Release 2024 R1
January 2024

ANSYS, Inc. and ANSYS Europe, Ltd. are UL registered ISO 9001: 2015 companies.

Copyright and Trademark Information

© 2024 ANSYS, Inc. Unauthorized use, distribution or duplication is prohibited.

ANSYS, Ansys Workbench, AUTODYN, CFX, FLUENT and any and all ANSYS, Inc. brand, product, service and feature names, logos and slogans are registered trademarks or trademarks of ANSYS, Inc. or its subsidiaries located in the United States or other countries. ICEM CFD is a trademark used by ANSYS, Inc. under license. CFX is a trademark of Sony Corporation in Japan. All other brand, product, service and feature names or trademarks are the property of their respective owners. FLEXlm and FLEXnet are trademarks of Flexera Software LLC.

Disclaimer Notice

THIS ANSYS SOFTWARE PRODUCT AND PROGRAM DOCUMENTATION INCLUDE TRADE SECRETS AND ARE CONFIDENTIAL AND PROPRIETARY PRODUCTS OF ANSYS, INC., ITS SUBSIDIARIES, OR LICENSORS. The software products and documentation are furnished by ANSYS, Inc., its subsidiaries, or affiliates under a software license agreement that contains provisions concerning non-disclosure, copying, length and nature of use, compliance with exporting laws, warranties, disclaimers, limitations of liability, and remedies, and other provisions. The software products and documentation may be used, disclosed, transferred, or copied only in accordance with the terms and conditions of that software license agreement.

ANSYS, Inc. and ANSYS Europe, Ltd. are UL registered ISO 9001: 2015 companies.

U.S. Government Rights

For U.S. Government users, except as specifically granted by the ANSYS, Inc. software license agreement, the use, duplication, or disclosure by the United States Government is subject to restrictions stated in the ANSYS, Inc. software license agreement and FAR 12.212 (for non-DOD licenses).

Third-Party Software

See the legal information in the product help files for the complete Legal Notice for ANSYS proprietary software and third-party software. If you are unable to access the Legal Notice, contact ANSYS, Inc.

List of Figures

1. RCL Lumped Circuit 253
2. Example Command Actions 599
3. Boundary Condition Key Behavior 600
4. Input Signal 748
5. Amplitude Spectrum of the FFT 749
6. Signal Obtained with the Filter 749
7. Basic Ocean Data Type Components 1309
8. Ocean Zone Types (Specified via *ZoneType*) 1323
9. Usage Example: Positive and Negative *NSECT* Values 1635
10. Usage Example: Extrusions with *Axis* = ZEXT and CEXT 1636
11. Independent and Dependent Facets in a Model with Planar Symmetry Employing View Factor Condensation 1636
12. Independent and Dependent Facets in a Model with Cyclic Symmetry Employing View Factor Condensation 1637
13. Independent and Dependent Facets for a Model Built by Extrusions Employing View Factor Condensation 1637
14. Usage Example: *Option* = COND 1638
15. Offsets for a CHAN Section Subtype 1686
16. Two-hole Box Section 1695
17. Cell Mesh for the Two-hole Box Section 1695
18. Coordinate System for Load Application on the Faces of 3D Solid and Shell Elements 1751
19. Load Direction in the Default Coordinate System 1753
20. Default Coordinate System of Surface Load on the Edge of a 3D Shell Element 1754
21. Projected Coordinate System of Surface Load on the Edge of a 3D Shell Element 1754
22. Positive Tangential Load on the Edge of a Plane Element 1755
23. Follower Load Behavior in the Projected Coordinate System 1756
24. Follower Load Behavior for a User-Defined Orientation 1756
25. Follower Load Behavior on the Edges of 3D Shell and 2D Elements 1757
26. Virtual Shell Elements Following the Contact Interface Edge 1793
27. Virtual Shell Elements Overlapping Target Elements 1793
28. View Factor Update Timing 2112
29. Examples of Radiation Problems that Undergo an Enclosure Status Change 2114
30. View Factor Updates and Reciprocity 2115

Chapter 1: About This Reference

Welcome to the *Command Reference* (p. 1). This reference contains a complete dictionary of detailed Mechanical APDL command descriptions, arranged in alphabetical order. It is the definitive resource for correct command usage, providing comprehensive specifications for every argument of every command.

The *Command Reference* (p. 1) is intended to provide information about individual commands. Although the reference also contains lists of commands arranged by functional grouping (p. 11), it is not intended to be your primary source of procedural information. For introductory information and procedural guidelines concerning when and where to use commands, see the appropriate analysis guide for your application.

A command mentioned in the various analysis guides implies a link to the detailed command description given in this reference. For ordering purposes, the alphabetical ordering of commands that begin with a star (*) or a slash (/) ignores those symbols.

A printed copy of the *Commands Quick Reference Guide* is available on the Ansys customer site in the documentation area.

The following *Command Reference* (p. 1) topics are available:

1.1. Conventions Used in This Reference

1.2. Terminology

1.3. Command Characteristics

1.1. Conventions Used in This Reference

This reference uses the following conventions to help you identify various types of information:

Type style or text	Indicates
UPPERCASE or **UPPERCASE**	Uppercase indicates an element name (such as SOLID273 or ELBOW290). Bold uppercase indicates a command name (such as **K (p. 969)** or **DDELE (p. 505)**).
Bold> Bold	Bold text in mixed case indicates a menu path within the graphical user interface (GUI), a series of menu options for accessing a command from the GUI. One or more angle brackets (>) separate menu items in a menu path. A command shown in the text is sometimes followed by its GUI equivalent in parentheses, as shown in this example:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Type style or text	Indicates
	***GET (p. 797)** command (**Utility Menu> Parameters> Get Scalar Data**).
ITALICS	Uppercase italic letters (such as *VALUE*, *INC*, *TIME*) generally indicate command arguments for *numeric* values. In some cases (where indicated), non-numeric convenience labels (such as ON, OFF and ALL) can also be specified for these arguments.
Italics	Mixed case italic letters (such as *Lab* or *Fname*) generally indicate command arguments for *alphanumeric* values.
COURIER	A courier font indicates command input or output.

1.1.1. Applicable Products

This document applies to the following family of products:

Ansys Mechanical Pro (structural, full thermal, and vibration analysis)

Ansys Mechanical Premium (nonlinear structural, full thermal, vibration, linear dynamics analysis)

Ansys Mechanical Enterprise (advanced nonlinear structural, full thermal, vibration, linear dynamics and nonlinear transient dynamics, fracture, acoustics, full coupled-field, hydrodynamics)

Ansys Mechanical Enterprise PrepPost

Ansys Mechanical Enterprise Solver (batch mode)

Note:

While connection capabilities and High Performance Computing are included as part of the release distribution, they are separately licensed and separately installed products. Contact your Support Representative if you want to install and run any of these separately licensed products at your site.

1.1.2. Valid Products

Some commands are only valid in a subset of the Applicable Products (p. 2). The valid products for each command appear (as abbreviations) in the **Valid Products** list, below and to the right of each short command description.

The abbreviations correspond to the products as shown in this table:

Product	Abbreviation
Ansys Mechanical Pro	Pro
Ansys Mechanical Premium	Premium
Ansys Mechanical Enterprise	Enterprise

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Product	Abbreviation
Ansys Mechanical Enterprise PrepPost	PrepPost
Ansys Mechanical Enterprise Solver	Solver
Additive Suite add-on (requires one of the Enterprise products)	AS add-on

If the abbreviation in the **Valid Products** list is dark bold, the command is valid in that product. If the abbreviation is light gray ("grayed out"), the command is not valid or applicable and should not be used in that product. For example,

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | PrepPost | **Solver** | AS add-on

indicates the command is valid in Ansys Mechanical Pro, Ansys Mechanical Premium, Ansys Mechanical Enterprise, and Ansys Mechanical Enterprise Solver, but not in Ansys Mechanical Enterprise PrepPost. The "AS add-on" code behaves a bit differently. When this code is bold, the command is *only* available in the Additive Suite, an add-on to any of the Enterprise products.

Even if a command is shown as valid in a particular product, some options on that command may be invalid in that product. Any invalid options on an otherwise valid command are documented in the **Product Restrictions** section of that command documentation.

1.2. Terminology

Various terms are used in the command descriptions throughout this reference, defined as follows:

Analysis -- The set of input lines relating to a single problem. An analysis basically consists of three phases: the Preprocessing Phase, the Solution Phase, and the Postprocessing Phase.

Argument Default -- The value assumed for a command argument if the argument is not specified. See Command and Argument Defaults (p. 7).

Command -- An instruction to supply data, or control, to the program. Commands usually begin with a prescribed name, followed by alphanumeric data. For example, the command **ET (p. 686)**, *ITYPE*, *Ename*, ... may be input as **ET (p. 686)**,1,PIPE288 stating that element type 1 is defined as the PIPE288 element. The uppercase argument name indicates that a numerical value is typically entered in that field, whereas an upper-lower case data label indicates that an alphanumeric value is typically entered in that field. Another command, for example, **/PREP7 (p. 1479)**, instructs the program to enter the PREP7 portion of the program. All valid commands are alphabetically listed in the Command Dictionary (p. 65) of this document. Unrecognized commands are further processed in a macro search (***USE (p. 2059)**) before being ignored. Commands may be indented on a line for clarity.

Command Default -- Default program settings when a command is *not* issued. Default settings associated with a command are listed in the "Command Default" section of command description. See Command and Argument Defaults (p. 7). Not all commands have associated default settings (for example, action commands such as **SOLVE (p. 1822)** and **PRNSOL (p. 1505)**).

