (2,2,2) give the same view. The display orientation may be changed as desired (**/ANGLE (p. 140)**). The display coordinate system type may be changed (from Cartesian to cylindrical, spherical, toroidal, etc.) with the **DSYS (p. 582)** command.

This command is valid in any processor.

Utility Menu>PlotCtrls>View Settings>Viewing Direction

VIMP, *VOL*, *CHGBND*, *IMPLEVEL*

Improves the quality of the tetrahedral elements in the selected volume(s).

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VOL

Number of the volume containing the tetrahedral elements to be improved. If *VOL* = ALL (default), improve the tetrahedral elements in all selected volumes. If *VOL* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *VOL*.

CHGBND

Specifies whether to allow boundary modification. Boundary modification includes such things as changes in the connectivity of the element faces on the boundary and the addition of boundary nodes. (Also see "Notes" (p. 2133) below for important usage information for *CHGBND*.)

0

Do not allow boundary modification.

1

Allow boundary modification (default).

IMPLEVEL

Identifies the level of improvement to be performed on the elements. (Improvement occurs primarily through the use of face swapping and node smoothing techniques.)

0

Perform the least amount of swapping/smoothing.

1

Perform an intermediate amount of swapping/smoothing.

2

Perform the greatest amount of swapping/smoothing.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3

Perform the greatest amount of swapping/smoothing, plus additional improvement techniques (default).

Notes

VIMP (p. 2132) is useful for further improving a volume mesh created in Mechanical APDL (**VMESH (p. 2140)**), especially quadratic tetrahedral element meshes.

The command enables you to improve a given tetrahedral mesh by reducing the number of poorly-shaped tetrahedral elements (in particular, the number of sliver tetrahedral elements)--as well as the overall number of elements--in the mesh. It also improves the overall quality of the mesh.

Regardless of the value of the *CHGBND* argument, boundary mid-nodes can be moved.

When loads or constraints have been placed on boundary nodes or mid-nodes, and boundary mid-nodes are later moved, the program issues a warning message indicating that it will not update the loads or constraints.

Even when *CHGBND* = 1, no boundary modification is performed on areas and lines that are not modifiable. For example, areas that are adjacent to other volumes or that contain shell elements, or lines that are not incident on modifiable areas, contain beam elements, or have line divisions specified for them (**LESIZE (p. 1041)**).

Menu Paths

Main Menu>Preprocessor>Meshing>Modify Mesh>Improve Tets>Volumes

---

VINP, *NV1*, *NV2*, *NV3*, *NV4*, *NV5*, *NV6*, *NV7*, *NV8*, *NV9*

Finds the pairwise intersection of volumes.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1, NV2, NV3, . . . , NV9

Numbers of volumes to be intersected pairwise. If *NV1* = ALL, *NV2* to *NV9* are ignored and the pairwise intersection of all selected volumes is found. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1*.

Notes

Finds the pairwise intersection of volumes. The pairwise intersection is defined as all regions shared by any two or more volumes listed on this command. New volumes will be generated where the original volumes intersect pairwise. If the regions of pairwise intersection are only areas, new areas will be generated. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Intersect>Pairwise>Volumes

---

VINV, *NV1*, *NV2*, *NV3*, *NV4*, *NV5*, *NV6*, *NV7*, *NV8*, *NV9*

Finds the intersection of volumes.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1, NV2, NV3, . . . , NV9

Numbers of volumes to be intersected. If *NV1* = ALL, *NV2* to *NV9* are ignored, and the intersection of all selected volumes is found. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1*.

Notes

Finds the common (not pairwise) intersection of volumes. The common intersection is defined as the regions shared (in common) by **all** volumes listed on this command. New volumes will be generated where the original volumes intersect. If the regions of intersection are only areas, new areas will be generated instead. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Intersect>Common>Volumes

---

*VITRP, *ParR*, *ParT*, *ParI*, *ParJ*, *ParK*

Forms an array parameter by interpolation of a table.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the resulting array parameter. See ***SET (p. 1720)** for name restrictions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ParT

The name of the TABLE array parameter. The parameter must exist as a dimensioned array of type TABLE (***DIM (p. 530)**).

ParI

Array parameter vector of I (row) index values for interpolation in *ParT*.

ParJ

Array parameter vector of J (column) index values for interpolation in *ParT* (which must be at least 2D).

ParK

Array parameter vector of K (depth) index values for interpolation in *ParT* (which must be 3D).

Notes

Forms an array parameter (of type ARRAY) by interpolating values of an array parameter (of type TABLE) at specified table index locations according to:

ParR = f(*ParT*, *Parl*, *ParJ*, *ParK*)

where *ParT* is the type TABLE array parameter, and *ParI*, *ParJ*, *ParK* are the type ARRAY array parameter vectors of index values for interpolation in *ParT*. See the ***DIM (p. 530)** command for TABLE and ARRAY declaration types. Linear interpolation is used. The starting array element number for the TABLE array (*ParT*) is not used (but a value must be input). Starting array element numbers must be defined for each array parameter vector if it does not start at the first location. For example, ***VITRP (p. 2134)**,R(5),TAB(1,1),X(2),Y(4) uses the second element of X and the fourth element of Y as index values (row and column) for a 2D interpolation in TAB and stores the result in the fifth element of R. Operations continue on successive array elements (***VLEN (p. 2136)**, ***VMASK (p. 2139)**) with the default being all successive elements. Absolute values and scale factors may be applied to the result parameter (***VABS (p. 2072)**, ***VFACT (p. 2092)**). Results may be cumulative (***VCUM (p. 2080)**). See the ***VOPER (p. 2142)** command for details.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Vector Interpolate

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***VLEN**, *NROW*, *NINC*

Specifies the number of rows to be used in array parameter operations.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

NROW

Number of rows to be used with the ***V*XX** or ***M*XX** operations. Defaults to the number of rows needed to fill the result array.

NINC

Perform the operation on every *NINC* row (defaults to 1).

Command Default

Fill all locations of the result array from the specified starting location.

Notes

Specifies the number of rows to be used in array parameter operations. The size of the submatrix used is determined from the upper left starting array element (defined on the operation command) to the lower right array element (defined by the number of rows on this command and the number of columns on the ***VCOL (p. 2077)** command). *NINC* allows skipping row operations for some operation commands. Skipped rows are included in the row count. The starting row number must be defined on the operation command for each parameter read and for the result written.

The default *NROW* is calculated from the maximum number of rows of the result array (the ***DIM (p. 530)** row dimension) minus the starting location + 1. For example, ***DIM (p. 530)**,R,,10 and a starting location of R(7) gives a default of 4 loops (filling R(7), R(8), R(9), and R(10)). Repeat operations automatically terminate at the last row of the result array. Existing values in the rows and columns of the results matrix remain unchanged where not overwritten by the requested input or operation values.

The stride (*NINC*) allows operations to be performed at regular intervals. It has no effect on the total number of row operations. Skipped operations retain the previous result. For example, ***DIM (p. 530)**,R,,6, with a starting location of R(1), *NROW* = 10, and *NINC* = 2 calculates values for locations R(1), R(3), and R(5) and retains values for locations R(2), R(4), and R(6). A more general skip control may be done by masking (***VMASK (p. 2139)**). The row control settings are *reset* to the defaults after each ***V*XX** or ***M*XX** operation. Use ***VSTAT (p. 2167)** to list settings.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Operation Settings

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VLIST, *NV1*, *NV2*, *NINC*

Lists the defined volumes.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1*, *NV2*, *NINC

List volumes from *NV1* to *NV2* (defaults to *NV1*) in steps of *NINC* (defaults to 1). If *NV1* = ALL (default), *NV2* and *NINC* are ignored and all selected volumes (**VSEL (p. 2163)**) are listed. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1* (*NV2* and *NINC* are ignored).

Notes

An attribute (TYPE, MAT, REAL, or ESYS) listed as a zero is unassigned; one listed as a positive value indicates that the attribute was assigned with the **VATT (p. 2075)** command (and will not be reset to zero if the mesh is cleared); one listed as a negative value indicates that the attribute was assigned using the attribute pointer [TYPE, MAT, REAL, or ESYS] that was active during meshing (and will be reset to zero if the mesh is cleared). A "-1" in the "nodes" column indicates that the volume has been meshed but there are no interior nodes. The volume size is listed only if a **VSUM (p. 2167)** command has been performed on the volume. Volume orientation attributes (KZ1 and KZ2) are listed only if a **VEORIENT (p. 2089)** command was previously used to define an orientation for the volume.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Volumes

VLSCALE, *NV1*, *NV2*, *NINC*, *RX*, *RY*, *RZ*, *KINC*, *NOELEM*, *IMOVE*

Generates a scaled set of volumes from a pattern of volumes.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1*, *NV2*, *NINC

Set of volumes (*NV1* to *NV2* in steps of *NINC*) that defines the pattern to be scaled. *NV2* defaults to *NV1*, *NINC* defaults to 1. If *NV1* = ALL, *NV2* and *NINC* are ignored and the pattern is defined by all selected volumes. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1* (*NV2* and *NINC* are ignored).

RX*, *RY*, *RZ

Scale factors to be applied to the X, Y, and Z keypoint coordinates in active coordinate system (*RR*, *R*θ, *RZ* for cylindrical; *RR*, *R*θ, *R*Φ for spherical). Note that the *R*θ and *R*Φ scale factors are interpreted

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

as angular *offsets*. For example, if CSYS = 1, *RX*, *RY*, *RZ* input of (1.5,10,3) would scale the specified keypoints 1.5 times in the radial and 3 times in the Z direction, while adding an offset of 10 degrees to the keypoints. Zero, blank, or negative scale factor values are assumed to be 1.0. Zero or blank angular offsets have no effect.

KINC

Increment to be applied to keypoint numbers for generated set. If zero, the lowest available keypoint numbers will be assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies whether nodes and elements are also to be generated:

0

Nodes and elements associated with the original volumes will be generated (scaled) if they exist.

1

Nodes and elements will *not* be generated.

IMOVE

Specifies whether volumes will be moved or newly defined:

0

Additional volumes will be generated.

1

Original volumes will be *moved* to new position (*KINC* and *NOELEM* are ignored). Use only if the old volumes are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Generates a scaled set of volumes (and their corresponding keypoints, lines, areas, and mesh) from a pattern of volumes. The MAT, TYPE, REAL, and ESYS attributes are based on the volumes in the pattern and not the current settings. Scaling is done in the active coordinate system. Volumes in the pattern could have been generated in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Scale>Volumes

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***VMASK**, *Par*

Specifies an array parameter as a masking vector.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Par

Name of the mask parameter. The starting subscript must also be specified.

Command Default

No mask parameter specified (use true for all operations).

Notes

Specifies the name of the parameter whose values are to be checked for each resulting row operation. The mask vector usually contains only 0 (for false) and 1 (for true) values. For each row operation the corresponding mask vector value is checked. A true value allows the operation to be done. A false value skips the operation (and retains the previous results). A mask vector can be created from direct input, such as M(1) = 1,0,0,1,1,0,1; or from the DATA function of the ***VFILL (p. 2097)** command. The NOT function of the ***VFUN (p. 2106)** command can be used to reverse the logical sense of the mask vector. The logical compare operations (LT, LE, EQ, NE, GE, and GT) of the ***VOPER (p. 2142)** command also produce a mask vector by operating on two other vectors. Any numeric vector can be used as a mask vector since the actual interpretation assumes values less than 0.0 are 0.0 (false) and values greater than 0.0 are 1.0 (true). If the mask vector is not specified (or has fewer values than the result vector), true (1.0) values are assumed for the unspecified values. Another skip control may be input with *NINC* on the ***VLEN (p. 2136)** command. If both are present, operations occur only when both are true. The mask setting is *reset* to the default (no mask) after each ***V*XX** or ***M*XX** operation. Use ***VSTAT (p. 2167)** to list settings.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Operation Settings

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VMESH,*NV1*,*NV2*,*NINC*

Generates nodes and volume elements within volumes.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1*, *NV2*, *NINC

Mesh volumes from *NV1* to *NV2* (defaults to *NV1*) in steps of *NINC* (defaults to 1). If *NV1* = ALL, *NV2* and *NINC* are ignored and all selected volumes (**VSEL (p. 2163)**) are meshed. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1* (*NV2* and *NINC* are ignored).