Data -- Data may be numeric (real or integer), alphabetic, or alphanumeric (containing letters and numbers). Nonnumeric data should not contain special characters such as

```
!   @   #    $   %    ^   &   *   (     )   _    -   +
=   |   \   {   }   [   ]    "     '   /    <     >   ~    `
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Numeric data may be input in a variety of ways as described in Data Input (p. 5). Some commands are switches of the form **Commandname**,*Key* where *Key* can be 0, NO or OFF to toggle the switch off; or 1, YES or ON to toggle the switch on.

Degree of Freedom -- The degrees of freedom are the primary nodal unknowns determined by the analysis. They may be displacements, rotations, temperatures, pressures, voltages, etc. A degree of freedom is defined by a node number and a label, for example, 1 UX, 87 ROTZ, 4 TEMP, etc. Derived results, such as stresses, heat flows, etc. are computed from the degree of freedom results and are considered secondary unknowns.

Element types with unequal sets of degrees of freedom can be combined in a single structure. For example, a 2D structure composed of 2D solid elements having two degrees of freedom (UX, UY) at each node and a 2D beam element having three degrees of freedom (UX, UY, ROTZ) at each node will have the latter three degrees of freedom at the common nodes. Nodes which do not have a beam element attached will have only two degrees of freedom with ROTZ eliminated from the solution printout.

Field -- The command name and data items entered on a command are separated into consecutive fields. A field is assumed to be as "wide" as the number of characters specified. A comma is used to end one field and begin the next.

Line -- A line of input is a physical record read by the computer. Input lines are limited to 640 characters (including preceding blanks, commas, and any special characters). For file input, a line is represented by one 640 column data record. For interactive input, a line is the string of characters (640 maximum) entered before the RETURN key is pressed. Several commands may be put on one line as described in Data Input (p. 5). Blank lines are permitted for clarity.

Command name -- Only the first four characters of any alphabetic (or alphanumeric) command name are interpreted by the program (except as noted for certain commands, such as **/POST*N***, **/AUX*N***. ***END-DO (p. 636)**, etc.). The remaining characters of the field are ignored. Names shown with fewer than four characters are assumed to have blanks up through the fourth character as part of the name. For example, this sample **ET (p. 686)** command may be input as **ET (p. 686)**,1,42 or **ET (p. 686)** ,1,42 or **ET (p. 686)** ,1,42, but not as **ETABCD**,1,42. Names may not contain special characters (as described in Data Input (p. 5)). If the command name is omitted, the name defaults to the name of the previous command, unless it was a slash (/) or star (*) command.

Postprocessing Phase -- The set of commands causing further processing of the solution output. These commands consist of commands from the POST1 and POST26 processors. The postprocessing phase may consist of input for several postprocessing sessions (in series).

Preprocessing Phase -- The set of commands related to defining the model. The preprocessing phase consists of input from the PREP7 processor.

Program -- The collection of all processors (preprocessing, postprocessing, auxiliary, etc.) is called the Mechanical APDL program.

Processor -- A group of related functions, such as model definition (PREP7) or results examination (POST1).

Run -- The collection of all commands between the system-level commands is called a run or session). A session may also consist of several analyses in series (separated by a **/CLEAR (p. 350)** command).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Solution Phase -- The set of commands which apply boundary conditions to the model created in preprocessing, then performs a solution for that set of boundary conditions. The solution phase may consist of several solutions in series, such as a static solution, followed by a modal solution, etc.

1.3. Command Characteristics

The following characteristics apply to commands:

1.3.1. Data Input
1.3.2. Free-Format Input
1.3.3. Nonrestrictive Data Input
1.3.4. Condensed Data Input
1.3.5. Units
1.3.6. Command and Argument Defaults
1.3.7. File Names
1.3.8. Star and Slash Commands

1.3.1. Data Input

The data input for each command is described in this manual. Data should not be input in any undocumented field, nor should other than documented values be input in any field. Also, the data input described in this manual should not be used with any earlier version of the program. Some features that allow easy input of data are free-format, nonrestrictive, and condensed input.

1.3.2. Free-Format Input

Free-format capability allows the user to input data in consecutive fields without having to space to each field. The comma (,) character effectively ends the field so that the next character will be input in the beginning of the next field. A blank field is skipped by having no data item between the commas. Fields are assumed to be as wide as the number of characters specified. Input is converted to formatted fields when coded files are written (of width large enough (16 characters maximum) to minimize loss of accuracy).

Significant figures of output should not be expected to match that of input. Machine precision, rounding of numbers when writing internal scratch files, etc., tend to lower the precision during the analysis.

1.3.3. Nonrestrictive Data Input

Nonrestrictive data input allows the user to enter any form of data in a field and the Mechanical APDL program will interpret it as required (integer, real, or alphabetic) or ignore it. Double precision is used throughout the program for all real numbers. Alphabetic data may be entered in upper or lower case. Lower case is internally converted to upper case within the program (except for case-sensitive applications, such as in comments, (text preceded by a !) titles, and file names.)

The following features are available with the nonrestrictive data input.

- No distinction is necessary between real and integer data.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Data may be placed anywhere within the field.
- Real data input without a decimal point has the decimal point assumed after the right-most digit.
- Real number values input to integer data fields will be rounded to the nearest integer. The absolute value of integer data must fall between zero and 2,000,000,000.
- Element and node numbers (IDs) should be between 1 and 999,999,999. Element type, material reference, real constant, section, and coordinate system IDs should be between 1 and 9,999,999. IDs larger than these may not be written out correctly in listings (xLIST commands), **CDWRITE (p. 293)** files, **LSWRITE (p. 1087)** files, and other text-based output files.
- Exponents may be input in the field after the number. The E (or D) character must be used (upper or lower case). The sign after the E character is assumed to be the sign associated with the exponent (the absence of a sign is assumed to be +). The acceptable range of values for real data is +/-1.0E+200 to +/-1.0E-200.
- A nonnumeric character in the numeric field (other than a valid convenience label, a parameter name, or an E or D exponent character) will be ignored and will cause the remainder of the field to be ignored. When the program can accept an alphanumeric label in a field, it will interpret any alphanumeric input that matches a valid label as the appropriate label. In other words, the program will not interpret a valid label as an identically named parameter. If you truly want to use a parameter in place of a valid label, you can use forced parametric substitution (using % signs). A non-alphanumeric character in a label field is taken as part of the label. Non-alphanumeric characters (such as CONTROL-characters, TAB-characters, and other terminal editing characters) should be avoided since they may be used directly instead of being interpreted by the terminal.

1.3.4. Condensed Data Input

An option for condensing the data input is available with the $ character. This character effectively ends a command and allows the next command to begin on the same line (at the next column). The line must not extend beyond 640 characters (including all commas and $ signs). If a command cannot be completed on the line, it should begin on the next line. Blank commands are ignored. The $ character should not be used following any command that causes a file switch to read additional commands (such as the **/INPUT (p. 948)**, ***USE (p. 2059)**, **CDREAD (p. 291)**, etc. commands, any "unknown command" macro, or any do-loops or if-then-else constructs). The $ character should not be used between a command and its required following format line (such as ***VREAD (p. 2153)**, ***VWRITE (p. 2174)**, ***MSG (p. 1185)**, etc.). The $ character should not be used after the **ALLSEL (p. 114)** command. Using the $ character in interactive mode may result in unexpected output behavior.

1.3.5. Units

The Mechanical APDL program permits the use of any consistent set of units for length, force, time, temperature, etc. Care must be taken to ensure that all input data are in the same set of units. The **/UNITS (p. 2054)** command may be used to note the system of units being used. Temperatures may be absolute or relative in most cases. For problems requiring absolute temperatures, such as those involving creep, swelling, or radiation, temperatures may be input as Celsius or Fahrenheit, for convenience, with a temperature shift from absolute zero (**TOFFST (p. 2008)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1.3.6. Command and Argument Defaults

To minimize the amount of data input, most commands have defaults which apply both to the command itself and to any arguments.

Command Defaults

A *command default* refers to the specification or behavior that is assumed when a command is not issued. For example, if you do not issue the **/FILNAME (p. 757)** command, the jobname defaults to FILE (or whatever jobname was specified when you entered the program).

Argument Defaults

An *argument default* is the value assumed for a command argument if the argument is not specified. For example, if you issue the command **N (p. 1207)**,10 (defining node 10 with the *X, Y, Z* coordinate arguments left blank), the node is defined at the origin; that is, *X, Y*, and *Z* default to zero.

Values for numeric arguments (such as *X, Y, Z*) typically default to zero, although exceptions exist for some commands, such as those with arguments specifying coefficients or tolerances. Such exceptions are noted in the documentation for those commands.

When an argument has a nonzero default, entering a blank *or a zero* for that argument triggers the nonzero default value. If an effective zero is desired for such an argument, input a very small number (such as 1E-14) instead.

In cases where no default is indicated or obvious for an argument, enter the desired value. Such arguments have no favored default value and require an explicit input value.

Some Command Defaults May Differ According to Product

The defaults for some commands and their arguments may differ depending on which product is using the commands. The "Product Restrictions" section of the descriptions of the affected commands clearly documents such cases.

If you intend to use your input file in more than one product, it is good practice to explicitly specify commands and argument values, rather than letting them default. Otherwise, behavior in the other product may differ from what you expect.

1.3.7. File Names

Various files are used during a session for reading, writing, and storing data. Program-generated files are identified by a name, a system-dependent separator, and an extension (as in the form `fname.ext`).

The name is obtained from the `Jobname` (250 characters maximum, including the directory name) as defined with the execution command. (Windows cannot create directory names longer than 245 characters.)

Unless otherwise specified, the `Jobname` defaults to a system-dependent name (usually `FILE`). The extension is a two- to four-character identifier. (See Program-Generated Files in the *Basic Analysis Guide*.) For example, the error message file (which has the identifier ERR) with a jobname of `FILE` and separator (.) would be generated as `FILE.ERR`. If the Jobname is `JOB1`, the file would be named `JOB1.ERR`. The documentation generically refers to program-generated files as `Jobname.identi-`

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

fier, such as Jobname.ERR for the error message file. Unless otherwise indicated, files are written in the current working directory.

Some commands (such as **/INPUT (p. 948)** and **/OUTPUT (p. 1334)**) allow you to specify a file name other than Jobname, and an extension other than the default extension. Such user-written files use a naming convention similar to the Mechanical APDL-generated files except that the name (248 characters maximum, including the directory name) is user defined, and the extension (8 characters maximum) is optional. The file name can include the directory path, but it is not necessary if you want to use the default directory. File names containing directory paths must reference existing directories. File and directory names may contain blank spaces, but strings containing blank spaces must be enclosed in single quotes.

A system dependent separator is automatically written between file name and extension (if the extension exists) input on commands.

File name fields are usually restricted to 248 characters (including the directory name) in command inputs. If you specify no directory path, the default path is your working directory, and you can use all 248 characters for the file name.

To help ensure portability of input files across systems, the program has certain requirements for file names. Avoid using special characters (+,-,*,/,$,!, etc.) in file names unless meaningful, and begin file names with a letter. Some system-dependent special characters (such as ~) are not interpreted the same as they are at the operating system level when used in path names. Parameter substitution can be forced within the name, extension, or directory fields by enclosing the parameter within percent (%) signs. For example, if I = 5, the name TEST%I% becomes TEST5.

Chinese and Japanese character file names are supported. The input file, output file, Jobname, and working directory can include Chinese or Japanese characters in the file or folder name. These names can be input at the command line, through the Mechanical APDL Launcher, or through commands such as **/FILNAME (p. 757)**, **RESUME (p. 1601)**, and **/ASSIGN (p. 201)**. Keep the following points in mind when using Chinese or Japanese characters:

- The locale setting of the operating system must match that of the language being used for naming.
- The file extensions must remain in standard English characters.
- Non-English characters are not supported by GUI operations. Specifically, the **Open File** button on the Standard Toolbar does not accept Mechanical APDL files that are named with non-English characters, and the GUI command input area does not accept commands that include non-English characters.

1.3.8. Star and Slash Commands

The slash (/) and star (*) commands are usually used for supplying general control instructions to the program. For example, slash commands are used for entering a processor (**/PREP7 (p. 1479)**, **/POST1 (p. 1461)**, etc.). Printout controls, display controls, and file controls are available within the slash command set.

Repeat, looping and macro controls are available within the star command set.

Many star and slash commands are global and apply to all processors. For example, the **/TITLE (p. 2007)** command may be used to change the title in any processor (PREP7, POST1, etc.). The star commands

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

can be input anywhere. Most slash commands can be input anywhere; however, some can only be input at a Begin level, and those commands are specifically noted in the command description. Graphics displays are controlled via the graphics display slash commands. The graphics display slash commands can be input anywhere.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information
of ANSYS, Inc. and its subsidiaries and affiliates.

Chapter 2: Command Groupings

Following are tables of related commands. The documentation for each command also references these tables, providing convenient access to related commands.

> **Example:** To define material types in the PREP7 general preprocessor, see PREP7 Commands (p. 22) and examine the commands available under Table 2.28: Materials (p. 24).

While this document is useful as a reference, you should first look at the appropriate analysis guide to learn which commands are used for a given operation or analysis type.

The following command groupings are available:

2.1. SESSION Commands
2.2. DATABASE Commands
2.3. GRAPHICS Commands
2.4. APDL Commands
2.5. PREP7 Commands
2.6. SOLUTION Commands
2.7. POST1 Commands
2.8. POST26 Commands
2.9. AUX2 Commands
2.10. AUX3 Commands
2.11. AUX12 Commands
2.12. AUX15 Commands
2.13. Mapping Processor Commands

2.1. SESSION Commands

These commands provide general control to the session. The commands are grouped by functionality.

Table 2.1: Run Controls

These SESSION commands control the overall characteristics of the session, including the jobname, Graphical User Interface behavior, and file switching.	
/BATCH (p. 217)	Sets the program mode to "batch."
/CONFIG (p. 410)	Assigns values to configuration parameters.
/CWD (p. 452)	Changes the current working directory.
/EOF (p. 645)	Exits the file being read.
/EXIT (p. 708)	Stops the run and returns control to the system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SESSION commands control the overall characteristics of the session, including the jobname, Graphical User Interface behavior, and file switching.

/FILNAME (p. 757) Changes the jobname for the analysis.

HELP (p. 903) Displays help information for commands and element types.

/INPUT (p. 948) Switches the input file for the commands that follow.

KEYW (p. 981) Sets a keyword used by the GUI for context filtering (GUI).

MEMM (p. 1120) Enables the current session to keep allocated memory.

/MENU (p. 1121) Activates the Graphical User Interface (GUI).

/MSTART (p. 1198) Controls the initial GUI components.

/NERR (p. 1215) Limits the number of warning and error messages displayed.

/OUTPUT (p. 1334) Redirects text output to a file or to the screen.

PAUSE (p. 1356) Temporarily releases (pauses) the currently used product license so that another application can use it.

/STATUS (p. 1865) Lists the status of items for the run.

/SYP (p. 1894) Passes a command string and arguments to the operating system.

/SYS (p. 1895) Passes a command string to the operating system.

/UI (p. 2040) Activates specified GUI dialog boxes.

/UIS (p. 2045) Controls the GUI behavior.

UNPAUSE (p. 2056) Restores use of a temporarily released (paused) product license. (Applicable only *after* a previously issued **PAUSE (p. 1356)** command.)

Table 2.2: Processor Entry

These SESSION commands enter and exit the various processors in the program.

/AUX2 (p. 208) Enters the binary file dumping processor.

/AUX3 (p. 209) Enters the results file editing processor.

/AUX12 (p. 209) Enters the radiation matrix generation processor.

/AUX15 (p. 210) Enters the IGES file transfer processor.

FINISH (p. 758) Exits normally from a processor.

/MAP (p. 1107) Enters the mapping processor.

/POST1 (p. 1461) Enters the database results postprocessor.

/POST26 (p. 1462) Enters the time-history results postprocessor.

/PREP7 (p. 1479) Enters the model creation preprocessor.

/QUIT (p. 1563) Exits a processor.

/SOLU (p. 1821) Enters the solution processor.

Table 2.3: Files

These SESSION commands control file operations, such as deleting, copying, and listing.

ANSTOAQWA (p. 153) Creates an AQWA-LINE input file from the current model.

ANSTOASAS (p. 156) Creates an ASAS input file from the current model.

/ASSIGN (p. 201) Reassigns a file name to a file identifier.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SESSION commands control file operations, such as deleting, copying, and listing.

/CLOG (p. 355)	Copies the session log file to a named file.
/COPY (p. 416)	Copies a file.
/DELETE (p. 514)	Deletes a file.
/FCLEAN (p. 736)	Deletes all local files in all processors in a distributed-memory parallel processing run.
/FCOMP (p. 737)	Specifies file compression level.
/FDELE (p. 744)	Deletes a binary file after it is used.
LGWRITE (p. 1048)	Writes the database command log to a file.
***LIST (p. 1055)**	Displays the contents of an external, coded file.
/RENAME (p. 1585)	Renames a file.
/UPF (p. 2050)	Links user-programmable routines into Mechanical APDL.

Table 2.4: List Controls

These SESSION commands control listings and printed program output.

C* (p. 283)**	Places a comment in the output.
/COM (p. 404)	Places a comment in the output.
/GO (p. 865)	Reactivates suppressed printout.
/GOLIST (p. 865)	Reactivates the suppressed data input listing.
/GOPR (p. 865)	Reactivates suppressed printout.
/NOLIST (p. 1249)	Suppresses the data input listing.
/NOPR (p. 1251)	Suppresses the expanded interpreted input data listing.

2.2. DATABASE Commands

These commands operate on the database in a global sense. The commands are grouped by functionality.

Table 2.5: Setup

These DATABASE commands initialize the database, save it to a file, or annotate it with titles and systems of units.

/CLEAR (p. 350)	Clears the database.
RESUME (p. 1601)	Resumes the database from the database file.
SAVE (p. 1645)	Saves all current database information.
/SMBC (p. 1806)	Controls the display of solid model boundary condition symbols and labels.
STAT (p. 1861)	Displays the status of database settings.
/STITLE (p. 1867)	Defines subtitles.
/TITLE (p. 2007)	Defines a main title.
UNDO (p. 2053)	Enables modifying or saving commands issued since the last **RESUME (p. 1601)** or **SAVE (p. 1645)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These DATABASE commands initialize the database, save it to a file, or annotate it with titles and systems of units.

/UNITS (p. 2054) Annotates the database with the system of units used.

Table 2.6: Selecting

These DATABASE commands select subsets of database entities for further operations.

ALLSEL (p. 114) Selects all entities with a single command.

ASLL (p. 199) Selects those areas containing the selected lines.

ASEL (p. 192) Selects a subset of areas.

ASLV (p. 200) Selects those areas contained in the selected volumes.

DOFSEL (p. 569) Selects a degree-of-freedom label set for reference by other commands.

ESEL (p. 661) Selects a subset of elements.

ESLA (p. 668) Selects those elements associated with the selected areas.

ESLL (p. 669) Selects those elements associated with the selected lines.

ESLN (p. 670) Selects those elements attached to the selected nodes.

ESLV (p. 671) Selects elements associated with the selected volumes.

KSEL (p. 995) Selects a subset of keypoints or hard points.

KSLL (p. 998) Selects those keypoints contained in the selected lines.

KSLN (p. 998) Selects those keypoints associated with the selected nodes.

LSEL (p. 1074) Selects a subset of lines.

LSLA (p. 1078) Selects those lines contained in the selected areas.

LSLK (p. 1079) Selects those lines containing the selected keypoints.

NSEL (p. 1266) Selects a subset of nodes.

NSLA (p. 1272) Selects those nodes associated with the selected areas.

NSLE (p. 1273) Selects those nodes attached to the selected elements.

NSLK (p. 1274) Selects those nodes associated with the selected keypoints.

NSLL (p. 1275) Selects those nodes associated with the selected lines.

NSLV (p. 1276) Selects those nodes associated with the selected volumes.

VSEL (p. 2163) Selects a subset of volumes.

VSLA (p. 2166) Selects those volumes containing the selected areas.

Table 2.7: Components

These DATABASE commands enable selected subsets of entities to be named as components for easy selection later on.

CM (p. 356) Groups geometry items into a component.

CMDELE (p. 362) Deletes a component or assembly definition.

CMEDIT (p. 365) Edits an existing component or assembly.

CMGRP (p. 365) Groups components and assemblies into an assembly.

CMLIST (p. 366) Lists the entities contained in a component or assembly.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These DATABASE commands enable selected subsets of entities to be named as components for easy selection later on.

CMMOD (p. 368) Modifies the specification of a component.

CMPLOT (p. 371) Plots the entities contained in a component or assembly.

CMSEL (p. 374) Selects a subset of components and assemblies.

CMWRITE (p. 381) Writes components and assemblies to a file.

Table 2.8: Working Plane

These DATABASE commands activate, move, rotate, and modify the working plane, which is used for picking operations.

KWPAVE (p. 1003) Moves the working plane origin to the average location of keypoints.

KWPLAN (p. 1004) Defines the working plane using three keypoints.

LWPLAN (p. 1095) Defines the working plane normal to a location on a line.

NWPAVE (p. 1303) Moves the working plane origin to the average location of nodes.

NWPLAN (p. 1304) Defines the working plane using three nodes.

WPAVE (p. 2178) Moves the working plane origin to the average of specified points.

WPCSYS (p. 2179) Defines the working plane location based on a coordinate system.

WPLANE (p. 2180) Defines a working plane to assist in picking operations.

WPOFFS (p. 2181) Offsets the working plane.

WPROTA (p. 2181) Rotates the working plane.

WPSTYL (p. 2182) Controls the display and style of the working plane.

Table 2.9: Coordinate System

These DATABASE commands define and manipulate coordinate systems.

CLOCAL (p. 352) Defines a local coordinate system relative to the active coordinate system.

CS (p. 435) Defines a local coordinate system by three node locations.

CSCIR (p. 436) Locates the singularity for non-Cartesian local coordinate systems.

CSDELE (p. 438) Deletes local coordinate systems.

CSKP (p. 438) Defines a local coordinate system by three keypoint locations.

CSLIST (p. 440) Lists coordinate systems.

CSWPLA (p. 440) Defines a local coordinate system at the origin of the working plane.

CSYS (p. 441) Activates a previously defined coordinate system.

LOCAL (p. 1059) Defines a local coordinate system by a location and orientation.

Table 2.10: Picking

These DATABASE commands are generated by the GUI when picking operations are performed.

FITEM (p. 758) Identifies items chosen by a picking operation (GUI).

FLST (p. 766) Specifies data required for a picking operation (GUI).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2.3. GRAPHICS Commands

These commands control Mechanical APDL graphics. The commands are grouped by functionality.

Table 2.11: Setup

These GRAPHICS commands are used for general graphics control, such as window setup, color settings, specifications saving, etc.

/CMAP (p. 359)	Changes an existing color mapping table or creates a new one .
/COLOR (p. 400)	Specifies the color mapping for various items.
/DEVICE (p. 523)	Controls graphics device options.
DSYS (p. 582)	Activates a display coordinate system for geometry listings and plots.
/DV3D (p. 584)	Sets 3D device option modes.
/ERASE (p. 653)	Specifies that the screen is to be erased before each display.
ERASE (p. 652)	Explicitly erases the current display.
/GCMD (p. 795)	Controls the type of element or graph display used for the **GPLOT (p. 866)** command.
/GCOLUMN (p. 795)	Applies a label to a specified curve.
/GFILE (p. 858)	Specifies the pixel resolution on Z-buffered graphics files.
GPLOT (p. 866)	Controls general plotting.
/GRAPHICS (p. 866)	Defines type of graphics display to be used for element plots.
/GRESUME (p. 868)	Sets graphics settings to the settings on a file.
/GSAVE (p. 875)	Saves graphics settings to a file for later use.
/GTYPE (p. 883)	Controls the entities that the **GPLOT (p. 866)** command displays.
/IMAGE (p. 933)	Enables graphics data to be captured and saved.
IMMED (p. 937)	Enables immediate display of a model as it is generated.
JPEG (p. 965)	Provides JPEG File Export for displays.
/MREP (p. 1182)	Enables you to reissue the graphics command macro "name" during a replot or zoom operation.
/NOERASE (p. 1249)	Prevents the screen erase between displays.
PNGR (p. 1455)	Sets file options for PNGR graphics export for displays.
/PSTATUS (p. 1550)	Displays the global or window display specifications.
/REPLOT (p. 1587)	Automatically reissues the last display command for convenience.
/RESET (p. 1599)	Resets display specifications to their initial defaults.
/SEG (p. 1707)	Enables graphics data to be stored in the local terminal memory.
/SHOW (p. 1785)	Specifies the device and other parameters for graphics displays.
TIFF (p. 1999)	Provides TIFF file Export for displays.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These GRAPHICS commands are used for general graphics control, such as window setup, color settings, specifications saving, etc.

/WINDOW (p. 2177) Defines the window size on the screen.

Table 2.12: Views

These GRAPHICS commands control the view of the model.

/ANGLE (p. 140) Rotates the display about an axis.

/AUTO (p. 207) Resets the focus and distance specifications to "automatically calculated."

/DIST (p. 536) Specifies the viewing distance for magnifications and perspective.

/FOCUS (p. 771) Specifies the focus point (center of the window).

/USER (p. 2061) Conveniently resets **/FOCUS (p. 771)** and **/DIST (p. 536)** to USER.

/VCONE (p. 2078) Defines the view cone angle for perspective displays.

/VIEW (p. 2131) Defines the viewing direction for the display.

/VUP (p. 2173) Specifies the global Cartesian coordinate system reference orientation.

/XFRM (p. 2194) Controls the centroid or the axis of dynamic rotation.

/ZOOM (p. 2203) Zooms a region of a display window.

Table 2.13: Scaling

These GRAPHICS commands scale various parts of the display.

/DSCALE (p. 575) Sets the displacement multiplier for displacement displays.

/ICLWID (p. 924) Scales the line width of circuit builder icons.

/ICSCALE (p. 927) Scales the icon size for elements supported in the circuit builder.

/RATIO (p. 1572) Distorts the object geometry.

/SHRINK (p. 1794) Shrinks elements, lines, areas, and volumes for display clarity.

/SSCALE (p. 1847) Sets the contour multiplier for topographic displays.

/TXTRE (p. 2029) Applies textured appearance to selected items.

/VSCALE (p. 2160) Scales the length of displayed vectors.

Table 2.14: Style

These GRAPHICS commands change the way a model is displayed.

/CPLANE (p. 426) Specifies the cutting plane for section and capped displays.

/CTYPE (p. 443) Specifies the type of contour display.

/EDGE (p. 594) Displays only the "edges" of an object.

/ESHAPE (p. 665) Displays elements with shapes determined from the real constants.

/FACET (p. 731) Specifies the facet representation used to form solid model displays.

/GLINE (p. 860) Specifies the element outline style.

/GMARKER (p. 861) Specifies the curve marking style.

GMFACE (p. 863) Specifies the facet representation used to form solid models.

/LIGHT (p. 1049) Specifies the light direction for the display window.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These GRAPHICS commands change the way a model is displayed.

/NORMAL (p. 1253) Enables displaying area elements by top or bottom faces.

/SHADE (p. 1783) Defines the type of surface shading used with Z-buffering.

/TRLCY (p. 2015) Specifies the level of translucency.

/TYPE (p. 2034) Defines the type of display.

Table 2.15: Labeling

These GRAPHICS commands add helpful labels and symbols to displays.

/CFORMAT (p. 317) Controls the graphical display of alpha character strings for parameters, components, assemblies, and tables.

/CLABEL (p. 349) Specifies contour labeling.

/CONTOUR (p. 415) Specifies the uniform contour values on stress displays.

/CVAL (p. 450) Specifies nonuniform contour values on stress displays.

/GFORMAT (p. 859) Specifies the format for the graphical display of numbers.

/HBC (p. 887) Determines how boundary conditions are displayed in a display window.

/NUMBER (p. 1290) Specifies whether numbers, colors, or both are used for displays.

/PBC (p. 1356) Shows boundary condition symbols and values on displays.

/PBF (p. 1360) Shows body-force loads as contours on displays.

/PLOPTS (p. 1435) Controls graphics options on subsequent displays.

/PNUM (p. 1457) Controls entity numbering/coloring on plots.

/PSF (p. 1537) Shows surface load symbols on model displays.

/PSYMB (p. 1552) Shows various symbols on displays.

/TRIAD (p. 2014) Shows the global XYZ coordinate triad on displays.

/UDOC (p. 2038) Determines position and content for the multi-legend options.

Table 2.16: Graphs

These GRAPHICS commands control the way line graphs are displayed.

/AXLAB (p. 216) Labels the X and Y axes on graph displays.

/GRID (p. 869) Selects the type of grid on graph displays.

/GROPT (p. 870) Sets various line graph display options.

/GRTYP (p. 874) Selects single or multiple Y-axes graph displays.

/GTHK (p. 882) Sets line thicknesses for graph lines.

/XRANGE (p. 2199) Specifies a linear abscissa (X) scale range.

/YRANGE (p. 2201) Specifies a linear ordinate (Y) scale range.

Table 2.17: Annotation

These GRAPHICS commands annotate a display with notes and symbols.

/AN3D (p. 129) Specifies 3D annotation functions

/ANNOT (p. 145) Activates graphics for annotating displays (GUI).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These GRAPHICS commands annotate a display with notes and symbols.

/ANUM (p. 166)	Specifies the annotation number, type, and hot spot (GUI).
/LARC (p. 1011)	Creates annotation arcs (GUI).
/LINE (p. 1051)	Creates annotation lines (GUI).
/LSPEC (p. 1081)	Specifies annotation line attributes (GUI).
/LSYMBOL (p. 1088)	Creates annotation symbols (GUI).
/PCIRCLE (p. 1370)	Creates an annotation circle (GUI).
/PMORE (p. 1454)	Creates an annotation polygon (GUI).
/POLYGON (p. 1460)	Creates annotation polygons (GUI).
/PSPEC (p. 1548)	Creates annotation polygon attributes (GUI).
/PWEDGE (p. 1557)	Creates an annotation wedge (GUI).
/TLABEL (p. 2007)	Creates annotation text (GUI).
/TSPEC (p. 2024)	Creates annotation text attributes (GUI).

2.4. APDL Commands

These commands make up the Ansys Parametric Design Language (APDL). The commands are grouped by functionality.

Table 2.18: Parameter Definition

These APDL commands define parameters and their values.

***AFUN (p. 83)**	Specifies units for angular functions in parameter expressions.
***ASK (p. 84)**	Prompts the user to input a parameter value.
***DEL (p. 512)**	Deletes a parameter (GUI).
***DIM (p. 530)**	Defines an array parameter and its dimensions.
***GET (p. 797)**	Retrieves a value and stores it as a user-named parameter.
/INQUIRE (p. 950)	Returns system information to a parameter.
PARRES (p. 1351)	Reads parameters from a file.
PARSAV (p. 1352)	Writes parameters to a file.
***SET (p. 1720)**	Assigns values to user-named parameters.
***STATUS (p. 1863)**	Lists the current parameters and abbreviations.
***TAXIS (p. 1898)**	Defines table index numbers.
***TREAD (p. 2012)**	Reads data from an external file into a table array parameter.
***VFILL (p. 2097)**	Fills an array parameter.
***VGET (p. 2118)**	Retrieves values into an array parameter.
***VREAD (p. 2153)**	Reads data and produces an array parameter vector or matrix.

Table 2.19: Macro Files

These APDL commands build and execute command macros.

***CFCLOS (p. 316)**	Closes the "command" file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These APDL commands build and execute command macros.

***CFOPEN (p. 316)**	Opens a "command" file.
***CFWRITE (p. 318)**	Writes a command (or similar string) to a "command" file.
***CREATE (p. 434)**	Opens (creates) a macro file.
/DFLAB (p. 527)	Changes degree of freedom labels for user custom elements.
***END (p. 635)**	Closes a macro file.
/MKDIR (p. 1129)	Creates a directory.
***MSG (p. 1185)**	Writes an output message via the message subroutine.
/PMACRO (p. 1449)	Specifies that macro contents be written to the session log file.
/PSEARCH (p. 1535)	Specifies a directory to be searched for "unknown command" macro files.
/RMDIR (p. 1612)	Removes (deletes) a directory.
/TEE (p. 1995)	Writes a list of commands to a specified file at the same time that the commands are being executed.
***ULIB (p. 2051)**	Identifies a macro library file.
***USE (p. 2059)**	Executes a macro file.

Table 2.20: Encryption/Decryption

These APDL commands encrypt and decrypt command input and other data.

/DBDECRYPT (p. 499)	Controls decryption of material data in the database file.
/DBENCRYPT (p. 500)	Controls encryption of material data in the database file.
/DECRYPT (p. 510)	Controls decryption of command input.
/ENCRYPT (p. 634)	Controls encryption of command input.

Table 2.21: Abbreviations

These APDL commands can be used to define abbreviations for longer commands, and to create user-defined commands.

***ABBR (p. 81)**	Defines an abbreviation.
ABBRES (p. 86)	Reads abbreviations from a coded file.
ABBSAV (p. 87)	Writes the current abbreviation set to a coded file.
/UCMD (p. 2037)	Assigns a user-defined command name.

Table 2.22: Array Parameters

These APDL commands operate on parameter arrays (that is, vectors and matrices).

/DIRECTORY (p. 534)	Put the file names in the current directory into a string parameter array.
***MFOURI (p. 1124)**	Calculates the coefficients for, or evaluates, a Fourier series.
***MFUN (p. 1125)**	Copies or transposes an array parameter matrix.
***MOPER (p. 1147)**	Performs matrix operations on array parameter matrices.
***MWRITE (p. 1202)**	Writes a matrix to a file in a formatted sequence.
***SREAD (p. 1844)**	Reads a file into a string array parameter.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These APDL commands operate on parameter arrays (that is, vectors and matrices).

***TOPER (p. 2009)** Operates on table parameters.
***VABS (p. 2072)** Applies the absolute value function to array parameters.
***VCOL (p. 2077)** Specifies the number of columns in matrix operations.
***VCUM (p. 2080)** Enables array parameter results to add to existing results.
***VEDIT (p. 2089)** Enables numerical array parameters to be graphically edited.
***VFACT (p. 2092)** Applies a scale factor to array parameters.
***VFUN (p. 2106)** Performs a function on a single array parameter.
***VITRP (p. 2134)** Forms an array parameter by interpolation of a table.
***VLEN (p. 2136)** Specifies the number of rows to be used in array parameter operations.
***VMASK (p. 2139)** Specifies an array parameter as a masking vector.
***VOPER (p. 2142)** Operates on two array parameters.
***VPLOT (p. 2146)** Graphs columns (vectors) of array parameters.
***VPUT (p. 2149)** Restores array parameter values into the database.
***VSCFUN (p. 2161)** Determines properties of an array parameter.
***VSTAT (p. 2167)** Lists the current specifications for the array parameters.
***VWRITE (p. 2174)** Writes data to a file in a formatted sequence.

Table 2.23: Process Controls

These APDL commands can be used to control the order in which other commands are processed.

***CYCLE (p. 462)** Bypasses commands within a do-loop.
***DO (p. 567)** Defines the beginning of a do-loop.
***DOWHILE (p. 573)** Loops repeatedly through the next ***ENDDO (p. 636)** command.
***ELSE (p. 620)** Separates the final if-then-else block.
***ELSEIF (p. 620)** Separates an intermediate if-then-else block.
***ENDDO (p. 636)** Ends a do-loop and starts the looping action.
***ENDIF (p. 636)** Ends an if-then-else.
***EXIT (p. 707)** Exits a do-loop.
***GO (p. 864)** Causes a specified line on the input file to be read next.
***IF (p. 927)** Conditionally causes commands to be read.
***REPEAT (p. 1586)** Repeats the previous command.
***RETURN (p. 1605)** Returns input stream to a higher level.
/WAIT (p. 2177) Introduces a delay before reading the next command.

Table 2.24: Matrix Operations (APDL Math)

These APDL Math commands can be used to create, manipulate, and solve matrices.

***AXPY (p. 86)** Performs the matrix operation M2= v*M1 + w*M2.
***COMP (p. 405)** Compresses the columns of a matrix using a specified algorithm.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These APDL Math commands can be used to create, manipulate, and solve matrices.

***DMAT (p. 551)**	Creates a dense matrix.
***DOT (p. 572)**	Computes the dot (or inner) product of two vectors.
***EIGEN (p. 605)**	Performs a modal solution with unsymmetric or damping matrices.
***EXPORT (p. 716)**	Exports a matrix to a file in the specified format.
***FFT (p. 747)**	Computes the fast Fourier transformation of a specified matrix or vector.
***FREE (p. 776)**	Deletes a matrix or a solver object and frees its memory allocation.
***HPROD (p. 907)**	Performs a Hadamard vector product (C = A B).
***INIT (p. 945)**	Initializes a vector or dense matrix.
***INQUIRE (p. 949)**	Retrieves properties of an existing APDL Math Object.
***ITENGINE (p. 963)**	Performs a solution using an iterative solver.
***KRON (p. 991)**	Computes the Kronecker product of two matrices/vectors, $M_3 = M_1 \otimes M_2$
***LSBAC (p. 1066)**	Performs the solve (forward/backward substitution) of a factorized linear system.
***LSENGINE (p. 1072)**	Creates a linear solver engine.
***LSFACTOR (p. 1078)**	Performs the numerical factorization of a linear solver system.
***MERGE (p. 1122)**	Merges two dense matrices or vectors into one.
***MULT (p. 1201)**	Performs the matrix multiplication M3 = M1(T1)*M2(T2).
***NRM (p. 1260)**	Computes the norm of the specified matrix or vector.
***PRINT (p. 1496)**	Prints the matrix values to a file.
***REMOVE (p. 1583)**	Suppresses rows or columns of a dense matrix or a vector.
***RENAME (p. 1584)**	Renames an existing vector or matrix.
***SCAL (p. 1647)**	Scales a vector or matrix by a constant
***SMAT (p. 1801)**	Creates a sparse matrix.
***SORT (p. 1822)**	Sorts the values of the specified vector.
***VEC (p. 2085)**	Creates a vector.
***XPL (p. 2196)**	Accesses content of a Mechanical APDL file.

2.5. PREP7 Commands

These commands create and set up the model. The commands are grouped by functionality.

Table 2.25: Database

These PREP7 commands read model data into the database, list out the database, and control the numbering of entities in the database.

AFLIST (p. 106)	Lists the current data in the database.
CDREAD (p. 291)	Reads a file of solid model and database information into the database.
CDWRITE (p. 293)	Writes geometry and load database items to a file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands read model data into the database, list out the database, and control the numbering of entities in the database.

CDOPT (p. 290) Specifies format to be used for archiving geometry.

CECHECK (p. 299) Check constraint equations and couplings for rigid body motions.

CHECK (p. 333) Checks current database items for completeness.

CNCHECK (p. 382) Provides and/or adjusts the initial status of contact pairs.

FC (p. 732) Provides failure criteria information and activates a data table to input temperature-dependent stress and strain limits.

FCCHECK (p. 735) Checks both the strain and stress input criteria for all materials.

FCDELE (p. 736) Deletes previously defined failure criterion data for the given material.

FCLIST (p. 737) To list what the failure criteria is that you have input.

IGESOUT (p. 932) Writes solid model data to a file in IGES Version 5.1 format.

NOOFFSET (p. 1250) Prevents the **CDREAD (p. 291)** command from offsetting specified data items.

NUMCMP (p. 1291) Compresses the numbering of defined items.

NUMMRG (p. 1295) Merges coincident or equivalently defined items.

NUMOFF (p. 1299) Adds a number offset to defined items.

NUMSTR (p. 1301) Establishes starting numbers for automatically numbered items.

/PREP7 (p. 1479) Enters the model creation preprocessor.

Table 2.26: Element Type

These PREP7 commands define the type of elements to be used in the model.

DOF (p. 568) Adds degrees of freedom to the current degree-of-freedom set.

ELBOW (p. 616) Specifies degrees of freedom to be coupled for end release and applies section constraints to elbow elements.

ET (p. 686) Defines a local element type from the element library.

ETCHG (p. 699) Changes element types to their corresponding types.

ETCONTROL (p. 700) Controls the element technologies used in element formulation (for applicable elements).

ETDELE (p. 702) Deletes element types.

ETLIST (p. 702) Lists currently defined element types.

KEYOPT (p. 979) Sets element key options.

NSVR (p. 1289) Defines the number of variables for user-programmable element options.

Table 2.27: Real Constants

These PREP7 commands define the model real constants.

R (p. 1565) Defines the element real constants.

RDELE (p. 1577) Deletes real constant sets.

RLIST (p. 1611) Lists the real constant sets.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands define the model real constants.

RMODIF (p. 1613) Modifies real constant sets.

RMORE (p. 1614) Adds real constants to a set.

SETFGAP (p. 1729) Updates real constant table for squeeze film elements.

Table 2.28: Materials

These PREP7 commands define the linear material properties.

EMUNIT (p. 632) Specifies the system of units for magnetic field problems.

MP (p. 1160) Defines a linear material property.

MPAMOD (p. 1166) Modifies temperature-dependent coefficients of thermal expansion.

MPCHG (p. 1167) Changes the material number attribute of an element.

MPCOPY (p. 1167) Copies material model data from one material reference number to another.

MPDATA (p. 1168) Defines property data to be associated with the temperature table.