Notes

Missing nodes required for the generated elements are created and assigned the lowest available numbers (**NUMSTR (p. 1301)**). During a batch run and if elements already exist, a mesh abort will write an alternative database file (`File.dbe`) for possible recovery.

Tetrahedral mesh expansion (**MOPT (p. 1151)**,TETEXPND,*Value*) is supported for both the **VMESH (p. 2140)** and **FVMESH (p. 784)** commands.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh>Volumes>Free

Main Menu>Preprocessor>Meshing>Mesh>Volumes>Mapped>4 to 6 sided

VOFFST,*NAREA*,*DIST*,*KINC*

Generates a volume, offset from a given area.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NAREA

Area from which generated volume is to be offset. If *NAREA* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

DIST

Distance normal to given area at which keypoints for generated volume are to be located. Positive normal is determined from the right-hand rule keypoint order.

KINC

Increment to be applied to the keypoint numbers between sets. If zero, keypoint numbers will be automatically assigned beginning with the lowest available value (**NUMSTR (p. 1301)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Generates a volume (and its corresponding keypoints, lines, and areas) by offsetting from an area. The direction of the offset varies with the given area normal. End slopes of the generated lines remain the same as those of the given pattern.

If element attributes have been associated with the input area via the **AATT (p. 85)** command, the opposite area generated by the **VOFFST (p. 2140)** operation will also have those attributes (that is, the element attributes from the input area are copied to the opposite area). Note that only the area opposite the input area will have the same attributes as the input area; the areas adjacent to the input area will not.

If the areas are meshed or belong to meshed volumes, a 3D mesh can be extruded with this command. Note that the *NDIV* argument on the **ESIZE (p. 668)** command should be set before extruding the meshed areas.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Extrude>Areas>Along Normal

---

VOLUMES

Specifies "Volumes" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and appear in the log file (`Jobname.log`) if status is requested for some items by choosing **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*VOPER,*ParR*,*Par1*,*Oper*,*Par2*,*CON1*,*CON2*

Operates on two array parameters.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the resulting array parameter vector. See ***SET (p. 1720)** for name restrictions.

Par1

First array parameter vector in the operation. May also be a scalar parameter or a literal constant.

Oper

Operations:

ADD--

Addition: *Par1*+*Par2*.

SUB --

Subtraction: *Par1*-*Par2*.

MULT --

Multiplication: *Par1***Par2*.

DIV --

Division: *Par1*/*Par2* (a divide by zero results in a value of zero).

MIN --

Minimum: minimum of *Par1* and *Par2*.

MAX --

Maximum: maximum of *Par1* and *Par2*.

LT --

Less than comparison: *Par1*<*Par2* gives 1.0 if true, 0.0 if false.

LE --

Less than or equal comparison: *Par1* ≤ *Par2* gives 1.0 if true, 0.0 if false.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EQ --

Equal comparison: *Par1* = *Par2* gives 1.0 if true, 0.0 if false.

NE --

Not equal comparison: *Par1* ≠ *Par2* gives 1.0 if true, 0.0 if false.

GE --

Greater than or equal comparison: *Par1* ≥ Par2 gives 1.0 if true, 0.0 if false.

GT --

Greater than comparison: *Par1*>*Par2* gives 1.0 if true, 0.0 if false.

DER1 --

First derivative: d(*Par1*)/d(*Par2*). The derivative at a point is determined over points half way between the previous and next points (by linear interpolation). *Par1* must be a function (a unique *Par1* value for each *Par2* value) and *Par2* must be in ascending order.

DER2 --

Second derivative: d^2(*Par1*)/d(*Par2*)^2. See also DER1.

INT1 --

Single integral: $\int$ *Par1* d(*Par2*), where *CON1* is the integration constant. The integral at a point is determined by using the single integration procedure described in the *Mechanical APDL Theory Reference*.

INT2 --

Double integral: $\int\int$ *Par1* d(*Par2*), where *CON1* is the integration constant of the first integral and *CON2* is the integration constant of the second integral. If *Par1* contains acceleration data, *CON1* is the initial velocity and *CON2* is the initial displacement. See also INT1.

DOT --

Dot product: *Par1* . *Par2*. *Par1* and *Par2* must each have three consecutive columns of data, with the columns containing the i, j, and k vector components, respectively. Only the starting row index and the column index for the i components are specified for *Par1* and *Par2*, such as A(1,1). The j and k components of the vector are assumed to begin in the corresponding next columns, such as A(1,2) and A(1,3).

CROSS --

Cross product: *Par1* x *Par2*. *Par1*, *Par2*, and *ParR* must each have 3 components, respectively. Only the starting row index and the column index for the i components are specified for *Par1*, *Par2*, and *ParR*, such as A(1,1). The j and k components of the vector are assumed to begin in the corresponding next columns, such as A(1,2) and A(1,3).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

GATH --

Gather: For a vector of position numbers, *Par2*, copy the value of *Par1* at each position number to *ParR*. Example: for *Par1* = 10,20,30,40 and *Par2* = 2,4,1; *ParR* = 20,40,10.

SCAT --

Scatter: Opposite of GATH operation. For a vector of position numbers, *Par2*, copy the value of *Par1* to that position number in *ParR*. Example: for *Par1* = 10,20,30,40,50 and *Par2* = 2,1,0,5,3; *ParR* = 20,10,50,0,40.

ATN2 --

Arctangent: arctangent of *Par1*/*Par2* with the sign of each component considered.

LOCAL --

Transform the data in *Par1* from the global Cartesian coordinate system to the local coordinate system given in *CON1*. *Par1* must be an *N x 3* (that is, vector) or an *N x 6* (that is, stress or strain tensor) array. If the local coordinate system is a cylindrical, spherical, or toroidal system, then you must provide the global Cartesian coordinates in *Par2* as an *N x 3* array. Set *CON2* = 1 if the data is strain data.

GLOBAL --

Transform the data in *Par1* from the local coordinate system given in *CON1* to the global Cartesian coordinate system. *Par1* must be an *N x 3* (that is, vector) or an *N x 6* (that is, stress or strain tensor) array. If the local coordinate system is a cylindrical, spherical, or toroidal system, then you must provide the global Cartesian coordinates in *Par2* as an *N x 3* array. Set *CON2* = 1 if the data is strain data.

Par2

Second array parameter vector in the operation. May also be a scalar parameter or a literal constant.

CON1

First constant (used only with the INT1 and INT2 operations).

CON2

Second constant (used only with the INT2 operation).

Notes

Operates on two input array parameter vectors and produces one output array parameter vector according to:

ParR = *Par1* o *Par2*

where the operations (o) are described below. *ParR* can be the same as *Par1* or *Par2*.

Absolute values and scale factors can be applied to all parameters (***VABS (p. 2072)**, ***VFACT (p. 2092)**). Results can be cumulative (***VCUM (p. 2080)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Starting array element numbers must be defined for each array parameter vector if it does not start at the first location, such as ***VOPER (p. 2142)**,A,B(5),ADD,C(3) which adds the third element of C to the fifth element of B and stores the result in the first element of A.

Operations continue on successive array elements (***VLEN (p. 2136)**, ***VMASK (p. 2139)**) with the default being all successive elements.

Skipping array elements via ***VMASK (p. 2139)** or ***VLEN (p. 2136)** for the DER_ and INT_ functions skips only the writing of the results (skipped array element data are used in all calculations).

Parameter functions and operations are available to operate on a scalar parameter or a single element of an array parameter, such as SQRT(B) or SQRT(A(4)). (See ***SET (p. 1720)** for more information.)

Operations on a sequence of array elements can be performed by repeating the desired function or operation in a do-loop (***DO (p. 567)**). The vector operations within Mechanical APDLm (***V*XX** commands) are internally programmed do-loops that conveniently perform the indicated operation over a sequence of array elements. If the array is multidimensional, only the first subscript is incremented in the do-loop; that is, the operation repeats in column vector fashion down the array. For example, for A(1,5), A(2,5), A(3,5), etc. The starting location of the row index must be defined for each parameter read and for the result written.

The default number of loops is from the starting result location to the last result location and can be altered via ***VLEN (p. 2136)**.

A logical mask vector can be defined to control at which locations the operations are to be skipped (***VMASK (p. 2139)**). The default is to skip no locations.

Repeat operations automatically terminate at the last array element of the result array column if the number of loops is undefined or if it exceeds the last result array element.

Zeroes are used in operations for values read beyond the last array element of an input array column. Existing values in the rows and columns of the results matrix remain unchanged where not changed by the requested operation values.

The result array column may be the same as the input array column, as results in progress are stored in a temporary array until being moved to the results array at the end of the operation. Results may be overwritten or accumulated with the existing results (***VCUM (p. 2080)**). The default is to overwrite results.

The absolute value can be used for each parameter read or written (***VABS (p. 2072)**). A scale factor (defaulting to 1.0) is also applied to each parameter read and written (***VFACT (p. 2092)**).

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Vector Operations

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VOVLAP, *NV1*, *NV2*, *NV3*, *NV4*, *NV5*, *NV6*, *NV7*, *NV8*, *NV9*

Overlaps volumes.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1, NV2, NV3, . . . , NV9

Numbers of volumes to be operated on. If *NV1* = ALL, *NV2* to *NV9* are ignored and all selected volumes are used. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1*.

Notes

Overlaps volumes. Generates new volumes which encompass the geometry of all the input volumes. The new volumes are defined by the regions of intersection of the input volumes, and by the complementary (non-intersecting) regions. See the *Modeling and Meshing Guide* for an illustration. This operation is only valid when the region of intersection is a volume. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Overlap>Volumes

***VPLOT**, *ParX*, *ParY*, *Y2*, *Y3*, *Y4*, *Y5*, *Y6*, *Y7*, *Y8*

Graphs columns (vectors) of array parameters.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParX

Name of the array parameter whose column vector values will be the abscissa of the graph. If blank, row subscript numbers are used instead. *ParX* is not sorted by the program.

ParY

Name of the array parameter whose column vector values will be graphed against the *ParX* values.

Y2, Y3, Y4, . . . , Y8

Additional column subscript of the *ParY* array parameter whose values are to be graphed against the *ParX* values.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The column to be graphed and the starting row for each array parameter must be specified as subscripts. Additional columns of the *ParY* array parameter may be graphed by specifying column numbers for *Y2*, *Y3*, ...,*Y8*. For example, ***VPLOT (p. 2146)**,TIME (4,6), DISP (8,1),2,3 specifies that the 1st, 2nd, and 3rd columns of array parameter DISP (all starting at row 8) are to be graphed against the 6th column of array parameter TIME (starting at row 4). The columns are graphed from the starting row to their maximum extent. See the ***VLEN (p. 2136)** and ***VMASK (p. 2139)** commands to limit or skip data to be graphed. The array parameters specified on the ***VPLOT (p. 2146)** command must be of the same type (type ARRAY or TABLE; (***DIM (p. 530)**). Arrays of type TABLE are graphed as continuous curves. Arrays of type ARRAY is displayed in bar chart fashion.