MPDELE (p. 1172) Deletes linear material properties.

MPDRES (p. 1173) Reassembles existing material data with the temperature table.

/MPLIB (p. 1173) Sets the default material library read and write paths.

MPLIST (p. 1175) Lists linear material properties.

MPPLOT (p. 1175) Plots linear material properties as a function of temperature.

MPREAD (p. 1176) Reads a file containing material properties.

MPTEMP (p. 1178) Defines a temperature table for material properties.

MPTGEN (p. 1179) Adds temperatures to the temperature table by generation.

MPTRES (p. 1180) Restores a temperature table previously defined.

MPWRITE (p. 1181) Writes linear material properties in the database to a file (if the Lib option is not specified) or writes both linear and nonlinear material properties (if Lib is specified) from the database to a file.

NSMASS (p. 1277) Applies nonstructural mass to selected elements.

TBFPLOT (p. 1968) Plots material curve-fitting data.

TBFT (p. 1969) Performs material curve-fitting operations on materials.

UIMP (p. 2044) Defines constant material properties (GUI).

Table 2.29: Material Data Tables

These PREP7 commands create and modify the material data tables (that is, to specify and define material models).

TB (p. 1899) Activates a material data table.

TBCOPY (p. 1959) Copies a data table from one material to another.

TBDATA (p. 1960) Defines data for the material data table.

TBDELE (p. 1961) Deletes previously defined material data tables.

TBEO (p. 1961) Sets special options or parameters for material data tables.

TBFIELD (p. 1966) Defines values of field variables for the material data tables.

TBIN (p. 1963) Sets parameters used for interpolation of the material data tables.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands create and modify the material data tables (that is, to specify and define material models).

TBLIST (p. 1988) Lists the material data tables.

TBMODIF (p. 1989) Modifies data for the material data table (GUI).

TBPLOT (p. 1990) Displays the material data table.

TBPT (p. 1992) Defines a point on a stress-strain or B-H curve.

TBTEMP (p. 1993) Defines a temperature for the material data table.

Table 2.30: Primitives

These PREP7 commands create primitive shapes for modeling.

BLC4 (p. 266) Creates a rectangular area or block volume by corner points.

BLC5 (p. 267) Creates a rectangular area or block volume by center and corner points.

BLOCK (p. 268) Creates a block volume based on working plane coordinates.

CON4 (p. 409) Creates a conical volume anywhere on the working plane.

CONE (p. 409) Creates a conical volume centered about the working plane origin.

CYL4 (p. 477) Creates a circular area or cylindrical volume anywhere on the working plane.

CYL5 (p. 478) Creates a circular area or cylindrical volume by end points.

CYLIND (p. 479) Creates a cylindrical volume centered about the working plane origin.

PCIRC (p. 1369) Creates a circular area centered about the working plane origin.

POLY (p. 1460) Creates a polygonal area based on working plane coordinate pairs.

PRI2 (p. 1495) Creates a polygonal area or a prism volume by vertices (GUI).

PRISM (p. 1497) Creates a prism volume based on working plane coordinate pairs.

PTXY (p. 1556) Defines coordinate pairs for use in polygons and prisms.

RECTNG (p. 1580) Creates a rectangular area anywhere on the working plane.

RPOLY (p. 1616) Creates a regular polygonal area centered about the working plane origin.

RPR4 (p. 1617) Creates a regular polygonal area or prism volume anywhere on the working plane.

RPRISM (p. 1618) Creates a regular prism volume centered about the working plane origin.

SPH4 (p. 1830) Creates a spherical volume anywhere on the working plane.

SPH5 (p. 1830) Creates a spherical volume by diameter end points.

SPHERE (p. 1831) Creates a spherical volume centered about the working plane origin.

TORUS (p. 2010) Creates a toroidal volume.

Table 2.31: Keypoints

These PREP7 commands create, modify, list, etc., keypoints.

GSUM (p. 881) Calculates and prints geometry items.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands create, modify, list, etc., keypoints.

K (p. 969)	Defines a keypoint.
KBETW (p. 972)	Creates a keypoint between two existing keypoints.
KCENTER (p. 973)	Creates a keypoint at the center of a circular arc defined by three locations.
KDELE (p. 976)	Deletes unmeshed keypoints.
KDIST (p. 976)	Calculates and lists the distance between two keypoints.
KFILL (p. 981)	Generates keypoints between two keypoints.
KGEN (p. 982)	Generates additional keypoints from a pattern of keypoints.
KL (p. 983)	Generates a keypoint at a specified location on an existing line.
KLIST (p. 984)	Lists the defined keypoints or hard points.
KMODIF (p. 985)	Modifies an existing keypoint.
KMOVE (p. 986)	Calculates and moves a keypoint to an intersection.
KNODE (p. 987)	Defines a keypoint at an existing node location.
KPLOT (p. 988)	Displays the selected keypoints.
KPSCALE (p. 988)	Generates a scaled set of (meshed) keypoints from a pattern of keypoints.
KSCALE (p. 993)	Generates a scaled pattern of keypoints from a given keypoint pattern.
KSUM (p. 999)	Calculates and prints geometry statistics of the selected keypoints.
KSYMM (p. 1000)	Generates a reflected set of keypoints.
KTRAN (p. 1001)	Transfers a pattern of keypoints to another coordinate system.
SOURCE (p. 1824)	Defines a default location for undefined nodes or keypoints.

Table 2.32: Hard Points

These PREP7 commands create, modify, list, etc., hard points.

HPTCREATE (p. 908)	Defines a hard point.
HPTDELETE (p. 909)	Deletes selected hard points.

Table 2.33: Lines

These PREP7 commands create, modify, list, etc., lines.

BSPLIN (p. 275)	Generates a single line from a spline fit to a series of keypoints.
CIRCLE (p. 344)	Generates circular arc lines.
GSUM (p. 881)	Calculates and prints geometry items.
L (p. 1005)	Defines a line between two keypoints.
L2ANG (p. 1006)	Generates a line at an angle with two existing lines.
L2TAN (p. 1007)	Generates a line tangent to two lines.
LANG (p. 1009)	Generates a straight line at an angle with a line.
LARC (p. 1010)	Defines a circular arc.
LAREA (p. 1012)	Generates the shortest line between two keypoints on an area.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands create, modify, list, etc., lines.

LCOMB (p. 1025) Combines adjacent lines into one line.
LDELE (p. 1033) Deletes unmeshed lines.
LDIV (p. 1034) Divides a single line into two or more lines.
LDRAG (p. 1035) Generates lines by sweeping a keypoint pattern along path.
LEXTND (p. 1043) Extends a line at one end by using its slope.
LFILLT (p. 1044) Generates a fillet line between two intersecting lines.
LGEN (p. 1046) Generates additional lines from a pattern of lines.
LLIST (p. 1056) Lists the defined lines.
LPLOT (p. 1061) Displays the selected lines.
LREVERSE (p. 1063) Reverses the normal of a line, regardless of its connectivity or mesh status.
LROTAT (p. 1064) Generates circular lines by rotating a keypoint pattern about an axis.
LSSCALE (p. 1084) Generates a scaled set of lines from a pattern of lines.
LSTR (p. 1086) Defines a straight line irrespective of the active coordinate system.
LSUM (p. 1086) Calculates and prints geometry statistics of the selected lines.
LSYMM (p. 1089) Generates lines from a line pattern by symmetry reflection.
LTAN (p. 1091) Generates a line at the end of, and tangent to, an existing line.
LTRAN (p. 1091) Transfers a pattern of lines to another coordinate system.
SPLINE (p. 1832) Generates a segmented spline through a series of keypoints.
SSLN (p. 1848) Selects and displays small lines in the model.

Table 2.34: Areas

These PREP7 commands create, modify, list, etc., areas.

A (p. 81) Defines an area by connecting keypoints.
AATT (p. 85) Associates element attributes with the selected, unmeshed areas.
ADELE (p. 97) Deletes unmeshed areas.
ADGL (p. 98) Lists keypoints of an area that lie on a parametric degeneracy.
ADRAG (p. 101) Generates areas by dragging a line pattern along a path.
AFILLT (p. 105) Generates a fillet at the intersection of two areas.
AGEN (p. 107) Generates additional areas from a pattern of areas.
AL (p. 112) Generates an area bounded by previously defined lines.
ALIST (p. 113) Lists the defined areas.
ANORM (p. 147) Reorients area normals.
AOFFST (p. 168) Generates an area, offset from a given area.
APLOT (p. 169) Displays the selected areas.
AREVERSE (p. 181) Reverses the normal of an area, regardless of its connectivity or mesh status.
AROTAT (p. 182) Generates cylindrical areas by rotating a line pattern about an axis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands create, modify, list, etc., areas.

ARSCALE (p. 183)	Generates a scaled set of areas from a pattern of areas.
ARSYM (p. 184)	Generates areas from an area pattern by symmetry reflection.
ASKIN (p. 198)	Generates an area by "skinning" a surface through guiding lines.
ASUB (p. 202)	Generates an area using the shape of an existing area.
ASUM (p. 203)	Calculates and prints geometry statistics of the selected areas.
ATRAN (p. 205)	Transfers a pattern of areas to another coordinate system.
GSUM (p. 881)	Calculates and prints geometry items.
SPLOT (p. 1833)	Displays the selected areas and a faceted view of their underlying surfaces

Table 2.35: Volumes

These PREP7 commands create, modify, list, etc., volumes.

EXTOPT (p. 722)	Controls options relating to the generation of volume elements from area elements.
GSUM (p. 881)	Calculates and prints geometry items.
V (p. 2069)	Defines a volume through keypoints.
VA (p. 2072)	Generates a volume bounded by existing areas.
VDELE (p. 2082)	Deletes unmeshed volumes.
VDGL (p. 2082)	Lists keypoints of a volume that lie on a parametric degeneracy.
VDRAG (p. 2084)	Generates volumes by dragging an area pattern along a path.
VEXT (p. 2091)	Generates additional volumes by extruding areas.
VGEN (p. 2116)	Generates additional volumes from a pattern of volumes.
VLIST (p. 2137)	Lists the defined volumes.
VLSCALE (p. 2137)	Generates a scaled set of volumes from a pattern of volumes.
VOFFST (p. 2140)	Generates a volume, offset from a given area.
VPLOT (p. 2147)	Displays the selected volumes.
VROTAT (p. 2155)	Generates cylindrical volumes by rotating an area pattern about an axis.
VSUM (p. 2167)	Calculates and prints geometry statistics of the selected volumes.
VSYMM (p. 2169)	Generates volumes from a volume pattern by symmetry reflection.
VTRAN (p. 2171)	Transfers a pattern of volumes to another coordinate system.

Table 2.36: Booleans

These PREP7 commands perform Boolean operations on solid model entities.

AADD (p. 82)	Adds separate areas to create a single area.
AGLUE (p. 108)	Generates new areas by "gluing" areas.
AINA (p. 109)	Finds the intersection of areas.
AINP (p. 110)	Finds the pairwise intersection of areas.
AINV (p. 110)	Finds the intersection of an area with a volume.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands perform Boolean operations on solid model entities.

AOVLAP (p. 169)	Overlaps areas.
APTN (p. 174)	Partitions areas.
ASBA (p. 186)	Subtracts areas from areas.
ASBL (p. 187)	Subtracts lines from areas.
ASBV (p. 189)	Subtracts volumes from areas.
ASBW (p. 190)	Subtracts the intersection of the working plane from areas (divides areas).
BOPTN (p. 269)	Specifies Boolean operation options.
BTOL (p. 279)	Specifies the Boolean operation tolerances.
LCSL (p. 1030)	Divides intersecting lines at their point(s) of intersection.
LGLUE (p. 1047)	Generates new lines by "gluing" lines.
LINA (p. 1050)	Finds the intersection of a line with an area.
LINL (p. 1053)	Finds the common intersection of lines.
LINP (p. 1053)	Finds the pairwise intersection of lines.
LINV (p. 1054)	Finds the intersection of a line with a volume.
LOVLAP (p. 1060)	Overlaps lines.
LPTN (p. 1061)	Partitions lines.
LSBA (p. 1065)	Subtracts areas from lines.
LSBL (p. 1067)	Subtracts lines from lines.
LSBV (p. 1069)	Subtracts volumes from lines.
LSBW (p. 1070)	Subtracts the intersection of the working plane from lines (divides lines).
VADD (p. 2074)	Adds separate volumes to create a single volume.
VGLUE (p. 2130)	Generates new volumes by "gluing" volumes.
VINP (p. 2133)	Finds the pairwise intersection of volumes.
VINV (p. 2134)	Finds the intersection of volumes.
VOVLAP (p. 2146)	Overlaps volumes.
VPTN (p. 2148)	Partitions volumes.
VSBA (p. 2156)	Subtracts areas from volumes.
VSBV (p. 2157)	Subtracts volumes from volumes.
VSBW (p. 2159)	Subtracts intersection of the working plane from volumes (divides volumes).

Table 2.37: Meshing

These PREP7 commands mesh solid models with nodes and elements.

ACCAT (p. 90)	Concatenates multiple areas in preparation for mapped meshing.
ACLEAR (p. 93)	Deletes nodes and area elements associated with selected areas.
AESIZE (p. 104)	Specifies the element size to be meshed onto areas.
AMAP (p. 116)	Generates a 2D mapped mesh based on specified area corners.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands mesh solid models with nodes and elements.

AMESH (p. 121) Generates nodes and area elements within areas.

AREFINE (p. 178) Refines the mesh around specified areas.

CHKMSH (p. 334) Checks area and volume entities for previous meshes.

CLRMSHLN (p. 355) Clears meshed entities.

CPCYC (p. 423) Couples the two side faces of a cyclically symmetric model for loadings that are the same on every segment.

CZDEL (p. 479) Edits or clears cohesive zone sections.

CZMESH (p. 480) Creates and meshes a cohesive zone group of elements.

DESIZE (p. 519) Controls default element sizes.

EORIENT (p. 646) Reorients solid element normals.

EREFINE (p. 654) Refines the mesh around specified elements.

ESIZE (p. 668) Specifies the default number of line divisions.

ESYS (p. 685) Sets the element coordinate system attribute pointer.

FVMESH (p. 784) Generates nodes and tetrahedral volume elements from detached exterior area elements (facets).

GSGDATA (p. 877) Specifies the reference point and defines the geometry in the fiber direction for the generalized plane strain element option.

IMESH (p. 935) Generates nodes and interface elements along lines or areas.

KATT (p. 969) Associates attributes with the selected, unmeshed keypoints.

KCLEAR (p. 975) Deletes nodes and point elements associated with selected keypoints.

KESIZE (p. 978) Specifies the edge lengths of the elements nearest a keypoint.

KMESH (p. 985) Generates nodes and point elements at keypoints.

KREFINE (p. 990) Refines the mesh around specified keypoints.

KSCON (p. 994) Specifies a keypoint about which an area mesh will be skewed.

LATT (p. 1014) Associates element attributes with the selected, unmeshed lines.

LCCAT (p. 1020) Concatenates multiple lines into one line for mapped meshing.

LCLEAR (p. 1024) Deletes nodes and line elements associated with selected lines.

LESIZE (p. 1041) Specifies the divisions and spacing ratio on unmeshed lines.

LMESH (p. 1057) Generates nodes and line elements along lines.

LREFINE (p. 1062) Refines the mesh around specified lines.

MAT (p. 1111) Sets the element material attribute pointer.

MCHECK (p. 1115) Checks mesh connectivity.

MODMSH (p. 1138) Controls the relationship of the solid model and the FE model.

MOPT (p. 1151) Specifies meshing options.

MSHAPE (p. 1188) For elements that support multiple shapes, specifies the element shape to be used for meshing.

MSHCOPY (p. 1189) Simplifies the generation of meshes that have matching node element patterns on two different line groups (in 2D) or area groups (3D).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands mesh solid models with nodes and elements.

MSHKEY (p. 1190) Specifies whether free meshing or mapped meshing should be used to mesh a model.

MSHMID (p. 1191) Specifies placement of midside nodes.

MSHPATTERN (p. 1192) Specifies pattern to be used for mapped triangle meshing.

NREFINE (p. 1257) Refines the mesh around specified nodes.

PSMESH (p. 1543) Splits an initially continuous group of beam, shell, plane, or solid elements into two unconnected groups, tied together with PRETS179 pretension elements.

REAL (p. 1579) Sets the element real constant set attribute pointer.

RSMESH (p. 1621) Generates a result section.

SHPP (p. 1787) Controls element shape checking.

SMRTSIZE (p. 1811) Specifies meshing parameters for automatic (smart) element sizing.

TCHG (p. 1994) Converts 20-node degenerate tetrahedral elements to their 10-node non-degenerate counterparts.

TIMP (p. 2003) Improves the quality of tetrahedral elements that are not associated with a volume.

TYPE (p. 2036) Sets the element type attribute pointer.

VATT (p. 2075) Associates element attributes with the selected, unmeshed volumes.

VCLEAR (p. 2076) Deletes nodes and volume elements associated with selected volumes.

VIMP (p. 2132) Improves the quality of the tetrahedral elements in the selected volume(s).

VMESH (p. 2140) Generates nodes and volume elements within volumes.

VEORIENT (p. 2089) Specifies brick element orientation for volume mapped (hexahedron) meshing.

VSWEEP (p. 2168) Fills an existing unmeshed volume with elements by sweeping the mesh from an adjacent area throughout the volume.

Table 2.38: Nodes

These PREP7 commands create, modify, list, etc., nodes.

CENTER (p. 309) Defines a node at the center of curvature of 2 or 3 nodes.

FILL (p. 755) Generates a line of nodes between two existing nodes.

MOVE (p. 1158) Calculates and moves a node to an intersection.

N (p. 1207) Defines a node.

NAXIS (p. 1208) Generates or clears nodes for general axisymmetric element sections.

NANG (p. 1208) Rotates a nodal coordinate system by direction cosines.

NDELE (p. 1211) Deletes nodes.

NDIST (p. 1212) Calculates and lists the distance between two nodes.

NGEN (p. 1218) Generates additional nodes from a pattern of nodes.

NKPT (p. 1219) Defines a node at an existing keypoint location.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands create, modify, list, etc., nodes.

NLIST (p. 1239) Lists nodes.
NMODIF (p. 1247) Modifies an existing node.
NORA (p. 1252) Rotates nodal coordinate systems to surface normal.
NPLOT (p. 1254) Displays nodes.
NREAD (p. 1256) Reads nodes from a file.
NROTAT (p. 1264) Rotates nodal coordinate systems into the active system.
NRRANG (p. 1265) Specifies the range of nodes to be read from the node file.
NSCALE (p. 1265) Generates a scaled set of nodes from a pattern of nodes.
NSMOOTH (p. 1280) Smooths selected nodes among selected elements.
NSYM (p. 1289) Generates a reflected set of nodes.
NWRITE (p. 1305) Writes nodes to a file.
QUAD (p. 1562) Generates a quadratic line of nodes from three nodes.
SOURCE (p. 1824) Defines a default location for undefined nodes or keypoints.
TRANSFER (p. 2011) Transfers a pattern of nodes to another coordinate system.

Table 2.39: Elements

These PREP7 commands create, modify, list, etc., elements.

AFSURF (p. 106) Generates surface elements overlaid on the surface of existing solid elements and assigns the extra node as the closes fluid element node.
E (p. 591) Defines an element by node connectivity.
ECPCHG (p. 592) Optimizes degree-of-freedom usage in a coupled acoustic model.
EDELE (p. 593) Deletes selected elements from the model.
EEMBED (p. 595) Generates bonded connections between intersecting elements.
EGEN (p. 603) Generates elements from an existing pattern.
EGID (p. 605) Specifies a global identifier for MESH200 elements in a mesh-independent reinforcing analysis.
EINFIN (p. 606) Generates structural infinite elements from selected nodes.
EINTF (p. 614) Defines two-node elements between coincident nodes.
ELIST (p. 619) Lists the elements.
EMID (p. 624) Adds or removes midside nodes.
EMODIF (p. 626) Modifies a previously defined element.
EMORE (p. 627) Adds more nodes to the just-defined element.
EMSEL (p. 628) Selects a set of reinforcing elements via a global identifier.
EMTGEN (p. 630) Generates a set of TRANS126 elements
EN (p. 633) Defines an element by its number and node connectivity.
ENDRELEASE (p. 637) Specifies degrees of freedom to be decoupled for end release.
ENGEN (p. 642) Generates elements from an existing pattern.
ENORM (p. 643) Reorients shell element normals or line element node connectivity.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands create, modify, list, etc., elements.

ENSYM (p. 644) Generates elements by symmetry reflection.

EORIENT (p. 646) Reorients solid element normals.

EPLOT (p. 648) Produces an element display.

EREAD (p. 653) Reads elements from a file.

EREINF (p. 656) Generates reinforcing elements from selected existing (base) elements.

ERRANG (p. 660) Specifies the element range to be read from a file.

ESURF (p. 682) Generates elements overlaid on the free faces of selected nodes.

ESYM (p. 684) Generates elements from a pattern by a symmetry reflection.

ESYS (p. 685) Sets the element coordinate system attribute pointer.

EWRITE (p. 703) Writes elements to a file.

GCDEF (p. 788) Defines interface interactions between general contact surfaces.

GCGEN (p. 792) Creates contact elements for general contact.

INISTATE (p. 938) Applies initial state data to an element or a selection of elements.

LAYLIST (p. 1017) Lists real constants material properties for layered elements.

LAYPLOT (p. 1018) Displays the layer stacking sequence for layered elements.

LFSURF (p. 1045) Generates surface elements overlaid on the edge of existing solid elements and assigns the extra node as the closest fluid element node.

MAT (p. 1111) Sets the element material attribute pointer.

NDSURF (p. 1213) Generates surface elements overlaid on the edge of existing elements and assigns the extra node as the closest fluid element node.

REAL (p. 1579) Sets the element real constant set attribute pointer.

SHSD (p. 1791) Creates or deletes shell-solid interface to be used in shell-to-solid assemblies.

SWADD (p. 1889) Adds more surfaces to an existing spot weld set.

SWDEL (p. 1889) Deletes spot weld sets.

SWGEN (p. 1890) Creates a new spot weld set.

SWLIST (p. 1893) Lists spot weld sets.

TSHAP (p. 2023) Defines simple 2D and 3D geometric surfaces for target segment elements.

TYPE (p. 2036) Sets the element type attribute pointer.

UPGEOM (p. 2058) Adds displacements from a previous analysis and updates the geometry to the deformed configuration.

USRDOF (p. 2064) Specifies the degrees of freedom for the user-defined element USER300.

USRELEM (p. 2065) Specifies the characteristics of the user-defined element USER300.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands create, modify, list, etc., elements.

WTBCREATE (p. 2168) Creates and defines USER300 elements for use in aeroelastic analysis.

Table 2.40: Superelements

These PREP7 commands create and modify superelements.

SE (p. 1651) Defines a superelement.

SEDLIST (p. 1705) Lists the degree-of-freedom solution of a superelement after the use pass.

SELIST (p. 1708) Lists the contents of a superelement matrix file.

SESYMM (p. 1718) Performs a symmetry operation on a superelement within the use pass.

SETRAN (p. 1730) Creates a superelement from an existing superelement.

Table 2.41: Coupled Degrees of Freedom

These PREP7 commands define, modify, list, etc., coupled degrees of freedom.

CP (p. 421) Defines (or modifies) a set of coupled degrees of freedom.

CPDELE (p. 424) Deletes coupled degree of freedom sets.

CPINTF (p. 425) Defines coupled degrees of freedom at an interface.

CPLGEN (p. 427) Generates sets of coupled nodes from an existing set.

CPLIST (p. 427) Lists the coupled degree of freedom sets.

CPMERGE (p. 428) Merges different couple sets with duplicate degrees of freedom into one couple set.

CPNGEN (p. 430) Defines, modifies, or adds to a set of coupled degrees of freedom.

CPSEL (p. 431) Selects coupled degree-of-freedom sets via predefined reference numbers.

CPSGEN (p. 432) Generates sets of coupled nodes from existing sets.

Table 2.42: Constraint Equations

These PREP7 commands define, modify, list, etc., constraint equations.

CE (p. 297) Defines a constraint equation relating degrees of freedom.

CECYCMS (p. 300) Generates the constraint equations for a multistage cyclic symmetry analysis.

CEDELE (p. 304) Deletes constraint equations.

CEFILTER (p. 304) Bypasses the error message when constraint equations have excessive terms.

CEIMS (p. 306) Generates constraint equations at the interface between stages in a multistage cyclic symmetry analysis.

CEINTF (p. 305) Generates constraint equations at an interface.

CELIST (p. 308) Lists the constraint equations.

CESEL (p. 313) Selects constraint equations via predefined reference numbers.

CERIG (p. 310) Defines a rigid region.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands define, modify, list, etc., constraint equations.

CESGEN (p. 314)	Generates a set of constraint equations from existing sets.
RBE3 (p. 1573)	Distributes the force/moment applied at an independent node to a set of dependent nodes.

Table 2.43: Status

These PREP7 commands are for use with the STAT command.

AREAS (p. 178)	Specifies "Areas" as the subsequent status topic.
BOOL (p. 268)	Specifies "Booleans" as the subsequent status topic.
CEQN (p. 310)	Specifies "Constraint equations" as the subsequent status topic.
COUPLE (p. 420)	Specifies "Node coupling" as the subsequent status topic.
ELEM (p. 618)	Specifies "Elements" as the subsequent status topic.
ETYPE (p. 703)	Specifies "Element types" as the subsequent status topic.
FEBODY (p. 745)	Specifies "Body loads on elements" as the subsequent status topic.
FECONS (p. 745)	Specifies "Constraints on nodes" as the subsequent status topic.
FEFOR (p. 746)	Specifies "Forces on nodes" as the subsequent status topic.
FESURF (p. 746)	Specifies "Surface loads on elements" as the subsequent status topic.
GEOMETRY (p. 797)	Specifies "Geometry" as the subsequent status topic.
KEYPTS (p. 980)	Specifies "Keypoints" as the subsequent status topic.
LINE (p. 1051)	Specifies "Lines" as the subsequent status topic.
MATER (p. 1112)	Specifies "Material properties" as the subsequent status topic.
MESHING (p. 1124)	Specifies "Meshing" as the subsequent status topic.
NODES (p. 1248)	Specifies "Nodes" as the subsequent status topic.
PRIM (p. 1495)	Specifies "Solid model primitives" as the subsequent status topic.
RCON (p. 1574)	Specifies "Real constants" as the subsequent status topic.
SELM (p. 1709)	Specifies "Superelements" as the subsequent status topic.
TBLE (p. 1988)	Specifies "Data table properties" as the subsequent status topic.
VOLUMES (p. 2141)	Specifies "Volumes" as the subsequent status topic.

Table 2.44: Sections

These PREP7 commands manage sections.

BSAX (p. 271)	Specifies axial strain and force for a nonlinear general beam section.
BSM1 (p. 273)	Specifies bending moment and curvature in plane XZ for a nonlinear general beam section.
BSM2 (p. 274)	Specifies bending moment and curvature in plane XY for a nonlinear general beam section.
BSMD (p. 272)	Specifies mass density for a nonlinear general beam section.
BSS1 (p. 276)	Specifies transverse shear force and strain in plane XZ for a nonlinear general beam section.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands manage sections.

BSS2 (p. 277) Specifies transverse shear force and strain in plane XY for a nonlinear general beam section.

BSTE (p. 278) Specifies a thermal expansion coefficient for a nonlinear general beam section.

BSTQ (p. 278) Specifies cross section torque and twist for a nonlinear general beam section.

CBMD (p. 287) Specifies preintegrated mass-density matrix for composite-beam sections.

CBMX (p. 288) Specifies preintegrated cross-section stiffness for composite-beam sections.

CBTE (p. 289) Specifies a thermal expansion coefficient for a composite-beam section.

CBTMP (p. 290) Specifies a temperature for the composite-beam section matrix.

SDELETE (p. 1650) Deletes sections from the database.

SECCONTROL (p. 1652) Supplements or overrides default section properties.

SECDATA (p. 1655) Describes the geometry of a section.

SECJOINT (p. 1679) Defines local coordinate systems at joint element nodes and other data for joint elements.

/SECLIB (p. 1682) Sets the default section library path for the **SECREAD (p. 1693)** command.

SECLOCK (p. 1682) Specifies locks on the element degrees of freedom.

SECNUM (p. 1685) Sets the element section attribute pointer.

SECOFFSET (p. 1685) Defines the section offset for cross sections.

SECPLOT (p. 1688) Plots the geometry of a beam, pipe, elbow, shell, or reinforcing section to scale.

SECREAD (p. 1693) Reads a custom section library or a user-defined section mesh into Mechanical APDL.

SECSTOP (p. 1696) Specifies stops on the element degrees of freedom.

SECTYPE (p. 1697) Associates section type information with a section ID number.

SECWRITE (p. 1703) Creates an ASCII file containing user mesh section information.

SFLEX (p. 1779) Sets section flexibility factors for pipe elements.

SLIST (p. 1795) Summarizes the section properties for all defined sections in the current session of Mechanical APDL.

SLOAD (p. 1797) Loads a pretension section.

SSBT (p. 1846) Specifies the bending thermal effects quantity for a preintegrated shell section.

SSMT (p. 1849) Specifies the membrane thermal effects quantity for a preintegrated shell section.

SSPA (p. 1851) Specifies the membrane stiffness quantity for a preintegrated shell section.

SSPB (p. 1852) Specifies the coupling stiffness quantity for a preintegrated shell section.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands manage sections.

SSPD (p. 1853) Specifies the bending stiffness quantity for a preintegrated shell section.

SSPE (p. 1854) Specifies the transverse shear stiffness quantity for a preintegrated shell section.

SSPM (p. 1855) Specifies the mass density and stress-free initial temperature for a preintegrated shell section.

Table 2.45: Morphing

These PREP7 commands adjust the finite element mesh in the non-structural regions to coincide with the deflections of the structural regions.

MORPH (p. 1156) Specifies morphing and remeshing controls.

DAMORPH (p. 494) Move nodes in selected areas to conform to structural displacements.

DEMORPH (p. 516) Move nodes in selected elements to conform to structural displacements.

DVMORPH (p. 588) Move nodes in selected volumes to conform to structural displacements.

Table 2.46: Artificially Matched Layers

These PREP7 commands create artificially matched layers (PMLs or AMLs) designed to absorb high frequency waves.

PMLOPT (p. 1451) Defines perfectly matched layers (PMLs) or irregular perfectly matched layers (IPMLs).

PMLSIZE (p. 1453) Determines the number of PML or IPML layers.

PSYS (p. 1554) Sets the PML element coordinate system attribute pointer.

Table 2.47: Special Purpose

These PREP7 commands are used for special-purpose operations.

AEROCOEFF (p. 102) Computes the aero-damping and stiffness coefficients and writes them to an APDL array

CINT (p. 334) Defines parameters associated with fracture parameter calculations.

/CYCEXPAND (p. 454) Verifies a cyclically symmetric model by graphically expanding it partially or into the full 360 degrees.

CYCFREQ (p. 458) Specifies solution options for a cyclic symmetry mode superposition harmonic analysis.

CYCLIC (p. 462) Specifies a cyclic symmetry analysis.

CYCOPT (p. 466) Specifies solution options for a cyclic symmetry analysis.

EMSYM (p. 629) Specifies circular symmetry for electromagnetic sources.

MSOPT (p. 1195) Specifies solution options for a multistage cyclic symmetry analysis.

MSTOLE (p. 1200) Adds two extra nodes from FLUID116 elements to SURF152 elements for convection analyses.

PERBC2D (p. 1376) Generates periodic constraints for 2D planar magnetic field analyses.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These PREP7 commands are used for special-purpose operations.

RACE (p. 1566)	Defines a "racetrack" current source.
SSTATE (p. 1855)	Defines a steady-state rolling analysis.
XFCRKMESH (p. 2191)	Defines a crack in the model when the crack surface is discretized by MESH200 elements.
XFDATA (p. 2192)	Defines a crack in the model by specifying nodal level set values.
XFENRICH (p. 2193)	Defines parameters associated with crack propagation using XFEM.
XFLIST (p. 2194)	Lists enrichment details and associated crack information.

2.6. SOLUTION Commands

These commands load and solve the model. The commands are grouped by functionality.

Table 2.48: Analysis Options

These SOLUTION commands set general analysis options.

ABEXTRACT (p. 88)	Extracts the alpha-beta damping multipliers for Rayleigh damping.
ACCOPTION (p. 91)	Specifies GPU accelerator capability options.
ADAMS (p. 94)	Performs solutions and writes flexible body information to a modal neutral file.
ADPCI (p. 98)	Defines parameters associated with adaptive crack initiation.
ANTYPE (p. 162)	Specifies the analysis type and restart status.
ASCRES (p. 192)	Specifies the output type for an acoustic scattering analysis.
ASOL (p. 200)	Activate a specified acoustic solution.
BCSOPTION (p. 218)	Sets memory option for the sparse solver.
CECHECK (p. 299)	Check constraint equations and couplings for rigid body motions.
CEFILTER (p. 304)	Bypasses the error message when constraint equations have excessive terms.
CHECK (p. 333)	Checks current database items for completeness.
CINT (p. 334)	Defines parameters associated with contour integral calculations.
CJUMP (p. 347)	Initiates a cycle-jump analysis.
CLOAD (p. 351)	Initiates a cyclic-loading analysis.
CMATRIX (p. 360)	Performs electrostatic field solutions and calculates the self and mutual capacitances between multiple conductors.
CMSOPT (p. 378)	Specifies component mode synthesis (CMS) analysis options.
CNCHECK (p. 382)	Provides and/or adjusts the initial status of contact pairs.
CNKMOD (p. 392)	Modifies contact element key options.
CNTR (p. 395)	Redirects contact pair output quantities to a text file.
CUTCONTROL (p. 425)	Controls time-step cutback during a nonlinear solution.
CYCOPT (p. 466)	Specifies solution options for a cyclic symmetry analysis.
DAMPOPT (p. 495)	Sets damped eigensolver options.
DDOPTION (p. 508)	Sets domain decomposer option for DMP solution.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands set general analysis options.

DMPEXT (p. 557) Extracts modal damping coefficients in a specified frequency range.

DMPOPTION (p. 559) Specifies distributed-memory parallel (DMP) file combination options.

DSPOPTION (p. 576) Sets the memory option for the distributed sparse solver.

EXBOPT (p. 705) Specifies `.exb` file output options in a CMS generation pass.

EMATWRITE (p. 623) Forces the writing of all the element matrices to `File.emat`.

EQSLV (p. 648) Specifies the type of equation solver.

ERESX (p. 658) Specifies extrapolation of integration point results.

ESCHECK (p. 660) Perform element shape checking for a selected element set.

EXPASS (p. 714) Specifies an expansion pass of an analysis.

GAUGE (p. 787) Gauges the problem domain for an edge-element formulation.

GMATRIX (p. 862) Performs electric field solutions and calculates the self and mutual conductances between multiple conductors.

INVOPT (p. 957) Enables or disables inverse solving for the current load step.

KRYOPT (p. 992) Specifies solution options for a Krylov method harmonic analysis.

LANBOPTION (p. 1007) Specifies Block Lanczos eigensolver options.

LUMPM (p. 1093) Specifies a lumped mass matrix formulation.

MODDIR (p. 1134) Activates the remote read-only modal files usage.

MONITOR (p. 1145) Controls contents of variable fields in the nonlinear solution monitor file.

MSAVE (p. 1183) Sets the memory saving feature for the PCG solver.

MSOLVE (p. 1193) Starts multiple solutions for an acoustic analysis.

OPNCONTROL (p. 1226) Sets decision parameter for automatically increasing the time step interval in a pure thermal analysis.

OUTAERO (p. 1329) Outputs the superelement matrices and load vectors to formatted files for aeroelastic analysis.

PCGOPT (p. 1365) Controls PCG solver options.

PERTURB (p. 1378) Sets linear perturbation analysis options.

PRSCONTROL (p. 1520) Specifies whether to include pressure load stiffness in the element stiffness formation.

PSCONTROL (p. 1526) Turns off shared-memory parallel operations during solution.

RATE (p. 1571) Specifies whether the effect of creep strain rate will be used in the solution of a load step.

RESVEC (p. 1603) Calculates residual vectors in a modal analysis, or includes residual vectors in a modal superposition transient/harmonic analysis.

RSTOFF (p. 1630) Offsets node or element IDs in the FE geometry record.

SCOPT (p. 1649) Specifies System Coupling options.

SEEXP (p. 1705) Specifies options for the substructure expansion pass.

SEOPT (p. 1715) Specifies substructure analysis options.

SNOPTION (p. 1815) Specifies supernode (SNODE) eigensolver options.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands set general analysis options.

/SOLU (p. 1821) Enters the solution processor.

SOLVE (p. 1822) Starts a solution.

STABILIZE (p. 1858) Activates stabilization for all elements that support nonlinear stabilization.

THEXPAND (p. 1996) Enables or disables thermal loading.

THOPT (p. 1997) Nonlinear transient thermal solution option.

TOFFST (p. 2008) Specifies the temperature offset from absolute zero to zero.

Table 2.49: Nonlinear Options

These SOLUTION commands define options for nonlinear analyses.

ARCLEN (p. 175) Activates the arc-length method.

ARCTRM (p. 177) Controls termination of the solution when the arc-length method (**ARCLEN (p. 175)**,ON) is used.

BUCOPT (p. 280) Specifies buckling analysis options.

CNVTOL (p. 396) Sets convergence values for nonlinear analyses.

/GST (p. 880) Turns Graphical Solution Tracking (GST) on or off.

LNSRCH (p. 1057) Activates a line search to be used with Newton-Raphson.

MXPAND (p. 1203) Specifies modal or buckling analysis expansion options.

NCNV (p. 1210) Sets the key to terminate an analysis.

NEQIT (p. 1214) Specifies the maximum number of equilibrium iterations for nonlinear analyses.

NLADAPTIVE (p. 1216) Defines the criteria under which the mesh is refined or modified during a nonlinear solution.

NLDIAG (p. 1224) Sets nonlinear diagnostics functionality.

NLGEOM (p. 1231) Includes large deformation effects in a static or full transient analysis.

NLHIST (p. 1232) Specify results items to track during solution.

NLMESH (p. 1240) Controls remeshing in nonlinear adaptivity.

NROPT (p. 1261) Specifies the Newton-Raphson options in a static or full transient analysis.

PRED (p. 1476) Activates a predictor in a nonlinear analysis.

PSTRES (p. 1551) Specifies whether prestress effects are calculated or included.

SEMIIMPLICIT (p. 1710) Specifies parameters for a semi-implicit solution.

SOLOPTION (p. 1857) **Specifies solution transition options.**

Table 2.50: Dynamic Options

These SOLUTION commands define options for dynamic analyses.

AEROCOEFF (p. 102) Computes the aero-damping and stiffness coefficients and writes them to an APDL array

ALPHAD (p. 115) Defines the mass matrix multiplier for damping.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands define options for dynamic analyses.

BETAD (p. 220) Defines the stiffness matrix multiplier for damping.

CECYCMS (p. 300) Generates the constraint equations for a multistage cyclic symmetry analysis.

CYCFREQ (p. 458) Specifies solution options for a cyclic symmetry mode-superposition harmonic analysis.

CEIMS (p. 306) Generates constraint equations at the interface between stages in a multistage cyclic symmetry analysis.

DMPRAT (p. 562) Sets a constant modal damping ratio.

DMPSTR (p. 563) Sets a constant structural damping coefficient.

FRQSCL (p. 777) Turns on automatic scaling of the entire mass matrix and frequency range for modal analyses.

HARFRQ (p. 885) Defines the frequency range in the harmonic analysis.

HREXP (p. 911) Specifies the phase angle for the harmonic analysis expansion pass.

HROCEAN (p. 917) Includes ocean wave effects in a harmonic analysis.

HROPT (p. 912) Specifies harmonic analysis options.

HROUT (p. 918) Specifies the harmonic analysis output options.

LVSCALE (p. 1094) Scales the load vector for mode-superposition analyses.

MASCALE (p. 1110) Turns on the scaling of the entire system matrix.

MCFOPT (p. 1116) Specifies options for the Modal Coordinates File (*Jobname.mcf*).

MDAMP (p. 1117) Defines the damping ratios as a function of mode.

MDPLOT (p. 1119) Plots frequency-dependent modal damping coefficients.

MIDTOL (p. 1127) Sets middle step residual criterion values for structural transient analysis.

MODCONT (p. 1132) Creates multiple load vectors in a modal analysis.

MODOPT (p. 1140) Specifies modal analysis options.

MSOPT (p. 1195) Specifies solution options for a multistage cyclic symmetry analysis.

MXPAND (p. 1203) Specifies modal or buckling analysis expansion options.

QRDOPT (p. 1560) Specifies additional QRDAMP modal analysis option.

RIGID (p. 1609) Specifies known rigid body modes (if any) of the model.

SUBOPT (p. 1869) Specifies SUBSPACE eigensolver options

TIMINT (p. 2001) Turns on transient effects.

TINTP (p. 2004) Defines transient integration parameters.

TRNOPT (p. 2017) Specifies transient analysis options.

Table 2.51: Spectrum Options

These SOLUTION commands define options for spectrum analyses.

ADDAM (p. 96) Specifies the acceleration spectrum computation constants for the analysis of shock resistance of shipboard structures.

COVAL (p. 420) Defines PSD cospectral values.

CQC (p. 433) Specifies the complete quadratic mode combination method.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands define options for spectrum analyses.

DSUM (p. 578) Specifies the double sum mode combination method.

FREQ (p. 776) Defines the frequency points for the SV vs. FREQ tables.

GRP (p. 873) Specifies the grouping mode combination method.

MMASS (p. 1131) Specifies the missing mass response calculation.

NRLSUM (p. 1258) Specifies the Naval Research Laboratory (NRL) sum mode combination method.

PFACT (p. 1385) Calculates participation factors for the PSD or multi-point response spectrum table.

PSDCOM (p. 1527) Specifies the power spectral density mode combination method.

PSDFRQ (p. 1528) Defines the frequency points for the input spectrum vs. FREQ tables of PSD and multi-point spectrum analyses.

PSDGRAPH (p. 1529) Displays input PSD curves

PSDRES (p. 1530) Controls solution output written to the results file from a PSD analysis.

PSDSPL (p. 1532) Defines a partially correlated excitation in a PSD analysis.

PSDUNIT (p. 1532) Defines the type of PSD or multi-point response spectrum.

PSDVAL (p. 1534) Defines PSD or multi-point response spectrum values.

PSDWAV (p. 1534) Defines a wave propagation excitation in a PSD analysis.

QDVAL (p. 1559) Defines PSD quadspectral values.

ROCK (p. 1614) Specifies a rocking response spectrum.

ROSE (p. 1615) Specifies the Rosenblueth mode combination method.

RIGRESP (p. 1610) Selects the spectrum type and other spectrum options.

SED (p. 1704) Defines the excitation direction for a single-point response spectrum.

SPDAMP (p. 1827) Defines input spectrum damping in a multi-point response spectrum analysis.

SPFREQ (p. 1828) Defines the frequency points for the input spectrum tables **SPVAL (p. 1842)** vs. **SPFREQ (p. 1828)** for multi-point spectrum analyses.

SPGRAPH (p. 1829) Displays input spectrum curves for MPRS analysis.

SPOPT (p. 1837) Selects the spectrum type and other spectrum options.

SPUNIT (p. 1841) Defines the type of multi-point response spectrum.

SPVAL (p. 1842) Defines multi-point response spectrum values.

SRSS (p. 1845) Specifies the square root of sum of squares mode combination method.

SV (p. 1886) Defines spectrum values to be associated with frequency points.

SVPLOT (p. 1886) Displays input spectrum curves.

SVTYP (p. 1887) Defines the type of single-point response spectrum.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands define options for spectrum analyses.

VDDAM (p. 2081) Specifies the velocity spectrum computation constants for the analysis of shock resistance of shipboard structures.

Table 2.52: Load Step Options

These SOLUTION commands define options for individual load steps.

AUTOTS (p. 207) Specifies whether to use automatic time stepping or load stepping.

CAMPBELL (p. 284) Prepares the result file for a subsequent Campbell diagram of a prestressed structure.

CECMOD (p. 300) Modifies the constant term of a constraint equation during solution.

DELTIM (p. 515) Specifies the time step sizes to be used for this load step.

EXPSOL (p. 721) Specifies the solution to be expanded for reduced analyses.

KBC (p. 970) Specifies stepped or ramped loading within a load step.

KUSE (p. 1002) Specifies whether or not to reuse the factorized matrix.

MAGOPT (p. 1102) Specifies options for a 3D magnetostatic field analysis.

MAGSOLV (p. 1103) Specifies magnetic solution options and initiates the solution.

MODE (p. 1136) Specifies the harmonic loading term for this load step.

NSUBST (p. 1287) Specifies the number of substeps to be taken this load step.

NUMEXP (p. 1293) Specifies solutions to be expanded from reduced analyses.

TIME (p. 2000) Sets the time for a load step.

TREF (p. 2013) Defines the reference temperature for the thermal strain calculations.

TSRES (p. 2026) Defines an array of key times at which the time-stepping strategy changes.

UPCOORD (p. 2056) Modifies the coordinates of the active set of nodes, based on the current displacements.

USRCAL (p. 2062) Enables user-solution subroutines to be activated or deactivated.

WRFULL (p. 2184) Stops solution after assembling global matrices.

Table 2.53: Solid Constraints

These SOLUTION commands define constraints on the solid model.

DA (p. 487) Defines symmetry or antisymmetry degree-of-freedom constraints on areas.

DADELE (p. 491) Deletes degree-of-freedom constraints on an area.

DALIST (p. 493) Lists the degree-of-freedom constraints on an area.

DK (p. 541) Defines degree-of-freedom constraints at keypoints.

DKDELE (p. 543) Deletes degree-of-freedom constraints at a keypoint.

DKLIST (p. 545) Lists the degree-of-freedom constraints at keypoints.