The normal curve labeling scheme for ***VPLOT (p. 2146)** is to label curve 1 "COL 1", curve 2 "COL 2" and so on. You can use the **/GCOLUMN (p. 795)** command to apply user-specified labels (8 characters maximum) to your curves. See Modifying Curve Labels in the *Ansys Parametric Design Language Guide* for more information on using **/GCOLUMN (p. 795)**.

When a graph plot reaches minimum or maximum y-axis limits, the program indicates the condition by clipping the graph. The clip appears as a horizontal magenta line. Mechanical APDL calculates y-axis limits automatically; however, you can modify the (YMIN and YMAX) limits via the **/YRANGE (p. 2201)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>Plot>Array Parameters

VPLOT,*NV1*,*NV2*,*NINC*,*DEGEN*,*SCALE*

Displays the selected volumes.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1*, *NV2*, *NINC

Display volumes from *NV1* to *NV2* (defaults to *NV1*) in steps of *NINC* (defaults to 1). If *NV1* = ALL (default), *NV2* and *NINC* are ignored and all selected volumes (**VSEL (p. 2163)**) are displayed.

DEGEN

Degeneracy marker:

(blank)

No degeneracy marker is used (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DEGE

A red star is placed on keypoints at degeneracies (see the *Modeling and Meshing Guide*). Not available if **/FACET (p. 731)**,WIRE is set.

SCALE

Scale factor for the size of the degeneracy-marker star. The scale is the size in window space (-1 to 1 in both directions) (defaults to .075).

Notes

Displays selected volumes. (Only volumes having areas within the selected area set (**ASEL (p. 192)**) will be plotted.) With PowerGraphics on (**/GRAPHICS (p. 866)**,POWER), **VPLOT (p. 2147)** will display only the currently selected areas. This command is also a utility command, valid anywhere. The degree of tessellation used to plot the volumes is set through the **/FACET (p. 731)** command.

Menu Paths

Main Menu>Preprocessor>Modeling>Check Geom>Show Degeneracy>Plot Degen Volus

Utility Menu>Plot>Volumes

VPTN, *NV1*, *NV2*, *NV3*, *NV4*, *NV5*, *NV6*, *NV7*, *NV8*, *NV9*

Partitions volumes.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1, NV2, NV3, . . . , NV9

Numbers of volumes to be operated on. If *NV1* = ALL, *NV2* to *NV9* are ignored and all selected volumes are used. If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1*.

Notes

Partitions volumes. Generates new volumes which encompass the geometry of all the input volumes. The new volumes are defined by the regions of intersection of the input volumes, and by the complementary (non-intersecting) regions. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Partition>Volumes

---

*VPUT,*ParR*,*Entity*,*ENTNUM*,*Item1*,*IT1NUM*,*Item2*,*IT2NUM*,*KLOOP*

Restores array parameter values into the Mechanical APDL database.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the input vector array parameter. See ***SET (p. 1720)** for name restrictions. The parameter must exist as a dimensioned array (***DIM (p. 530)**) with data input.

Entity

Entity keyword. Valid keywords are shown for *Entity* = in the table below.

ENTNUM

The number of the entity (as shown for *ENTNUM*= in the table below).

Item1

The name of a particular item for the given entity. Valid items are as shown in the *Item1* columns of the table below.

IT1NUM

The number (or label) for the specified *Item1* (if any). Valid *IT1NUM* values are as shown in the *IT1NUM* columns of the table below. Some *Item1* labels do not require an *IT1NUM* value.

Item2, IT2NUM

A second set of item labels and numbers to further qualify the item for which data is to be stored. Most items do not require this level of information.

KLOOP

Field to be looped on:

0 or 2 --

Loop on the *ENTNUM* field (default).

3 --

Loop on the *Item1* field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4 --

Loop on the *IT1NUM* field. Successive items are as shown with *IT1NUM*.

5 --

Loop on the *Item2* field.

6 --

Loop on the *IT2NUM* field. Successive items are as shown with *IT2NUM*.

Notes

The ***VPUT (p. 2149)** command is not supported for PowerGraphics displays. Inconsistent results may be obtained if this command is not used in **/GRAPHICS (p. 866)**, FULL.

Plot and print operations entered via the GUI (**Utility Menu> Pltcrtls, Utility Menu> Plot**) incorporate the **AVPRIN (p. 210)** command. This means that the principal and equivalent values are recalculated. If you use ***VPUT (p. 2149)** to put data back into the database, issue the plot commands from the command line to preserve your data.

This operation is basically the inverse of the ***VGET (p. 2118)** operation. Vector items are put directly (without any coordinate system transformation) into the Mechanical APDL database. Items can only replace existing items of the database and not create new items. Degree of freedom results that are replaced in the database are available for all subsequent postprocessing operations. Other results are changed temporarily and are available mainly for the immediately following print and display operations. The vector specification ***VCUM (p. 2080)** does not apply to this command. The valid labels for the location fields (*Entity*, *ENTNUM*, *Item1*, and *IT1NUM*) are listed below. *Item2* and *IT2NUM* are not currently used. Not all items from the ***VGET (p. 2118)** list are allowed on ***VPUT (p. 2149)**, as putting values into some locations could cause the database to be inconsistent.

This command is valid in any processor.

Table 247: *VPUT - POST1 Items

***Entity* = NODE, *ENTNUM* = *n* (node number)**

Item1	IT1NUM	Description
Valid labels for nodal degree of freedom results are:		
U	X, Y, Z	X, Y, or Z structural displacement.
ROT	X, Y, Z	X, Y, or Z structural rotation.
TEMP		Temperature. For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use TBOT, TE2, TE3, . . ., TTOP instead of TEMP. Alternative get functions: TEMP(N), TBOT(N), TE2(N), etc.
PRES		Pressure.
VOLT		Electric potential.
MAG		Magnetic scalar potential.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= NODE,** ***ENTNUM*** **=** ***n*** **(node number)**

Item1	IT1NUM	Description
V	X, Y, Z	X, Y, or Z fluid velocity. X, Y, or Z nodal velocity in a transient structural analysis (analysis with **ANTYPE (p. 162)**,TRANS).
A	X, Y, Z	X, Y, or Z magnetic vector potential. X, Y, or Z nodal acceleration in a transient structural analysis (analysis with **ANTYPE (p. 162)**,TRANS).
CONC		Concentration.
CURR		Current.
EMF		Electromotive force drop.

Valid labels for element nodal results are:

Item1	IT1NUM	Description
S	X, Y, Z, XY, YZ, XZ	Component stress.
"	1, 2, 3	Principal stress.
"	INT, EQV	Stress intensity or equivalent stress.
EPTO	X, Y, Z, XY, YZ, XZ	Component total strain (EPEL + EPPL + EPCR).
"	1,2,3	Principal total strain.
"	INT, EQV	Total strain intensity or total equivalent strain.
EPEL	X, Y, Z, XY, YZ, XZ	Component elastic strain.
"	1, 2, 3	Principal elastic strain.
"	INT, EQV	Elastic strain intensity or elastic equivalent strain.
EPPL	X, Y, Z, XY, YZ, XZ	Component plastic strain.
"	1,2,3	Principal plastic strain.
"	INT, EQV	Plastic strain intensity or plastic equivalent strain.
EPCR	X, Y, Z, XY, YZ, XZ	Component creep strain.
"	1, 2, 3	Principal creep strain.
"	INT, EQV	Creep strain intensity or creep equivalent strain.
EPTH	X, Y, Z, XY, YZ, XZ	Component thermal strain.
"	1, 2, 3	Principal thermal strain.
"	INT, EQV	Thermal strain intensity or thermal equivalent strain.
EPSW		Swelling strain.
NL	SEPL	Equivalent stress (from stress-strain curve).
"	SRAT	Stress state ratio.
"	HPRES	Hydrostatic pressure.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= NODE,** ***ENTNUM*** **=** ***n*** **(node number)**

Item1	IT1NUM	Description
"	EPEQ	Accumulated equivalent plastic strain.
"	CREQ	Accumulated equivalent creep strain.
"	PSV	Plastic state variable.
"	PLWK	Plastic work/volume.
TG	X, Y, Z	Component thermal gradient.
TF	X, Y, Z	Component thermal flux.
PG	X, Y, Z	Component pressure gradient.
EF	X, Y, Z	Component electric field.
D	X, Y, Z	Component electric flux density.
H	X, Y, Z	Component magnetic field intensity.
B	X, Y, Z	Component magnetic flux density.
FMAG	X, Y, Z	Component electromagnetic force.

Entity **= ELEM,** ***ENTNUM*** **=** ***n*** **(element number)**

Valid labels for element results are:

Item1	IT1NUM	Description
ETAB	Lab	Any user-defined element table label (**ETABLE (p. 687)**).

Menu Paths

Utility Menu>Parameters>Array Operations>Put Array Data

VPUT,*Par*,*IR*,*TSTRT*,*KCPLX*,*Name*

Moves an array parameter vector into a variable.

POST26 (p. 58): Special Purpose (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Par

Array parameter vector in the operation.

IR

Arbitrary reference number assigned to this variable (1 to *NV* (**NUMVAR (p. 1302)**)). Overwrites any existing results for this variable.

TSTRT

Time (or frequency) corresponding to start of *IR* data. If between values, the nearer value is used.

KCPLX

Complex number key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Use the real part of the *IR* data.

1

Use the imaginary part of the *IR* data.

Name

Thirty-two character name identifying the item on printouts and displays. Defaults to the label formed by concatenating VPUT with the reference number *IR*.

Notes

At least one variable should be defined (**NSOL (p. 1281)**, **ESOL (p. 672)**, **RFORCE (p. 1607)**, etc.) before using this command. The starting array element number must be defined. For example, **VPUT (p. 2152)**,A(1),2 moves array parameter A to variable 2 starting at time 0.0. Looping continues from array element A(1) with the index number incremented by one until the variable is filled. Unfilled variable locations are assigned a zero value. The number of loops may be controlled with the ***VLEN (p. 2136)** command (except that loop skipping (NINC) is not allowed). For multi-dimensioned array parameters, only the first (row) subscript is incremented.

Menu Paths

Main Menu>TimeHist Postpro>Table Operations>Parameter to Var

***VREAD**,*ParR*,*Fname*,*Ext*,--,*Label*,*n1*,*n2*,*n3*,*NSKIP*

Reads data and produces an array parameter vector or matrix.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the resulting array parameter vector. See ***SET (p. 1720)** for name restrictions. The parameter must exist as a dimensioned array (***DIM (p. 530)**). String arrays are limited to a maximum of 8 characters.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

If the *Fname* field is left blank, reading continues from the current input device, such as the terminal.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ext

Filename extension (eight-character maximum).

--

Unused field.

Label

Can take a value of IJK, IKJ, JIK, JKI, KIJ, KJI, or blank (IJK).

n1, n2, n3

Read as (((*ParR* (i,j,k), k = 1,n1), i = 1, n2), j = 1, n3) for *Label* = KIJ. *n2* and *n3* default to 1.

NSKIP

Number of lines at the beginning of the file being read that will be skipped during the reading. Default = 0.

Notes

Reads data from a file and fills in an array parameter vector or matrix. Data are read from a formatted file or, if the menu is off (**/MENU (p. 1121)**,OFF) and *Fname* is blank, from the next input lines. The format of the data to be read must be input immediately following the ***VREAD (p. 2153)** command. The format specifies the number of fields to be read per record, the field width, and the placement of the decimal point (if none specified in the value). The read operation follows the available FORTRAN FORMAT conventions of the system (see your system FORTRAN manual). Any standard FORTRAN *real* format (such as (4F6.0), (E10.3,2X,D8.2), etc.) or alphanumeric format (A) may be used. Alphanumeric strings are limited to a maximum of 8 characters for any field (A8). For storage of string arrays greater than 8 characters, the *SREAD command can be used. Integer (I) and list-directed (*) descriptors may *not* be used. *The parentheses must be included in the format* and the format must not exceed 80 characters (including parentheses). The input line length is limited to 128 characters.

A starting array element number must be defined for the result array parameter vector (numeric or character). For example, entering these two lines:

```
*VREAD,A(1),ARRAYVAL
(2F6.0)
```

will read two values from each line of file ARRAYVAL and assign the values to A(1), A(2), A(3), etc. Reading continues until successive row elements (***VLEN (p. 2136)**, ***VMASK (p. 2139)**, ***DIM (p. 530)**) are filled.

For an array parameter matrix, a starting array element row and column number must be defined. For example, entering these two lines:

```
*VREAD,A(1,1),ARRAYVAL,,,IJK,10,2
(2F6.0)
```

will read two values from each line of file ARRAYVAL and assign the values to A(1,1), A(2,1), A(3,1), etc. Reading continues until *n1* (10) successive row elements are filled. Once the maximum row number is reached, subsequent data will be read into the next column (for example, A(1,2), A(2,2), A(3,2), etc.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For numerical parameters, absolute values and scale factors may be applied to the result parameter (***VABS (p. 2072)**, ***VFACT (p. 2092)**). Results may be cumulative (***VCUM (p. 2080)**). See the ***VOPER (p. 2142)** command for details. If you are in the GUI the ***VREAD (p. 2153)** command must be contained in an externally prepared file read into Mechanical APDL (that is, ***USE (p. 2059)**, **/INPUT (p. 948)**, etc.).

This command is not applicable to 4- or 5-D arrays.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Parameters>Read from File

VROTAT, *NA1*, *NA2*, *NA3*, *NA4*, *NA5*, *NA6*, *PAX1*, *PAX2*, *ARC*, *NSEG*

Generates cylindrical volumes by rotating an area pattern about an axis.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1, NA2, NA3, . . . , NA6

List of areas in the pattern to be rotated (6 maximum if using keyboard entry). Areas must lie to one side of, and in the plane of, the axis of rotation. If *NA1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). If *NA1* = ALL, all selected areas will define the pattern to be rotated. A component name may also be substituted for *NA1*.

PAX1, PAX2

Keypoints defining the axis about which the area pattern is to be rotated.

ARC

Arc length (in degrees). Positive follows right-hand rule about *PAX1-PAX2* vector. Defaults to 360.

NSEG

Number of volumes (8 maximum) around circumference. Defaults to minimum required for 90° (maximum) arcs, that is, 4 for 360°, 3 for 270°, etc.

Notes

Generates cylindrical volumes (and their corresponding keypoints, lines, and areas) by rotating an area pattern (and its associated line and keypoint patterns) about an axis. Keypoint patterns are generated at regular angular locations (based on a maximum spacing of 90°). Line patterns are generated at the keypoint patterns. Arc lines are also generated to connect the keypoints circumferentially. Keypoint, line, area, and volume numbers are automatically assigned (beginning with the lowest available values). Adjacent lines use a common keypoint, adjacent areas use a common line, and adjacent volumes use a common area.

To generate a single volume with an arc greater than 180°, *NSEG* must be greater than or equal to 2.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If element attributes have been associated with the input area via the **AATT (p. 85)** command, the opposite area generated by the **VROTAT (p. 2155)** operation will also have those attributes (that is, the element attributes from the input area are copied to the opposite area). Note that only the area opposite the input area will have the same attributes as the input area; the areas adjacent to the input area will not.

If the given areas are meshed or belong to meshed volumes, the 2D mesh can be rotated (extruded) to a 3D mesh. See the *Modeling and Meshing Guide* for more information. Note that the *NDIV* argument on the **ESIZE (p. 668)** command should be set before extruding the meshed areas.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Extrude>Areas>About Axis

---

VSBA, *NV*, *NA*, *SEP0*, *KEEPV*, *KEEPA*

Subtracts areas from volumes.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV

Volume (or volumes, if picking is used) to be subtracted from. If ALL, use all selected volumes. If P, graphical picking is enabled (valid only in the GUI) and remaining fields are ignored. A component name may also be substituted for *NV*.

NA

Area (or areas, if picking is used) to subtract. If ALL, use all selected areas. A component name may also be substituted for *NA*.

SEP0

Behavior of the touching boundary:

(blank)

The resulting volumes will share area(s) where they touch.

SEPO

The resulting volumes will have separate, but coincident area(s) where they touch.

KEEPV

Specifies whether *NV* volumes are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DELETE

Delete *NV* volumes after **VSBA (p. 2156)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NV* volumes after **VSBA (p. 2156)** operation (override **BOPTN (p. 269)** command settings).

KEEPA

Specifies whether *NA* areas are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NA* areas after **VSBA (p. 2156)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NA* areas after **VSBA (p. 2156)** operation (override **BOPTN (p. 269)** command settings).

Notes

Generates new volumes by subtracting the regions common to both the volumes and areas (the intersection) from the *NV* volumes. The intersection will be an area(s). If *SEP0* is blank, the volume is divided at the area and the resulting volumes will be connected, sharing a common area where they touch. If *SEP0* is set to SEPO, the volume is divided into two unconnected volumes with separate areas where they touch. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>Volume by Area

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>With Options>Volume by Area

---

VSBV, *NV1*, *NV2*, *SEP0*, *KEEP1*, *KEEP2*

Subtracts volumes from volumes.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV1

Volume (or volumes, if picking is used) to be subtracted from. If ALL, use all selected volumes. Volumes specified in set *NV2* are removed from set *NV1*. If P, graphical picking is enabled (valid

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

only in the GUI) and remaining fields are ignored. A component name may also be substituted for *NV1*.

NV2

Volume (or volumes, if picking is used) to subtract. If ALL, use all selected volumes (except those included in the *NV1* argument). A component name may also be substituted for *NV2*.

SEP0

Behavior if the intersection of the *NV1* volumes and the *NV2* volumes is an area or areas:

(blank)

The resulting volumes will share area(s) where they touch.

SEPO

The resulting volumes will have separate, but coincident area(s) where they touch.

KEEP1

Specifies whether *NV1* volumes are to be deleted:

(blank)

Use the setting of *KEEP* on the **BOPTN (p. 269)** command.

DELETE

Delete *NV1* volumes after **VSBV (p. 2157)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NV1* volumes after **VSBV (p. 2157)** operation (override **BOPTN (p. 269)** command settings).

KEEP2

Specifies whether *NV2* volumes are to be deleted:

(blank)

Use the setting of *KEEP* on the **BOPTN (p. 269)** command.

DELETE

Delete *NV2* volumes after **VSBV (p. 2157)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NV2* volumes after **VSBV (p. 2157)** operation (override **BOPTN (p. 269)** command settings).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Generates new volumes by subtracting the regions common to both *NV1* and *NV2* volumes (the intersection) from the *NV1* volumes. The intersection can be a volume(s) or area(s). If the intersection is an area and *SEP0* is blank, the *NV1* volume is divided at the area and the resulting volumes will be connected, sharing a common area where they touch. If *SEP0* is set to SEPO, *NV1* is divided into two unconnected volumes with separate areas where they touch. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated. **VSBV (p. 2157)**,ALL,ALL will have no effect because all the volumes in set *NV1*will have been moved to set *NV2*.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Subtract>Volumes

Main Menu>Preprocessor>Modeling>Operate>Booleans>Subtract>With Options>Volumes

Main Menu>Preprocessor>Modeling>Operate>Subract>Volumes

VSBW, *NV*, *SEP0*, *KEEP*

Subtracts intersection of the working plane from volumes (divides volumes).

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NV

Volume (or volumes, if picking is used) to be subtracted from. If *NV* = ALL, use all selected volumes. If *NV* = P, graphical picking is enabled (valid only in the GUI). A component name may also be input for *NV*.

SEP0

Behavior of the created boundary.

(blank)

The resulting volumes will share area(s) where they touch.

SEPO

The resulting volumes will have separate, but coincident area(s).

KEEP

Specifies whether *NV* volumes are to be deleted.

(blank)

Use the setting of *KEEP* on the **BOPTN (p. 269)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DELETE

Delete *NV* volumes after **VSBW (p. 2159)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NV* volumes after **VSBW (p. 2159)** operation (override **BOPTN (p. 269)** command settings).

Notes

Generates new volumes by subtracting the intersection of the working plane from the *NV* volumes. The intersection will be an area(s). If *SEPO* is blank, the volume is divided at the area and the resulting volumes will be connected, sharing a common area where they touch. If *SEPO* is set to SEPO, the volume is divided into two unconnected volumes with separate areas. The SEPO option may cause unintended consequences if any keypoints exist along the cut plane. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Issuing the **VSBW (p. 2159)** command under certain conditions may generate a topological degeneracy error. Do not issue the command if:

- A sphere or cylinder has been scaled. (A cylinder must be scaled unevenly in the XY plane.)
- A sphere or cylinder has not been scaled but the work plane has been rotated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>With Options>Volu by WrkPlane

Main Menu>Preprocessor>Modeling>Operate>Divide>Volu by WrkPlane

---

/VSCALE, *WN*, *VRATIO*, *KEY*

Scales the length of displayed vectors.

GRAPHICS (p. 16): Scaling (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

VRATIO

Ratio value applied to the automatically calculated scale factor (defaults to 1.0, that is, use scale factor as automatically calculated).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KEY

Relative scaling key:

0

Use relative length scaling among vectors based on magnitudes.

1

Use uniform length scaling for all vector lengths.

Command Default

Automatic vector scaling.

Notes

Allows scaling of the vector length displayed with the **PLVECT (p. 1445)** command of POST1 and the **/PBC (p. 1356)** and **/PSF (p. 1537)** commands. Also allows the scaling of the element (that is, **/PSYMB (p. 1552)**,ESYS) and the nodal (that is, **/PSYMB (p. 1552)**,NDIR) coordinate system symbols.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Multi-Plot Contrls

Utility Menu>PlotCtrls>Style>Vector Arrow Scaling

***VSCFUN**,*ParR*,*Func*,*Par1*

Determines properties of an array parameter.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

ParR

The name of the resulting scalar parameter. See ***SET (p. 1720)** for name restrictions.

Func

Functions:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MAX --

Maximum: the maximum *Par1* array element value.

MIN --

Minimum: the minimum *Par1* array element value.

LMAX --

Index location of the maximum *Par1* array element value. Array *Par1* is searched starting from its specified index.

LMIN --

Index location of the minimum *Par1* array element value. Array *Par1* is searched starting from its specified index.

FIRST --

Index location of the first nonzero value in array *Par1*. Array *Par1* is searched starting from its specified index.

LAST --

Index location of the last nonzero value in array *Par1*. Array *Par1* is searched starting from its specified index.

SUM --

Sum: *Par1* (the summation of the *Par1* array element values).

MEDI --

Median: value of *Par1* at which there are an equal number of values above and below.

MEAN --

Mean: (σ Par1)/NUM, where NUM is the number of summed values.

VARI --

Variance: (σ ((*Par1*-MEAN)**2))/NUM.

STDV --

Standard deviation: square root of VARI.

RMS --

Root-mean-square: square root of (σ (*Par1***2))/NUM.

NUM --

Number: the number of summed values (masked values are not counted).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Par1

Array parameter vector in the operation.