DL (p. 545) Defines symmetry or antisymmetry degree-of-freedom constraints on lines.

DLDELE (p. 548) Deletes degree-of-freedom constraints on a line.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands define constraints on the solid model.

DLLIST (p. 551)	Lists degree-of-freedom constraints on a line.
DTRAN (p. 583)	Transfers solid model degree-of-freedom constraints to the finite element model.

Table 2.54: Solid Forces

These SOLUTION commands define forces on the solid model.

FK (p. 762)	Defines force loads at keypoints.
FKDELE (p. 764)	Deletes force loads at a keypoint.
FKLIST (p. 765)	Lists the forces at keypoints.
FTRAN (p. 783)	Transfers solid model forces to the finite element model.

Table 2.55: Solid Surface Loads

These SOLUTION commands define surface loads on the solid model.

SFA (p. 1739)	Specifies surface loads on the selected areas.
SFADELE (p. 1744)	Deletes surface loads from areas.
SFALIST (p. 1745)	Lists the surface loads for the specified area.
SFL (p. 1774)	Specifies surface loads on lines of an area.
SFLDELE (p. 1777)	Deletes surface loads from lines.
SFLLIST (p. 1781)	Lists the surface loads for lines.
SFTRAN (p. 1782)	Transfer the solid model surface loads to the finite element model.

Table 2.56: Solid Body Loads

These SOLUTION commands define body loads on the solid model.

BFA (p. 229)	Defines a body-force load on an area.
BFADELE (p. 231)	Deletes body-force loads on an area.
BFALIST (p. 233)	Lists the body-force loads on an area.
BFK (p. 248)	Defines a body-force load at a keypoint.
BFKDELE (p. 250)	Deletes body-force loads at a keypoint.
BFKLIST (p. 251)	Lists the body-force loads at keypoints.
BFL (p. 252)	Defines a body-force load on a line.
BFLDELE (p. 254)	Deletes body-force loads on a line.
BFLLIST (p. 256)	Lists the body-force loads on a line.
BFTRAN (p. 259)	Transfers solid model body-force loads to the finite element model.
BFV (p. 261)	Defines a body-force load on a volume.
BFVDELE (p. 263)	Deletes body-force loads on a volume.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands define body loads on the solid model.

BFVLIST (p. 264) Lists the body-force loads on a volume.

Table 2.57: Inertia

These SOLUTION commands define inertial loads on the model.

ACEL (p. 92) Specifies the linear acceleration of the structure.

AIRL (p. 111) Specifies that automatic inertia relief calculations are to be performed.

CGLOC (p. 319) Specifies the origin location of the acceleration coordinate system.

CGOMGA (p. 320) Specifies the rotational velocity of the global origin.

CMACEL (p. 358) Specifies the translational acceleration of an element component.

CMDOMEGA (p. 362) Specifies the rotational acceleration of an element component about a user-defined rotational axis.

CMOMEGA (p. 368) Specifies the rotational velocity of an element component about a user-defined rotational axis.

CMROTATE (p. 373) Specifies the rotational velocity of an element component about a user-defined rotational axis

CORIOLIS (p. 417) Applies the Coriolis effect to a rotating structure.

DCGOMG (p. 501) Specifies the rotational acceleration of the global origin.

DOMEGA (p. 571) Specifies the rotational acceleration of the structure.

IRLF (p. 960) Specifies that inertia relief calculations are to be performed.

OMEGA (p. 1324) Specifies the rotational velocity of the structure.

SPOINT (p. 1836) Defines a point for moment summations.

SYNCHRO (p. 1893) Specifies whether the excitation frequency is synchronous or asynchronous with the rotational velocity of the structure.

Table 2.58: Miscellaneous Loads

These SOLUTION commands are for miscellaneous load definition and control.

ANPRES (p. 148) Produces an animated sequence of the time-harmonic pressure variation of an engine-order excitation in a cyclic harmonic analysis.

APORT (p. 170) Specifies input data for plane wave and acoustic duct ports.

ASIFILE (p. 195) Writes or reads one-way acoustic-structural coupling data.

AWAVE (p. 213) Specifies input data for an acoustic incident wave.

BIOT (p. 265) Calculates the Biot-Savart source magnetic field intensity.

DFSWAVE (p. 529) Specifies the incident planar waves with random phases for the diffuse sound field.

FLUREAD (p. 769) Reads one-way Fluent-to-Mechanical APDL coupling data via a `.cgns` file with one-side fast Fourier transformation complex pressure peak value.

IC (p. 921) Specifies initial conditions at nodes.

ICDELE (p. 923) Deletes initial conditions at nodes.

ICLIST (p. 923) Lists the initial conditions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands are for miscellaneous load definition and control.

ICROTATE (p. 925) Specifies initial velocity at nodes as a sum of rotation about an axis and translation.

INISTATE (p. 938) Applies initial state data to an element or a selection of elements.

MPCHG (p. 1167) Changes the material number attribute of an element.

MRPM (p. 1183) Defines the revolutions per minute (RPM) for a machine rotation.

NSMASS (p. 1277) Applies nonstructural mass to selected elements.

OSRESULT (p. 1327) Controls the selected result data written to the database.

OUTGEOM (p. 1330) Controls geometry-related data written to the results file.

OUTPR (p. 1332) Controls the solution printout.

OUTRES (p. 1336) Controls the solution data written to the database.

RESCONTROL (p. 1592) Controls file writing for multiframe restarts.

RSTCONTROL (p. 1624) Controls whether element single value results are written to the results file.

SBCLIST (p. 1646) Lists solid model boundary conditions.

SBCTRAN (p. 1647) Transfers solid model loads and boundary conditions to the FE model.

WSPRINGS (p. 2187) Creates weak springs on corner nodes of a bounding box of the currently selected elements.

XFLIST (p. 2194) Lists enrichment details and associated crack information.

Table 2.59: Load Step Operations

These SOLUTION commands write and solve multiple load steps.

LSCLEAR (p. 1071) Clears loads and load step options from the database.

LSDELE (p. 1073) Deletes load step files.

LSREAD (p. 1083) Reads load and load step option data into the database.

LSSOLVE (p. 1085) Reads and solves multiple load steps.

LSWRITE (p. 1087) Writes load and load step option data to a file.

Table 2.60: Master Degrees of Freedom

These SOLUTION commands define master degrees of freedom.

M (p. 1097) Defines master degrees of freedom for reduced and superelement generation analyses.

MDELE (p. 1118) Deletes master degrees of freedom.

MGEN (p. 1127) Generates additional master degrees of freedom from a previously defined set.

MLIST (p. 1130) Lists the master degrees of freedom.

Table 2.61: Rezoning

These SOLUTION commands apply to analyses that use rezoning.

REZONE (p. 1606) Initiates a rezoning operation, sets rezoning options, and rebuilds the database.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands apply to analyses that use rezoning.

MAPSOLVE (p. 1108)	Maps the solved node and element solutions from an original mesh to a new mesh.
MAPVAR (p. 1109)	Defines tensors and vectors in user-defined state variables (for user-defined materials or user-defined creep laws).
REMESH (p. 1581)	Specifies the starting and ending remeshing points.
AREMESH (p. 180)	Generates an area for creating a new mesh.

Table 2.62: 2D to 3D Analysis

These SOLUTION commands apply to 2D to 3D analyses.

MAP2DTO3D (p. 1107)	Initiates the 2D to 3D analysis process.

Table 2.63: Birth and Death

These SOLUTION commands are used for the birth and death option for elements.

EALIVE (p. 592)	Reactivates an element (for the birth and death capability).
EKILL (p. 616)	Deactivates an element (for the birth and death capability).
ESTIF (p. 681)	Specifies the matrix multiplier for deactivated elements.

Table 2.64: FE Constraints

These SOLUTION commands define constraints on the finite element model.

D (p. 483)	Defines degree-of-freedom constraints at nodes.
DCUM (p. 502)	Specifies that degree-of-freedom constraint values are to be accumulated.
DDELE (p. 505)	Deletes degree-of-freedom constraints.
DFLX (p. 528)	Imposes a uniform magnetic flux B on an edge-element electromagnetic model.
DJ (p. 537)	Specify boundary conditions on the components of relative motion of a joint element.
DJDELE (p. 539)	Deletes boundary conditions on the components of relative motion of a joint element.
DJLIST (p. 541)	Lists boundary conditions applied to joint elements.
DLIST (p. 550)	Lists degree-of-freedom constraints.
DSCALE (p. 574)	Scales degree-of-freedom constraint values.
DSYM (p. 580)	Specifies symmetry or antisymmetry degree-of-freedom constraints on nodes.
DVAL (p. 587)	Defines values at enforced group.
GSBDATA (p. 876)	Specifies the constraints or applies the load at the ending point for the generalized plane strain element option.
GSLIST (p. 878)	When using generalized plane strain, lists the input data or solutions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands define constraints on the finite element model.

LDREAD (p. 1036) Reads results from the results file and applies them as loads.

Table 2.65: FE Forces

These SOLUTION commands define nodal loads on the finite element model.

F (p. 729) Specifies force loads at nodes.

FCUM (p. 739) Specifies that force loads are to be accumulated.

FDELE (p. 742) Deletes force loads on nodes.

FJ (p. 759) Specify forces or moments on the components of the relative motion of a joint element.

FJDELE (p. 760) Deletes forces (or moments) on the components of the relative motion of a joint element.

FJLIST (p. 762) Lists forces and moments applied on joint elements.

FLIST (p. 766) Lists force loads on the nodes.

FSCALE (p. 778) Scales force load values in the database.

Table 2.66: FE Surface Loads

These SOLUTION commands define surface loads on the finite element model.

SF (p. 1733) Defines surface loads on nodes.

SFBEAM (p. 1746) Specifies surface loads on beam elements.

SFCONTROL (p. 1758) Defines surface load properties on selected elements and nodes for subsequent **SF (p. 1733)** or **SFE (p. 1761)** loading commands.

SFCUM (p. 1758) Specifies that surface loads are to be accumulated.

SFDELE (p. 1760) Deletes surface loads.

SFE (p. 1761) Defines surface loads on elements.

SFEDELE (p. 1768) Deletes surface loads from elements.

SFELIST (p. 1770) Lists the surface loads for elements.

SFFUN (p. 1771) Specifies a varying surface load.

SFGRAD (p. 1772) Specifies a gradient (slope) for surface loads.

SFLIST (p. 1780) Lists surface loads.

SFSCALE (p. 1781) Scales surface loads on elements.

Table 2.67: FE Body Loads

These SOLUTION commands define body loads on the finite element model.

BF (p. 221) Defines a nodal body-force load.

BFCUM (p. 233) Specifies that nodal body-force loads are to be accumulated.

BFDELE (p. 235) Deletes nodal body-force loads.

BFE (p. 237) Defines an element body-force load.

BFECUM (p. 241) Specifies whether to ignore subsequent element body-force loads.

BFEDELE (p. 243) Deletes element body-force loads.

BFELIST (p. 244) Lists the element body-force loads.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands define body loads on the finite element model.

BFESCAL (p. 245) Scales element body-force loads.

BFLIST (p. 255) Lists the body-force loads on nodes.

BFPORT (p. 257) Transfers a thermal body-force load (HGEN) load from selected MESH200 elements to reinforcing elements.

BFSCALE (p. 257) Scales body-force loads at nodes.

BFUNIF (p. 259) Assigns a uniform body-force load to all nodes.

LDREAD (p. 1036) Reads results from the results file and applies them as loads.

TUNIF (p. 2027) Assigns a uniform temperature to all nodes.

Table 2.68: Ocean

These SOLUTION commands define ocean load data.

OCDATA (p. 1307) Defines an ocean load using non-table data.

OCDELETE (p. 1314) Deletes a previously defined ocean load.

OCLIST (p. 1315) Summarizes all currently defined ocean loads.

OCREAD (p. 1315) Reads externally defined ocean data.

OCTABLE (p. 1316) Defines an ocean load using table data.

OCTYPE (p. 1320) Specifies the type of ocean load data to follow (basic, current, or wave).

OCZONE (p. 1322) Specifies the type of ocean zone data to follow (component, Z-level, or pipe)

Table 2.69: Status

These SOLUTION commands are for use with the STAT (p. 1861) command.

ATYPE (p. 206) Specifies "Analysis types" as the subsequent status topic.

BIOOPT (p. 264) Specifies "Biot-Savart options" as the subsequent status topic.

DEACT (p. 510) Specifies "Element birth and death" as the subsequent status topic.

DYNOPT (p. 590) Specifies "Dynamic analysis options" as the subsequent status topic.

GENOPT (p. 796) Specifies "General options" as the subsequent status topic.

INRTIA (p. 955) Specifies "Inertial loads" as the subsequent status topic.

LSOPER (p. 1080) Specifies "Load step operations" as the subsequent status topic.

MASTER (p. 1111) Specifies "Master DOF" as the subsequent status topic.

NLOPT (p. 1247) Specifies "Nonlinear analysis options" as the subsequent status topic.

OUTOPT (p. 1332) Specifies "Output options" as the subsequent status topic.

SMBODY (p. 1806) Specifies "Body loads on the solid model" as the subsequent status topic.

SMCONS (p. 1807) Specifies "Constraints on the solid model" as the subsequent status topic.

SMFOR (p. 1807) Specifies "Forces on the solid model" as the subsequent status topic.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands are for use with the STAT (p. 1861) command.

SMSURF (p. 1814) Specifies "Surface loads on the solid model" as the subsequent status topic.

SOLUOPT (p. 1821) Specifies "Solution options" as the subsequent status topic.

SPTOPT (p. 1840) Specifies "Spectrum analysis options" as the subsequent status topic.

Table 2.70: Radiosity

These SOLUTION commands calculate the radiation view factors and to specify the solution parameters for the Radiosity solver method.

HEMIOPT (p. 904) Specifies options for Hemicube view factor calculation.

RADOPT (p. 1567) Specifies Radiosity Solver options.

RDEC (p. 1575) Defines the decimation parameters used by the radiosity solver method.

RSOPT (p. 1622) Creates or loads the radiosity mapping data file for SURF251 or SURF252 element types.

RSURF (p. 1631) Generates the radiosity surface elements and stores them in the database.

RSYMM (p. 1632) Defines symmetry, rotation, or extrusion parameters for the radiosity method.

SPCNOD (p. 1825) Defines a space node for radiation using the Radiosity method.

SPCTEMP (p. 1826) Defines a free-space ambient temperature for radiation using the Radiosity method.

STEF (p. 1866) Specifies Stefan-Boltzmann radiation constant.

V2DOPT (p. 2070) Specifies 2D/axisymmetric view factor calculation options.

VFDI (p. 2095) Specifies diagnostic options to check that the row sum relationship is satisfied.

VFOPT (p. 2099) Specifies options for view factor file.

QSOPT (p. 1561) Specifies quasi static radiation options.

VFUP (p. 2110) Controls view factor updating at the substep level for a coupled-field radiation analysis that includes large-deflection effects.

Table 2.71: Additive Manufacturing

These SOLUTION commands define options for additive manufacturing analysis.

AMBEAM (p. 117) For multiple-beam printers, specifies the number of beams.

AMBUILD (p. 118) Specifies printer parameters for the build and other options.

AMENV (p. 120) Specifies the build-environment thermal boundary conditions.

AMMAT (p. 121) Specifies the melting and relaxation temperatures of the build material in an additive manufacturing analysis.

AMPOWDER (p. 122) Specifies the powder thermal conditions.

AMRESULT (p. 123) Specifies result data written to an `AMResults.txt` file.

AMSTEP (p. 124) Specifies the process-sequence steps.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These SOLUTION commands define options for additive manufacturing analysis.

AMSUPPORTS (p. 127)	Specifies the support information.
AMTYPE (p. 128)	Specifies the printing process.

2.7. POST1 Commands

These commands postprocess the results with the database processor. The commands are grouped by functionality.

Table 2.72: Setup

These POST1 commands put data into the database for postprocessing.

APPEND (p. 173)	Reads data from the results file and appends it to the database.
DESOL (p. 520)	Defines or modifies solution results at a node of an element.
DNSOL (p. 564)	Defines or modifies solution results at a node.
FILE (p. 752)	Specifies the data file where results are to be found.
HRCPLX (p. 910)	Computes and stores in the database the time-harmonic solution at a prescribed phase angle.
/POST1 (p. 1461)	Enters the database results postprocessor.
RESCOMBINE (p. 1589)	Reads results from local results files into the database after a distributed-memory parallel (DMP) solution.
RESET (p. 1598)	Resets all POST1 or POST26 specifications to initial defaults.
SET (p. 1724)	Defines the data set to be read from the results file.
SUBSET (p. 1871)	Reads results for the selected portions of the model.

Table 2.73: Controls

These POST1 commands control the calculations done for other commands.

AVPRIN (p. 210)	Specifies how principal and vector sums are to be calculated.
AVRES (p. 212)	Specifies how results data will be averaged when PowerGraphics is enabled.
/EFACET (p. 602)	Specifies the number of facets per element edge for PowerGraphics displays.
ERNORM (p. 659)	Controls error estimation calculations.
FORCE (p. 772)	Selects the element nodal force type for output.
INRES (p. 953)	Identifies the data to be retrieved from the results file.
LAYER (p. 1015)	Specifies the element layer for which data are to be processed.
RSYS (p. 1639)	Activates a coordinate system for printout or display of results.
SHELL (p. 1784)	Selects a shell element or shell layer location for results output.

Table 2.74: Results

These POST1 commands process results, such as degree-of-freedom results, nodal stresses, and element summable and nonsummable miscellaneous data.

NSORT (p. 1283)	Sorts nodal data.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These POST1 commands process results, such as degree-of-freedom results, nodal stresses, and element summable and nonsummable miscellaneous data.

NUSORT (p. 1303) Restores original order for nodal data.

PLCINT (p. 1396) Plots the contour integral (**CINT (p. 334)**) result data.

PLCKSURF (p. 1399) Plots the $\Phi = 0$ level set surface in an XFEM-based crack analysis

PLDISP (p. 1400) Displays the displaced structure.

PLESOL (p. 1401) Displays solution results as discontinuous element contours.

PLNSOL (p. 1425) Displays solution results as continuous element contours.

PLORB (p. 1437) Displays the orbital motion of a rotating structure undergoing vibration.

PRENERGY (p. 1478) Prints the total energies of a model.

PRORB (p. 1515) Prints the orbital motion characteristics of a rotating structure undergoing vibration.

PLVECT (p. 1445) Displays results as vectors.

PRCINT (p. 1472) Lists the contour integral (**CINT (p. 334)**) result data.

PRESOL (p. 1481) Prints the solution results for elements.

PRJSOL (p. 1498) Print joint element output.

PRNLD (p. 1503) Prints the summed element nodal loads.

PRNSOL (p. 1505) Prints the nodal solution results.

PRRFOR (p. 1517) Used with the **FORCE (p. 772)** command. Prints the constrained node reaction solution.

PRRSOL (p. 1518) Prints the constrained node reaction solution.

PRVECT (p. 1524) Prints results as vector magnitude and direction cosines.

SUMTYPE (p. 1880) Sets the type of summation to be used in the following load case operations.

Table 2.75: Element Table

These POST1 commands operate with the element table, which in turn is used to process results stored for each element, such as average stresses, heat fluxes, etc.

DETAB (p. 522) Modifies element table results in the database.

ESORT (p. 680) Sorts the element table.

ETABLE (p. 687) Fills a table of element values for further processing.

EUSORT (p. 703) Restores original order of the element table.

PLETAB (p. 1411) Displays element table items.

PLLS (p. 1419) Displays element table items as contoured areas along elements.

PLVECT (p. 1445) Displays results as vectors.

PRETAB (p. 1490) Prints the element table items.

PRVECT (p. 1524) Prints results as vector magnitude and direction cosines.

SABS (p. 1643) Specifies absolute values for element table operations.

SADD (p. 1643) Forms an element table item by adding two existing items.

SALLOW (p. 1644) Defines the allowable stress table for safety factor calculations.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These POST1 commands operate with the element table, which in turn is used to process results stored for each element, such as average stresses, heat fluxes, etc.

SEXP (p. 1732) Forms an element table item by exponentiating and multiplying.

SFACT (p. 1743) Enables safety factor or margin of safety calculations to be made.

SFCALC (p. 1747) Calculates the safety factor or margin of safety.

SMAX (p. 1805) Forms an element table item from the maximum of two other items.

SMIN (p. 1808) Forms an element table item from the minimum of two other items.

SMULT (p. 1814) Forms an element table item by multiplying two other items.

SSUM (p. 1858) Calculates and prints the sum of element table items.

TALLOW (p. 1897) Defines the temperature table for safety factor calculations.

VCROSS (p. 2079) Forms element table items from the cross product of two vectors.

VDOT (p. 2083) Forms an element table item from the dot product of two vectors.

Table 2.76: Listing

These POST1 commands control printed listings of results.

/FORMAT (p. 774) Specifies format controls for tables.

/HEADER (p. 902) Sets page and table heading print controls.

IRLIST (p. 962) Prints inertia relief summary table.

/PAGE (p. 1348) Defines the printout and screen page size.

PRERR (p. 1480) Prints SEPC and TEPC.

PRITER (p. 1497) Prints solution summary data.

Table 2.77: Animation

These POST1 commands animate results.

ANCNTR (p. 131) Produces an animated sequence of a contoured deformed shape.

ANCUT (p. 132) Produces an animated sequence of Q-slices.

ANDATA (p. 134) Produces a sequential contour animation over a range of results data.

ANDSCL (p. 136) Produces an animated sequence of a deformed shape.

ANCYC (p. 133) Applies a traveling wave animation to graphics data in a modal cyclic symmetry analysis.

ANDYNA (p. 137) Produces an animated sequence of contour values through substeps.

/ANFILE (p. 138) Saves or resumes an animation sequence to or from a file.

ANFLOW (p. 139) Produces an animated sequence of a charged particle traveling in an electric or magnetic field.

ANHARM (p. 141) Produces an animated sequence of time-harmonic results or complex mode shapes.

ANIM (p. 142) Displays graphics data in animated form.

ANISOS (p. 143) Produces an animated sequence of an isosurface.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These POST1 commands animate results.

ANMODE (p. 144) Produces an animated sequence of a mode shape.

ANTIME (p. 161) Generates a sequential contour animation over a range of time.

TRTIME (p. 2022) Defines the options used for the **PLTRAC (p. 1442)** (charged particle trace) command.

Table 2.78: Path Operations

These POST1 commands are used for path operations.

PADELE (p. 1347) Deletes a defined path.

PAGET (p. 1349) Writes current path information into an array variable.

PAPUT (p. 1350) Retrieves path information from an array variable.

PARESU (p. 1350) Restores previously saved paths from a file.

PASAVE (p. 1353) Saves selected paths to an external file.

PATH (p. 1354) Defines a path name and establishes parameters for the path.

PCALC (p. 1362) Forms additional labeled path items by operating on existing path items.

PCROSS (p. 1371) Calculates the cross product of two path vectors along the current path.

PDEF (p. 1372) Interpolates an item onto a path.

PDOT (p. 1375) Calculates the dot product of two path vectors along the current path.

PLPAGM (p. 1438) Displays path items along the path geometry.

PLPATH (p. 1439) Displays path items on a graph.

PLSECT (p. 1440) Displays membrane and membrane-plus-bending linearized stresses.

PMAP (p. 1449) Creates mapping of the path geometry by defining path interpolation division points.

PPATH (p. 1463) Defines a path by picking or defining nodes, or locations on the currently active working plane, or by entering specific coordinate locations.

PRANGE (p. 1464) Determines the path range.

PRPATH (p. 1517) Prints path items along a geometry path.

PRSECT (p. 1520) Calculates and prints linearized stresses along a section path.

PSEL (p. 1536) Selects a path or paths.

PVECT (p. 1556) Interpolates a set of items onto a path.

Table 2.79: Surface Operations

These POST1 commands define an arbitrary surface and to develop results information for that surface.

SUCALC (p. 1873) Create new result data by operating on two existing result datasets on a given surface.

SUCR (p. 1875) Create a surface.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These POST1 commands define an arbitrary surface and to develop results information for that surface.

SUDEL (p. 1877)	Delete geometry information as well as any mapped results for specified surface or for all selected surfaces.
SUEVAL (p. 1877)	Perform operations on a mapped item and store result in a scalar parameter.
SUGET (p. 1878)	Create and dimension an NPT row array parameter named PARM, where NPT is the number of geometry points in SurfName.
SUMAP (p. 1879)	Map results onto selected surface(s).
SUPL (p. 1881)	Plot specified SetName result data on all selected surfaces or on the specified surface.
SUPR (p. 1881)	Print surface information.
SURESU (p. 1882)	Resume surface definitions from a specified file.
SUSAVE (p. 1883)	Save surface definitions and result items to a file.
SUSEL (p. 1884)	Selects a subset of surfaces
SUVECT (p. 1885)	Operate between two mapped result vectors.

Table 2.80: Load Case Calculations

These POST1 commands are used for combining results from different load steps.

LCABS (p. 1018)	Specifies absolute values for load case operations.
LCASE (p. 1019)	Reads a load case into the database.
LCDEF (p. 1021)	Creates a load case from a set of results on a results file.
LCFACT (p. 1022)	Defines scale factors for load case operations.
LCFILE (p. 1023)	Creates a load case from an existing load case file.
LCOPER (p. 1026)	Performs load case operations.
LCSEL (p. 1029)	Selects a subset of load cases.
LCSUM (p. 1031)	Specifies whether to process nonsummable items in load case operations.
LCWRITE (p. 1031)	Creates a load case by writing results to a load case file.
LCZERO (p. 1032)	Zeroes the results portion of the database.
RAPPND (p. 1570)	Appends results data from the database to the results file.

Table 2.81: Magnetics Calculations

These POST1 commands are used for special purpose magnetics postprocessing.

CURR2D (p. 444)	Calculates current flow in a 2D conductor.
EMAGERR (p. 622)	Calculates the relative error in an electrostatic or electromagnetic field analysis.
EMF (p. 623)	Calculates the electromotive force (emf), or voltage drop along a predefined path.
EMFT (p. 624)	Summarizes electromagnetic forces and torques on a selected set of nodes.
FLUXV (p. 768)	Calculates the flux passing through a closed contour.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These POST1 commands are used for special purpose magnetics postprocessing.

MMF (p. 1132) Calculates the magnetomotive force along a path.

PLF2D (p. 1417) Generates a contour line plot of equipotentials.

POWERH (p. 1462) Calculates the rms power loss in a conductor or lossy dielectric.

SENERGY (p. 1714) Determines the stored magnetic energy or co-energy.

Table 2.82: Trace Points

These POST1 commands trace charged particle motion.

PLTRAC (p. 1442) Displays a charged particle trace on an element display.

TRPDEL (p. 2020) Deletes charged particle trace points.

TRPLIS (p. 2020) Lists charged particle trace points.

TRPOIN (p. 2021) Defines a point through which a charged particle trace will travel.

Table 2.83: Special Purpose

These POST1 commands are used for various special purposes.

BFINT (p. 246) Activates the body force interpolation operation.

CBDOF (p. 285) Activates cut boundary interpolation (for submodeling).

CMSFILE (p. 376) Specifies the component mode synthesis (CMS) results files to include when plotting the mode shape of an assembly.

CYCCALC (p. 453) Calculates results from a cyclic harmonic mode-superposition analysis using the specifications defined by **CYCSPEC (p. 475)**.

/CYCEXPAND (p. 454) Graphically expands displacements, stresses and strains of a cyclically symmetric model partially or through the full 360 degrees.

CYCFILES (p. 457) Specifies the data files where results are to be found for a cyclic symmetry mode-superposition harmonic analysis.

CYCPHASE (p. 472) Provides tools for determining minimum and maximum possible result values from frequency couplets produced in a modal cyclic symmetry analysis.

CYCSPEC (p. 475) Defines the set of result items for a subsequent **CYCCALC (p. 453)** command in postprocessing a cyclic harmonic mode-superposition analysis.

EXOPTION (p. 709) Specifies the **EXPROFILE (p. 719)** options for the Mechanical APDL to Ansys CFX profile file transfer.

/EXPAND (p. 712) Enables the creation of a larger graphic display than that which is represented by the actual finite element analysis model.

EXPAND (p. 711) Displays the results of a modal cyclic symmetry analysis.

EXPROFILE (p. 719) Exports interface loads to a CFX Profile file.

EXUNIT (p. 725) Indicates units assumed for an interface load for Mechanical APDL to CFX transfer.

FSSPARM (p. 780) Calculates reflection and transmission properties of a frequency selective surface.

FSUM (p. 780) Sums the nodal force and moment contributions of elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These POST1 commands are used for various special purposes.

HFANG (p. 904)	Defines or displays spatial angles of a spherical radiation surface for antenna parameter calculations.
HFSYM (p. 905)	Sets symmetry planes for the computation of high-frequency acoustic fields in the near and far field domains (beyond the finite element region).
MACOPT (p. 1098)	Specifies modal assurance criterion (MAC) calculation options for **RSTMAC (p. 1627)**.
MAXCYCMODE (p. 1112)	Computes the maximum results value of cyclic mode pairs at the same frequency or the amplitude of a single complex mode.
MSOPT (p. 1195)	Specifies solution options for a multistage cyclic symmetry analysis
NFORCE (p. 1216)	Sums the nodal forces and moments of elements attached to nodes.
NLDPOST (p. 1229)	Gets element component information from nonlinear diagnostic files.
PLAS (p. 1387)	Plots a specified acoustic quantity during postprocessing of an acoustic analysis.
PLCAMP (p. 1392)	Plots a Campbell diagram for applications involving rotating structure dynamics.
PLCFREQ (p. 1395)	Plots the frequency response for the given **CYCSPEC (p. 475)** specification
PLCHIST (p. 1395)	Plots a histogram of the frequency response of each sector for the given **CYCSPEC (p. 475)** specification.
PLFAR (p. 1412)	Plots electric far fields and far field parameters.
PLMC (p. 1421)	Plots the modal coordinates from a mode-superposition solution.
PLNEAR (p. 1423)	Plots the electric field in the near zone exterior to the equivalent source surface.
PLZZ (p. 1448)	Plots the interference diagram from a cyclic modal analysis.
PRAS (p. 1464)	Prints a specified acoustic quantity during postprocessing of an acoustic analysis.
PRCAMP (p. 1469)	Prints a Campbell diagram for applications involving rotating structure dynamics.
PRFAR (p. 1490)	Prints electric far fields and far field parameters.
PRMC (p. 1499)	Prints the modal coordinates from a mode-superposition solution.
PRNEAR (p. 1501)	Prints the electric field in the near zone exterior to the equivalent source surface.
RESWRITE (p. 1604)	Appends results data from the database to a results file in a top-down substructure analysis.
RMFLVEC (p. 1612)	Writes eigenvectors of fluid nodes to a file for use in damping parameter extraction.
RSPLIT (p. 1623)	Creates one or more results file(s) from the current results file based on subsets of elements.
SPOINT (p. 1836)	Defines a point for moment summations.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These POST1 commands are used for various special purposes.

SPMWRITE (p. 1833)	Calculates state-space matrices and writes them to the `.spm` file.

Table 2.84: Status

These POST1 commands are for use with the STAT (p. 1861) command.

CALC (p. 283)	Specifies "Calculation settings" as the subsequent status topic.
DATADEF (p. 498)	Specifies "Directly defined data status" as the subsequent status topic.
DEFINE (p. 511)	Specifies "Data definition settings" as the subsequent status topic.
DISPLAY (p. 535)	Specifies "Display settings" as the subsequent status topic.
LCCALC (p. 1020)	Specifies "Load case settings" as the subsequent status topic.
POINT (p. 1459)	Specifies "Point flow tracing settings" as the subsequent status topic.
PRINT (p. 1496)	Specifies "Print settings" as the subsequent status topic.
SORT (p. 1824)	Specifies "Sort settings" as the subsequent status topic.
SPEC (p. 1828)	Specifies "Miscellaneous specifications" as the subsequent status topic.

Table 2.85: Failure Criteria

These POST1 commands are for use with the failure criteria.

FC (p. 732)	Provides failure criteria information and activates a data table to input temperature-dependent stress and strain limits.
FCCHECK (p. 735)	Checks both the strain and stress input criteria for all materials.
FCDELE (p. 736)	Deletes previously defined failure criterion data for the given material.
FCLIST (p. 737)	Lists the failure criteria that has been input.
FCTYP (p. 740)	Activates or removes failure-criteria types for postprocessing.

2.8. POST26 Commands

These commands postprocess the results with the time-history processor. The commands are grouped by functionality.

Table 2.86: Setup

These POST26 commands store data for processing.

ANSOL (p. 149)	Specifies averaged element nodal data to be stored from the results file.
CISOL (p. 345)	Stores J-integral information in a variable.
DATA (p. 497)	Reads data records from a file into a variable.
ENERSOL (p. 641)	Specifies the total energies to be stored.
ESOL (p. 672)	Specifies element data to be stored from the results file.
FILE (p. 752)	Specifies the data file where results are to be found.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These POST26 commands store data for processing.

GSSOL (p. 879)	Specifies which results to store from the results file when using generalized plane strain.
JSOL (p. 966)	Specifies result items to be stored for the joint element.
NSOL (p. 1281)	Specifies nodal data to be stored from the results file.
NSTORE (p. 1287)	Defines which time points are to be stored.
NUMVAR (p. 1302)	Specifies the number of variables allowed in POST26.
/POST26 (p. 1462)	Enters the time-history results postprocessor.
RESET (p. 1598)	Resets all POST1 or POST26 specifications to initial defaults.
RFORCE (p. 1607)	Specifies the total reaction force data to be stored.
/RGB (p. 1608)	Specifies the RGB color values for indices and contours.
SOLU (p. 1819)	Specifies solution summary data per substep to be stored.
STORE (p. 1867)	Stores data in the database for the defined variables.
TIMERANGE (p. 2001)	Specifies the time range for which data are to be stored.
VARDEL (p. 2074)	Deletes a variable (GUI).
VARNAM (p. 2075)	Names (or renames) a variable.

Table 2.87: Controls

These POST26 commands control the calculations of other commands.

CFACT (p. 315)	Defines complex scaling factors to be used with operations.
FORCE (p. 772)	Selects the element nodal force type for output.
LAYERP26 (p. 1016)	Specifies the element layer for which data are to be stored.
SHELL (p. 1784)	Selects a shell element or shell layer location for results output.
TVAR (p. 2029)	Changes time to the cumulative iteration number.

Table 2.88: Operations

These POST26 commands perform operations on the stored variables.

ABS (p. 89)	Forms the absolute value of a variable.
ADD (p. 95)	Adds variables.
ATAN (p. 204)	Forms the arctangent of a complex variable.
CLOG (p. 354)	Forms the common log of a variable
CONJUG (p. 414)	Forms the complex conjugate of a variable.
DERIV (p. 518)	Differentiates a variable.
EXP (p. 710)	Forms the exponential of a variable.
FILLDATA (p. 756)	Fills a variable by a ramp function.
IMAGIN (p. 934)	Forms an imaginary variable from a complex variable.
INT1 (p. 956)	Integrates a variable.
LARGE (p. 1013)	Finds the largest (the envelope) of three variables.
NLOG (p. 1246)	Forms the natural log of a variable.
PROD (p. 1515)	Multiplies variables.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These POST26 commands perform operations on the stored variables.

QUOT (p. 1563) Divides two variables.

REALVAR (p. 1579) Forms a variable using only the real part of a complex variable.

SMALL (p. 1800) Finds the smallest of three variables.

SQRT (p. 1843) Forms the square root of a variable.

Table 2.89: Display

These POST26 commands display the results.

KEEP (p. 977) Stores POST26 definitions and data during active session.

PLCPLX (p. 1399) Specifies the part of a complex variable to display.

PLTIME (p. 1441) Defines the time range for which data are to be displayed.

PLVAR (p. 1444) Displays up to ten variables in the form of a graph.

SPREAD (p. 1840) Turns on a dashed tolerance curve for the subsequent curve plots.

XVAR (p. 2199) Specifies the X variable to be displayed.

Certain graphics commands (p. 16) also apply, such as **/AXLAB (p. 216)**, **/XRANGE (p. 2199)**, and **/YRANGE (p. 2201)**.

Table 2.90: Listing

These POST26 commands produce tabular listings of the results.

EXTREM (p. 725) Lists the extreme values for variables.

LINES (p. 1052) Specifies the length of a printed page.

NPRINT (p. 1255) Defines which time points stored are to be listed.

PRCPLX (p. 1476) Defines the output form for complex variables.

PRTIME (p. 1522) Defines the time range for which data are to be listed.

PRVAR (p. 1523) Lists variables vs. time (or frequency).

Table 2.91: Special Purpose

These POST26 commands are used for various special purposes.

CVAR (p. 451) Computes covariance between two quantities.

PMGTRAN (p. 1450) Summarizes electromagnetic results from a transient analysis.

RCYC (p. 1574) Calculates cyclic results for a mode-superposition harmonic solution.

RESP (p. 1599) Generates a response spectrum.

RPSD (p. 1619) Computes response power spectral density (PSD).

SMOOTH (p. 1809) Enables smoothing of noisy data and provides a graphical representation of the data.

VGET (p. 2129) Moves a variable into an array parameter vector.

VPUT (p. 2152) Moves an array parameter vector into a variable.

Table 2.92: Status

These POST26 commands are for use with the STAT (p. 1861) command.

DEFINE (p. 511) Specifies "Data definition settings" as the subsequent status topic.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These POST26 commands are for use with the STAT (p. 1861) command.	
OPERATE (p. 1325)	Specifies "Operation data" as the subsequent status topic.
PLOTTING (p. 1438)	Specifies "Plotting settings" as the subsequent status topic.
PRINT (p. 1496)	Specifies "Print settings" as the subsequent status topic.

2.9. AUX2 Commands

These commands examine or manipulate the contents of binary files produced by the program. The commands are grouped by functionality.

Table 2.93: Binary File Dump

These AUX2 commands dump the contents of binary files.	
/AUX2 (p. 208)	Enters the binary file dumping processor.
DUMP (p. 583)	Dumps the contents of a binary file.
FILEAUX2 (p. 753)	Specifies the binary file to be dumped.
FORM (p. 773)	Specifies the format of the file dump.
PTR (p. 1555)	Dumps the record of a binary file.

Table 2.94: Binary File Manipulation

These AUX2 commands manipulate the contents of binary files.	
COMBINE (p. 406)	Combines distributed-memory parallel (DMP) files.
HBMAT (p. 888)	Writes an assembled global matrix in Harwell-Boeing format.
PSMAT (p. 1540)	Writes an assembled global matrix to a postscript format that graphically displays nonzero matrix values.

2.10. AUX3 Commands

The auxiliary processor /AUX3 (p. 209) allows you to operate on results files by deleting sets or by changing values. AUX3 commands affect only the data steps index (DSI), time (TIM), loadstep, substep and cumulative step iteration (LSP) records in the results file.

Table 2.95: Results Files

These commands are related to the /AUX3 (p. 209) command.	
/AUX3 (p. 209)	Enters the results file editing processor.
COMPRESS (p. 408)	Deletes all specified sets.
DELETE (p. 513)	Specifies sets in the results file to be deleted before postprocessing.
FILEAUX3 (p. 754)	Specifies the results file to be edited.
LIST (p. 1054)	Lists out the sets in the results file.
MODIFY (p. 1137)	Changes the listed values of the data in a set.
UNDELETE (p. 2052)	Removes results sets from the group of sets selected for editing.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2.11. AUX12 Commands

These commands define radiation options for use in thermal analyses. The commands are grouped by functionality.

Table 2.96: General Radiation

These AUX12 commands specify general radiation parameters.	
/AUX12 (p. 209)	Enters the radiation matrix generation processor.
STEF (p. 1866)	Specifies Stefan-Boltzmann radiation constant.
TOFFST (p. 2008)	Specifies the temperature offset from absolute zero to zero.

Table 2.97: Radiation Matrix Method

These AUX12 commands calculate radiation view factors and to create a radiation substructure for the Radiation Matrix method.	
EMIS (p. 625)	Specifies the emissivity as a material property.
GEOM (p. 796)	Defines the geometry specifications for the radiation matrix calculation.
MPRINT (p. 1178)	Specifies that radiation matrices are to be printed.
SPACE (p. 1825)	Defines a space node for radiation.
VTYPE (p. 2172)	Specifies the viewing procedure used to determine the form factors.
WRITE (p. 2185)	Writes the radiation matrix file.

Table 2.98: Radiosity Solver

These AUX12 commands calculate the radiation view factors and to specify the solution parameters for the Radiosity solver method.	
HEMIOPT (p. 904)	Specifies options for Hemicube view factor calculation.
RADOPT (p. 1567)	Specifies Radiosity Solver options.
SPCNOD (p. 1825)	Defines a space node for radiation using the Radiosity method.
SPCTEMP (p. 1826)	Defines a free-space ambient temperature for radiation using the Radiosity method.
V2DOPT (p. 2070)	Specifies 2D/axisymmetric view factor calculation options.
VFDI (p. 2095)	Specifies diagnostic options to check that the row sum relationship is satisfied.
VFOPT (p. 2099)	Specifies options for view factor file.
VFQUERY (p. 2102)	Queries and prints element Hemicube view factors and average view factor.
VFSM (p. 2104)	Adjusts view factor matrix to satisfy reciprocity and/or row sum properties (view factor smoothing).
VFUP (p. 2110)	Controls view factor updating at the substep level for a coupled-field radiation analysis that includes large-deflection effects.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2.12. AUX15 Commands

These commands read in an IGES file for analysis in Mechanical APDL. The commands are grouped by functionality.

Table 2.99: IGES

These AUX15 commands read an IGES format file into PREP7 data.	
/AUX15 (p. 210)	Enters the IGES file transfer processor.
IGESIN (p. 931)	Transfers IGES data from a file into Mechanical APDL.
IOPTN (p. 957)	Controls options relating to importing a model.

2.13. Mapping Processor Commands

The **/MAP (p. 1107)** processor allows you to map data from an external file onto the existing geometry.

Table 2.100: Pressure Mapping

These commands read pressure data from an external file and map it onto a geometry.	
FTYPE (p. 783)	Specifies the file type and the pressure type for the subsequent import of source points and pressures.
MAP (p. 1105)	Maps pressures from source points to target surface elements.
/MAP (p. 1107)	Enters the mapping processor.
PLGEOM (p. 1418)	Plots target and source geometries.
PLMAP (p. 1420)	Plots target and source pressures.
READ (p. 1578)	Reads coordinate and pressure data from a file.
TARGET (p. 1897)	Specifies the target nodes for mapping pressure onto surface effect elements.
WRITEMAP (p. 2186)	Writes interpolated pressure data to a file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information
of ANSYS, Inc. and its subsidiaries and affiliates.

Chapter 3: Command Dictionary

This chapter contains a dictionary of the Mechanical APDL commands, listed in alphabetical order. The star (*) and slash (/) of the star and slash commands are ignored for alphabetization (for example, the **/SHOW (p. 1785)** command appears between the **SHELL (p. 1784)** and **SHPP (p. 1787)** commands). As in a dictionary, keywords are located at the top of each page (in the printed version only) indicating the first and last commands contained on that page.

The following section documents the components of a command description.

Components of a Command Description

SAMPLECMD, *Key*

Specifies whether to use automatic time stepping or load stepping.

SOLUTION: Load Step Options

Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Key

Automatic time stepping key:

OFF --

Do not use automatic time stepping

ON --

Use automatic time stepping.

Default: No automatic time stepping.

Notes

Specifies whether to use automatic time stepping (or load stepping) over this load step. If *Key* = ON, both time step prediction and time step bisection will be used. Used only if *DTIME* (specified on the **DELTIM (p. 515)** command) is less than the time span or conversely, if *NSBSTP* (on the **NSUBST (p. 1287)** command) is greater than one.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Product Restrictions

Ansys Mechanical Enterprise

Key = OFF is only valid with the Ansys Mechanical Enterprise family of products (Ansys Mechanical Enterprise, Ansys Mechanical Enterprise PrepPost, and Ansys Mechanical Enterprise Solver).

Menu Paths

Main Menu> Preprocessor >Loads> Load Step Opts> Time/Frequenc> Freq and Substps