Notes

Operates on one input array parameter vector and produces one output scalar parameter according to:

ParR = f(*Par1*)

where the functions (f) are described below. The starting array element number must be defined for the array parameter vector. For example, ***VSCFUN (p. 2161)**,MU,MEAN,A(1) finds the mean of the A vector values, starting from the first value and stores the result as parameter MU. Operations use successive array elements (***VLEN (p. 2136)**, ***VMASK (p. 2139)**) with the default being all successive array elements. Absolute values and scale factors may be applied to all parameters (***VABS (p. 2072)**, ***VFACT (p. 2092)**). Results may be cumulative (***VCUM (p. 2080)**). See the ***VOPER (p. 2142)** command for details.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Operations>Vector-Scalar Func

VSEL, *Type*, *Item*, *Comp*, *VMIN*, *VMAX*, *VINC*, *KSWP*

Selects a subset of volumes.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of volume select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Restore the full set.

NONE

Unselect the full set.

INVE

Invert the current set (selected becomes unselected and vice versa).

STAT

Display the current select status.

The following fields are used only with *Type* = S, R, A, or U:

Item

Label identifying data. Valid item labels are shown in the table below. Some items also require a component label. If *Item* = PICK (or simply "P"), graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). Defaults to VOLU.

Comp

Component of the item (if required). Valid component labels are shown in the table below.

VMIN

Minimum value of item range. Ranges are volume numbers, coordinate values, attribute numbers, etc., as appropriate for the item. A component name (as specified on the **CM (p. 356)** command) may also be substituted for *VMIN* (*VMAX* and *VINC* are ignored). If *Item* = MAT, TYPE, REAL, or ESYS and if *VMIN* is positive, the absolute value of *Item* is compared against the range for selection; if *VMIN* is negative, the signed value of *Item* is compared. See the **VLIST (p. 2137)** command for a discussion of signed attributes.

VMAX

Maximum value of item range. *VMAX* defaults to *VMIN*.

VINC

Value increment within range. Used only with integer ranges (such as for volume numbers). Defaults to 1. *VINC* cannot be negative.

KSWP

Specifies whether only volumes are to be selected:

0

Select volumes only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Select volumes, as well as keypoints, lines, areas, nodes, and elements associated with selected volumes. Valid only with *Type* = S.

Command Default

All volumes are selected.

Notes

Selects volumes based on values of a labeled item and component. For example, to select a new set of volumes based on volume numbers 1 through 7, use **VSEL (p. 2163)**,S,VOLU,,1,7. The subset is used when the ALL label is entered (or implied) on other commands, such as **VLIST (p. 2137)**,ALL. Only data identified by volume number are selected. Data are flagged as selected and unselected; no data are actually deleted from the database.

This command is valid in any processor.

For Selects based on non-integer numbers (coordinates, results, etc.), items that are within the range VMIN-*Toler* and VMAX+*Toler* are selected. The default tolerance *Toler* is based on the relative values of VMIN and VMAX as follows:

- If VMIN = VMAX, *Toler* = 0.005 x VMIN.
- If VMIN = VMAX = 0.0, *Toler* = 1.0E-6.
- If VMAX ≠ VMIN, *Toler* = 1.0E-8 x (VMAX-VMIN).

Use the **SELTOL (p. 1710)** (p. 1710) command to override this default and specify *Toler* explicitly.

Table 248: VSEL (p. 2163) - Valid Item and Component Labels

VSEL (p. 2163) *Type, Item, Comp, VMIN, VMAX, VINC, KABS*

Item	Comp	Description
VOLU		Volume number.
LOC	X, Y, Z	X, Y, or Z center (picking "hot spot" location in the active coordinate system).
MAT		Material number associated with the volume.
TYPE		Element type number associated with the volume.
REAL		Real constant set number associated with the volume.
ESYS		Element coordinate system associated with the volume.

Menu Paths

Utility Menu>Select>Entities

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VSLA, *Type*, *VLKEY*

Selects those volumes containing the selected areas.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of volume select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

VLKEY

Specifies whether all contained volume areas must be selected (**ASEL (p. 192)**):

0

Select volume if any of its areas are in the selected area set.

1

Select volume only if all of its areas are in the selected area set.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*VSTAT

Lists the current specifications for the array parameters.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Lists the current specifications for the ***VABS (p. 2072)**, ***VCOL (p. 2077)**, ***VCUM (p. 2080)**, ***VFACT (p. 2092)**, ***VLEN (p. 2136)**, and ***VMASK (p. 2139)** commands.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

VSUM, *LAB*

Calculates and prints geometry statistics of the selected volumes.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LAB

Controls the degree of tessellation used in the calculation of area properties. If *LAB* = DEFAULT, area calculations will use the degree of tessellation set through the **/FACET (p. 731)** command. If *LAB* = FINE, area calculations are based on a finer tessellation.

Notes

Calculates and prints geometry statistics (volume, centroid location, moments of inertia, etc.) associated with the selected volumes. Geometry items are reported in the global Cartesian coordinate system. A unit density is assumed unless the volumes have a material association via the **VATT (p. 2075)** command. Items calculated by **VSUM (p. 2167)** and later retrieved by a ***GET (p. 797)** or ***VGET (p. 2118)** command are valid only if the model is not modified after the **VSUM (p. 2167)** command is issued.

Setting a finer degree of tessellation will provide area calculations with greater accuracy, especially for thin, hollow models. However, using a finer degree of tessellation requires longer processing.

For very thin volumes, such that the ratio of the minimum to the maximum dimension is less than 0.01, the **VSUM (p. 2167)** command can provide erroneous volume information. To ensure that such calculations are accurate, make certain that you subdivide such volumes so that the ratio of the minimum to the maximum is at least 0.05.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Calc Geom Items>Of Volumes

---

VSWEEP, *VNUM*, *SRCA*, *TRGA*, *LSMO*

Fills an existing unmeshed volume with elements by sweeping the mesh from an adjacent area through the volume.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VNUM

Number identifying the volume that is to be meshed by **VSWEEP (p. 2168)**. If *VNUM* = P, graphical picking is enabled, you will be prompted to choose the volume or volumes based on the setting of **EXTOPT (p. 722)**,VSWE,AUTO. This argument is required.

"ALL" is a valid input value that when selected sends all the selected volumes to the sweeper. If *VNUM* = ALL, each volume that can be swept will be and those not able to be swept will be unmeshed or meshed with tets depending upon the setting of **EXTOPT (p. 722)**,VSWE,TETS.

A component name is a valid input value. All volumes that are part of the specified component will be sent to the sweeper.

SRCA

Number identifying the source area. This is the area whose mesh will provide the pattern for the volume elements. (If you do not mesh the source area prior to volume sweeping, the program meshes it internally when you initiate volume sweeping.) The program sweeps the pattern of the area elements through the volume to create the mesh of volume elements. You cannot substitute a component name for *SRCA*.

This argument is optional. If *VNUM* = ALL or is a component containing more than one volume, *SRCA* is ignored. If *SRCA* is not provided or if it is ignored, **VSWEEP (p. 2168)** attempts to automatically determine which area should be the target area.

TRGA

Number identifying the target area. This is the area that is opposite the source area specified by *SRCA*. You cannot substitute a component name for *TRGA*.

This argument is optional. If *VNUM* = ALL or component containing more than one volume, *TRGA* is ignored. If *TRGA* is not provided or if it is ignored, **VSWEEP (p. 2168)** attempts to automatically determine which area should be the target area.

LSMO

Value specifying whether the program should perform line smoothing during volume sweeping. (The value of this argument controls line smoothing for the **VSWEEP (p. 2168)** command only; it has no effect on the setting of the **MOPT (p. 1151)** command's LSMO option.) This argument is optional.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Do not perform line smoothing. This is the default.

1

Always perform line smoothing. This setting is not recommended for large models due to speed considerations.

Notes

If the source mesh consists of quadrilateral elements, the program fills the volume with hexahedral elements. If the source mesh consists of triangles, the program fills the volume with wedges. If the source mesh consists of a combination of quadrilaterals and triangles, the program fills the volume with a combination of hexahedral and wedge elements.

In the past, you may have used the **VROTAT (p. 2155)**, **VEXT (p. 2091)**, **VOFFST (p. 2140)**, and/or **VDRAG (p. 2084)** commands to extrude a meshed area into a meshed volume. However, those commands create the volume and the volume mesh simultaneously. In contrast, the **VSWEEP (p. 2168)** command is intended for use in an existing unmeshed volume. This makes **VSWEEP (p. 2168)** particularly useful when you have imported a solid model that was created in another program, and you want to mesh it in Mechanical APDL.

For related information, see the description of the **EXTOPT (p. 722)** command (although **EXTOPT (p. 722)** sets volume sweeping options, it does not affect element spacing). Also see the detailed discussion of volume sweeping in Meshing Your Solid Model of the *Modeling and Meshing Guide*.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh>Volume Sweep>Sweep

VSYMM,*Ncomp*,*NV1*,*NV2*,*NINC*,*KINC*,*NOELEM*,*IMOVE*

Generates volumes from a volume pattern by symmetry reflection.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ncomp

Symmetry key:

X

X symmetry (default).

Y

Y symmetry.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Z

Z symmetry.

NV1, NV2, NINC

Reflect volumes from pattern beginning with *NV1* to *NV2* (defaults to *NV1*) in steps of *NINC* (defaults to 1). If *NV1* = ALL, *NV2* and *NINC* are ignored and the pattern is all selected volumes (**VSEL (p. 2163)**). If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1* (*NV2* and *NINC* are ignored).

KINC

Keypoint increment between sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies whether nodes and elements are also to be generated:

0

Generate nodes and elements associated with the original volumes, if they exist.

1

Do not generate nodes and elements.

IMOVE

Specifies whether volumes will be moved or newly defined:

0

Generate additional volumes.

1

Move original volumes to new position retaining the same keypoint numbers (*KINC* and *NOELEM* are ignored). Corresponding meshed items are also moved if not needed at their original position.

Notes

Generates a reflected set of volumes (and their corresponding keypoints, lines, areas and mesh) from a given volume pattern by a symmetry reflection (see analogous node symmetry command, **NSYM (p. 1289)**). The MAT, TYPE, REAL, and ESYS attributes are based upon the volumes in the pattern and not upon the current settings. Reflection is done in the active coordinate system by changing a particular coordinate sign. The active coordinate system must be a Cartesian system. Volumes in the pattern may have been generated in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended. Volumes are generated as described in the **VGEN (p. 2116)** command.

See the **ESYM (p. 684)** command for additional information about symmetry elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Reflect>Volumes

VTRAN, *KCNTO*, *NV1*, *NV2*, *NINC*, *KINC*, *NOELEM*, *IMOVE*

Transfers a pattern of volumes to another coordinate system.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCNTO

Reference number of coordinate system where the pattern is to be transferred. Transfer occurs from the active coordinate system. The coordinate system type and parameters of *KCNTO* must be the same as the active system.

NV1*, *NV2*, *NINC

Transfer volumes from pattern beginning with *NV1* to *NV2* (defaults to *NV1*) in steps of *NINC* (defaults to 1). If *NV1* = ALL, *NV2* and *NINC* are ignored and the pattern is all selected volumes (**VSEL (p. 2163)**). If *NV1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NV1* (*NV2* and *NINC* are ignored).

KINC

Keypoint increment between sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies whether elements and nodes are also to be generated:

0

Generate nodes and elements associated with the original volumes, if they exist.

1

Do not generate nodes and elements.

IMOVE

Specifies whether to redefine the existing volumes:

0

Generate additional volumes.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Move original volumes to new position retaining the same keypoint numbers (*KINC* and *NOELEM* are ignored). Corresponding meshed items are also moved if not needed at their original position.

Notes

Transfers a pattern of volumes (and their corresponding keypoints, lines, areas and mesh) from one coordinate system to another (see analogous node transfer command, **TRANSFER (p. 2011)**). The MAT, TYPE, REAL, and ESYS attributes are based upon the volumes in the pattern and not upon the current settings. Coordinate systems may be translated and rotated relative to each other. Initial pattern may be generated in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended. Coordinate and slope values are interpreted in the active coordinate system and are transferred directly. Volumes are generated as described in the **VGEN (p. 2116)** command.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Transfer Coord>Volumes

---

VTYPE, *NOHID*, *NZONE*

Specifies the viewing procedure used to determine the form factors for the Radiation Matrix method.

AUX12 (p. 62): Radiation Matrix Method (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NOHID

Type of viewing procedure:

0

Hidden procedure.

1

Non-hidden (faster, but less general) procedure.

NZONE

Number of sampling zones for the hidden procedure (100 maximum for 3D, 1000 maximum for 2D). Defaults to 20 for 3D, 200 for 2D. Number of points is 2**NZONE* for 2D and 2**NZONE**(*NZONE*+1) for 3D.

Command Default

Hidden procedure using 20 zones for 3D, 200 zones for 2D.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Radiation Opt>Matrix Method>Write Matrix

/VUP, *WN*, *Label*

Specifies the global Cartesian coordinate system reference orientation.

GRAPHICS (p. 16): Views (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

Label

Orientation:

Y

Y vertical upward, X horizontal to the right, Z out from the screen (default).

-Y

Y vertical downward, X horizontal to the left, Z out from the screen.

X

X vertical upward, Y horizontal to the left, Z out from the screen.

-X

X vertical downward, Y horizontal to the right, Z out from the screen.

Z

Z vertical upward, Y horizontal to the right, X out from the screen. With this choice, you should use a view other than the **/VIEW (p. 2131)** default of (0,0,1).

-Z

Z vertical downward, Y horizontal to the left, X out from the screen. With this choice, you should use a view other than the **/VIEW (p. 2131)** default of (0,0,1).

Command Default

Y vertical upward, X horizontal to the right, Z out from the screen.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Specifies the global Cartesian coordinate system reference orientation. The **/VIEW (p. 2131)** and **/ANGLE (p. 140)** commands may be used to reorient the view and are relative to this reference orientation. All coordinate systems are right-handed.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>View Settings>Viewing Direction

***VWRITE**,*Par1*,*Par2*,*Par3*,*Par4*,*Par5*,*Par6*,*Par7*,*Par8*,*Par9*,*Par10*,*Par11*,*Par12*,*Par13*,*Par14*,*Par15*,*Par16*,*Par17*,*Par18*,*Par19*

Writes data to a file in a formatted sequence.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Par1*, *Par2*, *Par3*, . . . , *Par19

You can write up to 19 parameters (or constants) at a time. Any *Par* values after a blank *Par* value are ignored. If you leave them all blank, one line will be written (to write a title or a blank line). If you input the keyword SEQU, a sequence of numbers (starting from 1) will be written for that item.

Notes

You use ***VWRITE (p. 2174)** to write data to a file in a formatted sequence. Data items (*Par1*, *Par2*, etc.) may be array parameters, scalar parameters, character parameters (scalar or array), or constants. You must evaluate expressions and functions in the data item fields before using the ***VWRITE (p. 2174)** command, since initially they will be evaluated to a constant and remain constant throughout the operation. Unless a file is defined with the ***CFOPEN (p. 316)** command, data is written to the standard output file. Data written to the standard output file may be diverted to a different file by first switching the current output file with the **/OUTPUT (p. 1334)** command. You can also use the ***MWRITE (p. 1202)** command to write data to a specified file. Both commands contain format descriptors on the line immediately following the command. The format descriptors can be in either FORTRAN or C format.

You must enclose FORTRAN format descriptors in parentheses. They must immediately follow the ***VWRITE (p. 2174)** command on a separate line of the same input file. Do not include the word FORMAT. The format must specify the number of fields to be written per line, the field width, the placement of the decimal point, etc. You should use one field descriptor for each data item written. The write operation uses your system's available FORTRAN FORMAT conventions (see your system FORTRAN manual). You can use any standard FORTRAN *real* format (such as (4F6.0), (E10.3,2X,D8.2), etc.) and alphanumeric format (A). Alphanumeric strings are limited to a maximum of 8 characters for any field (A8) using the FORTRAN format. Use the "C" format for string arrays larger than 8 characters. Integer (I) and list-directed (*) descriptors may *not* be used. You can include text in the format as a quoted string. *The parentheses*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

must be included in the format and the format must not exceed 80 characters (including parentheses). The output line length is limited to 128 characters.

The "C" format descriptors are used if the first character of the format descriptor line is not a left parenthesis. "C" format descriptors are up to 80 characters long, consisting of text strings and predefined "data descriptors" between the strings where numeric or alphanumeric character data will be inserted. The normal descriptors are %I for integer data, %G for double precision data, %C for alphanumeric character data, and %/ for a line break. There must be one data descriptor for each specified value (8 maximum) in the order of the specified values. The enhanced formats described in ***MSG (p. 1185)** may also be used.

For array parameter items, you must define the starting array element number. Looping continues (incrementing the vector index number of each array parameter by one) each time you output a line, until the maximum array vector element is written. For example, ***VWRITE (p. 2174)**,A(1) followed by (F6.0) will write one value per output line, that is, A(1), A(2), A(3), A(4), etc. You write constants and scalar parameters with the same values for each loop. You can also control the number of loops and loop skipping with the ***VLEN (p. 2136)** and ***VMASK (p. 2139)** commands. The vector specifications ***VABS (p. 2072)**, ***VFACT (p. 2092)**, and ***VCUM (p. 2080)** do not apply to this command. If looping continues beyond the supplied data array's length, zeros will be output for numeric array parameters and blanks for character array parameters. For multi-dimensioned array parameters, only the first (row) subscript is incremented. See the ***VOPER (p. 2142)** command for details. If you are in the GUI, the ***VWRITE (p. 2174)** command must be contained in an externally prepared file and read into Mechanical APDL (that is, ***USE (p. 2059)**, **/INPUT (p. 948)**, etc.).

If *Par* is a table array name, the subscripts refer to the index numbers of the table and not the index values of its primary variables. See ***SET (p. 1720)** if you want to evaluate a table array at certain values of its primary variables for writing.

This command is valid in any processor.

of ANSYS, Inc. and its subsidiaries and affiliates.

W Commands

/WAIT, *DTIME*

Causes a delay before the reading of the next command.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

DTIME

Time delay (in seconds). Maximum time delay is 59 seconds.

Notes

The command following the **/WAIT (p. 2177)** will not be processed until the specified wait time increment has elapsed. Useful when reading from a prepared input file to cause a pause, for example, after a display command so that the display can be reviewed for a period of time. Another "wait" feature is available via the ***ASK (p. 84)** command.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

/WINDOW, *WN*, *XMIN*, *XMAX*, *YMIN*, *YMAX*, *NCOPY*

Defines the window size on the screen.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window reference number (1 to 5). Defaults to 1. This number, or ALL (for all active windows), may be used on other commands.

XMIN, XMAX, YMIN, YMAX

Screen coordinates defining window size. Screen coordinates are measured as -1.0 to 1.67 with the origin at the screen center. For example, (-1,1.67,-1,1) is full screen, (-1,0,-1,0) is the left bottom

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

quadrant. If *XMIN* = OFF, deactivate this previously defined window; if ON, reactivate this previously defined window. If FULL, LEFT, RIGH, TOP, BOT, LTOP, LBOT, RTOP, RBOT, form full, half, or quarter window. If SQUA, form largest square window within the current graphics area. If DELE, delete this window (cannot be reactivated with ON).

NCOPY

Copies the current specifications from window *NCOPY* (1 to 5) to this window. If *NCOPY* = 0 (or blank), no specifications are copied.

Command Default

One window at full screen.

Notes

Defines the window size on the screen. Windows may occupy a separate section of the screen or they may overlap. Requested displays are formed in all windows according to the selected window specifications.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Window Controls>Copy Window Specs

WPAVE,*X1*,*Y1*,*Z1*,*X2*,*Y2*,*Z2*,*X3*,*Y3*,*Z3*

Moves the working plane origin to the average of specified points.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

X1, Y1, Z1

Coordinates (in the active coordinate system) of the first point. If *X1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

X2, Y2, Z2

Coordinates (in the active coordinate system) of the second point.

X3, Y3, Z3

Coordinates (in the active coordinate system) of the third point.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Moves the origin of the working plane to the average of the specified points. A point is considered specified only if at least one of its coordinates is non-blank, and at least one point (1, 2, or 3) must be specified. Blank coordinates of a specified point are assumed to be zero. Averaging is based on the active coordinate system.

This command is valid in any processor.

Menu Paths

Utility Menu>WorkPlane>Offset WP to>Global Origin

Utility Menu>WorkPlane>Offset WP to>Origin of Active CS

Utility Menu>WorkPlane>Offset WP to>XYZ Locations

WPCSYS, *WN*, *KCN*

Defines the working plane location based on a coordinate system.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number whose viewing direction will be modified to be normal to the working plane (defaults to 1). If *WN* is a negative value, the viewing direction will not be modified.

KCN

Coordinate system number. *KCN* may be 0,1,2 or any previously defined local coordinate system number (defaults to the active system).

Notes

Defines a working plane location and orientation based on an existing coordinate system. If a Cartesian system is used as the basis (*KCN*) for the working plane, the working plane will also be Cartesian, in the X-Y plane of the base system. If a cylindrical, spherical, or toroidal base system is used, the working plane will be a polar system in the R-θ plane of the base system.

If working plane tracking has been activated (**CSYS (p. 441)**,WP or **CSYS (p. 441)**,4), the updated active coordinate system will be of a similar type, except that a toroidal system will be updated to a cylindrical system. See the *Modeling and Meshing Guide* for more information on working plane tracking.

This command is valid in any processor.

Some primitive generation commands will not honor R-theta transformations for non-cartesian coordinate systems. Refer to the primitive commands table (p. 25) for more information.

Utility Menu>WorkPlane>Align WP with>Global Cartesian

Utility Menu>WorkPlane>Align WP with>Specified Coord Sys

WPLANE, *WN*, *XORIG*, *YORIG*, *ZORIG*, *XXAX*, *YXAX*, *ZXAX*, *XPLAN*, *YPLAN*, *ZPLAN*

Defines a working plane to assist in picking operations.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number whose viewing direction will be modified to be normal to the working plane (defaults to 1). If *WN* is a negative value, the viewing direction will not be modified. If fewer than three points are used, the viewing direction of window *WN* will be used instead to define the normal to the working plane.

XORIG*, *YORIG*, *ZORIG

Global Cartesian coordinates of the origin of the working plane coordinate system.

XXAX*, *YXAX*, *ZXAX

Global Cartesian coordinates of a point defining the x-axis orientation. The x-axis aligns with the projection of the line from this orientation point to the origin.

XPLAN*, *YPLAN*, *ZPLAN

Global Cartesian coordinates of the third point defining the working plane. This point will also define the location of the positive XY-sector of the working plane coordinate system.

Command Default

Working plane parallel to the global X-Y plane at Z = 0.0.

Notes

Defines a working plane to assist in picking operations using the coordinates of three noncolinear points. The three points also define the working plane coordinate system. A minimum of one point (the working plane origin) is required. Immediate mode may also be active. See **WPSTYL (p. 2182)** command to set the style of working plane display.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>WorkPlane>Align WP with>XYZ Locations

WPOFFS, *X0FF*, *Y0FF*, *Z0FF*

Offsets the working plane.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

X0FF*, *Y0FF*, *Z0FF

Offset increments defined in the working plane coordinate system. If only *Z0FF* is used, the working plane will be redefined parallel to the present plane and offset by *Z0FF*.