Main Menu> Preprocessor> Loads> Load Step Opts> Time/Frequenc> Time - Time Step

Main Menu> Solution> Load Step Opts> Time/Frequenc> Freq and Substps

Main Menu> Solution> Load Step Opts> Time/Frequenc> Time - Time Step

Features Documented in Mechanical APDL Commands

The first line of the command description shows the command name followed by the argument names (if any). The second line summarizes the command function. The summary is *not* intended to be all inclusive:

SAMPLECMD, *Key*

Specifies whether to use automatic time stepping or load stepping.

Listed on the next line are codes that will help you find other commands in the program with related functionality.

SOLUTION: Load Step Options

Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

There is at least one group code for each command. "SOLUTION: Load Step Options" is the code in the example above. The portion of the code before the colon (:) tells which of the tables in Command Groupings (p. 11) the command can be found in. These tables represent major groupings, such as PREP7 or APDL commands. In the example above, SOLUTION commands are found in SOLUTION Commands (p. 38). Most of these major groupings are processors, and in those cases the command can be entered only when in that processor. Any exceptions are noted under "Notes" later in the description.

The portion of the code after the colon is the subtable in Command Groupings (p. 11) containing the command. The subtables list commands that functionally relate to each other. In the example, "Load Step Options" means that the command can be found in Table 2.52: Load Step Options (p. 43), a subtable of SOLUTION Commands (p. 38), with other load step option commands.

If you are viewing this reference in the Mechanical APDL Help System, just click on the code to follow the link to the corresponding table. Then click on any of the commands in the table, to follow the link to its description.

If you are reading the printed version, simply turn to the appropriate table in Command Groupings (p. 11). The table lists the page number where the command is documented.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The next line displays a series of product codes, which may contain all of the Mechanical APDL product codes:

Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

or a subset of them:

Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

For more information on product codes, see Valid Products (p. 2).

Following this "product code" line is the description of all arguments, if any, of the command:

Key

Automatic time stepping key:

OFF --

Do not use automatic time stepping (default).

ON --

Use automatic time stepping.

The argument is described and, where necessary, valid choices for the argument are described. Many arguments list defaults, which are the values assumed for *that* argument if you *enter the command but leave the argument blank*. On the other hand, shown after the argument descriptions is often another default:

Command Default

No automatic time stepping.

This is the *command default*. This is the specification assumed by the program if you *do not enter the command at all*. Only commands that set specifications (*specification* commands) have defaults listed. Commands that cause some action, such as performing some calculation, are called *action* commands and simply do not perform the action if the command is not entered. Defaults are not listed for action commands.

Following the default listing are any notes about the command. These notes expand on the summary description given up near the command format, and describe any other behavior, restrictions, suggestions, etc. of that command:

Notes

Specifies whether to use automatic time stepping (or load stepping) over this load step. If *Key* = ON, both time step prediction and time step bisection will be used. Used only if *DTIME* (specified on the **DELTIM (p. 515)** command) is less than the time span or conversely, if *NSBSTP* (on the **NSUBST (p. 1287)** command) is greater than one.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If the command behaves differently, or has restrictions, in any of the various Ansys products, those differences are described in the *Product Restrictions* section:

Product Restrictions

Ansys Mechanical Enterprise

Key = OFF is only valid with the Ansys Mechanical Enterprise family of products (Ansys Mechanical Enterprise, Ansys Mechanical Enterprise PrepPost, and Ansys Mechanical Enterprise Solver).

Menu Paths

Main Menu >Preprocessor> Loads> Load Step Opts> Time/Frequenc> Freq and Substps

Main Menu >Preprocessor> Loads> Load Step Opts> Time/Frequenc> Time - Time Step

Main Menu> Solution> Load Step Opts> Time/Frequenc >Freq and Substps

Main Menu> Solution> Load Step Opts> Time/Frequenc> Time - Time Step

These menu paths are intended as guides to help you find the commands in the GUI. Be aware, however, that often the paths are valid only if some other command has been previously issued. For example, you won't be able to follow a path to transient analysis options if you have not selected a transient analysis in the first place.

Not all commands are directly accessible through the menu (although some of them may be generated indirectly by some menu function). Such cases are indicated by the following statement in the menu path listing:

Menu Paths

This command cannot be accessed directly in the menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Connection Commands

~CAT5IN,*Name*,*Extension*,*Path*,*Entity*,*FMT*,*NOCL*,*NOAN*

Transfers a .CATPart file into the Mechanical APDL program.

CAD Import

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Name

The name of a valid .CATPart file, created with CATIA Version 5.0. The first character of the file name must be an alphanumeric.

Extension

The extension for the file. The default extension is .CATPart.

Path

The path name of the directory in which the file resides enclosed in single quotes. The default path name is the current working directory.

Entity

Entity to be imported.

SOLIDS

Solids only, imported as Mechanical APDL volumes (default).

SURFACES

Surfaces only, imported as Mechanical APDL areas.

ALL

All entities. Use this option when the file contains different types of entities.

FMT

The format in which Mechanical APDL will store the model.

0

Neutral format (default). Defeaturing after import is restricted.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Solid format; this allows defeaturing after import.

NOCL

Remove tiny objects.

0

Remove tiny objects without checking model validity (default).

1

Do not remove tiny objects.

NOAN

Perform an analysis of the model.

0

Analyze the model (default).

1

Do not analyze the model.

Notes

If defeaturing is specified (*FMT* = 1), this command must be the last line of any file, script, or other interactive input.

More information on importing CATIA Version 5 parts is available in CATIA V5 in the *Connection User's Guide*.

Menu Paths

File>Import>CATIA V5

~CATIAIN,*Name*,*Extension*,*Path*,- -,- -,*BLANK*,- -

Transfers a CATIA model into the Mechanical APDL program.

CAD Import

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Name

The name of a valid CATIA model, created with CATIA 4.x or lower. The first character of the file name must be an alphanumeric. Special characters such as & - and * and spaces are not permitted in the part name.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Extension

The extension for the file. The default extension is `.model`.

Path

The path name of the directory in which the file resides, enclosed in single quotes. The default path name is the current working directory.

--

Unused field.

--

Unused field.

BLANK

Sets whether to import "blanked" entities.

0

Does not import "blanked" (suppressed) CATIA entities (default).

1

Imports "blanked" entities. The portions of CATIA data that were suppressed will be included in the import.

--

Unused field.

Notes

More information on importing CATIA parts is available in CATIA V4 in the *Connection User's Guide*.

Menu Paths

File>Import>CATIA

~PARAIN,*Name*,*Extension*,*Path*,*Entity*,*FMT*,*Scale*

Transfers a Parasolid file into Mechanical APDL.

CAD Import

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Name

The name of a valid Parasolid file. The first character of the file name must be an alphanumeric.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Extension

The extension for the file. The default extension is `.x_t` on a PC or `.xmt_txt` on a Linux system. Parasolid files are compatible across systems, and do not need to be renamed to be used on another platform.

Path

The path name of the directory in which the file resides, enclosed in single quotes. The default path name is the current working directory.

Entity

Entity to be imported:

SOLIDS

Solids only, imported as Mechanical APDL volumes (default)

SURFACES

Surfaces only, imported as Mechanical APDL areas.

WIREFRAME

Wireframe only, imported as Mechanical APDL lines.

ALL

All entities. Use this option when the file contains more than one type of entity.

FMT

Sets the format in which Mechanical APDL will store the model

0

Neutral format (default). Defeaturing after import is restricted. Use this option if you need to scale a model to a specific unit of measure (other than meters).

1

Solid format; this allows defeaturing after import.

Scale

Allows scaling for the model

0

Do not rescale the model; retain the default Parasolid setting of meters (default).

1

Scale the model if warranted by the model size.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Very small models will be scaled by the factor of 10 or 100 to increase the chance of successful import; the scaling factor used is displayed in the output window and in the `.para_log` file. Because scaling changes the dimensions of the model, you must apply loads and material properties appropriately. If the model cannot be properly scaled, the analysis may fail.

If you need to scale your model to a specific set of measurements, set FMT = 0, then use either the **VLSCALE (p. 2137)**, **ARSCALE (p. 183)** or **LSSCALE (p. 1084)** command to select a different unit of measure.

Notes

More information on importing Parasolid parts is available in Parasolid in the *Connection User's Guide*.

Menu Paths

File>Import>PARA

~PROEIN,*Name*,*Extension*,*Path*,*Proecomm*

Transfers a Creo Parametric part into Mechanical APDL.

CAD Import

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Name

The name of the Creo Parametric part to be imported, which cannot exceed 64 characters in length and must begin with an alphanumeric character. Special characters such as & - and * and spaces are not permitted in the part name.

Extension

The general Creo Parametric extension format is `prt` for parts and `asm` for assemblies.

Path

Full path name to the directory containing the part. The default is the current working directory.

Proecomm

The start command for the version of Creo Parametric you are using. `proe1` is the default command. Note that the full path name to the Creo Parametric command need not be used here if the path had been included in the PATH variable. The Creo Parametric command name is set by the **PROE_START_CMD241** environment variable.

Notes

More information on importing Creo Parametric parts is available in Creo Parametric in the *Connection User's Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

File>Import>Creo Parametric

~SATIN,*Name*,*Extension*,*Path*,*Entity*,*FMT*,*NOCL*,*NOAN*

Transfers a `.sat` file into Mechanical APDL.

CAD Import

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Name

The name of a valid `.sat` file, created with a supported version of ACIS. The first character of the file name must be an alphanumeric. Special characters such as & - and * and spaces are not permitted in the part name. See File Names (p. 7) in the *Command Reference* (p. 1) for more information about Mechanical APDL file-naming conventions.

Extension

The extension for the file. The default extension is `.sat`.

Path

The path name of the directory in which the file resides enclosed in single quotes. The default path name is the current working directory.

Entity

Entity to be imported.

SOLIDS

Solids only, imported as Mechanical APDL volumes (Not implemented, imports **All**).

SURFACES

Surfaces only, imported as Mechanical APDL areas (Not implemented, imports **All**).

WIREFRAME

Wireframe only, imported as Mechanical APDL lines (Not implemented, imports **All**).

ALL

All entities. Use this option when the file contains different types of entities.

FMT

The format in which Mechanical APDL will store the model.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Neutral format (default). Defeaturing after import is restricted.

1

Solid format; this allows defeaturing after import.

NOCL

Remove tiny objects.

0

Remove tiny objects without checking model validity (default).

1

Do not remove tiny objects.

NOAN

Perform an ACIS analysis of the model.

0

Analyze the model (default).

1

Do not analyze the model.

Note:

NOCL and *NOAN* are not supported in the Mechanical APDL GUI.

Notes

More information on importing ACIS parts is available in ACIS in the *Connection User's Guide*.

Menu Paths

File>Import>ACIS

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

~UGIN,*Name*,*Extension*,*Path*,*Entity*,*LAYER*,*FMT*

Transfers an NX part into Mechanical APDL.

CAD Import

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Name

The file name of the NX part to be imported, which cannot exceed 64 characters in length. The path name must begin with an alphanumeric character. Special characters such as &, -, and * are not permitted in the part name.

Extension

The NX part file extension. The default is `.prt`.

Path

The full path name to the directory containing the part, enclosed in single quotes; for example, `'/ug_parts'`. The default is the current working directory.

Entity

Entity to be imported.

0 or Solid

Solids only, imported as Mechanical APDL volumes (the default).

1 or Surface

Surfaces only, imported as Mechanical APDL areas.

2 or Wireframe

Wireframe only, imported as Mechanical APDL lines.

3 or All

All entities. Use this option when the part contains entities that may not be attached to each other, such as a solid in one location and a surface in another.

LAYER

The number(s) assigned to the layer(s) to be imported. You can import one layer or a range of layers (designated by hyphens). Defaults to 1-256 (all layers).

FMT

The format in which Mechanical APDL stores the model.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Neutral format (default). Defeaturing after import is restricted.

1

Solid format; this allows defeaturing after import.

Notes

More information on importing NX parts is available in UG/NX in the *Connection User's Guide*.

Menu Paths

of ANSYS, Inc. and its subsidiaries and affiliates.

Plugin Commands

*DPF,*Action*,*WorkflowId*,*Val1*,*Val2*,*Val3*

Specifies an input data processing framework (DPF) workflow file or a DPF workflow output pin.

DPF commands

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Description

This command is added to the list of Mechanical APDL commands when the data processing framework (DPF) Plugin is loaded. This command can be found in input files automatically generated by the Mechanical Application (see Load Mapping Workflow Specification in the *Mechanical User's Guide*), but manual use of this command is not currently supported.

Argument Descriptions

Action

Action to process. No default, you must choose one of the available options:

WFF --

Load a DPF workflow file.

WFO --

Associate a DPF workflow output pin to an ADPL Variable.

***WorflowId* --**

worflow name used by Mechanical APDL.

Val1

For Action = WFF: DPF workflow filename (typically `WorflowFile.swf`).

For Action = WFO:

APDL Variable name, associated to a DPF output pin.

Notes

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

***PLUG**,*Action*,*PLuginName*

Loads a plugin into Mechanical APDL so that new functionalities can be dynamically added.

DPF commands

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Description

This command can be found in input files automatically generated by the Mechanical Application (see Load Mapping Workflow Specification in the *Mechanical User's Guide*), but manual use of this command is not currently supported.

Argument Descriptions

Action

Action to process. No default, you must choose one of the available options:

LOAD

Load a plugin.

UNLOAD

Unload a plugin to free up memory.

PLuginName

Name (case-sensitive, 32-character maximum) of the plugin to load, which defines the dynamic library name as follows:

- For Windows: *PluginName*.dll.
- For Linux: lib*PluginName*.so

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A Commands

A,*P1*,*P2*,*P3*,*P4*,*P5*,*P6*,*P7*,*P8*,*P9*,*P10*,*P11*,*P12*,*P13*,*P14*,*P15*,*P16*,*P17*,*P18*

Defines an area by connecting keypoints.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

P1, P2, P3, . . . , P18

List of keypoints defining the area (18 maximum if using keyboard entry). At least 3 keypoints must be entered. If *P1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI).

Notes

Keypoints (*P1* through *P18*) must be input in a clockwise or counterclockwise order around the area. This order also determines the positive normal direction of the area according to the right-hand rule. Existing lines between adjacent keypoints will be used; missing lines are generated "straight" in the active coordinate system and assigned the lowest available numbers (**NUMSTR (p. 1301)**). If more than one line exists between two keypoints, the shorter one will be chosen. If the area is to be defined with more than four keypoints, the required keypoints and lines must lie on a constant coordinate value in the active coordinate system (such as a plane or a cylinder). Areas may be redefined only if not yet attached to a volume. Solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Areas>Arbitrary>Through KPs

***ABBR**,*Abbr*,*String*

Defines an abbreviation.

APDL (p. 19): Abbreviations (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Abbr

The abbreviation (up to 8 alphanumeric characters) used to represent the string *String*. If *Abbr* is the same as an existing Mechanical APDL command, the abbreviation overrides. Avoid using an *Abbr* which is the same as an Mechanical APDL command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

String

String of characters (60 maximum) represented by *Abbr*. Cannot include a $ or any of the commands **C*** (p. 283)**, **/COM (p. 404)**, **/GOPR (p. 865)**, **/NOPR (p. 1251)**, **/QUIT (p. 1563)**, **/UI (p. 2040)**, or ***END (p. 635)**. Parameter names and commands of the ***DO (p. 567)** and Use the ***IF (p. 927)** groups may not be abbreviated. If *String* is blank, the abbreviation is deleted. To abbreviate multiple commands, create an "unknown command" macro or define *String* to execute a macro file (***USE (p. 2059)**) containing the desired commands.

Notes

Once the abbreviation *Abbr* is defined, you can issue it at the beginning of a command line and follow it with a blank (or with a comma and appended data), and the program will substitute the string *String* for *Abbr* as the line is executed. Up to 100 abbreviations may exist at any time and are available throughout the program. Abbreviations may be redefined or deleted at any time.

Use ***STATUS (p. 1863)** to display the current list of abbreviations. For abbreviations repeated with ***REPEAT (p. 1586)**, substitution occurs before the repeat increments are applied. There are a number of abbreviations that are predefined by the program (these can be deleted by using the blank *String* option described above). Note that *String* will be written to the `File.log`.

This command is valid in any processor.

Menu Paths

Utility Menu>Macro>Edit Abbreviations

Utility Menu>MenuCtrls>Edit Toolbar

AADD, *NA1*, *NA2*, *NA3*, *NA4*, *NA5*, *NA6*, *NA7*, *NA8*, *NA9*

Adds separate areas to create a single area.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1, NA2, NA3, . . . , NA9

Numbers of areas to be added. If *NA1* = ALL, add all selected areas and ignore *NA2* to *NA9*. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1*.

Notes

The areas must be coplanar. The original areas (and their corresponding lines and keypoints) will be deleted by default. See the **BOPTN (p. 269)** command for the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated. Concatenated entities are not valid with this command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Add>Areas

---

*AFUN, *Lab*

Specifies units for angular functions in parameter expressions.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Lab

Specifies the units to be used:

RAD --

Use radians for input and output of parameter angular functions (default).

DEG --

Use degrees for input and output of parameter angular functions.

STAT --

Show current setting (DEG or RAD) for this command.

Command Default

Use radians for input or output of parameter angular functions.

Notes

Only the SIN, COS, TAN, ASIN, ACOS, ATAN, ATAN2, ANGLEK, and ANGLEN functions (***SET (p. 1720)**, ***VFUN (p. 2106)**) are affected by this command.

Menu Paths

Utility Menu>Parameters>Angular Units

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*ASK, *Par*, *Query*, *DVAL*

Prompts the user to input a parameter value.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Par

An alphanumeric name used to identify the scalar parameter. See ***SET (p. 1720)** for name restrictions.

Query

Text string to be displayed on the next line as the query (32 characters maximum). Characters having special meaning (such as $! ,) should not be included.

DVAL

Default value assigned to the parameter if the user issues a blank response. May be a number or character string (up to 8 characters enclosed in single quotes). If a default is not assigned, a blank response will delete the parameter.

Notes

Intended primarily for use in macros, the command prints the query (after the word ENTER) on the next line and waits for a response. The response is read from the keyboard, except in batch mode (**/BATCH (p. 217)**), when the response(s) must be the next-read input line(s). The response may be a number, a character string (up to 8 characters enclosed in single quotes), a parameter (numeric or character) or an expression that evaluates to a number. The scalar parameter is then set to the response value. For example, ***ASK (p. 84)**,NN,PARAMETER NN will set NN to the value entered on the next line (after the prompt ENTER PARAMETER NN).

The ***ASK (p. 84)** command is not written to `File.log`, but the responses are written there as follows: If ***ASK (p. 84)** is contained in a macro, the response(s) (only) is written to `File.log` on the line(s) following the macro name. If not contained in a macro, the response is written to `File.log` as a parameter assignment (that is, *Par* = "user-response").

If used within a do-loop that is executed interactively, ***ASK (p. 84)** should be contained in a macro. If not contained in a macro, ***ASK (p. 84)** will still query the user as intended, but the resulting log file will *not* reproduce the effects of the original run.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AATT, *MAT*, *REAL*, *TYPE*, *ESYS*, *SECN*

Associates element attributes with the selected, unmeshed areas.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT

The material number to be associated with selected, unmeshed areas.

REAL

The real constant set number to be associated with selected, unmeshed areas.

TYPE

The type number to be associated with selected, unmeshed areas.

ESYS

The coordinate system number to be associated with selected, unmeshed areas.

SECN

The section number to be associated with selected unmeshed areas.

Notes

Areas subsequently generated from the areas will also have these attributes. These element attributes will be used when the areas are meshed. If an area does not have attributes associated with it (by this command) at the time it is meshed, the attributes are obtained from the then current **MAT (p. 1111)**, **REAL (p. 1579)**, **TYPE (p. 2036)**, **ESYS (p. 685)**, and **SECNUM (p. 1685)** command settings. Reissue the **AATT (p. 85)** command (before areas are meshed) to change the attributes. A zero (or blank) argument removes the corresponding association. If any of the arguments *MAT*, *REAL*, *TYPE*, *ESYS*, or *SECN* are defined as -1, then that value will be left unchanged in the selected set.

In some cases, Mechanical APDL can proceed with an area meshing operation even when no logical element type has been assigned via **AATT (p. 85)**,,,*TYPE* or **TYPE (p. 2036)**. For more information, see the discussion on setting element attributes in Meshing Your Solid Model in the *Modeling and Meshing Guide*.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh Attributes>All Areas

Main Menu>Preprocessor>Meshing>Mesh Attributes>Picked Areas

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*AXPY,*vr*,*vi*,*M1*,*wr*,*wi*,*M2*

Performs the matrix operation M2= v*M1 + w*M2.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

vr*,*vi

The real and imaginary parts of the scalar *v*. Default value is 0.

M1

Name of matrix *M1*. If not specified, the operation M2 = w*M2 will be performed.

wr*,*wi

The real and imaginary parts of the scalar *w*. Default value is 0.

M2

Name of matrix *M2*. Must be specified.

Notes

The matrices *M1* and *M2* must have the same dimensions and same type (dense or sparse). If *M2* is real, *vi* and *wi* are ignored.

Menu Paths

This command cannot be accessed from a menu.

ABBRES,*Lab*,*Fname*,*Ext*,*--

Reads abbreviations from a coded file.

APDL (p. 19): Abbreviations (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Lab

Label that specifies the read operation:

NEW --

Replace current abbreviation set with these abbreviations (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CHANGE --

Extend current abbreviation set with these abbreviations, replacing any of the same name that already exist.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to `Jobname`.

Ext

Filename extension (eight-character maximum).

The extension defaults to ABBR if *Fname* is blank.

--

Unused field.

Notes

The abbreviation file may have been written with the **ABBSAV (p. 87)** command. Do not issue **ABBRES (p. 86)**,NEW while inside an executing abbreviation. Doing so will cause all data for the executing abbreviation to be deleted.

This command is valid in any processor.

Menu Paths

Utility Menu>Macro>Restore Abbr

Utility Menu>MenuCtrls>Restore Toolbar

ABBSAV, *Lab*, *Fname*, *Ext*, *--*

Writes the current abbreviation set to a coded file.

APDL (p. 19): Abbreviations (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Lab

Label that specifies the write operation:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL --

Write all abbreviations (default).

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to `Jobname`.

Ext

Filename extension (eight-character maximum).

The extension defaults to ABBR if *Fname* is blank.

--

Unused field.

Notes

Existing abbreviations on this file, if any, will be overwritten. The abbreviation file may be read with the **ABBRES (p. 86)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>Macro>Save Abbr

Utility Menu>MenuCtrls>Save Toolbar

ABEXTRACT,*MODE1*,*MODE2*

Extracts the alpha-beta damping multipliers for Rayleigh damping.

`SOLUTION` (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MODE1

First mode number.

MODE2

Second mode number.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

ABEXTRACT (p. 88) calls the command macro **DMPEXT (p. 557)** to extract the damping ratio of *MODE1* and *MODE2* and then computes the Alpha and Beta damping multipliers for use in a subsequent structural harmonic or transient analysis. See Damping in the *Structural Analysis Guide* for more information on the alpha and beta damping multipliers. The damping multipliers are stored in parameters ALPHADMP and BETADMP and can be applied using the **ALPHAD (p. 115)** and **BETAD (p. 220)** commands. Before calling **ABEXTRACT (p. 88)**, you must issue **RMFLVEC (p. 1612)** to extract the modal displacements. In addition, a node component FLUN must exist from all FLUID136 nodes. See Introduction for more information on thin film analyses.

This command is also valid in PREP7.

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

Menu Paths

Main Menu>Solution>ThinFilm>RayleighDamp

ABS, *IR*, *IA*, - -, - -, *Name*, - -, - -, *FACTA*

Forms the absolute value of a variable.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA

Reference number of the variable to be operated on.

- -, - -

Unused fields.

Name

Thirty-two character name for identifying the variable on the printout and displays. Embedded blanks are compressed upon output.

- -, - -

Unused fields.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FACTA

Scaling factor (positive or negative) applied to variable *IA* (defaults to 1.0).

Notes

The new variable is calculated as:

IR = | FACTA x IA |

For a complex number (a + *i*b), the absolute value is the magnitude, where the *IA* values are obtained from:

$$\sqrt{a^2 + b^2}$$

See POST26 - Data Operations in the *Mechanical APDL Theory Reference* for details.

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Absolute Value

ACCAT, *NA1*, *NA2*

Concatenates multiple areas in preparation for mapped meshing.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1, NA2

Areas to be concatenated. If *NA1* = ALL, *NA2* will be ignored and all selected areas (**ASEL (p. 192)**) will be concatenated. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1* (*NA2* is ignored).

Notes

Concatenates multiple, adjacent areas (the input areas) into one area (the output area) in preparation for mapped meshing. A volume that contains too many areas for mapped meshing can still be mapped meshed if some of the areas in that volume are first concatenated (see Meshing Your Solid Model in the *Modeling and Meshing Guide* for details on mapped meshing restrictions).

Because of modeling restrictions that result from its use, **ACCAT (p. 90)** is meant to be used solely for meshing. Specifically, (a) the output area and any volumes that have the output area on their area list (**VLIST (p. 2137)**) cannot be used as input to any other solid modeling operation (not even another **ACCAT (p. 90)** command); and (b) the output area cannot accept solid model boundary conditions (**DA (p. 487)**, **SFA (p. 1739)**).

The output area (or volumes which contain it) will be meshed (**AMESH (p. 121)**, **VMESH (p. 2140)**) by meshing the input areas, which themselves must be meshable. The output area from the **ACCAT (p. 90)** operation will be coincident with the input areas and the input areas will be retained. Consider the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AADD (p. 82) command instead of **ACCAT (p. 90)** if you wish to delete the input areas. When an **ACCAT (p. 90)** command is issued, volume area lists (**VLIST (p. 2137)**) that contain *all* of the input areas will be updated so that the volume area lists refer to the output area instead of the input area. Deletion of the output area (**ADELE (p. 97)**) effectively reverses the **ACCAT (p. 90)** operation and restores volume area lists to their original condition. **ACCAT (p. 90)** operations on pairs of adjacent four-sided areas automatically concatenate appropriate lines (**LCCAT (p. 1020)**); in all other situations, line concatenations must be addressed by the user.

You can use the **ASEL (p. 192)** command to select areas that were created by concatenation, and then follow it with an **ADELE (p. 97)**,ALL command to delete them. See Meshing Your Solid Model in the *Modeling and Meshing Guide* for a discussion on how to easily select and delete concatenated areas in one step.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh>Volumes>Mapped>Concatenate>Areas

---

ACCOPTION,*Activate*

Specifies GPU accelerator capability options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Activate

Activates the GPU accelerator capability within the equation solvers.

OFF --

Do not use GPU accelerator.

ON --

Use GPU accelerator.

Command Default

Activate is set to ON when the GPU acceleration command line option (-acc) is specified upon launching Mechanical APDL; otherwise it is OFF.

Notes

The GPU accelerator capability requires specific hardware to be installed on the machine. See the appropriate Ansys, Inc. Installation Guide (Windows or Linux) for a list of supported GPU hardware. Use of this capability also requires HPC licensing. For more information, see GPU Accelerator Capability in the *Parallel Processing Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The GPU accelerator capability is available for the sparse direct solver and the PCG and JCG iterative solvers. Static, buckling, modal, full harmonic, and full transient analyses are supported. For buckling analyses, the Block Lanczos and Subspace eigensolvers are supported. For modal analyses, only the Block Lanczos, PCG Lanczos, Subspace, Unsymmetric, and Damped eigensolvers are supported. Activating this capability when using other equation solvers or other analysis types has no effect.

The GPU accelerator capability is supported only on the Windows 64-bit and Linux 64-bit platforms.

Menu Paths

This command cannot be accessed from a menu.

ACEL,*ACEL_X*,*ACEL_Y*,*ACEL_Z*

Specifies the linear acceleration of the global Cartesian reference frame for the analysis.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ACEL_X, ACEL_Y, ACEL_Z

Linear acceleration of the reference frame along global Cartesian X, Y, and Z axes, respectively.

Notes

In the absence of any other loads or supports, the acceleration of the structure in each of the global Cartesian (X, Y, and Z) axes would be equal in magnitude but opposite in sign to that applied in the **ACEL (p. 92)** command. Thus, to simulate gravity (by using inertial effects), accelerate the reference frame with an **ACEL (p. 92)** command in the direction opposite to gravity.

You can define the acceleration for the following analyses types:

- Static (**ANTYPE (p. 162)**,STATIC)
- Harmonic (**ANTYPE (p. 162)**,HARMIC), full, VT [1], Krylov [1], or mode-superposition [2]
- Transient (**ANTYPE (p. 162)**,TRANS), full or mode-superposition [2]
- Substructure (**ANTYPE (p. 162)**,SUBSTR).

1. Loads for VT and Krylov methods are supported as long as they are not:
   - complex tabulated loads (constant or trapezoidal loads in tabulated form are supported)
   - used in conjunction with Rotordynamics (**CORIOLIS (p. 417)**,on).
2. In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For all transient dynamic (**ANTYPE (p. 162)**,TRANS) analyses, accelerations are combined with the element mass matrices to form a body-force load vector term. The element mass matrix may be formed from a mass input constant or from a nonzero density (DENS) property, depending upon the element type.

For analysis type **ANTYPE (p. 162)**,HARMIC, the acceleration is assumed to be the real component with a zero imaginary component.

Units of acceleration and mass must be consistent to give a product of force units.

The **ACEL (p. 92)** command supports tabular boundary conditions (%*TABNAME_X*%, %*TABNAME_Y*%, and %*TABNAME_Z*%) for *ACEL_X*, *ACEL_Y*, and *ACEL_Z* input values (***DIM (p. 530)**) as a function of both time and frequency for full transient and harmonic analyses.

Related commands for rotational effects are **CMACEL (p. 358)**, **CGLOC (p. 319)**, **CGOMGA (p. 320)**, **DCGOMG (p. 501)**, **DOMEGA (p. 571)**, **OMEGA (p. 1324)**, **CMOMEGA (p. 368)**, and **CMDOMEGA (p. 362)**.

See Analysis Tools in the *Theory Reference* for more information.

This command is also valid in **/PREP7 (p. 1479)**.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Structural>Inertia>Gravity>Global

Main Menu>Preprocessor>Loads>Define Loads>Delete>Structural>Inertia>Gravity

---

ACLEAR, *NA1*, *NA2*, *NINC*

Deletes nodes and area elements associated with selected areas.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1*, *NA2*, *NINC

Delete mesh for areas *NA1* to *NA2* (defaults to *NA1*) in steps of *NINC* (defaults to 1). If *NA1* = ALL, *NA2* and *NINC* are ignored and the mesh for all selected areas (**ASEL (p. 192)**) is deleted. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1* (*NA2* and *NINC* are ignored).

Notes

Deletes *all* nodes and area elements associated with selected areas (regardless of whether the nodes or elements are selected). Nodes shared by adjacent meshed areas and nodes associated with non-area elements will not be deleted. Attributes assigned as a result of **AATT (p. 85)** are maintained. In the program's response to the command, if an area, line, or keypoint is tallied as "cleared," it means either its node or element reference was deleted.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is also valid for rezoning. When issued during rezoning (after the **REMESH (p. 1581)**,START command and before the **REMESH (p. 1581)**,FINISH command), **ACLEAR (p. 93)** clears only the area generated by the **AREMESH (p. 180)** command.

Menu Paths

Main Menu>Preprocessor>Meshing>Clear>Areas

ADAMS, *NMODES*, *KSTRESS*, *KSHELL*

Performs solutions and writes flexible body information to a modal neutral file (`Jobname.MNF`) for use in an ADAMS analysis.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NMODES

Number of normal modes to be written to `Jobname.MNF` file (no default).

KSTRESS

Specifies whether to write stress or strain results:

0

Do not write stress or strain results (default).

1

Write stress results.

2

Write strain results.

3

Write both stress and strain results.

KSHELL

Shell element output location. This option is valid only for shell elements.

0, 1

Shell top surface (default).

2

Shell middle surface.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3

Shell bottom surface.

Notes

ADAMS (p. 94) invokes a predefined Mechanical APDL macro that solves a series of analyses and then writes the modal neutral file, `Jobname.MNF`. This file can be imported into the ADAMS program in order to perform a rigid body dynamics simulation. For detailed information about how to use the **ADAMS (p. 94)** command macro to create a modal neutral file, see Rigid Body Dynamics and the Ansys-Adams Interface in the *Substructuring Analysis Guide*.

Before running the **ADAMS (p. 94)** command macro, you must specify the units with the **/UNITS (p. 2054)** command. The interface points should be the only selected nodes when the command macro is initiated. (Interface points are nodes where constraints may be applied in ADAMS.) Only selected elements will be considered in the calculations.

By default, stress and strain data is transferred to the ADAMS program for all nodes, as specified by the *KSTRESS* value. If you want to transfer stress/strain data for only a subset of nodes, select the desired subset and create a node component named STRESS before running the **ADAMS (p. 94)** command macro. For example, you may want to select exterior nodes for the purpose of visualization in the ADAMS program.

The default filename for the modal neutral file is `Jobname.MNF`. In interactive (GUI) mode, you can specify a filename other than `Jobname.MNF`. In batch mode, there is no option to change the filename, and the modal neutral file is always written to `Jobname.MNF`.

Menu Paths

Main Menu>Solution>ADAMS Connection>Export to ADAMS

ADD, *IR*, *IA*, *IB*, *IC*, *Name*, - -, - -, *FACTA*, *FACTB*, *FACTC*

Adds (sums) variables.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA, IB, IC

Reference numbers of the three variables to be operated on. If only two variables, leave *IC* blank. If only one, leave *IB* and *IC* blank.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name

Thirty-two character name for identifying the variable on the printout and displays. Embedded blanks are compressed upon output.

--,--

Unused fields.

FACTA, FACTB, FACTC

Scaling factors (positive or negative) applied to the corresponding variables (default to 1.0).

Notes

Adds variables (up to three at once) according to the operation:

$$IR = (FACTA \times IA) + (FACTB \times IB) + (FACTC \times IC)$$

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Add

ADDAM, *AF*, *AA*, *AB*, *AC*, *AD*, *AMIN*

Specifies the acceleration spectrum computation constants for the analysis of shock resistance of shipboard structures.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AF

Direction-dependent acceleration coefficient for elastic or elastic-plastic analysis option (default = 0).

AA, AB, AC, AD

Coefficients for the DDAM acceleration spectrum equations. Default for these coefficients is zero.

AMIN

Minimum acceleration value. It defaults to 6g, where g is the acceleration due to gravity.

Notes

This command specifies acceleration coefficients to analyze shock resistance of shipboard equipment. These coefficients are used to compute mode coefficients according to the equations given in Dynamic Design Analysis Method in the *Mechanical APDL Theory Reference*. The form of these equations is based on the Naval NRL Dynamic Design Analysis Method. This command, along with the **VDDAM (p. 2081)**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

and **SED (p. 1704)** commands, is used with the spectrum (**ANTYPE (p. 162)**,SPECTR) analysis as a special purpose alternative to the **SV (p. 1886)**, **FREQ (p. 776)**, and **SVTYP (p. 1887)** commands.

In order to perform a DDAM spectrum analysis using a units system other than BIN (default), you must specify the units system complying with the mass and length units of the model using the **/UNITS (p. 2054)** command. Issue the **/UNITS (p. 2054)** command before defining the shock spectrum computation constants (**ADDAM (p. 96)**). The **ADDAM (p. 96)** command is not supported with the user-defined unite system (*Label* = USER on **/UNITS (p. 2054)**).

DDASPEC (p. 503) may alternatively be used to calculate spectrum coefficients.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>DDAM Options

Main Menu>Solution>Load Step Opts>Spectrum>DDAM Options

ADELE, *NA1*, *NA2*, *NINC*, *KSWP*

Deletes unmeshed areas.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1*, *NA2*, *NINC

Delete areas from *NA1* to *NA2* (defaults to *NA1*) in steps of *NINC* (defaults to 1). If *NA1* = ALL, *NA2* and *NINC* are ignored and all selected areas (**ASEL (p. 192)**) are deleted. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1* (*NA2* and *NINC* are ignored).

KSWP

Specifies whether keypoints and lines are also to be deleted:

0

Delete areas only (default).

1

Delete areas, as well as keypoints and lines attached to specified areas but not shared by other areas.

Notes

An area attached to a volume cannot be deleted unless the volume is first deleted.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

ADGL,*NA1*,*NA2*,*NINC*

Lists keypoints of an area that lie on a parametric degeneracy.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1*, *NA2*, *NINC

List keypoints that lie on a parametric degeneracy on areas from *NA1* to *NA2* (defaults to *NA1*) in steps of *NINC* (defaults to 1). If *NA1* = ALL (default), *NA2* and *NINC* will be ignored and keypoints on all selected areas (**ASEL (p. 192)**) will be listed. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may be substituted in *NA1* (*NA2* and *NINC* will be ignored).

Notes

See the *Modeling and Meshing Guide* for details on parametric degeneracies.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Show Degeneracy>List Degen Areas

---

ADPCI,*Action*,*Par1*,*Par2*,*Par3*,*Par4*,*Par5*,*Par6*,*Par7*,*Par8*

Defines parameters associated with adaptive crack initiation.

PREP7 (p. 22): Special Purpose (p. 37)
SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Specifies action for defining or manipulating initial crack data:

DEFINE

Initiate a new adaptive-crack calculation and assign an ID. (p. 99)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

GEOM

Define the geometry data for initializing a crack. (p. 99)

DELE

Delete the **ADPCI (p. 98)** data set associated with the specified ID. (p. 101)

LIST

List the **ADPCI (p. 98)** data set associated with the specified ID. (p. 101)

Command Specification for *Action* = DEFINE

ADPCI (p. 98), DEFINE, *Par1*, *Par2*, *Par3*, *Par4*

Par1 --

ADPCI (p. 98) ID number.

Par2 --

Node component name ($\leq$ 32 characters) for defining the crack-initiation zone.

Par3 --

Material ID for defining the crack-initiation criterion.

Par4 --

Shape of the initialized crack:

ELLIPSE – Elliptical crack shape (default, and the only valid value).

Command Specifications for *Action* = GEOM

ADPCI (p. 98), GEOM, *Par1*, *Par2*, *Par3*, *Par4*, *Par5*, *Par6*, *Par7*, *Par8*

Par1 --

ADPCI (p. 98) ID number.

Par2 --

Crack geometry characteristic to define:

CENTER – Specify the ellipse center location.

AXES – Specify the directions of the two ellipse axes.

ALEN – Specify the lengths of two ellipse axes. This value is required when AXES or LCS is specified.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LCS – Local coordinate system number for defining the ellipse center location and axes directions. See "Notes" (p. 101) below.

Par3 --

The first value to assign to the geometry characteristic specified via *Par2*:

If *Par2* = CENTER, the X coordinate of the ellipse center.

If *Par2* = AXES, the X component of the first ellipse axis direction.

If *Par2* = ALEN, the length of the first ellipse axis.

If *Par2* = LCS, the local coordinate system number.

Par4 --

The second value to assign to the geometry characteristic specified via *Par2*:

If *Par2* = CENTER, the Y coordinate of the ellipse center.

If *Par2* = AXES, the Y component of the first ellipse axis direction.

If *Par2* = ALEN, the length of the second ellipse axis.

Par5 --

The third value to assign to the geometry characteristic specified via *Par2*:

If *Par2* = CENTER, the Z coordinate of the ellipse center.

If *Par2* = AXES, the Z component of the first ellipse axis direction.

Par6 --

The fourth value to assign to the geometry characteristic specified via *Par2*:

If *Par2* = AXES, the X component of the second ellipse axis direction.

Par7 --

The fifth value to assign to the geometry characteristic specified via *Par2*:

If *Par2* = AXES, the Y component of the second ellipse axis direction.

Par8 --

The sixth value to assign to the geometry characteristic specified via *Par2*:

If *Par2* = AXES, the Z component of the second ellipse axis direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specifications for *Action* = DELE

ADPCI (p. 98), DELE, *Par1*

Par1 --

ADPCI (p. 98) ID (default = ALL).

Command Specifications for *Action* = LIST

ADPCI (p. 98), LIST, *Par1*

Par1 --

ADPCI (p. 98) ID number (default = ALL).

Notes

For **ADPCI (p. 98)**,GEOM,LCS, the ellipse center locates at the origin of the local coordinate system. The local coordinate system Y axis defines the plane normal of the ellipse, and X and Z axes define two orientations of the ellipse. (The LCS argument is equivalent to combining the CENTER and AXES arguments. Separate **ADPCI (p. 98)**,GEOM commands to specify those arguments are therefore not issued.)

For more information about using **ADPCI (p. 98)** in a crack-initiation analysis, see SMART Method for Crack-Initiation Simulation in the *Fracture Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

ADRAG, *NL1, NL2, NL3, NL4, NL5, NL6, NLP1, NLP2, NLP3, NLP4, NLP5, NLP6*

Generates areas by dragging a line pattern along a path.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1, NL2, NL3, . . . , NL6

List of lines in the pattern to be dragged (6 maximum if using keyboard entry). Lines should form a continuous pattern (no more than two lines connected to any one keypoint. If *NL1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). If *NL1* = ALL, all selected lines (except those that define the drag path) will be swept along the path. A component name may also be substituted for *NL1*.

NLP1, NLP2, NLP3, . . . , NLP6

List of lines defining the path along which the pattern is to be dragged (6 maximum if using keyboard entry). Must be a continuous set of lines.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Generates areas (and their corresponding keypoints and lines) by sweeping a given line pattern along a characteristic drag path. If the drag path consists of multiple lines, the drag direction is determined by the sequence in which the path lines are input (*NLP1*, *NLP2*, etc.). If the drag path is a single line (*NLP1*), the drag direction is from the keypoint on the drag line that is closest to the first keypoint of the given line pattern to the other end of the drag line.

The magnitude of the vector between the keypoints of the given pattern and the first path keypoint remains constant for all generated keypoint patterns and the path keypoints. The direction of the vector relative to the path slope also remains constant so that patterns may be swept around curves.

Keypoint, line, and area numbers are automatically assigned, beginning with the lowest available values (**NUMSTR (p. 1301)**). Adjacent lines use a common keypoint. Adjacent areas use a common line. For best results, the entities to be dragged should be orthogonal to the start of the drag path. Drag operations that produce an error message may create some of the desired entities prior to terminating.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Extrude>Lines>Along Lines

---

AEROCOEFF,*AeroModeType*,*AeroMappedFileNames*,*AeroSpecs*,*AeroScalar*,*nBlades*,*AutoFileRead*

Computes the aero-damping and stiffness coefficients and writes them to an APDL array.

PREP7 (p. 22): Special Purpose (p. 37)
SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AeroModeType

Mode type to be used.

BLADE

Non-cyclic cantilevered blade mode (default)

AeroMappedFiles

Name of string array containing file names of mapped pressures from CFD. The file names should be ordered to correspond to the *AeroSpecs* array.

AeroSpecs

Name of numerical array containing data organized to correspond to the *AeroMappedFiles* array. See the "Notes" (p. 103) section for specific information that must be in the array.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AeroScalar

Scaling value(s) to handle any modal scaling difference between structural and CFD modes. The values can be entered as a scalar or 1-dimensional array. (each scaling value defaults to 1)

nBlades

Number of blades.

AutoFileRead

Key to automatically read and use values from CFD file header.

0 (OFF or NO)

Do not read scaling values or nodal diameter from the CFD file header. (default)

1 (ON or YES)

Read scaling values (labeled `Mode Multiplier` in CFD file) from CFD file header. The scaling values read will be used in calculations and the *AeroScalar* input will be ignored. The nodal diameter values will be used to cross check the value of i (input through *AeroSpecs* array).

Command Default

No defaults are available for the **AEROCOEFF (p. 102)** command.

Notes

The **AEROCOEFF (p. 102)** command is designed to generate an array of aerodynamic coefficients that can be used in a cyclic mode-superposition harmonic response analysis using the **CYCFREQ (p. 458)**,AERO command to represent aerodynamic stiffness and damping. These aerodynamic coefficients can also be used in a damped modal analysis phase (**CYCFREQ (p. 458)**,MODAL) of a cyclic mode-superposition harmonic solve. An APDL array called *Jobname*AeroArray is generated using the **AEROCOEFF (p. 102)** command. This array is compatible with the array needed for the **CYCFREQ (p. 458)**,AERO command.

The format of the written array follows that of the **CYCFREQ (p. 458)**,AERO command. The array is formatted as follows:

$$i, m, n, V_{\text{real}}, V_{\text{imag}}$$

where

i = the ith interblade phase angle (IBPA)

m = the mth vibrating blade mode

n = the nth blade mode generating the pressure oscillations

V_{real} and V_{imag} = the real and imaginary coefficients.

Prior to issuing the **AEROCOEFF (p. 102)** command, a non-cyclic cantilevered blade modal analysis must be run, either stress-free or prestressed using linear perturbation. For more information, see Modal

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Analysis in the *Structural Analysis Guide*. The file requirements for the **AEROCOEFF (p. 102)** command are the same as those needed for modal restart as described in Modal Analysis Restart.

The *AeroSpecs* values are specified in a 3×r array (***DIM (p. 530)**), where r is a positive integer equal to the number of interblade phase angles and the pressure modes solved for in the CFD analysis. Each row has the structure:

$$i,m,n$$

where

i = the ith interblade phase angle (IBPA)

m = the mth vibrating blade mode

n = the nth blade mode generating the pressure oscillations

At least one aerodynamic damping coefficient must be specified for each IBPA (equal to the number of blades) while keeping m and n constant. If a value is not specified, the program writes an array value of zero for both V_{real} and V_{imag}. The values of m and n are relative to the modes computed in the required modal analysis.

The number of *AeroScalar* values must be equal to the number of pressure modes (n from *AeroSpecs*). If the number of *AeroScalar* values is greater than 1, the values must be entered by defining an n×1 array (***DIM (p. 530)**) and entering the array name in the *AeroScalar* field. For a discussion of how *AeroScalar* values are computed, see Scaling Aerodynamic Coupling Coefficients.

The value for *nBlades* should be equal to the number of sectors of the system. If there are multiple blades per cyclic sector, then the combination of blades on the single sector will have an aero coefficient value. In this case, each blade will not have a distinct aero coefficient.

Menu Paths

This command cannot be accessed from a menu.

AESIZE, *ANUM*, *SIZE*,

Specifies the element size to be meshed onto areas.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ANUM

Area number of the area to which this element size specification applies. If *ANUM* = ALL, size applies to all selected areas. If *ANUM* = P, graphical picking is enabled. A component name may also be substituted for *ANUM*.

SIZE

Desired element size.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

AESIZE (p. 104) allows control over the element sizing inside any area or on the face(s) of a volume.

SIZE controls element size on the interior of the area. For any line on the area not having its own size assignment and not controlled by keypoint size assignments, it specifies the element size along the line as well, so long as no adjacent area has a smaller size, which would take precedence. If the **AESIZE (p. 104)** governs the boundary and SmartSizing is on, the boundary size can be refined for curvature or proximity.

This command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Size Cntrls>ManualSize>Areas>All Areas

Main Menu>Preprocessor>Meshing>Size Cntrls>ManualSize>Areas>Clr Size

Main Menu>Preprocessor>Meshing>Size Cntrls>ManualSize>Areas>Picked Areas

---

AFILLT, *NA1*, *NA2*, *RAD*

Generates a fillet at the intersection of two areas.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1

Number of the first intersecting area. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI).

NA2

Number of the second intersecting area.

RAD

Radius of fillet to be generated.

Notes

Generates an area of constant fillet radius at the intersection of two areas using a series of Boolean operations. Corresponding lines and keypoints are also generated. See **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. If areas do not initially intersect at a common line, use the **AINA (p. 109)** command.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Areas>Area Fillet

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AFLIST

Lists the current data in the database.

PREP7 (p. 22): Database (p. 22)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Lists the current data and specifications in the database. If batch, lists all appropriate data. If interactive, lists only summaries.

Menu Paths

Utility Menu>List>Other>Database Summary

AFSURF, *SAREA*, *TLINE*

Generates surface elements overlaid on the surface of existing solid elements and assigns the extra node as the closest fluid element node.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SAREA

Component name for the surface areas of the meshed solid volumes. The component name must be 32 characters or less.

TLINE

Component name for the target lines meshed with fluid elements. The component name must be 32 characters or less.

Notes

This command macro is used to generate surface effect elements overlaid on the surface of existing solid elements and, based on proximity, to determine and assign the extra node for each surface element. The underlying volumes of the solid region and the fluid lines must be meshed prior to calling this command macro. The active element type must be SURF152 with appropriate settings for KEYOPT(4), KEYOPT(5), KEYOPT(6), and KEYOPT(8).

The surface areas of the solid and the target lines of the fluid are grouped into components and named using the **CM (p. 356)** command. The names must be enclosed in single quotes (for example, '*SAREA*') when the **AFSURF (p. 106)** command is manually typed in.

When using the GUI method, node and element components are created through the picking dialog boxes associated with this command.

The macro is applicable for the SURF152 and FLUID116 element types.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

---

AGEN, *ITIME*, *NA1*, *NA2*, *NINC*, *DX*, *DY*, *DZ*, *KINC*, *NOELEM*, *IMOVE*

Generates additional areas from a pattern of areas.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITIME

Do this generation operation a total of *ITIME*s, incrementing all keypoints in the given pattern automatically (or by *KINC*) each time after the first. *ITIME* must be more than 1 for generation to occur.

NA1, NA2, NINC

Generate areas from the pattern of areas *NA1* to *NA2* (defaults to *NA1*) in steps of *NINC* (defaults to 1). If *NA1* = ALL, *NA2* and *NINC* are ignored and the pattern is all selected areas (**ASEL (p. 192)**). If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1* (*NA2* and *NINC* are ignored).

DX, DY, DZ

Keypoint location increments in the active coordinate system (--, D θ, DZ for cylindrical; --, D θ, -- for spherical).

KINC

Keypoint number increment between generated sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**}.

NOELEM

Specifies if elements and nodes are also to be generated:

0

Generate nodes and elements associated with the original areas, if they exist.

1

Do not generate nodes and elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IMOVE

Specifies whether to redefine the existing areas:

0

Generate new areas as requested with the *ITIME* argument.

1

Move original areas to new position, retaining the same keypoint numbers (*ITIME*, *KINC*, and *NOELEM* are ignored). If the original areas are needed in the original position (for example, they may be attached to a volume), they are not moved, and new areas are generated instead. Meshed items corresponding to moved areas are also moved if not needed at their original position.

Notes

Generates additional areas (and their corresponding keypoints, lines and mesh) from a given area pattern. The MAT, TYPE, REAL, ESYS, and SECNUM attributes of the new areas are based upon the areas in the pattern and not upon the current settings of the pointers. End slopes of the generated lines remain the same (in the active coordinate system) as those of the given pattern. For example, radial slopes remain radial. Generations which produce areas of a size or shape different from the pattern (that is, radial generations in cylindrical systems, radial and phi generations in spherical systems, and theta generations in elliptical systems) are not allowed. Solid modeling in a toroidal coordinate system is not recommended. Area and line numbers are automatically assigned, beginning with the lowest available values (**NUMSTR (p. 1301)**).

Menu Paths

Main Menu>Preprocessor>Modeling>Copy>Areas

Main Menu>Preprocessor>Modeling>Move / Modify>Areas>Areas

AGLUE, *NA1*, *NA2*, *NA3*, *NA4*, *NA5*, *NA6*, *NA7*, *NA8*, *NA9*

Generates new areas by "gluing" areas.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1, NA2, NA3, . . . , NA9

Numbers of the areas to be glued. If *NA1* = ALL, all selected areas will be glued (*NA2* to *NA9* will be ignored). If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1*.

Notes

Use of the **AGLUE (p. 108)** command generates new areas by "gluing" input areas. The glue operation redefines the input areas so that they share lines along their common boundaries. The new areas en-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

compass the same geometry as the original areas. This operation is only valid if the intersection of the input areas are lines along the boundaries of those areas. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to new entities generated.

The **AGLUE (p. 108)** command results in the merging of lines and keypoints at the common area boundaries. The lines and keypoints of the lower numbered area will be kept. This means one must be aware of area numbering when multiple **AGLUE (p. 108)** commands are applied to avoid any "ungluing" of geometry.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Glue>Areas

AINA, *NA1*, *NA2*, *NA3*, *NA4*, *NA5*, *NA6*, *NA7*, *NA8*, *NA9*

Finds the intersection of areas.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1, NA2, NA3, . . . , NA9

Numbers of areas to be intersected. If *NA1* = ALL, *NA2* to *NA9* are ignored and the intersection of all selected areas is found. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1*.

Notes

Finds the common (not pairwise) intersection of areas. The common intersection is defined as the regions shared (in common) by **all** areas listed on this command. New areas will be generated where the original areas intersect. If the regions of intersection are only lines, new lines will be generated instead. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Intersect>Common>Areas

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AINP, *NA1*, *NA2*, *NA3*, *NA4*, *NA5*, *NA6*, *NA7*, *NA8*, *NA9*

Finds the pairwise intersection of areas.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1, NA2, NA3, . . . , NA9

Numbers of areas to be intersected pairwise. If *NA1* = ALL, *NA2* to *NA9* are ignored and the pairwise intersection of all selected areas is found. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may be substituted for *NA1*.

Notes

Finds the pairwise intersection of areas. The pairwise intersection is defined as all regions shared by any two or more areas listed on this command. New areas will be generated where the original areas intersect pairwise. If the regions of pairwise intersection are only lines, new lines will be generated. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Intersect>Pairwise>Areas

AINV, *NA*, *NV*

Finds the intersection of an area with a volume.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA

Number of area to be intersected. If P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI).

NV

Number of volume to be intersected.

Notes

New areas will be generated where the areas intersect the volumes. If the regions of intersection are only lines, new lines will be generated instead. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Intersect>Area with Volume

---

AIRL, *NRB*, *RIGID_CALC*

Specifies that automatic inertia relief calculations are to be performed.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NRB

Number of rigid body modes in the model:

AUTO

Activate automatic inertia relief (default). The program automatically determines the number of rigid body modes.

n

Activate automatic inertia relief with the assumption of *n* rigid body modes ($1 \leq n \leq 6$).

0

Deactivate automatic inertia relief.

RIGID_CALC

Method for computing the rigid body modes:

0

Use an eigensolver to compute rigid body modes (default).

1

Use the geometry to compute rigid body modes (valid only when *NRB* = AUTO). The geometric rigid body vectors are calculated according to Equation 15.171 in Participation Factors and Mode Coefficients in the *Theory Reference*.

Command Default

No automatic inertia relief calculations.

Notes

The **AIRL (p. 111)** command activates automatic inertia relief for models having up to six rigid body modes. This method is only valid for linear static analyses (**ANTYPE (p. 162)**,STATIC).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

By default (*NRB* = AUTO), the number of rigid body modes in the structure is automatically determined. The static solution is altered so that the inertial effects factor into counterbalancing the external loads. This method relies on calculation of the rigid body modes using either an eigensolver (*RIGID_CALC* = 0, which is the default) or the model geometry (*RIGID_CALC* = 1).

For the *NRB* = AUTO option, no supports should be defined.

For a model that is partially constrained by design, you must set *NRB* to the number of rigid body modes present in the structure and set *RIGID_CALC* = 0. The use of geometry (*RIGID_CALC* = 1) to compute the rigid-body modes of a partially constrained model is not supported.

Loads may be input as usual. Displacements and stresses are calculated as usual.

Use **IRLIST (p. 962)** to print inertia relief calculation results. The mass and moment of inertia summary printed before the solution is accurate (because of the additional pre-calculations required for inertia relief). See Inertia Relief in the *Theory Reference* for calculation details. See Including Inertia Relief Calculations in the *Basic Analysis Guide* for procedural details, including requirements and limitations.

This command is also valid in PREP7.

Example Usage

Example command input for including automatic inertia relief calculations in a linear static analysis is found in Including Inertia Relief Calculations in the *Basic Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

AL, *L1*, *L2*, *L3*, *L4*, *L5*, *L6*, *L7*, *L8*, *L9*, *L10*

Generates an area bounded by previously defined lines.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

L1, L2, L3, . . . , L10

List of lines defining area. The minimum number of lines is 3. The positive normal of the area is controlled by the direction of *L1* using the right-hand rule. A negative value of *L1* reverses the normal direction. If *L1* = ALL, use all selected lines with *L2* defining the normal (*L3* to *L10* are ignored and *L2* defaults to the lowest numbered selected line). If *L1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *L1*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Lines may be input (once each) in any order and must form a simply connected closed curve. If the area is defined with more than four lines, the lines must also lie in the same plane or on a constant coordinate value in the active coordinate system (such as a plane or a cylinder).

Note:

Solid modeling in a toroidal coordinate system is not recommended. Areas may be re-defined only if not yet attached to a volume.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Areas>Arbitrary>By Lines

---

ALIST, *NA1*, *NA2*, *NINC*, *Lab*

Lists the defined areas.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1*, *NA2*, *NINC

List areas from *NA1* to *NA2* (defaults to *NA1*) in steps of *NINC* (defaults to 1). If *NA1* = ALL (default), *NA2* and *NINC* are ignored and all selected areas (**ASEL (p. 192)**) are listed. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1* (*NA2* and *NINC* are ignored).

Lab

Determines what type of listing is used (one of the following):

(blank)

Prints information about all areas in the specified range.

HPT

Prints information about only those areas that contain hard points.

Notes

An attribute (TYPE, MAT, REAL, or ESYS) listed as a zero is unassigned; one listed as a positive value indicates that the attribute was assigned with the **AATT (p. 85)** command (and will not be reset to zero if the mesh is cleared); one listed as a negative value indicates that the attribute was assigned using the attribute pointer (**TYPE (p. 2036)**, **MAT (p. 1111)**, **REAL (p. 1579)**, or **ESYS (p. 685)**) that was active during meshing (and will be reset to zero if the mesh is cleared). A "-1" in the "nodes" column indicates that

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the area has been meshed but there are no interior nodes. The area size is listed only if an **ASUM (p. 203)** command has been performed on the area.

Menu Paths

Utility Menu>List>Areas

ALLSEL, *LabT*, *Entity*

Selects all entities with a single command.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabT

Type of selection to be made:

ALL

Selects all items of the specified entity type and all items of lower entity types (default).

BELOW

Selects all items directly associated with and below the selected items of the specified entity type.

Entity

Entity type on which selection is based:

ALL

All entity types (default).

VOLU

Volumes.

AREA

Areas.

LINE

Lines.

KP

Keypoints.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ELEM

Elements.

NODE

Nodes.

Notes

ALLSEL (p. 114) is a convenience command that allows the user to select all items of a specified entity type or to select items associated with the selected items of a higher entity.

An entity hierarchy is used to decide what entities will be available in the selection process. This hierarchy from top to bottom is as follows: volumes, areas, lines, keypoints, elements, and nodes. The hierarchy may also be divided into two branches: the solid model and the finite element model. The label ALL selects items based on one branch only, while BELOW uses the entire entity hierarchy. For example, **ALLSEL (p. 114)**,ALL,VOLU selects all volumes, areas, lines, and keypoints in the data base. **ALLSEL (p. 114)**,BELOW,AREA selects all lines belonging to the selected areas; all keypoints belonging to those lines; all elements belonging to those areas, lines, and keypoints; and all nodes belonging to those elements.

The $ character should not be used after the **ALLSEL (p. 114)** command.

This command is valid in any processor.

ALPHAD, *VALUE*

Defines the mass matrix multiplier for damping.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VALUE

Mass matrix multiplier for damping.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command defines the mass matrix multiplier α used to form the viscous damping matrix $[C]=\alpha[M]$, where $[M]$ is the mass matrix.

Values of α can also be input as a material property (**MP (p. 1160)**,ALPD or **TB (p. 1899)**,SDAMP,,,,ALPD). If ALPD in either form is included, the ALPD value is added to the **ALPHAD (p. 115)** value as appropriate. (See Material Damping in the *Material Reference* and Damping Matrices in the *Theory Reference*.) Damping is not used in static (**ANTYPE (p. 162)**,STATIC) or buckling (**ANTYPE (p. 162)**,BUCKLE) analyses.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Sol'n Controls>Transient

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>Damping

Main Menu>Solution>Analysis Type>Sol'n Controls>Transient

Main Menu>Solution>Load Step Opts>Time/Frequenc>Damping

AMAP, *AREA*, *KP1*, *KP2*, *KP3*, *KP4*

Generates a 2D mapped mesh based on specified area corners.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AREA

Area number of area to be meshed. If *AREA* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI).

KP1, KP2, KP3, KP4

Keypoints defining corners of the mapped mesh. Three or four corners may be specified, and may be input in any order.

Notes

Only one area at a time can be meshed with this command. The program *internally* concatenates all lines between the specified keypoints, then meshes the area with all quadrilateral elements. If line divisions are set, the mesh will follow the rules for mapped meshing (see Meshing Your Solid Model in the *Modeling and Meshing Guide*).

If the area being meshed has concatenated lines, the program will ask if those concatenations should be removed (in batch, the concatenations will automatically be removed). Nodes required for the generated elements are created and assigned the lowest available node numbers. If a mapped mesh is not possible due to mismatched line divisions or poor element shapes, the meshing operation is aborted.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh>Areas>Mapped>By Corners

AMBEAM, *NUMBEAMS*, *POWER*, *ABSORPTIVITY*

Specifies energy source parameters in an additive manufacturing analysis.

SOLUTION (p. 38): Additive Manufacturing (p. 50)

Valid Products: (p. 2) Pro | Premium | Enterprise | PrepPost | Solver | **AS add-on**

NUMBEAMS

Number of beams used in the build process. Default = 1.

POWER

(Optional) Beam power for the build process.

ABSORPTIVITY

(Optional) Beam absorptivity value. Must be between 0 and 1. Default = 1.

Command Default

One beam is used in the build process.

If *POWER* is not specified, the melting temperature will be used for heating steps.

ABSORPTIVITY is only used if *POWER* is also specified.

Notes

This command is also valid in PREP7.

For the *POWER* option, if a value is specified, then *POWER* * *ABSORPTIVITY* will be used with other process and geometric parameters (scan speed, hatch spacing, deposition thickness, heating time, superlayer volume) to define the heat generation to heat new element layers. The heating time for this option is specified with the **AMBUILD (p. 118)**,TIME command. If a *POWER* is not specified, new layers will be set to the melting temperature (**AMMAT (p. 121)**).

For more information, including a list of the elements and commands used in an additive manufacturing analysis, see Additive Simulation in Mechanical in the *LPBF Simulation Guide*.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AMBUILD,*Option*,*VAL1*,*VAL2*,*VAL3*,*VAL4*

Specifies printer parameters for the build and other options in an additive manufacturing analysis.

SOLUTION (p. 38): Additive Manufacturing (p. 50)

Valid Products: (p. 2) Pro | Premium | Enterprise | PrepPost | Solver | **AS add-on**

Option

Option:

LAYERT

VAL1 – Deposition-layer thickness.

VAL2 – Mesh height.

VAL3 – Error-checking flag. Set to 0 (default) or 1. Setting to 1 causes the application to omit error checks for consistent element size and elements spanning across layers.

SCAN

VAL1 – Hatch spacing.

VAL2 – Beam-travel speed.

TIME

VAL1 – Inter-layer dwell time. Default = 0.0.

VAL2 – Dwell-time multiplier for multiple parts on the build plate or number of repeated symmetry sectors in simulations with symmetry. Default = 1.0.

VAL3 – Heating step time for use with beam power option (**AMBEAM (p. 117)**,,*POWER*).

VAL4 – Scan time table.

PLATE

VAL1 – Z-coordinate of the top of the build plate. Default = 0.0.

CHECK

VAL1 – If YES, create the build-summary file but do not solve. Default = NO.

RTHFILE

VAL1 – Name of the thermal-results file (including its path). Default = `file.rth` in the current working directory.

SSF

VAL1 – Strain Scaling Factor. Default = 1.0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

None. An *Option* label is required.

Notes

If using a layered tetrahedral mesh, specify the mesh height (LAYERT,*VAL2*). For Cartesian meshes, the mesh height is determined automatically.

When setting the error-checking flag (LAYERT,,,1), verify your model and results carefully. Using the flag may lead to improper setup of layers or boundary conditions.

The hatch spacing and beam travel speed are the average values used during the build.

The inter-layer dwell time (TIME,*VAL1*) is the span of time from the end of the deposition of a layer to the start of the deposition of the next layer. It includes the time required for recoater-blade repositioning and powder-layer spreading.

The dwell-time multiplier (TIME,,*VAL2*) accounts for more than one part being printed on the build plate, or it is used to reconcile build time in simulations using symmetry. For multiple parts on a build plate, if the additional parts are the same part as the one being simulated and are arranged in the same orientation on the build plate, the multiplier is the total number of parts. If different parts exist on the plate, the multiplier is an estimate of the time required to build the other parts relative to the part being simulated. In simulations with symmetry, the dwell-time multiplier is the total number of repeated symmetry sectors: 2 for half symmetry, 4 for ¼ symmetry, and so on.

The heating step time (TIME,,,*VAL3*) is used along with other defined process and geometric parameters (power, scan speed, hatch spacing, deposition thickness, superlayer volume) to set the time duration and magnitude of heat generation on new element layers. A value of 0 (default) sets the heating time to the minimum time step constraint. See General Options in the *Thermal Analysis Guide*. When power has been specified, you can alternatively enter SCAN in this field to set the heating time to the amount of time it would take to scan the volume of material in each element layer. With the SCAN option, the cooling between layers will still be the recoater time. Setting *VAL3* = SCAN may give better temperature results at the end of the layer and is more stable across different mesh sizes. Note that the SCAN option will have a different end time of the simulation because the layer thickness adjustment for cooling will not be used.

The scan time (TIME,*VAL4*) represents the amount of time it takes to scan a real layer. By default, the scan time will be determined from each layer's cross-sectional area and other process parameters. When specified, it must be defined as a table with times specified on the Z primary variable. Times that are averaged or interpolated from the table should not include recoating time and will be adjusted to account for superlayer size compared to the deposition thickness.

When specifying the name of the thermal-results file (RTHFILE,*VAL1*), omit the `.rth` extension. The program also looks for the `thermal.build` file in the same path.

The strain scaling factor (SSF,*VAL1*) scales the thermal strains in the structural portion of thermal-structural simulations by the specified value.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For more information, including a list of the elements and commands used in an additive manufacturing analysis, see Additive Simulation in Mechanical in the *LPBF Simulation Guide*.

Menu Paths

This command cannot be accessed from a menu.

AMENV, *TGAS*, *HGAS*

Specifies the build-environment thermal boundary conditions in an additive manufacturing analysis.

SOLUTION (p. 38): Additive Manufacturing (p. 50)

Valid Products: (p. 2) Pro | Premium | Enterprise | PrepPost | Solver | **AS add-on**

TGAS

Temperature of the gas in the build enclosure.

HGAS

Convection coefficient from the part to the enclosure gas.

Command Default

No convection is included.

Notes

If using the power-bed fusion process (**AMTYPE (p. 128)**,PBF), the convection is applied only to the top of a newly laid layer.

If using the directed-energy deposition process (**AMTYPE (p. 128)**,DED), the convection is applied to the top of a newly laid layer *and* to the sides of the part already built.

No convection boundary conditions are applied to the plate, although you can define them manually (**SF (p. 1733)** and related commands).

This command is also valid in PREP7.

For more information, including a list of the elements and commands used in an additive manufacturing analysis, see Additive Simulation in Mechanical in the *LPBF Simulation Guide*.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AMESH, *NA1*, *NA2*, *NINC*

Generates nodes and area elements within areas.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1*, *NA2*, *NINC

Mesh areas from *NA1* to *NA2* (defaults to *NA1*) in steps of *NINC* (defaults to 1). If *NA1* = ALL, *NA2* and *NINC* are ignored and all selected areas (**ASEL (p. 192)**) are meshed. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1* (*NA2* and *NINC* are ignored).

Notes

Any undefined nodes required for the generated elements are created and assigned the lowest available numbers.

This command is also valid for rezoning.

Main Menu>Preprocessor>Meshing>Mesh>Areas>Target Surf

AMMAT, *MATPART*, *TMELT*, *TRELAX*

Specifies the melting and relaxation temperatures of the build material in an additive manufacturing analysis.

SOLUTION (p. 38): Additive Manufacturing (p. 50)

Valid Products: (p. 2) Pro | Premium | Enterprise | PrepPost | Solver | **AS add-on**

MATPART

The material ID of the build part. Default = 1.

TMELT

Melting temperature of the build part (required).

TRELAX

Relaxation temperature of the build part (optional).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

The material ID of the build part is 1. A melting temperature is required.

Notes

This command is required in an additive manufacturing analysis.

If the part consists of multiple material IDs, you can specify any of the material IDs (*MATPART*), as all are of the same material.

The melting temperature (*TMELT*) is the temperature at which thermal strains begin to accumulate. This value is typically the liquidus-to-solidus temperature, but may be less for some phase-transition material (such as Ti64).

The relaxation temperature (*TRELAX*) is the temperature at which the strains are zeroed out (annealed). You can use *TRELAX* during the build process (**AMSTEP (p. 124)**,BUILD) to account for stress relaxation, but it serves primarily as a simplified stress-relaxation method during the heat-treat step (**AMSTEP (p. 124)**,HEATTREAT). (A creep model offers a more stringent stress-relaxation approach if needed.)

This command is also valid in PREP7.

For more information, including a list of the elements and commands used in an additive manufacturing analysis, see Additive Simulation in Mechanical in the *LPBF Simulation Guide*.

Menu Paths

This command cannot be accessed from a menu.

AMPOWDER, *TPOWDER*, *HPOWDER*, *MATFACTOR*

Specifies the thermal conditions of the powder in an additive manufacturing analysis.

SOLUTION (p. 38): Additive Manufacturing (p. 50)

Valid Products: (p. 2) Pro | Premium | Enterprise | PrepPost | Solver | **AS add-on**

TPOWDER

Temperature of the newly added powder.

HPOWDER

Effective convection coefficient from the part to the powder bed.

MATFACTOR

Knockdown factor applied to the solid material properties (to obtain the powder material properties). Default = 0.01.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

No heat flow is included into the powder bed.

Notes

This command applies only to the powder-bed fusion (**AMTYPE (p. 128)**,PBF) process.

To estimate the convection coefficient (*HPOWDER*), divide the conduction property of the powder (its KXX) by a characteristic conduction length into the powder (for example, ¼ of the distance from the part boundary to the build-chamber wall).

The program uses the knockdown factor (*MATFACTOR*) to estimate the powder properties. The program applies the factor (typically 0.01) to the solid material properties to estimate the properties of the material in its powder state. The powder-state properties are used during the heating of the new layer (before its subsequent solidification and cooldown) prior to the next layer being applied.

This command is also valid in PREP7.

For more information, including a list of the elements and commands used in an additive manufacturing analysis, see Additive Simulation in Mechanical in the *LPBF Simulation Guide*.

Menu Paths

This command cannot be accessed from a menu.

AMRESULT,*Item*,*Key*

Specifies additive manufacturing result data written to a `.txt` file.

SOLUTION (p. 38): Additive Manufacturing (p. 50)

Valid Products: (p. 2) Pro | Premium | Enterprise | PrepPost | Solver | **AS add-on**

Item

Result item to output to a tab-delimited `.txt` file:

RINT

Recoater interference. Available in a *structural* additive manufacturing analysis only.

DTEMP

Layer end temperature. Available in a *thermal* additive manufacturing analysis only.

HSTN

High Strain. Available in a *structural* additive manufacturing analysis only.

Key

Write-control key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

Does not write the specified result item (default).

ON

Writes the specified result item.

Command Default

Result items are not written.

Notes

This command controls additive manufacturing result data written to a `.txt` file. Specifically, `AMResults.txt` is written for recoater interference and layer end temperature, and `AMHighStrain.txt` is written for high strains. The specified results are not written to the database results (`.RST`) file.

Result items written to the `.txt` file also include node numbers and x, y, z locations.

RINT gives the z-deformation of a layer just before a new layer is applied. This result value can help to determine whether an issue may occur when spreading a new layer.

DTEMP gives the temperature of a layer just before a new layer is applied. This result value can help to identify regions where the build may be overheating that may result in problematic thermal conditions.

HSTN gives the maximum equivalent strain experienced during the build process. This result value can help to identify regions at risk of cracking.

Menu Paths

This command cannot be accessed from a menu.

AMSTEP, *Sequence*, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*

Specifies the process-sequence steps in an additive manufacturing analysis.

`SOLUTION` (p. 38): Additive Manufacturing (p. 50)

Valid Products: (p. 2) Pro | Premium | Enterprise | PrepPost | Solver | **AS add-on**
Product Restrictions (p. 126)

Sequence

One of the following sequence options:

PREHEAT

VAL1 – Preheat temperature of the build plate. Default = **TUNIF (p. 2027)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BUILD

VAL1 – Unused.

VAL2 – Ending-layer number (for performing the simulation from the first layer to the specified layer only). Default = last layer necessary to build the part.

VAL3 – Number of time steps taken to apply heating. Default = 2.

VAL4 – Number of time steps taken between layer additions. Default = 2.

VAL5 – Unused.

VAL6 – Bias growth factor for time steps between layer additions. Default = 1.

COOLDOWN

VAL1 – Ambient (room) temperature (to serve as the target cooldown temperature).

VAL2 – Cooldown time. If 0 or unspecified, the program calculates the time based on the volume of the part and the convection coefficient (**AMENV (p. 120)** and **AMPOWDER (p. 122)**).

VAL3 – Number of time steps taken to cool down. Default = 20.

UNBOLT

Perform a base unbolting step where base constraints are removed.

HEATTREAT

Perform a heat-treat (stress-relief) step.

REMOVE

VAL1 – The number of a support to remove. Specify 0 for plate.

VAL2 – Directional cutoff step size. Only valid if *VAL1* = 0.

VAL3 – Directional cutoff angle specified on the X-Y plane from the +X axis. Only valid if *VAL1* = 0. Default = 0 radians.

USER

Perform a user-defined step.

Command Default

None. A sequence option is required.

Notes

AMSTEP (p. 124) executes a process-sequence step:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- In a thermal analysis, *Sequence* = PREHEAT sets the value of the starting temperature of the build plate. It is ignored in a structural analysis.
- *Sequence* = BUILD executes the layer-by-layer build sequence.
- *Sequence* = COOLDOWN executes the cooldown step and must occur after the BUILD step.
- *Sequence* = HEATTREAT performs a heat-treatment step to stress-relieve the part. Issue **AMBUILD (p. 118)**,RTHFILE to point to the heat-treat thermal-cycle results and specify either a relaxation temperature (**AMMAT (p. 121)**) or creep properties (**TB (p. 1899)**).
- In a structural analysis, *Sequence* = REMOVE removes the requested support or build plate. It is ignored in a thermal analysis.
- In a structural analysis, *Sequence* = USER can specify an initial step (such as bolt-pretension the build plate) or a final step (such as a manufacturing postprocessing step).

For *Sequence* = BUILD and *Sequence* = COOLDOWN, the number of time steps specified determines the accuracy of the captured temperature profile. For distortion and global residual stresses, the default is usually sufficient. With some materials (Al alloys in particular), the default of evenly spaced time steps during the build (*Sequence* = BUILD) may not adequately capture the cooldown. The bias growth factor (*VAL6*) adjusts the time spacing to better resolve temperatures as they cool between layers.

When *Sequence* = UNBOLT, constraints for UX, UY, and UZ will be removed from base nodes. Constraints on weak spring or nonbuild (NONBUILD_ELEMENTS component name) elements will not be deleted. Similarly, symmetry nodes (SYMM_NODES component name) will not be deleted. Note that for symmetry this may mean that the Z, and other undesired constraints on symmetry nodes may need to be deleted manually for this step.

For *Sequence* = REMOVE, directional cutoff is activated when *VAL1* is set to 0 (plate), and a value is given for *VAL2* (cut step size). This option will sequentially remove the first layer of elements in a series of steps with each step moving the specified distance (*VAL2*). The cutoff steps will continue across the entire part in the direction of the specified angle (*VAL3*). If neither *VAL1* nor *VAL2* are specified, the entire base is removed in a single instantaneous step.

When *Sequence* = USER, the process-sequence steps are bypassed, and the usual nonlinear solution is performed during this step. All applicable load and load step options are accessible. If USER is the initial step, all times are offset by the TIME associated with the USER step.

This command starts a solution. You must remain in SOLUTION between sequence steps.

This command is valid in the SOLUTION processor only.

For more information, including a list of the elements and commands used in an additive manufacturing analysis, see Additive Simulation in Mechanical in the *LPBF Simulation Guide*.

Product Restrictions

Ansys Mechanical Enterprise PrepPost

This command is not valid.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

AMSUPPORTS, *NSUPPORTS*, *CompName*, *SectArray*

Specifies information about the supports in an additive manufacturing analysis.

SOLUTION (p. 38): Additive Manufacturing (p. 50)

Valid Products: (p. 2) Pro | Premium | Enterprise | PrepPost | Solver | **AS add-on**

NSUPPORTS

Number of supports.

CompName

Root name of the components containing the elements comprising each support. (For example, if *CompName* = "MySupport," MySupport1 represents support 1, MySupport2 represents support 2, etc.)

SectArray

Name of the array (***DIM (p. 530)**) containing the section-reference ID for each support.

Command Default

No supports are included in the build. All non-plate elements are assumed to be the build part.

Notes

The section-reference ID array (*SectArray*) is *NSUPPORTS* long, with each array member representing a section-reference ID of a corresponding support.

SECTYPE (p. 1697) specifies the type of support, and **SECDATA (p. 1655)** specifies the geometry of the support.

Example 1: Specifying Support Information in an Additive Manufacturing Analysis