Notes

Changes the origin of the working plane by translating the working plane along its coordinate system axes.

This command is valid in any processor.

Menu Paths

Utility Menu>WorkPlane>Offset WP by Increments

WPROTA, *THXY*, *THYZ*, *THZX*

Rotates the working plane.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

THXY

First rotation about the working plane Z axis (positive X toward Y).

THYZ

Second rotation about working plane X axis (positive Y toward Z).

THZX

Third rotation about working plane Y axis (positive Z toward X).

Notes

The specified angles (in degrees) are relative to the orientation of the working plane.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is valid in any processor.

Menu Paths

Utility Menu>WorkPlane>Offset WP by Increments

WPSTYL,*SNAP*,*GRSPAC*,*GRMIN*,*GRMAX*,*WPTOL*,*WPCTYP*,*GRTYPE*,*WPVIS*,*SNAPANG*

Controls the display and style of the working plane.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SNAP

Snap increment for a locational pick (1E-6 minimum). If -1, turn off snap capability. For example, a picked location of 1.2456 with a snap of 0.1 gives 1.2, with 0.01 gives 1.25, with 0.001 gives 1.246, and with 0.025 gives 1.250 (defaults to 0.05).

GRSPAC

Graphical spacing between grid points. For graphical representation only and not related to snap points (defaults to 0.1).

GRMIN*, *GRMAX

Defines the size of a square grid (if *WPCTYP* = 0) to be displayed over a portion of the working plane. The opposite corners of the grid will be located at grid points nearest the working plane coordinates of (*GRMIN*,*GRMIN*) and (*GRMAX*,*GRMAX*). If a polar system (*WPCTYP* = 1), *GRMAX* is the outside radius of grid and *GRMIN* is ignored. If *GRMIN* = *GRMAX*, no grid will be displayed (defaults to -1.0 and 1.0 for *GRMIN* and *GRMAX* respectively).

WPTOL

The tolerance that an entity's location can deviate from the specified working plane, while still being considered on the plane. Used only for locational picking of vertices for polygons and prisms (defaults to 0.003).

WPCTYP

Working plane coordinate system type:

0

Cartesian (default). If working plane tracking is on (**CSYS (p. 441)**,4), the updated active coordinate system will also be Cartesian.

1

Polar. If working plane tracking is on, the updated active coordinate system will be cylindrical.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2

Polar. If working plane tracking is on, the updated active coordinate system will be spherical.

GRTYPE

Grid type:

0

Grid and WP triad.

1

Grid only.

2

WP triad only (default).

WPVIS

Grid visibility:

0

Do not show *GRTYPE* entities (grid and/or triad) (default).

1

Show *GRTYPE* entities. Cartesian working planes will be displayed with a Cartesian grid, polar with a polar grid.

SNAPANG

Snap angle (0--180) in degrees. Used only if *WPCTYP* = 1 or 2. Defaults to 5 degrees.

Command Default

Snap capability on with an increment of .05, spacing between grid points of 0.1, Cartesian coordinate system, WP triad displayed, and a tolerance of .003.

Notes

Use **WPSTYL (p. 2182)**,DEFA to reset the working plane to its default location and style. Use **WPSTYL (p. 2182)**,STAT to list the status of the working plane. Blank fields will keep present settings.

It is possible to specify *SNAP* and *WPTOL* values that will cause conflicts during picking operations. Check your values carefully, and if problems are noted, revert to the default values.

WPSTYL (p. 2182) with no arguments will toggle the grid on and off. The working plane can be displayed in the non-GUI interactive mode only after issuing a **/PLOPTS (p. 1435)**,WP,1 command. See the *Modeling*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

and Meshing Guide for more information on working plane tracking. See **/PLOPTS (p. 1435)** command for control of hidden line working plane.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Circuit>Set Grid

Utility Menu>List>Status>Working Plane

Utility Menu>WorkPlane>Display Working Plane

Utility Menu>WorkPlane>Offset WP by Increments

Utility Menu>WorkPlane>Show WP Status

Utility Menu>WorkPlane>WP settings

WRFULL, *Ldstep*

Stops solution after assembling global matrices.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ldstep

Specify action to take:

OFF or 0

Turn off feature (default)

N

Turn on feature and set it to stop after assembling the global matrices and writing the `.full` file for load step N.

Command Default

By default the WRFULL command is turned OFF.

Notes

This command is used in conjunction with the **SOLVE (p. 1822)** command to generate the assembled matrix file (`.full` file) only. The element matrices are assembled into the relevant global matrices for the particular analysis being performed and the `.full` file is written. Equation solution and the output of data to the results file are skipped. To dump the matrices written on the `.full` file into Harwell-Boeing format, use the **HBMAT (p. 888)** command in /AUX2. To copy the matrices to a postscript format that can be viewed graphically, use the **PSMAT (p. 1540)** command.

To use the **LSSOLVE (p. 1085)** macro with this command, you may need to modify the **LSSOLVE (p. 1085)** macro to properly stop at the load step of interest.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command only valid for linear static, full harmonic, and full transient analyses when the sparse direct solver is selected. This command is also valid for buckling or modal analyses with any mode extraction method. This command is not valid for nonlinear analyses. It is not supported in a linear perturbation analysis.

In general, the assembled matrix file `.full` contains stiffness, mass, and damping matrices. However, the availability of the matrices depends on the analysis type chosen when the file is written. Some analyses do not write the matrices individually but instead write combined matrices. For example, a full transient writes a combined stiffness/mass/damping matrix to the full file.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Stop Solution

Main Menu>Solution>Load Step Opts>Stop Solution

WRITE, *Fname*

Writes the radiation matrix file.

AUX12 (p. 62): Radiation Matrix Method (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name Defaults to `Jobname`.

Notes

Writes radiation matrix file (`File.sub`) for input to the substructure thermal "use" pass. Subsequent **WRITE (p. 2185)** operations to the same file overwrite the file.

Menu Paths

Main Menu>Radiation Opt>Matrix Method>Write Matrix

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

WRITEMAP, *Fname*

Writes interpolated pressure data to a file.

/MAP (p. 63): Pressure Mapping (p. 63)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Notes

Writes the interpolated pressure data to the specified file. The data is written as **SFE (p. 1761)** commands applied to the SURF154 elements that are on the target surface. You may read this data for inclusion in an analysis by using **/INPUT (p. 948)**,*Fname*.

Menu Paths

This command cannot be accessed from a menu.

***WRK**, *Num*

Sets the active workspace number.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Num

Number of the active memory workspace for APDLMath vector and matrices. All the following APDLMath vectors and matrices will belong to this memory workspace, until the next call to the ***WRK (p. 2186)** command. By default, all the APDLMath objects belong to workspace number 1.

Notes

This feature enables you to associate a set of vector and matrices in a given memory workspace, so that you can easily manage the free step:

```
*VEC,V,D,ALLOC,5  ! V belongs to the default Workspace 1

*WRK,2     ! Set the active workspace as the number 2

*VEC,W,D,IMPORT,FULL,file.full,RHS ! W belongs to the Workspace 2
*SMAT,K,D,IMPORT,FULL,file.full,STIFF ! K belongs to the Workspace 2
*DMAT,M,ALLOC,10,10    ! M belongs to the Workspace 2
…
*FREE,WRK,2   ! W, K and M are deleted, but not V
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
*PRINT,V
```

This feature can be useful to free all the temporary APDLMath variables inside a MACRO in one call.

Menu Paths

This command cannot be accessed from a menu.

WSPRINGS

Creates weak springs on corner nodes of a bounding box of the currently selected elements.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This command invokes a predefined Mechanical APDL macro that is used during the import of loads from the ADAMS program into Mechanical APDL.

The command creates weak springs on the corner nodes of the bounding box of the currently selected elements. The six nodes of the bounding box are attached to ground using COMBIN14 elements. The stiffness is chosen as a small number and can be changed by changing the real constants of the COMBIN14 elements.

The command works only for models that have a geometric extension in two or three dimensions. One-dimensional problems (pure beam in one axis) are not supported.

For more information about how **WSPRINGS (p. 2187)** is used during the transfer of loads from the ADAMS program to Mechanical APDL, see Import Loads into Mechanical APDL.

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

Menu Paths

Main Menu>Solution>ADAMS Connection>Import fr ADAMS

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

WTBCREATE, *IEL*, *NODE*, *DAMP*

Creates a USER300 element to model the turbine for full aeroelastic coupling analysis and specifies relevant settings for the analysis.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IEL

Element number (next available number by default).

NODE

Node number connecting support structure and turbine.

DAMP

Damping option for the turbine:

0

Damping matrix obtained from the aeroelastic code plus Rayleigh damping (default).

1

Rayleigh damping only.

2

Damping from the aeroelastic code only.

Notes

WTBCREATE (p. 2188) invokes a predefined Mechanical APDL macro that automatically generates a turbine element and issue relevant data commands that are necessary to run a full aeroelastic coupling analysis. For detailed information on how to perform a fully coupled aeroelastic analysis, see Fully Coupled Wind Turbine Example in Mechanical APDL in the *Programmer's Reference*.

The generated USER300 turbine element will have 9 nodes with node numbers NODE, NMAX+1, NMAX+2, ..., NMAX+8, where NMAX is the maximum node number currently in the model.

There are six freedoms on the first node of the element: UX, UY, UZ, ROTX, ROTY, ROTZ, and these are true structural freedoms. For all the other nodes (that is, nodes 2 to 9), only the translational freedoms (UX, UY, UZ) are used. These are generalized freedoms that are internal to the turbine element and are used by the aeroelastic code only.

The element type integer of the USER300 element is the current maximum element type integer plus one.

The command will also set up the analysis settings appropriate for a full aeroelastic coupling analysis. These include full Newton-Raphson solution (**NROPT (p. 1261)**,FULL) and a **USRCAL (p. 2062)** command to activate the relevant user routines.

of ANSYS, Inc. and its subsidiaries and affiliates.

X Commands

XFCRKMESH,*EnrichmentID*,*ElemComp*,*NodeComp*

Defines a crack in the model when the crack surface is discretized by MESH200 elements

PREP7 (p. 22): Special Purpose (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

EnrichmentID

Name of the enrichment specified via the associated **XFENRICH (p. 2193)** command.

ElemComp

Name of the element component consisting of MESH200 elements that form the crack surface.

NodeComp

Name of the node component consisting of the crack front nodes of the crack surface.

Notes

Used in an XFEM-based crack analysis, this command defines a crack in the model when the crack surface is discretized by MESH200 elements. For more informatiom, see MESH200 Element Method in the *Fracture Analysis Guide*.

Issue the **XFCRKMESH (p. 2191)** command multiple times as needed to define multiple crack surfaces in the model.

This command is valid in PREP7 (**/PREP7 (p. 1479)**) only.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

XFDATA, *EnrichmentID*, LSM or --, *ELEMNUM*, *NODENUM*, *PHI*, *PSI*

Defines a crack in the model by specifying nodal level set values

PREP7 (p. 22): Special Purpose (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

EnrichmentID

Name of the enrichment specified via the associated **XFENRICH (p. 2193)** command.

LSM

Indicates that level set values are being specified (default).

ELEMNUM

Element number.

NODENUM

Node number associated with the specified element *ELNUM*.

PHI

Signed normal distance of the node from the crack.

PSI

Signed normal distance of the node from the crack tip (or crack front). Used only in the singularity-based XFEM method.