```
! specify supports
*dim,suppsect,,2               ! two supports
suppsect(1)=101                ! support 1 sectID=101
suppsect(2)=101                ! support 2 sectID=101
!
sectype,101,support,block      ! sectype is a block support
secdata,.07,1                  ! wall thickness and spacing
amsupport,2,support,suppsect   ! root name is "support" and suppsect is the
                               !   array name containing the section IDs
```

This command is also valid in PREP7.

For more information, including a list of the elements and commands used in an additive manufacturing analysis, see Additive Simulation in Mechanical in the *LPBF Simulation Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

AMTYPE, *Process*

Specifies the printing process in an additive manufacturing analysis.

SOLUTION (p. 38): Additive Manufacturing (p. 50)

Valid Products: (p. 2) Pro | Premium | Enterprise | PrepPost | Solver | **AS add-on**

Process

Process option:

PBF

Powder-bed fusion process.

DED

Directed-energy deposition process.

Command Default

None. A process option is required.

Notes

The powder-bed fusion (PBF) process uses thermal energy from a laser or electron beam to selectively fuse powder in a powder bed.

The directed-energy deposition (DED) process uses thermal energy, typically from a laser, to fuse materials by melting them as they are deposited.

This command is also valid in PREP7.

For more information, including a list of the elements and commands used in an additive manufacturing analysis, see Additive Simulation in Mechanical in the *LPBF Simulation Guide*.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/AN3D, *Keyword*, *KEY*

Specifies 3D annotation functions

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

If *Keyword* = ANUM, the type of annotation is defined, along with its location. The command format is **/AN3D (p. 129)**,ANUM,*NUM*,*TYPE*,*XHOT*,*YHOT*,*ZHOT*.

NUM

Unique number assigned as each annotation is applied to a model. These numbers are applied sequentially, although when an annotation entity is deleted, its number is reassigned.

TYPE

Annotation internal type number (101 = text, 102 = line, 103 = point, 104 = area, 105 = arrow, 106 = symbol, 108 = bitmap).

XHOT, YHOT, ZHOT

X, Y, Z coordinates for hot spot location.

If *Keyword* = BITM, the annotation is a bitmap. The command format is **/AN3D (p. 129)**,BITM,*TYPE*,*X*,*Y*,*Z*.

TYPE

An integer value between 1 and 99, indicating a texture or bitmap. Numbers 1 through 40 correspond to existing textures (see **/TXTRE (p. 2029)**). Numbers 51 through 99 correspond to textures defined using the File option of the **/TXTRE (p. 2029)** command. You can use this capability to override the predefined logo, clamp and arrow files available from the GUI dialog box (numbers 51 through 57). Numbers 41 through 50 are reserved.

X, Y, Z

X, Y, Z coordinates for the lower left corner of the bitmap.

If *Keyword* = TEXT, an annotation text string is created. The command format is **/AN3D (p. 129)**,TEXT,*X*,*Y*,*Z*,*Text_String*.

X, Y, Z

X, Y, Z coordinate location for text string.

Text_String

Text string to be applied as annotation.

If *Keyword* = LINE, an annotation line is created. The command format is **/AN3D (p. 129)**,LINE,*X1*,*Y1*,*Z1*,*X2*,*Y2*,*Z2*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X1, Y1, Z1

X, Y, Z coordinates for beginning of line.

X2, Y2, Z2

X, Y, Z coordinates for end of line.

If *Keyword* = POINT, a dot will be drawn in space (this option is not available from the GUI). The command format is **/AN3D (p. 129)**,POINT,*X*,*Y*,*Z*.

X, Y, Z

X, Y, Z coordinates for point.

If *Keyword* = AREA, a polygonal area with *n* vertices will be drawn. The command format is **/AN3D (p. 129)**,AREA,*NVERT*,*Xn*,*Yn*,*Zn*.

NVERT

The number of vertices (*n*) for the polygon. Your Polygon can have between 3 and 9 vertices.

Xn, Yn, Zn

X, Y, Z coordinate location for vertex *n*.

If *Keyword* = ARROW, an annotation arrow is created. The command format is **/AN3D (p. 129)**,ARROW,*SIZE*,*X1*,*Y1*,*Z1*,*X2*,*Y2*,*Z2*.

SIZE

Symbol size multiplier (0.1 to 20.0, default = 1.0) for the head of the arrow.

X1, Y1, Z1

X, Y, Z coordinates for the location of the tail.

X2, Y2, Z2

X, Y, Z coordinate for the location of the tip.

If *Keyword* = SYMBOL, an annotation symbol is created. The command format is **/AN3D (p. 129)**,SYMBOL,*TYPE*,*X*,*Y*,*Z*,*SIZE*.

TYPE

The symbol type (1 = CAP, 2 = TEE, 3 = CIRCLE, 4 = TRIANGLE, 5 = STAR).

X, Y, Z

X, Y, Z coordinate location for the symbol.

SIZE

Size multiplier for the symbol (0.1 to 20.0, default = 1.0)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Because 3D annotation is applied in relation to the XYZ coordinates of the anchor, you can transform your model, and the annotation will maintain the spatial relationship with the model. This works within reason, and there are instances where changing the perspective or the size of the model will change the apparent relationship between the annotation and the model.

The overall 3D dimensions of your model are defined by a bounding box. If portions of your model's bounding box lie outside of the visible area of your graphics window (if you are zoomed in on a specific area of your model), it can affect the placement of your 3D annotations. Zooming out will usually overcome this problem.

3D annotation is valid for the Cartesian (**CSYS (p. 441)**,0) coordinate system only. If you want to annotate a model you created in another coordinate system, use 2D annotation (note that 2D annotations do not remain anchored for dynamic rotations or transformations).

When you apply user defined bitmaps, the size of the annotation can vary. Use the options menu of the 3D annotation widget to adjust the size and placement of your bitmaps.

You cannot use the "!" and "$" characters in Mechanical APDL text annotation.

The GUI generates this command during 3D annotation operations and inserts the command into the log file (`Jobname.LOG`). You should NOT type this command directly during a Mechanical APDL session (although the command can be included in an input file for batch input or for use with the **/INPUT (p. 948)** command).

Menu Paths

Utilty Menu>PlotCtrls>Annotate>Create 3D Annotation

ANCNTR, *NFRAM*, *DELAY*, *NCYCL*

Produces an animated sequence of a contoured deformed shape.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFRAM

Number of frames captures (defaults to 5).

DELAY

Time delay during animation (defaults to 0.1 seconds).

NCYCL

Number of animation cycles (defaults to 5). Available in non-UI mode only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

ANCNTR (p. 131) involves a Mechanical APDL macro which produces an animation of a contoured deformed shape of the last plot action command. This command operates only on graphic display platforms supporting the **/SEG (p. 1707)** command. After executing **ANCNTR (p. 131)**, you can replay the animated sequence by issuing the **ANIM (p. 142)** command.

The command functions only in the postprocessor.

Menu Paths

Utility Menu>PlotCtrls>Animate>Deformed Results

ANCUT, *NFRAM*, *DELAY*, *NCYCL*, *QOFF*, *KTOP*, *TOPOFF*, *NODE1*, *NODE2*, *NODE3*

Produces an animated sequence of Q-slices.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFRAM

Number of frames captures (defaults to 5).

DELAY

Time delay during animation (defaults to 0.1 seconds).

NCYCL

Number of animation cycles (defaults to 5). Available in non-UI mode only.

QOFF

Q-slice working plane increment (defaults to .1 half screens).

KTOP

Topological effect on or off (YES or NO; default is NO).

TOPOFF

Topological offset (default is .1 half screens).

NODE1

Node 1 for start of the Q-slice.

NODE2

Node 2 for direction of the Q-slice.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NODE3

Node 3 for plane of the Q-slice.

Notes

ANCUT (p. 132) involves a Mechanical APDL macro which produces an animation of Q-slices of the last plot action command. This command operates only on graphic display platforms supporting the **/SEG (p. 1707)** command. After executing **ANCUT (p. 132)**, you can replay the animated sequence by issuing the **ANIM (p. 142)** command.

The command functions only in the postprocessor.

Menu Paths

Utility Menu>PlotCtrls>Animate>Q-Slice Contours

Utility Menu>PlotCtrls>Animate>Q-Slice Vectors

ANCYC, *NUMFRAMES*, *KCYCL*, *DELAY*

Applies a traveling wave animation to graphics data in a modal cyclic symmetry analysis.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NUMFRAMES

The number of plot frames for the animation. Valid values range from 5 through 36. The default is 18. A low value (because it specifies fewer graphical frames) produces a rougher animation but loads faster. A high value produces a smoother animation but requires more time to load.

KCYCL

The animation mode:

0

Continuous animation cycle (forward-reverse-forward).

1

Discontinuous animation cycle (forward-reset-forward). This option is the default.

DELAY

The time delay (in seconds) between animation frames. Valid values range from 0.1 through 1.0. The default is 0.1 seconds, which produces a seemingly real-time animation. A higher value produces a slower animation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

The default **ANCYC (p. 133)** command (issuing the command with no arguments) specifies these implicit argument values: **ANCYC (p. 133)**, 18, 0, 0.1

Notes

The **ANCYC (p. 133)** command is valid in a modal cyclic symmetry analysis only.

The command animates the cyclic symmetry mode shape plot in the General Post Processor (**/POST1 (p. 1461)**). When you issue a nodal- or element-results plot command (for example, **PLNSOL (p. 1425)**, **PLESOL (p. 1401)**, or **PLDISP (p. 1400)**) and then issue the **ANCYC (p. 133)** command, Mechanical APDL applies a traveling wave animation to the mode shape plot.

Each frame of the animation is created by expanding the cyclic symmetry mode shape at increasing phase angles (via the **/CYCEXPAND (p. 454)** command) starting at zero in equal increments over 360°. The phase-angle increment is 360 / *NUMFRAMES*.

The animation display shows the traveling wave of the result quantity being plotted. The traveling wave animation is applicable only to nodal diameters (harmonic indices) greater than 0 and less than *N* / 2 (where *N* is the number of cyclic sectors in the model).

For more information, see Applying a Traveling Wave Animation to the Cyclic Model in the *Cyclic Symmetry Analysis Guide*.

Menu Paths

Utility Menu> PlotCtrls> Animate> Cyc Traveling Wave

ANDATA, *DELAY*, *NCYCL*, *RSLTDAT*, *MIN*, *MAX*, *INCR*, *FRCLST*, *AUTOCONT*, *--*, *AUTOCNTR*

Displays animated graphics data for nonlinear problems.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DELAY

Time delay during animation (defaults to 0.5 seconds).

NCYCL

Number of animation cycles (defaults to 5). Available in non-UI mode only.

RSLTDAT

The type of results data to be used for the animation sequence. This can be:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Current load step data (default).

1

Range of load step data.

2

Range of results data.

MIN

The range minimum value. If left blank or 0, defaults to the first data point.

MAX

The range maximum value. If left blank or 0, defaults to the last data point.

INCR

The increment between result data (defaults to 1).

FRCLST

Key to force the last sub step in a selected load step to be included in the animation (defaults to 0).

AUTOCONT

A value of 1 enables automatic scaling of contour values based on the overall subset range of values. The default value is 0 (no automatic scaling).

--

Unused field.

AUTOCNTR

A value of 1 disables automatic centering of displaced plots. The default value is 0 (allow automatic centering).

Notes

Use the **ANDATA (p. 134)** command to create animations for nonlinear problems. The command works by displaying an individual graphical image for each result data set from the results file. For information about creating animations for linear problems, see the **ANIM (p. 142)** command.

The command operates only on graphic display platforms supporting the **/SEG (p. 1707)** command. It uses a macro to produce an animation based on the last plot action command (for example, **PLDISP (p. 1400)**).

The results file must have more than one set of results.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The command implicitly issues **/DSCALE (p. 575)**, 1 for default displacement scaling. Large displacements may not give good results.

This command functions only in the postprocessor.

Menu Paths

Utility Menu>PlotCtrls>Animate>Animate Over Results

ANDSCL, *NFRAM*, *DELAY*, *NCYCL*

Produces an animated sequence of a deformed shape.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFRAM

Number of frames captured (defaults to 5).

DELAY

Time delay during animation (defaults to 0.1 seconds).

NCYCL

Number of animation cycles (defaults to 5). Available in non-UI mode only.

Notes

ANDSCL (p. 136) involves a Mechanical APDL macro which produces an animation of displacement of the last plot action command (for example, **PLDISP (p. 1400)**). This command operates only on graphic display platforms supporting the **/SEG (p. 1707)** command. After executing **ANDSCL (p. 136)**, you can replay the animated sequence by issuing the **ANIM (p. 142)** command.

The command functions only in the postprocessor.

Menu Paths

Utility Menu>PlotCtrls>Animate>Deformed Shape

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANDYNA, *DELAY*, *NCYCL*, *START*, *END*, *INC*, *AUTOCONTOURKEY*

Produces an animated sequence of contour values through substeps.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DELAY

Time delay during animation (defaults to 0.1 seconds).

NCYCL

Number of animation cycles (defaults to 5). Available in non-UI mode only.

START

Number of the starting substep (defaults to 1).

END

Number of the ending substep (defaults to the maximum substep).

INC

Increment between substeps (defaults to 1).

AUTOCONTOURKEY

Auto-scales contour values, based on the overall subset range of values (defaults to 0, no auto-scaling).

Notes

ANDYNA (p. 137) involves a Mechanical APDL macro which produces an animation of contour values through all the substeps of the last plot action command. This command operates only on graphic display platforms supporting the **/SEG (p. 1707)** command. After executing **ANDYNA (p. 137)**, you can replay the animated sequence by issuing **ANIM (p. 142)**.

The command functions only in the postprocessor.

Menu Paths

Utility Menu>PlotCtrls>Animate>Dynamic Results

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/ANFILE, *LAB*, *Fname*, *Ext*, - -

Saves or resumes an animation sequence to or from a file.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LAB

Label type.

SAVE

Save the current animation to a file.

RESUME

Resume an animation from a file.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to ANIM if *Fname* is blank.

- -

Unused field.

Notes

This command saves an animation to a file from local terminal segments or resumes an animation from a file to local terminal segments. See the **/SEG (p. 1707)** command for details on segment storage. See the **ANCNTR (p. 131)** macro for a convenient method of storing graphics frames in terminal memory segments. This command is device dependent and is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Animate>Restore Animation

Utility Menu>PlotCtrls>Animate>Save Animation

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANFLOW, *NFRAM*, *DELAY*, *NCYCL*, *TIME*, *SPACING*, *SIZE*, *LENGTH*

Produces an animated sequence of a charged particle traveling in an electric or magnetic field.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFRAM

Number of frames captured (defaults to 5).

DELAY

Time delay during animation (defaults to 0.1 seconds).

NCYCL

Number of animation cycles (defaults to 5). Non-UI mode only.

TIME

Total Trace Time (seconds) (defaults to 0, which is the full flow trace).

SPACING

Particle spacing in seconds (defaults to 0).

SIZE

Particle size (defaults to 0, which is a line).

LENGTH

Particle length fraction (defaults to .1).

Notes

ANFLOW (p. 139) invokes a Mechanical APDL macro which produces an animation of charged particle motion in an electric or magnetic field by the last plot action command (that is, **PLTRAC (p. 1442)**). This command is only operational on graphic display platforms supporting the **/SEG (p. 1707)** command. After executing **ANFLOW (p. 139)**, you can replay the animated sequence by issuing the **ANIM (p. 142)** command. This command is functional only in the Postprocessor.

The *TIME* option lets you set the time interval of forward travel for the trace. The *SPACING* option is used to define the particle spacing in seconds from adjacent particles in the stream line. The *SIZE* variable sets the radius of the particle. The *LENGTH* variable is used to define the particle length fraction. By default, the *LENGTH* is set to .1, which means the particle occupies 10% of the trace region and the other 90% is a color-code line. The *SPACING* and *LENGTH* variables only make sense when the *SIZE* variable is nonzero (that is, the particle is bigger than the line).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>PlotCtrls>Animate>Particle Flow

/ANGLE,*WN*,*THETA*,*Axis*,*KINCR*

Rotates the display about an axis.

GRAPHICS (p. 16): Views (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

THETA

Angle (degrees) for changing display orientation (positive, counterclockwise about specified axis).

Axis

Rotation axis: XS, YS, or ZS (default) for the screen axes; XM, YM, or ZM for the global Cartesian model axes. ZS is normal to the screen; all axes pass through the focus point.

KINCR

Cumulative rotation key:

0

Do not use cumulative successive rotations.

1

Use cumulative rotations. Rotations are relative to the previous rotation. View settings (**/VIEW (p. 2131)**) are recalculated.

Notes

Default orientation is YS vertical. When the **/XFRM (p. 2194)** command is set for rotation about two points, or for entities, the **/ANGLE (p. 140)** command is functional only for *Axis* = ZS or ZM and *KINCR* = 1.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Pan, Zoom, Rotate

Utility Menu>PlotCtrls>View Settings>Angle of Rotation

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANHARM, *NFRAM*, *DELAY*, *NCYCL*, *NPERIOD*, *CMS_ANTYPE*, *CMS_MODOPT*

Produces an animated sequence of time-harmonic results or complex mode shapes.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFRAM

Number of frame captures per cycle. Defaults to 12.

DELAY

Time delay (seconds) during animation. Defaults to 0.1 seconds.

NCYCL

Number of animation cycles. Defaults to 5. Not available in the GUI.

NPERIOD

Period number for the second set of frames showing the decay or growth of a mode shape. Only applies to complex mode shape animation. Defaults to 1, animating the decay or growth on the first period. Issue -1 to animate without decay or growth.

CMS_ANTYPE

Analysis type performed in the CMS use pass. No default.

MODAL

Modal analysis

HARMIC

Harmonic analysis

CMS_MODOPT

Mode extraction method selected in the CMS use pass. No default.

UNSYM

Unsymmetric matrix

DAMP

Damped system

QRDAMP

Damped system using QR algorithm

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

ANHARM (p. 141) invokes a Mechanical APDL macro which produces an animated sequence of:

- Time-harmonic results in the case of a harmonic analysis (**ANTYPE (p. 162)**,HARMIC)
- Complex mode shapes in the case of a modal analysis (**ANTYPE (p. 162)**,MODAL).

In both cases, the results are those of the last plot action (for example, **PLNSOL (p. 1425)**,B,SUM).

The animation converts the complex solution variables (real and imaginary sets) into time varying results over one period. For example, if *NFRAM* = 12, then the frame captures are in increments of 30 degree phase angles.

A second set of *NFRAM* frames will be generated for damped eigenmodes from complex eigensolvers to visualize any exponential decay or growth of the oscillations. The second set generated will display frames from the period number specified by *NPERIOD*.

In a CMS analysis, the **ANHARM (p. 141)** command can be used after the CMS expansion pass or the use pass. To use **ANHARM (p. 141)** after the expansion pass, you must indicate whether a modal analysis or a harmonic analysis was performed in the CMS use pass by setting *CMS_ANTYPE* to either MODAL or HARMIC. If the use pass was a modal analysis, you must also set the *CMS_MODOPT* field to indicate the mode extraction method that was used (UNSYM, DAMP, or QRDAMP). If *CMS_MODOPT* = QRDAMP, it is assumed that *CPXMOD* was set to ON in the **MODOPT (p. 1140)** command to request complex eigenmodes. If the **ANHARM (p. 141)** command is used after the use pass, it is not necessary to set the *CMS_ANTYPE* or *CMS_MODOPT* arguments.

For more information about complex results postprocessing, see POST1 and POST26 – Complex Results Postprocessing in the *Theory Reference*

Menu Paths

Utility Menu>PlotCtrls>Animate>Animate Over Time

Utility Menu>PlotCtrls>Animate>Time-harmonic

ANIM, *NCYCL*, *KCYCL*, *DELAY*

Displays animated graphics data for linear problems.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NCYCL

Number of cycles associated with the animation (defaults to 5 in non-GUI mode only)

KCYCL

Animation mode:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Continuous animation cycle (forward-reverse-forward-etc.) (default).

1

Discontinuous animation cycle (forward-reset-forward-etc.).

DELAY

Time delay (seconds) between animation frames (defaults to 0.1 seconds).

Notes

Use the **ANIM (p. 142)** command to create animations for linear problems only. The command uses the currently displayed picture based on one particular data set from the results file, and linearly interpolates that data into different sets, displaying pictures of each interpolated data set in sequence to create animation. For information about creating animations for nonlinear problems, see the **ANDATA (p. 134)** command.

This command is device-dependent.

Do not resize the graphic while animation is in progress; doing so can result in distorted plots.

For more information, see the **/SEG (p. 1707)** command for details about segment storage, and the **ANCNTR (p. 131)** macro for a convenient method of storing graphics frames in terminal memory segments.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Animate>Replay Animation

Utility Menu>PlotCtrls>Animate>Restore Animation

ANISOS, *NFRAM*, *DELAY*, *NCYCL*

Produces an animated sequence of an isosurface.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFRAM

Number of frames captures (defaults to 9).

DELAY

Time delay during animation (defaults to 0.1 seconds).

NCYCL

Number of animation cycles (defaults to 5). Available in non-UI mode only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

ANISOS (p. 143) invokes a Mechanical APDL macro which produces an animation of an isosurface of the last plot action command (for example, **PLNSOL (p. 1425)**,S,EQV). The **ANISOS (p. 143)** command operates only on graphic display platforms supporting the **/SEG (p. 1707)** command. After executing **ANISOS (p. 143)**, you can replay the animated sequence by issuing the **ANIM (p. 142)** command.

This command functions only in the postprocessor.

Menu Paths

Utility Menu>PlotCtrls>Animate>Isosurfaces

ANMODE, *NFRAM*, *DELAY*, *NCYCL*, *KACCEL*

Produces an animated sequence of a mode shape.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFRAM

Number of frames captures (defaults to 5).

DELAY

Time delay during animation (defaults to 0.1 seconds).

NCYCL

Number of animation cycles (defaults to 5). Available in non-UI mode only.

KACCEL

Acceleration type:

0

Linear acceleration.

1

Sinusoidal acceleration.

Notes

ANMODE (p. 144) invokes a Mechanical APDL macro which produces an animation of mode shape of the last plot action command (for example, **PLDISP (p. 1400)**). The **ANMODE (p. 144)** command operates only on graphic display platforms supporting the **/SEG (p. 1707)** command. After executing **ANMODE (p. 144)**, you can replay the animated sequence by issuing the **ANIM (p. 142)** command.

This command functions only in the postprocessor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>PlotCtrls>Animate>Mode Shape

/ANNOT, *Lab*, *VAL1*, *VAL2*

Activates graphics for annotating displays (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Annotation control key:

OFF

Turns off annotation for each subsequent display (default).

ON

Turns on annotation for each subsequent display.

DELE

Deletes all annotation.

SAVE

Saves annotation on a file. Use *VAL1* for file name (defaults to Jobname) and *VAL2* for the extension (defaults to ANO).

SCALE

Sets annotation scale factor (direct input only). Use *VAL1* for value (0.1 to 10.0) (defaults to 1.0).

XORIG

Sets the annotation x origin (direct input only). Use *VAL1* for value (-3.0 to 3.0).

YORIG

Sets annotation y origin (direct input only). Use *VAL1* for value (-3.0 to 3.0).

SNAP

Sets annotation snap (menu button input only). Use *VAL1* for value (0.002 to 0.2) (defaults to 0.002).

STAT

Displays current annotation status.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DEFA

Sets annotation specifications to the default values.

REFR

Redisplays annotation graphics.

TMOD

Sets the annotation text mode. If *VAL1* = 1, annotation text will be drawn in scalable bitmap fonts (default). If *VAL1* = 0, annotation text will be drawn with stroke text.

VAL1

Value (or file name) as noted with label above.

VAL2

Value (or file name extension) as noted with label above.

Notes

This is a command generated by the GUI and will appear in the log file (`Jobname.log`) if annotation is used. This command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with the **/INPUT (p. 948)** command).

You cannot use the "!" and "$" characters in Mechanical APDL text annotation.

/ANNOT (p. 145) activates annotation graphics for adding annotation to displays. Commands representing the annotation instructions are automatically created by the annotation functions in the GUI and written to `Jobname.log`.

The annotation commands are **/ANNOT (p. 145)**, **/ANUM (p. 166)**, **/TLABEL (p. 2007)**, **/LINE (p. 1051)**, **/LARC (p. 1011)**, **/LSYMBOL (p. 1088)**, **/POLYGON (p. 1460)**, **/PMORE (p. 1454)**, **/PCIRCLE (p. 1370)**, **/PWEDGE (p. 1557)**, **/TSPEC (p. 2024)**, **/LSPEC (p. 1081)**, and **/PSPEC (p. 1548)**. Annotation graphics are relative to the full Graphics Window and are not affected by Mechanical APDL window-specific commands (**/WINDOW (p. 2177)**, **/VIEW (p. 2131)**, etc.).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANORM,*ANUM*,*NOEFLIP*

Reorients area normals.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ANUM

Area number having the normal direction that the reoriented areas are to match.

NOEFLIP

Indicates whether you want to change the normal direction of the existing elements on the reoriented area(s) so that they are consistent with each area's new normal direction.

0

Make the normal direction of existing elements on the reoriented area(s) consistent with each area's new normal direction (default).

1

Do not change the normal direction of existing elements on the reoriented area(s).

Notes

Reorients areas so that their normals are consistent with that of a specified area.

If any of the areas have inner loops, the **ANORM (p. 147)** command will consider the inner loops when it reorients the area normals.

You cannot use the **ANORM (p. 147)** command to change the normal direction of any element that has a body or surface load. We recommend that you apply all of your loads only *after* ensuring that the element normal directions are acceptable.

Real constants (such as nonuniform shell thickness and tapered beam constants) may be invalidated by an element reversal.

See Revising Your Model of the *Modeling and Meshing Guide* for more information.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Areas>Area Normals

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANPRES,*NFRAM*,*DELAY*,*NCYCL*,*RefFrame*

Produces an animated sequence of the time-harmonic pressure variation of an engine-order excitation in a cyclic harmonic analysis.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFRAM

Number of frame captures per cycle. Defaults to 3 times the number of sectors.

DELAY

Time delay (seconds) during animation. Defaults to 0.1 seconds.

NCYCL

Number of animation cycles. Defaults to 5.

RefFrame

Reference frame for the model rotation.

0

Rotating reference frame (default). The model remains fixed in space and the pressure revolve around the model.

1

Stationary reference frame. The model rotates and the pressure locations remain fixed in space.

Notes

ANPRES (p. 148) invokes a macro which produces an animated sequence of the time-harmonic applied pressure in the case of a mode-superposition harmonic analysis (**ANTYPE (p. 162)**,HARMIC with **CYCOPT (p. 466)**,MSUP,ON). The engine-order excitation must also have been specified (**CYCFREQ (p. 458)**,EO). While pressure loads are not accepted as valid loading in a mode-superposition analysis (they must be applied in the modal analysis and the modal load vector applied in the mode-superposition analysis) you can apply them for the purposes of this animation.

For *RefFrame* = 1 (stationary reference frame), the rotational velocity from the Linear Perturbation step, or the current **OMEGA (p. 1324)** or **CGOMGA (p. 320)** value, is used to determine the rotation direction about the cyclic cylindrical axis, otherwise a positive rotation is assumed.

You may use **/HBC (p. 887)**,,ON to hide overlapping pressure faces, and use **/GLINE (p. 860)**,,-1 to suppress the element outlines if desired.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANSOL,*NVAR*,*NODE*,*Item*,*Comp*,*Name*,*Mat*,*Real*,*Ename*,*DataKey*

Specifies averaged element nodal data to be stored from the results file.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR

Arbitrary reference number assigned to this variable (2 to *NV* (**NUMVAR (p. 1302)**)). Overwrites any existing results for this variable.

NODE

Node number for which data are to be stored.

Item

Label identifying the item. General item labels are shown in Table 101: ANSOL - General Result Item and Component Labels (p. 151) below. Some items also require a component label. For selected result output, specify SRES and see Table 102: ANSOL - Selected Result (SRES) Component Labels (p. 153).

Comp

Component of the item (if required). General component labels are shown in Table 101: ANSOL - General Result Item and Component Labels (p. 151). Selected result components (*Item* = SRES) are shown in Table 102: ANSOL - Selected Result (SRES) Component Labels (p. 153).

Name

32-character name to identify the item on the printout and displays. Default: An eight-character label formed by concatenating the first four characters of the *Item* and *Comp* labels.

Mat

Material number. Average is calculated based on the subset of elements with the specified material number. Default: Use all elements in the active set unless *Real* and/or *Ename* is specified.

Real

Real number. Average is calculated based on the subset of elements with the specified real number. Default: Use all elements in the active set unless *Mat* and/or *Ename* is specified.

Ename

Element type name. Average is calculated based on the subset of elements with the specified element type name. Default: Use all elements in the active set unless *Mat* and/or *Real* is specified.

DataKey

Key to specify which data is stored:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AUTO

Nodal-averaged results are used if they are available for the first applicable time step; otherwise, the element-based data is used, if available. (Default.)

ESOL

Only element-based results are used. If they are not available, the command is ignored.

NAR

Only nodal-averaged results are used. If they are not available, the command is ignored.

Mat, *Real*, and *Ename* are ignored when nodal-averaged results are used.

Notes

Valid item and component labels for element nodal results are listed in Table 101: ANSOL - General Result Item and Component Labels (p. 151).

ANSOL (p. 149) defines element nodal results data to be stored from a results file (**FILE (p. 752)**). Not all items are valid for all nodes. See the input and output summary tables of each element attached to the node for the available items.

If nodal-averaged results (**OUTRES (p. 1336)**,NAR or another nodal-averaged label) are available, then **ANSOL (p. 149)** uses the nodal-averaged data for the applicable items (S, EPEL, EPPL, EPCR, EPTH) as dictated by the by *DataKey* argument. By default, (*DataKey* = AUTO), the availability of nodal-averaged results or element-based data is determined at the first load step that has results for the associated item. For more information, see Postprocessing Nodal-Averaged Results in the *Element Reference*.

Coordinate systems: Generally, element nodal quantities stored by **ANSOL (p. 149)** are obtained in the solution coordinate system (**RSYS (p. 1639)**, SOLU) and then averaged. There are some exceptions as listed below. **ANSOL (p. 149)** does not transform results from **RSYS (p. 1639)**,SOLU (or from the coordinate systems described for the exceptions below) to other coordinate systems. Verify that all elements attached to the subject node have the same coordinate system before using **ANSOL (p. 149)**.

- Layered element results are in the layer coordinate system (**RSYS (p. 1639)**,LSYS). You can further specify the element nodal results, for some elements, with the **SHELL (p. 1784)**, **LAYERP26 (p. 1016)**, and **FORCE (p. 772)** commands.
- When **ANSOL (p. 149)** is used to store nodal-averaged result data (based on the *DataType* setting), the global Cartesian coordinate system (**RSYS (p. 1639)**,0) is used.

Shell elements: The default shell element coordinate system is based on node ordering. For shell elements the adjacent elements could have a different **RSYS (p. 1639)**,SOLU, making the resultant averaged data inconsistent. A message to this effect is issued when **ANSOL (p. 149)** is used in models containing shell elements. Ensure that consistent coordinate systems are active for all associated elements used by the **ANSOL (p. 149)** command.

Derived quantities: Some of the result items supported by **ANSOL (p. 149)** (Table 101: ANSOL - General Result Item and Component Labels (p. 151)) are derived from the component quantities. Issue **AVPRIN (p. 210)** to specify the principal and vector sum quantity averaging methods.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Default: If *Mat*, *Real* , and *Ename* are not specified, all elements attached to the node are considered. When a material ID, real constant ID, or element-type discontinuity is detected at a node, a message is issued. For example, in a FSI analysis, a FLUID30 element at the structure interface would be considered; however, because it contains no *SX* result, it is not used during **STORE (p. 1867)** operations.

Table 101: ANSOL - General Result Item and Component Labels

General Item and Component Labels ANSOL (p. 149), *NVAR, NODE, Item, Comp, Name, Mat, Real, Ename, DataType*		
Item	**Comp**	**Description**
S	X, Y, Z, XY, YZ, XZ	Component stress.[a]
	1, 2, 3	Principal stress.[a]
	INT	Stress intensity.[a]
	EQV	Equivalent stress.[a]
EPEL	X, Y, Z, XY, YZ, XZ	Component elastic strain.[a]
	1, 2, 3	Principal elastic strain.[a]
	INT	Elastic strain intensity.[a]
	EQV	Elastic equivalent strain.[a]
EPPL	X, Y, Z, XY, YZ, XZ	Component plastic strain.[a]
	1, 2, 3	Principal plastic strain.[a]
	INT	Plastic strain intensity.[a]
	EQV	Plastic equivalent strain.[a]
EPCR	X, Y, Z, XY, YZ, XZ	Component creep strain.[a]
	1,2,3	Principal creep strain.[a]
	INT	Creep strain intensity.[a]
	EQV	Creep equivalent strain.[a]
EPTH	X, Y, Z, XY, YZ, XZ	Component thermal strain.[a]
	1, 2, 3	Principal thermal strain.[a]
	INT	Thermal strain intensity.[a]
	EQV	Thermal equivalent strain.[a]
ESIG	X, Y, Z, XY, YZ, XZ	Components of Biot’s effective stress.
	1, 2, 3	Principal stresses of Biot's effective stress.
	INT	Stress intensity of Biot's effective stress.
	EQV	Equivalent stress of Biot's effective stress.
NL	SEPL	Equivalent stress (from stress-strain curve).
	SRAT	Stress state ratio.
	HPRES	Hydrostatic pressure.
	EPEQ	Accumulated equivalent plastic strain.
	CREQ	Accumulated equivalent creep strain.
	PSV	Plastic state variable.
	PLWK	Plastic work/volume.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels ANSOL (p. 149), *NVAR,NODE,Item,Comp,Name,Mat,Real,Ename,DataType*		
Item	**Comp**	**Description**
CONT	STAT[b]	Contact status.
	PENE	Contact penetration.
	PRES	Contact pressure.
	SFRIC	Contact friction stress.
	STOT	Contact total stress (pressure plus friction).
	SLIDE	Contact sliding distance.
	GAP	Contact gap distance.
	FLUX	Total heat flux at contact surface.
	CNOS	Total number of contact status changes during substep.
	FPRS	Fluid penetration pressure.
TG	X, Y, Z, SUM[c]	Component thermal gradient or vector sum.
TF	X, Y, Z, SUM[c]	Component thermal flux or vector sum.
PG	X, Y, Z, SUM	Component pressure gradient or vector sum.
EF	X, Y, Z, SUM	Component electric field or vector sum.
D	X, Y, Z, SUM	Component electric flux density or vector sum.
H	X, Y, Z, SUM	Component magnetic field intensity or vector sum.
B	X, Y, Z, SUM	Component magnetic flux density or vector sum.
CG	X, Y, Z, SUM	Component concentration gradient or vector sum.
DF	X, Y, Z, SUM	Component diffusion flux density or vector sum.
JC	X, Y, Z, SUM	Conduction current density for elements that support conduction current calculation. Components (X, Y, Z) and vector sum (SUM).
FFLX	X, Y, Z	Fluid-flow flux in poromechanics.
FGRA	X, Y, Z	Fluid pore-pressure gradient in poromechanics.
PMSV	VRAT, PPRE, DSAT, RPER	Void volume ratio, pore pressure, degree of saturation, and relative permeability for coupled pore-pressure-thermal elements.
NS	X, Y, Z, XY, YZ, XZ	Nominal strain for hyperelastic material, reported in the current configuration (unaffected by **RSYS (p. 1639)**).
MPLA	DMAC, DMAX	Microplane damage, macroscopic and maximum values.
MPDP	TOTA, TENS, COMP, RW	Microplane homogenized total, tension, and compression damages (TOTA, TENS, COMP), and split weight factor (RW).
EPFR		Free strain in porous media
DAMAGE	1,2,3,MAX	Damage in directions 1, 2, 3 (1, 2, 3) and the maximum damage (MAX).
GDMG		Damage
IDIS		Structural-thermal dissipation rate

[a] This item stores nodal-averaged results if they are available on the results file.

[b] For more information about the meaning of contact status and its possible values, see Reviewing Results in POST1 in the *Contact Technology Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

[c] *Comp* = SUM is not supported for coupled pore-pressure-thermal (CPT*nnn*) elements.

Table 102: ANSOL - Selected Result (SRES) Component Labels

ANSOL (p. 149),*NVAR*,*NODE*,SRES,*Comp*,*Name*,*Mat*,*Real*,*Ename*	
Comp	**Description**
SVAR*n*	The *n*th state variable.