Notes

Issue the **XFDATA (p. 2192)** command multiple times as needed to specify nodal level set values for all nodes of an element.

This command is valid in PREP7 (**/PREP7 (p. 1479)**) only.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

XFENRICH, *EnrichmentID*, *CompName*, *MAT_ID*, *Method*, *RADIUS*, *SNAPTOLER*

Defines parameters associated with crack propagation using XFEM

PREP7 (p. 22): Special Purpose (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

EnrichmentID

An alphanumeric name assigned to identify the enrichment. The name can contain up to 32 characters and must begin with an alphabetic character. Alphabetic characters, numbers, and underscores are valid.

CompName

Name of the element set component for which initial cracks are defined and possibly propagated.

MAT_ID

Material ID number referring to cohesive zone material behavior on the initial crack. If 0 or not specified, the initial crack is assumed to be free of cohesive zone behavior. Used only with the phantom-node XFEM method (*Method*).

Method

PHAN -- Use phantom-node-based XFEM (default).

SING -- Use singularity-based XFEM.

RADIUS

Radius defining the region around the crack tip encompassing the set of elements to be influenced by the crack-tip singularity effects. Default = 0.0. Used only in singularity-based XFEM.

SNAPTOLER

Snap tolerance to snap the crack tip to the closest crack face along the extension direction. Default = 1.0E-6. Used only in singularity-based XFEM.

Notes

If *MAT_ID* is specified, the cohesive zone behavior is described by the bilinear cohesive law.

If issuing multiple **XFENRICH (p. 2193)** commands, the element components (*CompName*) should not intersect (that is, the element components should not have any common elements between them).

When multiple **XFENRICH (p. 2193)** commands are issued in an analysis, combining the phantom-node-based method (*Method* = PHAN) and the singularity-based method (*Method* = SING) is not valid. Only one XFEM method per analysis is allowed.

This command is valid in PREP7 (**/PREP7 (p. 1479)**) only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

XFLIST, *EnrichmentID*

Lists enrichment details and associated crack information

PREP7 (p. 22): Special Purpose (p. 37)
SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

***EnrichmentID* or (blank)**

Name of the enrichment specified via the associated **XFENRICH (p. 2193)** command. Specifying *EnrichmentID* is optional.

If no value (or ALL) is specified, the command lists all enrichments and associated data.

Notes

This command is valid in PREP7 (**/PREP7 (p. 1479)**) and SOLUTION (**/SOLU (p. 1821)**).

Menu Paths

This command cannot be accessed from a menu.

/XFRM, *LAB*, *X1*, *Y1*, *Z1*, *X2*, *Y2*, *Z2*

Controls the centroid or the axis of dynamic rotation.

GRAPHICS (p. 16): Views (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LAB

The location or entity (centroid) used to define the center or axis of rotation.

NODE

If NODE is chosen for the center of rotation, the node number will be *X1*. If the rotation is to be about an axis, then *X1* and *Y1* define the two nodes between which a line is drawn to determine the axis. The remaining arguments are ignored.

ELEMENT

If ELEMENT is chosen for the center of rotation, the element number will be *X1*. If the rotation is to be about an axis, then *X1* and *Y1* define the two elements between which a line is drawn to determine the axis. The remaining arguments are ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KP

If KP is chosen for the center of rotation, the keypoint number will be *X1*. If the rotation is to be about an axis, then *X1* and *Y1* define the two keypoints between which a line is drawn to determine the axis. The remaining arguments are ignored.

LINE

If LINE is chosen for the center of rotation, the line number will be *X1*. If the rotation is to be about an axis, then *X1* and *Y1* define the two lines between which a line is drawn to determine the axis. The remaining arguments are ignored.

AREA

If AREA is chosen for the center of rotation, the area number will be *X1*. If the rotation is to be about an axis, then *X1* and *Y1* define the two areas between which a line is drawn to determine the axis. The remaining arguments are ignored.

VOLUME

If VOLUME is chosen for the center of rotation, the volume number will be *X1*. If the rotation is to be about an axis, then *X1* and *Y1* define the two volumes between which a line is drawn to determine the axis. The remaining arguments are ignored.

XYZ

If XYZ is chosen for the center of rotation, the location of that center is determined by the coordinates *X1*, *Y1*, *Z1*. If values are specified for *X2*, *Y2*, *Z2*, then the axis of rotation will be about the line between those two points.

OFF

If *LAB* = OFF, DEFAULT, FOCUS or if no value is specified, then the center of rotation is set at the FOCUS point, as defined by the **/FOCUS (p. 771)** command.

X1

The entity number or X coordinate for the center of rotation.

Y1

The entity number or Y coordinate for the center of rotation.

Z1

The Z coordinate for the center of rotation.

X2

The X coordinate for the axis of rotation.

Y2

The Y coordinate for the axis of rotation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Z2

The Z coordinate for the axis of rotation.

Command Default

Issuing **/XFRM (p. 2194)**, with no *LAB* defined sets the center of rotation at the focal point specified by the **/FOCUS (p. 771)** command.

Notes

The **/XFRM (p. 2194)** command is active only when the cumulative rotation key is specified ON for the **/ANGLE (p. 140)** command (*KINCR* = 1). This command affects dynamic manipulations only.

For center rotation, the middle mouse button will rotate the model about the screen Z axis and the right mouse button will rotate the model about the screen X and Y axis.

For rotation about an axis, the middle mouse button will rotate the model about the defined axis of rotation and the right mouse button will be deactivated.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>ViewSettings>Rotational Center>ByPick

***XPL**,*Action*,*Val1*,*Val2*

Accesses content of a Mechanical APDL file.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Specifies the action for scanning file content (no default). Valid labels are:

OPEN

Open the specified file.

CLOSE

Close the specified file.

LIST

List the records at the current level in the hierarchy of records.

WHERE

Display the current location in the tree.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

STEP

Step down in the tree of records.

UP

Go up in the tree of records.

READ

Read a record into an APDL Math object.

INFO

Display information from a record.

GOTO

Move directly to a given place in the tree of records (this avoids multiple calls to the STEP and UP options).

MARK

Mark a set of records of the current file; the asterisk (*) character can be used to specify multiple branches/records.

COPY

Copy the current file to a new one, ignoring the marked records.

SAVE

Save the current file, ignoring the marked records.

Val1*, *Val2

Additional input. The meanings of *Val1* and *Val2* vary depending on the specified *Action*, as described in the table below.

Action **Label**	***Val1***	***Val2***
OPEN	Name of file[a] to open (no default)	(not used)
CLOSE	Name of file[a] to close (default is last file opened by *Action* = OPEN)	(not used)
LIST	Number of levels in the tree of records (default = 1)	(not used)
UP	Number of levels in the tree of records (default = 1), or TOP to go directly to the top of the tree	(not used)
STEP	Name of the record of interest (no default)	(not used)
INFO	Name of the record of interest (no default), or * for all records	(not used)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Action **Label**	***Val1***	***Val2***
READ	Name of the record of interest (no default)	Name of the APDL Math object to create (no default)
GOTO	The complete PATH to the new location Example: `*XPL,GOTO,RST::DSI::SET1`	(not used)
MARK	The complete path to the record(s); use (*) character to select multiple records (see example in next section)	(not used)
COPY	Name of the new file[a]	If blank (default), marked records are not copied to the new file. Valid inputs are: COMP - records are compressed using sparsification UNCOMP - records are uncompressed

[a] File name is case-sensitive with a 32-character maximum.

Notes

The ***XPL** command enables you to explore the contents of a Mechanical APDL file. Use this command to traverse up and down the tree structure of the specified file and review what is in the file. Files that can be scanned include `.rst`, `.mode`, `.full`, `.cms`, and `.sub` files. For more information and examples, see Using APDL to List File Structure and Content in the *Ansys Parametric Design Language Guide*.

The command ***XPL**,READ generates either a ***VEC (p. 2085)** or a ***DMAT (p. 551)** object according to the record type. You do not have to create the APDL Math object before issuing this command.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/XRANGE, *XMIN*, *XMAX*

Specifies a linear abscissa (X) scale range.

GRAPHICS (p. 16): Graphs (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XMIN

Minimum abscissa scale value.

XMAX

Maximum abscissa scale value.

Command Default

Automatically select X-range scale to include all data being displayed.

Notes

Specifies a linear abscissa (X) scale range for the line graph display. Use **/XRANGE (p. 2199)**,DEFAULT to return to automatic scaling.

Automatic scaling will often yield inappropriate range values for logarithmic scales (**/GROPT (p. 870)**, LOGX).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Graphs>Modify Axes

XVAR, *N*

Specifies the X variable to be displayed.

POST26 (p. 58): Display (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

N

X variable number:

0 or 1

Display **PLVAR (p. 1444)** values vs. time (or frequency).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

n

Display **PLVAR (p. 1444)** values vs. variable *n* (2 to *NV* (**NUMVAR (p. 1302)**)).

1

Interchange time and **PLVAR (p. 1444)** variable numbers with time as the curve parameter. **PLVAR (p. 1444)** variable numbers are displayed uniformly spaced along X-axis from position 1 to 10.

Command Default

Use time or frequency.

Notes

Defines the X variable (displayed along the abscissa) against which the Y variable(s) (**PLVAR (p. 1444)**) are to be displayed.

Menu Paths

Main Menu>TimeHist Postpro>Settings>Graph

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Y Commands

/YRANGE, *YMIN*, *YMAX*, *NUM*

Specifies a linear ordinate (Y) scale range.

GRAPHICS (p. 16): Graphs (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

YMIN

Minimum ordinate scale value.

YMAX

Maximum ordinate scale value.

NUM

Y-axis number to which range applies (defaults to 1). Valid numbers are 1 to 3 for **/GRTYP (p. 874)**,2 and 1 to 6 for **/GRTYP (p. 874)**,3. If ALL, apply to all Y-axes.

Command Default

Automatically select Y-range scale to include all data being displayed.

Notes

Specifies a linear ordinate (Y) scale range for the line graph display. Use **/YRANGE (p. 2201)**,DEFAULT to return to automatic scaling. For multiple Y-axes graphs (**/GRTYP (p. 874)**), see **/GROPT (p. 870)**, ASCAL to automatically scale the additional Y-axes.

Automatic scaling will often yield inappropriate range values for logarithmic scales (**/GROPT (p. 870)**, LOGY).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Graphs>Modify Axes

Z Commands

/ZOOM, *WN*, *Lab*, *X1*, *Y1*, *X2*, *Y2*

Zooms a region of a display window.

GRAPHICS (p. 16): Views (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number to which command applies (defaults to 1).

Lab

Label to define the desired type of zoom:

OFF

Turns zoom off (refits image of entire model to the window).

BACK

Goes back to previous zoom setting (five successive back ups, maximum).

SCRN

Interprets X1,Y1 as the screen coordinates of the center of a square zoom region; X2,Y2 as the screen coordinates of a point on one side of that square.

RECT

Interprets X1,Y1 and X2,Y2 as the screen coordinates of two opposite corners of a rectangular zoom region.

Notes

Zooms (centers and magnifies) the specified region of a display window. **/ZOOM (p. 2203)** will operate on a display that has been formed by an explicit graphics action command (**APLOT (p. 169)**, **EPLOT (p. 648)**, etc.). **/ZOOM (p. 2203)** has no effect on an "immediate" graphics display. When **/ZOOM (p. 2203)** is executed, the display is automatically replotted such that the specified zoom region is centered and sized to fill the window.

Auto resizing is disabled when you issue the **/ZOOM (p. 2203)** command. To restore auto resizing, issue the **/AUTO (p. 207)** command, or select **FIT** from the Pan, Zoom, Rotate box.

This command is valid in any processor.