FLDUF0*n*	The *n*th user-defined field variable.
ItemComp (concatenated *Item* + *Comp* label) from Table 208: OSRESULT - Item and Component Labels (p. 1328)[a]	See the table (p. 1328) for the combined item and component description.

Main Menu>TimeHist Postpro>Variable Viewer

ANSTOAQWA,*Fname*,*VertAxis*,*Gc*,*Rho*,*HWL*,*DiffKey*,*SymxKey*,*SymyKey*

Creates an AQWA-LINE input file from the current Mechanical APDL model.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

AQWA file name. Defaults to Jobname.

VertAxis

Axis in the vertical direction:

Y (or 2)

Global Y axis.

Z (or 3)

Global Z axis (default).

Gc

Gravitational acceleration. Defaults to 9.81.

Rho

Density of water. Defaults to 1025.0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HWL

Waterline height in model coordinates. Defaults to 0.0.

DiffKey

Diffracting model key:

0

Create a non-diffracting AQWA model.

1

Create a diffracting AQWA model (default).

SymxKey

Key indicating if model is symmetric about the global XZ plane:

0

No symmetry about XZ plane (default).

1

Use symmetry about XZ plane. Only include (or select) half the model.

SymyKey

Key indicating if model is symmetric about the global YZ plane:

0

No symmetry about YZ plane (default).

1

Use symmetry about YZ plane. Only include (or select) half the model.

Notes

This command creates the input file *Fname*.aqwa for the Ansys Aqwa Multi-Body Hydrodynamics System for diffraction analysis in AQWA-LINE from the model currently in the database, based on the currently selected set of elements. The selected set must only include the hull envelope; no internal structure should be selected.

There should be a line of nodes defined at the waterline. Only those elements that are entirely below the waterline will be specified as diffracting. If there are no waterline nodes, there will be no diffracting elements at the waterline, which will severely reduce the accuracy of the diffraction analysis.

The translator maps PLANE42, SHELL63, and SHELL181 elements to PANELs, and maps PIPE16 and PIPE59 elements to TUBEs. It does not recognize any other element types. Any material or geometric properties

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

can be used for the shell elements, as AQWA does not need any properties at all and the command does not use them. All the shell elements below the water must have their normals pointing outward.

TUBE elements in AQWA have material density, outside diameter, wall thickness, added mass, and drag coefficients, so appropriate properties should be used in the Mechanical APDL model. PIPE59 elements can have added mass and damping coefficients; these will be written to the file. The Mechanical APDL program uses the inertia coefficient C_M, whereas AQWA uses the added mass coefficient C_A, where $C_M = (1 + C_A)$. This correction is made automatically.

Documentation for archived elements PIPE16, PLANE42, PIPE59, and SHELL63 appears in the *Feature Archive*.

In AQWA the vertical axis is always the Z-axis. The command can convert a model built with either the Y or Z-axis vertical, but the X-axis must be horizontal and should preferably be along the fore/aft axis of the vessel. If the structure is symmetric and you wish to use the symmetry options, you must only select one half or one quarter of the model, as appropriate. If you model a complete vessel and specify X symmetry, the AQWA model will contain two sets of coincident elements.

If you are working from a model created for a structural analysis, it will probably be necessary to remesh the model as the structural mesh is most likely finer than needed for a diffraction analysis.

If you enter this command interactively (with the GUI active) and no data is provided for the command options, the application prompts you for their values.

You must verify the completeness and accuracy of the data written.

AQWA-LINE Notes

The file will specify restart stages 1-2 only. It has no options except REST, so AQWA may fail if any of the elements are badly shaped.

The total mass is obtained by integrating over the wetted surface area and adding the TUBE masses, so it should be reasonably accurate. However, the integration used is not as accurate as that in AQWA, so there may be a small difference between the weight and buoyancy, particularly if tubes represent a large portion of the model.

The position of the CG is unknown. A point mass is placed at the water-line above the CB, but you should change this to the correct position.

The moments of inertia are estimated based on the overall dimensions of the model and using standard formulae for a ship. You should change these to the correct values.

The maximum frequency is calculated from the maximum side length of the underwater elements. The range of frequencies runs from 0.1 rad/s to the calculated maximum, in steps of 0.1 rad/s.

The directions are in steps of 15° over a range that is determined by the symmetry you have specified, in accordance with the requirements of AQWA.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANSTOASAS, *Fname*, *KEY*

Creates an ASAS input file from the current Mechanical APDL model.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

ASAS file name. Defaults to Jobname.

KEY

Key indicating type of file to produce:

0

ASAS file for use by Ansys Aqwa (no loads written). Creates the file *Fname*.asas.

1

ASAS file (all data written, including loads). Creates the file *Fname*.asas.

2

ASAS(NL) file. Creates the file *Fname*.asnl.

Notes

This command creates an input file for the Ansys Asas Finite Element Analysis System from the model and loads currently in the database, based on the currently selected set of elements. Most common structural element types are written, as well as sections (or real constants), materials, boundary conditions and loads, and solution and load step options.

Data Written

The following data is written:

- Solution control options (p. 157)
- Nodes
- Elements (p. 157)
- Material data (p. 159)
- Geometry data (p. 159)
- Section data (p. 160)
- Mechanical APDL element components (ASAS sets)
- Boundary conditions (p. 160)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Loads (p. 160)
- Added mass (via MASS21 element)

Details are provided in the following sections.

Not all data is written. You must verify the completeness and accuracy of the data. Only loading at the current step is transferred; hence, no load step history is captured.

Solution Control Options

The ASAS project name is defined as "Ansys".

The solution control options are converted as follows:

Mechanical APDL Analysis Type	ASAS(L) / AQWA-WAVE Option	ASAS(NL) Option
Static (0)	JOB NEW LINE	JOB STAT
Buckling (1)	Not applicable	JOB STAT SPIT KGEOM
Modal (2)	JOB NEW FREQ	JOB STAT SPIT KGEOM
Transient (4)	Not applicable	JOB TRAN
Remaining analysis types	JOB NEW LINE	JOB STAT

For conversion to ASAS(NL), the large displacement option is set based on **NLGEOM (p. 1231)**, final load solution time is set based on **TIME (p. 2000)**, and sub-step times are set based on **DELTIM (p. 515)** or **NSUBST (p. 1287)** (assuming constant step size).

Element Data

If you intend to use the data only with AQWA-WAVE, only the elements that form the wetted surface are required. Selecting these elements before invoking the **ANSTOASAS (p. 156)** command will improve performance. In order for AQWA-WAVE to identify the direction of the wave loading, all elements must be defined by nodes in a clockwise direction. For further information, refer to the AQWA-WAVE manual.

The element types are converted as follows:

Element Type	Supported Facilities	Notes
COMBIN14 - Spring-Damper	SPR1 SPR2 if rotational spring FLA2 (ASAS(L) only) if nodes are not coincident and longitudinal spring	ASAS(L) does not support spring elements with non-coincident nodes. In this case, COMBIN14 is converted to FLA2.
MASS21 - Structural Mass	N/A	In ASAS, additional mass is not added as an element. Hence, if this element is included, equivalent ASAS

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Element Type	Supported Facilities	Notes
		lumped added mass information is written.
PLANE42 - 2D Structural Solid [1]	QUM4 TRM3 - if Triangular	-
SOLID45 - 3D Structural Solid [1]	BRK8 TET4 - if Tetrahedral BRK6 - if Prism	TET4 elements are only available in ASAS(L). Element is not converted if Pyramidal.
SHELL61 - Axisymmetric-Harmonic Structural Shell	ASH2	ASH2 elements are only available in ASAS(L).
SHELL63 - Elastic Shell [1]	QUS4 TBC3 - if Triangular	TBC3 elements are only available in ASAS(L).
PLANE82 - 2D 8-Node Structural Solid [1]	QUM8 TRM6 - if Triangular	-
SOLID92 - 3D 10-Node Tetrahedral Structural Solid [1]	TE10	-
SOLID95 - 3D 20-Node Structural Solid [1]	BR20 TE10 - if Tetrahedral BR15 - if Prism	TE10 elements are only available in ASAS(L). Element is not converted if Pyramidal.
LINK180 - 3D Finite Strain Spar (or Truss)	FLA2	-
SHELL181 - 4-Node Finite Strain Shell	QUS4 TBC3 - if Triangular	TBC3 elements are only available in ASAS(L).
PLANE182 - 2D 4-Node Structural Solid	QUM4 TRM3 - if Triangular	-
PLANE183 - 2D 8-Node or 6-Node Structural Solid	QUM8 TRM6 - if Triangular	-
SOLID185 - 3D 8-Node Structural Solid or Layered Solid	BRK8 TET4 - if Tetrahedral BRK6 - if Prism	TET4 elements are only available in ASAS(L). Element is not converted if Pyramidal.
SOLID186 - 3D 20-Node Structural Solid or Layered Solid	BR20 TE10 - if Tetrahedral BR15 - if Prism	TE10 elements are only available in ASAS(L). Element is not converted if Pyramidal.
SOLID187 - 3D 10-Node Tetrahedral Structural Solid	TE10	TE10 elements are only available in ASAS(L).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Element Type	Supported Facilities	Notes
BEAM188 - 3D Linear Finite Strain Beam	BM3D	-
BEAM189 - 3D Quadratic Finite Strain Beam	TCBM - if ASAS(L) STF4 - if ASAS(NL)	Refer to geometry details for limitations for TCBM elements. An orientation node is needed for STF4 and must be specified.
SHELL208 - 2-Node Finite Strain Axisymmetric Shell	ASH2	ASH2 elements are only available in ASAS(L).
SHELL281 - 8-Node Finite Strain Shell	TCS8	-
PIPE288 - 3D Linear Finite Strain Pipe	TUBE	-

1. Documentation for this archived element type appears in the *Feature Archive*.

Material Data

Linear isotropic material conversion is supported for ASAS and ASAS(NL).

Geometry Data

The following ASAS element geometry data is supported:

ASAS Element Type	Support Facilities	Notes
BM3D	Sections, orientation by 3rd node position.	Sections are always defined separately.
TUBE	Thickness and diameter defined, orientation by 3rd node or default local axes.	Using the default local axes will result in BETA being set to 90° (to ensure that the ASAS local axes are the same as those in Mechanical APDL).
BM2D	A, IZ & AY properties defined.	
TCBM	Uniform section properties supported.	TCBM does not support general local axis orientations. Hence, elements will only be correct if they lie in the global XY plane.
STF4	CTUB, RECT, and HREC Mechanical APDL subtypes supported.	STF4 elements are only supported in ASAS(NL). Local y and z are 90° to the Mechanical APDL definition.
FLA2	Uniform cross sectional area.	

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ASAS Element Type	Support Facilities	Notes
SPR1 / SPR2	Stiffness (and also linear damping if ASAS(NL)) included.	
All non-beam elements	Constant element thickness.	

For all beam elements, the third node position must be explicitly defined. If the position is not defined, the program generates an error code (-1) in the output file.

Section Data

No user sections are generated if AQWA-WAVE data is selected.

The following sections are converted for ASAS and ASAS(NL):

Mechanical APDL Section Type	ASAS Section Type	Notes
CTUB	TUB	Tubular section
I	FBI	Fabricated I beam
HREC	BOX	Fabricated box
All others	PRI	Prismatic section, only flexural properties defined.

Boundary Conditions

The following boundary conditions are converted for ASAS and ASAS(NL):

Mechanical APDL Boundary Condition	ASAS Boundary Condition	Notes
Nodal U* and ROT* constraints	SUPPressed freedoms: X, Y, Z, RX, RY, RZ	Skewed systems are not supported.
Nodal U* and ROT* imposed non-zero values	DISPlaced freedoms: X, Y, Z, RX, RY, RZ	Skewed systems are not supported.
CP (p. 421) and **CE (p. 297)** constraint equations	CONStraint equation data	Skewed systems are not supported.

Loads

No user loading is generated if AQWA-WAVE data is selected. However, a load case (number 1000) is automatically defined to identify the wetted surface of the elements for use by AQWA-WAVE based on the normal surface loads applied to the solid or shell elements.

Pressure loads from SURF154 elements are converted to equivalent nodal loads for ASAS. For AQWA-WAVE, the SURF154 pressures are used to identify the wetted surface of the underlying elements. The following loads are converted for ASAS:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mechanical APDL Load Type	ASAS Load Type	Notes
SFE (p. 1761) (PRES)	PRESSURE (no sub-types)	Element families supported: Solids, shells (excluding edge pressures), planes (edge pressures only), and axisymmetric shells.
SFE (p. 1761) (PRES)	DISTRIBUted loading Shells - ML2 Beams - BL1 / BL2 Tubes - GL1 Curved beams - CB1	Element families supported: Shells (edge pressures only), Beams (includes tubes and curved beams).
F (p. 729) (F* and M*)	NODAL Load, in X, Y, Z, RX, RY, RZ	Skewed systems are not supported.
D (p. 483) (U* and ROT*)	PRESCRIBed displacements	
ACEL (p. 92)	BODY FORce	

Menu Paths

This command cannot be accessed from a menu.

ANTIME, *NFRAM*, *DELAY*, *NCYCL*, *AUTOCNTRKY*, *RSLTDAT*, *MIN*, *MAX*

Generates a sequential contour animation over a range of time.

POST1 (p. 51): Animation (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFRAM

Number of frame captures (defaults to 5).

DELAY

Time delay during animation (defaults to 0.1 seconds).

NCYCL

Number of animation cycles (defaults to 5). Available in non-UI mode only.

AUTOCNTRKY

Auto-scales contour values, based on the overall subset range of values. The auto-scaling option defaults to 0, no auto-scaling.

RSLTDAT

The results data to be used for the animation sequence. This can be:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Current load step data (default).

1

Range of load step data.

2

Range of time data.

MIN

The range minimum value. If left blank defaults to the first data point.

MAX

The range maximum value. If left blank defaults to the last data point.

Notes

The **ANTIME (p. 161)** command operates only on graphic display platforms supporting the **/SEG (p. 1707)** command. It uses a Mechanical APDL macro to produce an animation of contour values for the last plot action command (for example, **PLDISP (p. 1400)**). After executing **ANTIME (p. 161)**, the **ANIM (p. 142)** command replays the animated sequence.

This command functions only in the postprocessor.

Menu Paths

Utility Menu>PlotCtrls>Animate>Animate Over Time

Utility Menu>PlotCtrls>Animate>Time-harmonic

ANTYPE,*Antype*,*Status*,*LDSTEP*,*SUBSTEP*,*Action*,--,*PRELP*

Specifies the analysis type and restart status.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Product Restrictions (p. 165)

Antype

Analysis type (defaults to the previously specified analysis type, or to STATIC if none specified):

STATIC or 0

Perform a static analysis. Valid for all degrees of freedom.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BUCKLE or 1

Perform a buckling analysis. Implies that a previous static solution was performed with prestress effects calculated (**PSTRES (p. 1551)**,ON). Valid for structural degrees of freedom only.

MODAL or 2

Perform a modal analysis. Valid for structural and fluid degrees of freedom.

HARMIC or 3

Perform a harmonic analysis. Valid for structural, fluid, magnetic, and electrical degrees of freedom.

TRANS or 4

Perform a transient analysis. Valid for all degrees of freedom.

SUBSTR or 7

Perform a substructure analysis. Valid for all degrees of freedom.

SPECTR or 8

Perform a spectrum analysis. Implies that a previous modal analysis was performed. Valid for structural degrees of freedom only.

SOIL or 9

Perform a soil analysis including geostatic stress equilibrium or consolidation. Valid for structural and fluid-pore-pressure degrees of freedom.

Status

Specifies the status of the analysis (new or restart):

NEW

Specifies a new analysis (default). If NEW, the remaining fields on this command are ignored.

RESTART

Specifies a restart of a previous analysis. Valid for static, modal, and transient (full or mode-superposition method) analyses. For more information about restarting static and transient analyses, see Multiframe Restart in the *Basic Analysis Guide*. For more information on restarting a modal analysis, see Modal Analysis Restart in the *Basic Analysis Guide*.

Multiframe restart is also valid for harmonic analysis, but is limited to 2D magnetic analysis only.

A substructure analysis (backsubstitution method only) can be restarted for the purpose of generating additional load vectors. For more information, see the **SEOPT (p. 1715)** command and Applying Loads and Creating the Superelement Matrices in the *Substructuring Analysis Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LDSTEP

Specifies the load step at which a multiframe restart begins.

For full transient and nonlinear static analyses, the default is the highest load step number found in the Jobname.R*nnn* files for the current jobname in the current directory.

For mode-superposition transient analyses, the default is none.

SUBSTEP

Specifies the substep at which a multiframe restart begins.

For full transient and nonlinear static analyses, the default is the highest substep number found for the specified *LDSTEP* in the Jobname.R*nnn* files in the current directory.

For mode-superposition transient analyses, the default is none.

Action

Specifies the manner of a multiframe restart.

CONTINUE

The program continues the analysis based on the specified *LDSTEP* and *SUBSTEP* (default). The current load step is continued. If the end of the load step is encountered in the .R*nnn* file, a new load step is started. The program deletes all .R*nnn* files, or .M*nnn* files for mode-superposition transient analyses, beyond the point of restart and updates the .ldhi file if a new load step is encountered.

ENDSTEP

At restart, force the specified load step (*LDSTEP*) to end at the specified substep (*SUBSTEP*), even though the end of the current load step has not been reached. At the end of the specified substep, all loadings are scaled to the level of the current ending and stored in the .ldhi file. A run following this ENDSTEP starts a new load step. This capability allows you to change the load level in the middle of a load step. The program updates the .ldhi file and deletes all .R*nnn* files, or .M*nnn* files for mode-superposition transient analyses, beyond the point of ENDSTEP. The .R*nnn* or .M*nnn* file at the point of ENDSTEP are re-written to record the rescaled load level.

RSTCREATE

At restart, retrieve information to be written to the results file for the specified load step (*LDSTEP*) and substep (*SUBSTEP*). Be sure to use **OUTRES (p. 1336)** to write the results to the results file. This action does not affect the .ldhi or .R*nnn* files. Previous items stored in the results file at and beyond the point of RSTCREATE are deleted. This option cannot be used to restart a mode-superposition transient analysis.

PERTURB

At restart, a linear perturbation analysis (static, modal, buckling, or full harmonic) is performed for the specified load step (*LDSTEP*) and substep (*SUBSTEP*). This action does not affect the .ldhi, .R*nnn*, or .RST files.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For a linear perturbation analysis, set *Action* = PERTURB; otherwise, the existing restart files, such as the .ldhi, .R*nnn*, or .RST file, may be modified by the linear perturbation analysis. Issue the **PERTURB (p. 1378)** command to indicate the desired analysis type (STATIC, MODAL, BUCKLE, HARMONIC, or SUBSTR).

- -

Unused field.

PRELP

Flag indicating whether a subsequent linear perturbation will be performed:

YES

Specifies the first static analysis with a sequential linear perturbation analysis. Setting PRELP = YES is necessary for acoustics-structural interaction linear perturbation analysis, if the **MORPH (p. 1156)** command with *StrOpt* = YES is not issued.

NO

No specification for a subsequent linear perturbation (default).

Command Default

New static analysis.

Notes

If using the **ANTYPE (p. 162)** command to change the analysis type in the same SOLVE session, the program issues the following message: "Some analysis options have been reset to their defaults. Please verify current settings or respecify as required." Typically, the program resets commands such as **NLGEOM (p. 1231)** and **EQSLV (p. 648)** to their default values.

To read in view factors after restarting a radiation analysis, issue **VFOPT (p. 2099)**,READ after **ANTYPE (p. 162)**,,RESTART.

The analysis type (*Antype*) cannot be changed if a restart is specified. Always save parameters before doing a restart. For more information on the different types of restart, see Restarting an Analysis in the *Basic Analysis Guide*.

Issue **/CLEAR (p. 350)**,NOSTART *before* performing a restart of a previous nonlinear mesh adaptivity via **ANTYPE (p. 162)**,,RESTART,,,CONTINUE or **ANTYPE (p. 162)**,,RESTART,,,ENDSTEP.

This command is also valid in PREP7.

/ANUM, *NUM*, *TYPE*, *XHOT*, *YHOT*

Specifies the annotation number, type, and hot spot (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NUM

Annotation number. Mechanical APDL automatically assigns the lowest available number. You cannot assign a higher number if a lower number is available; the program substitutes the lowest available number in place of any user-specified higher number.

TYPE

Annotation internal type number. If *TYPE* = DELE, delete annotation *NUM*.

YHOT

Y hot spot (-1.0 < Y < 1.0). Used for menu button item delete.

Command Default

Number, type, and hot spot are automatically determined.

Notes

This is a command generated by the GUI and will appear in the log file (`Jobname.log`) if annotation is used. This command is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with the **/INPUT (p. 948)** command).

Type 13 (bitmap) annotation applies user defined bitmaps defined using the FILE option of the **/TXTRE (p. 2029)** command.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

AOFFST, *NAREA*, *DIST*, *KINC*

Generates an area, offset from a given area.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NAREA

Area from which generated area is to be offset. If *NAREA* = ALL, offset from all selected areas (**ASEL (p. 192)**). If *NAREA* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI).

DIST

Distance normal to given area at which keypoints for generated area are to be located. Positive normal is determined from the right-hand-rule keypoint order.

KINC

Keypoint increment between areas. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

Notes

Generates an area (and its corresponding keypoints and lines) offset from a given area. The direction of the offset varies with the given area normal. End slopes of the generated lines remain the same as those of the given pattern. Area and line numbers are automatically assigned, beginning with the lowest available values (**NUMSTR (p. 1301)**).

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Areas>Arbitrary>By Offset

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AOVLAP, *NA1*, *NA2*, *NA3*, *NA4*, *NA5*, *NA6*, *NA7*, *NA8*, *NA9*

Overlaps areas.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1, NA2, NA3, . . . , NA9

Numbers of areas to be operated on. If *NA1* = ALL, use all selected areas and ignore *NA2* to *NA9*. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1*.

Notes

Generates new areas which encompass the geometry of all the input areas. The new areas are defined by the regions of intersection of the input areas, and by the complementary (non-intersecting) regions. See Solid Modeling in the *Modeling and Meshing Guide* for an illustration. This operation is only valid when the region of intersection is an area. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Overlap>Areas

APLOT, *NA1*, *NA2*, *NINC*, *DEGEN*, *SCALE*

Displays the selected areas.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1, NA2, NINC

Displays areas from *NA1* to *NA2* (defaults to *NA1*) in steps of *NINC* (defaults to 1). If *NA1* = ALL (default), *NA2* and *NINC* are ignored and all selected areas (**ASEL (p. 192)**) are displayed.

DEGEN

Degeneracy marker:

(blank)

No degeneracy marker is used (default).

DEGE

A red star is placed on keypoints at degeneracies (see the *Modeling and Meshing Guide*). Not available if **/FACET (p. 731)**,WIRE is set.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SCALE

Scale factor for the size of the degeneracy-marker star. The scale is the size in window space (-1 to 1 in both directions) (defaults to .075).

Notes

This command is valid in any processor. The degree of tessellation used to plot the selected areas is set through the **/FACET (p. 731)** command.

Menu Paths

APORT, *PortNum*, *Label*, *KCN*, *PRES*, *PHASE*, --, *VAL1*, *VAL2*, *VAL3*, *VAL4*

Specifies input data for plane wave and acoustic duct ports.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

PortNum

Port number. This number is associated with an exterior port or interior port previously specified by the **SF (p. 1733)** and **BF (p. 221)** family of commands, respectively. The number must be between 1 and 50.

Label

PLAN

Incident plane wave.

RECT

Rectangular duct.

CIRC

Circular duct.

COAX

Coaxial duct.

LIST

List the port settings. If *PortNum* = ALL, list the port settings for all defined ports.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DELE

Delete defined ports. If *PortNum* = ALL, delete all defined ports.

KCN

A previously-defined local (*KCN* >10) or global (*KCN* = 0) Cartesian coordinate system number used to specify the geometric properties of the duct. Defaults to the global Cartesian coordinate system (0). The local Z-direction must be the direction of wave propagation. The origin of the local coordinate system must be centered about the face of the duct port without considering symmetry.

PRES

Zero-to-peak amplitude of the pressure. If blank, the port will appear as a matching impedance.

PHASE

Phase angle of the applied pressure in degrees. Defaults to 0.

--

Unused field.

VAL1, VAL2, VAL3, VAL4

Additional input. The meaning of *VAL1* through *VAL4* varies depending on the specified *Label*.

Label = PLAN:

VAL1

ϕ angle from positive X-axis to positive Y-axis in the local Cartesian coordinates (*KCN*).

VAL2

θ angle away from positive Z-axis in the local Cartesian coordinates (*KCN*).

VAL3 - VAL4

Not used.

Label = RECT:

VAL1

Width of the rectangular duct.

VAL2

Height of the rectangular duct.

VAL3

Mode index for pressure variation along the width (defaults to 0).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL4

Mode index for pressure variation along the height (defaults to 0).

Label = CIRC:

VAL1

Radius of the circular duct.

VAL2

Not used.

VAL3

Mode index for pressure variation along the azimuth (defaults to 0).

VAL4

Mode index for pressure variation along the radii (defaults to 0).

Label = COAX:

VAL1

Inner radius of the coaxial duct.

VAL2

Outer radius of the coaxial duct.

VAL3

Mode index for pressure variation along the azimuth (defaults to 0).

VAL4

Mode index for pressure variation along the radii (defaults to 0).

Notes

Use the **APORT (p. 170)** command to launch a specified analytic acoustic mode into a guided duct.

The low-order FLUID30 element does not support the higher modes in the coaxial duct (*Label* = COAX).

For more information, see Specified Mode Excitation in an Acoustic Duct in the *Acoustic Analysis Guide*, and Analytic Port Modes in a Duct in the *Mechanical APDL Theory Reference*.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

APPEND, *LSTEP*, *SBSTEP*, *FACT*, *KIMG*, *TIME*, *ANGLE*, *NSET*

Reads data from the results file and appends it to the database.

POST1 (p. 51): Set Up (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LSTEP

Load step number of the data set to be read. Defaults to 1. If FIRST, ignore *SBSTEP* and *TIME* and read the first data set. If LAST, ignore *SBSTEP* and *TIME* and read the last data set. If NEXT, ignore *SBSTEP* and *TIME* and read the next data set. If already at the last data set, the next set is the first data set. If NEAR, ignore *SBSTEP* and read the data set nearest to *TIME*. If *TIME* is blank, read the first data set. If LIST, scan the results file to produce a summary of each load step (*FACT*, *KIMG*, *TIME* and *ANGLE* are ignored).

SBSTEP

Substep number (within *LSTEP*) (defaults to last substep of load step). For the Buckling (**ANTYPE (p. 162)**,BUCKLE) or Modal (**ANTYPE (p. 162)**,MODAL) analysis, the substep corresponds to the mode number (defaults to first mode). If *LSTEP* = LIST, *SBSTEP* = 0 or 1 will list the basic load step information; *SBSTEP* = 2 will also list the load step title, and label the imaginary data sets if they exist.

FACT

Scale factor applied to data read from the file. If zero (or blank), a value of 1.0 is used. Harmonic velocities or accelerations may be calculated from the displacement results from a modal or harmonic (**ANTYPE (p. 162)**,HARMIC) analyses. If *FACT* = VELO, the harmonic velocities (v) are calculated from the displacements (d) at a particular frequency (f) according to the relationship $v = 2 \pi f d$. Similarly, if *FACT* = ACEL, the harmonic accelerations (a) are calculated as $a = (2 \pi f)^2 d$.

KIMG

Used only with results from complex analyses:

0

Store real part of complex solution.

1

Store imaginary part.

TIME

Time-point identifying the data set to be read. For harmonic analyses, time corresponds to the frequency. For the buckling analysis, time corresponds to the load factor. Used only in the following cases: If *LSTEP* is NEAR, read the data set nearest to *TIME*. If both *LSTEP* and *SBSTEP* are zero (or blank), read data set at time = *TIME*. If *TIME* is between two solution time points on the results file, a linear interpolation is done between the two data sets. Solution items not written to the results

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

file (**OUTRES (p. 1336)**) for either data set will result in a null item after data set interpolation. If *TIME* is beyond the last time point on the file, the last time point is used.

ANGLE

Circumferential location (0° to 360°). Defines the circumferential location for the harmonic calculations used when reading from the results file. The harmonic factor (based on the circumferential angle) is applied to the harmonic elements (PLANE25, PLANE75, PLANE78, PLANE83, and SHELL61) of the load case. See the *Mechanical APDL Theory Reference* for details. Note that factored values of applied constraints and loads will overwrite any values existing in the database.

NSET

Data set number of the data set to be read. If a positive value for *NSET* is entered, *LSTEP*, *SBSTEP*, *KIMG*, and *TIME* are ignored. Available set numbers can be determined by **APPEND (p. 173)**,LIST. To determine if data sets are real or imaginary, issue **APPEND (p. 173)**,LIST,2 which labels imaginary data sets.

Notes

Reads a data set from the results file and appends it to the existing data in the database for the selected model only. The existing database is not cleared (or overwritten in total), allowing the requested results data to be merged into the database. Various operations may also be performed during the read operation. The database must have the model geometry available (or used the **RESUME (p. 1601)** command before the **APPEND (p. 173)** command to restore the geometry from `File.db`).

Main Menu>General Postproc>Read Results>By Time/Freq

APTN, *NA1*, *NA2*, *NA3*, *NA4*, *NA5*, *NA6*, *NA7*, *NA8*, *NA9*

Partitions areas.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1, NA2, NA3, . . . , NA9

Numbers of areas to be operated on. If *NA1* = ALL, *NA2* to *NA9* are ignored and all selected areas are used. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may be substituted for *NA1*.

Notes

Partitions areas that intersect. This command is similar to the combined functionality of the **ASBA (p. 186)** and **AOVLAP (p. 169)** commands. If the intersection of two or more areas is an area (that is, planar),

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

new areas will be created with boundaries that conform to the area of intersection and to the boundaries of the non-intersecting portions of the input areas (**AOVLAP (p. 169)**). If the intersection is a line (that is, not planar), the areas will be subtracted, or divided, along the line(s) of intersection (**ASBA (p. 186)**). Both types of intersection can occur during a single **APTN (p. 174)** operation. Areas that do not intersect will not be modified. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Partition>Areas

---

ARCLEN, *Key*, *MAXARC*, *MINARC*

Activates the arc-length method.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Arc-length key:

OFF

Do not use the arc-length method (default).

ON

Use the arc-length method.

MAXARC

Maximum multiplier of the reference arc-length radius (default = 25).

MINARC

Minimum multiplier of the reference arc-length radius (default = 1/1000).

Notes

Activates the arc-length method and sets the minimum and maximum multipliers for controlling the arc-length radius based on the initial arc-length radius.

The initial arc-length radius, t_0, is proportional (in absolute value) to the initial load factor. The initial load factor is given by:

Initial Load Factor = *TIME* / *NSBSTP*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

where *TIME* is the time specified by the **TIME (p. 2000)** command for the arc-length load step, and *NSBSTP* is the number of substeps specified by the **NSUBST (p. 1287)** command.

The factors *MAXARC* and *MINARC* are used to define the range for the arc-length radius to expand and shrink during the substep solution:

t_{MAX} = *MAXARC* * t_0

t_{MIN} = *MINARC* * t_0

In each substep, the arc-length radius is kept constant throughout the equilibrium iterations. After each converged substep, the arc-length radius for the next substep is modified depending on the convergence behavior. If the substep converges and the program heuristic predicts an easy convergence, the arc-length radius is enlarged. If the enlarged value is greater than t_{MAX}, the arc-length radius is reset to t_{MAX}. If the substep does not converge, bisection will take place until the arc-length radius is reduced to t_{MIN}. If further nonconvergence is encountered, the solution terminates.

The arc-length method predicts the next time increment (that is, load factor increment). Therefore, the **AUTOTS (p. 207)** and **PRED (p. 1476)** commands are ignored when the arc-length method is used.

The **STABILIZE (p. 1858)** and **LNSRCH (p. 1057)** commands are also ignored.

The arc-length method cannot be used in a multiframe restart.

For difficult problems, one suggestion is to increase the initial number of substeps (**NSUBST (p. 1287)**), and to prevent the arc-length radius from increasing too rapidly (*MAXARC* = 1).

ARCLEN (p. 175) cannot be used for any load step that has no applied load or displacement.

The arc-length method does not support tabular loads. In order to use the arc-length method, you must replace tabular loads by other load types and then run the analysis again.

The arc-length method can only be used with the sparse solver (**EQSLV (p. 648)**,SPARSE). If any other solver is specified, the solver method is automatically changed to sparse, and a warning message is issued to notify you.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Sol'n Controls>Advanced NL

Main Menu>Preprocessor>Loads>Load Step Opts>Nonlinear>Arc-Length Opts

Main Menu>Solution>Analysis Type>Sol'n Controls>Advanced NL

Main Menu>Solution>Load Step Opts>Nonlinear>Arc-Length Opts

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ARCTRM, *Lab*, *VAL*, *NODE*, *DOF*

Controls termination of the solution when the arc-length method is used.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Specifies the basis of solution termination:

OFF

Does not use **ARCTRM (p. 177)** to terminate analysis (default).

L

Terminates the analysis if the first limit point has been reached. The first limit point is that point in the response history when the tangent stiffness matrix becomes singular (that is, the point at which the structure becomes unstable). If *Lab* = L, arguments *VAL*, *NODE*, *DOF* are ignored.

U

Terminates the analysis when the displacement first equals or exceeds the maximum desired value.

VAL

Maximum desired displacement (absolute value). Valid only if *Lab* = U. The analysis terminates whenever the calculated displacement first equals or exceeds this value. For rotational degrees of freedom, *VAL* must be in radians (not degrees).

NODE

Node number corresponding to displacement used to compare with displacement specified by *VAL*. If blank, the maximum displacement will be used. Valid only if *Lab* = U.

DOF

Valid degree of freedom label for nodal displacement specified by *NODE*. Valid labels are UX, UY, UZ, ROTX, ROTY, ROTZ. Valid only if *NODE*>0 and *Lab* = U.

Notes

The **ARCTRM (p. 177)** command is valid only when the arc-length method (**ARCLEN (p. 175)**,ON) is used.

It can be convenient to use this command to terminate the analysis when the first limit point is reached. In addition, the **NCNV (p. 1210)** command should be used to limit the maximum number of iterations. If the **ARCTRM (p. 177)** command is not used, and the applied load is so large that the solution path can never reach that load, the arc-length solution will continue to run until a CPU time limit or a "maximum number of iterations" is reached.

Main Menu>Solution>Load Step Opts>Nonlinear>Arc-Length Opts

AREAS

Specifies "Areas" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

This command cannot be accessed from a menu.

AREFINE, *NA1*, *NA2*, *NINC*, *LEVEL*, *DEPTH*, *POST*, *RETAIN*

Refines the mesh around specified areas.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1*, *NA2*, *NINC

Areas (*NA1* to *NA2* in increments of *NINC*) around which the mesh is to be refined. *NA2* defaults to *NA1*, and *NINC* defaults to 1. If *NA1* = ALL, *NA2* and *NINC* are ignored and all selected areas are used for refinement. If *NA1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NA1* (*NA2* and *NINC* are ignored).

LEVEL

Amount of refinement to be done. Specify the value of *LEVEL* as an integer from 1 to 5, where a value of 1 provides minimal refinement, and a value of 5 provides maximum refinement (defaults to 1).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DEPTH

Depth of mesh refinement in terms of the number of elements outward from the indicated areas (defaults to 1).

POST

Type of postprocessing to be done after element splitting, in order to improve element quality:

OFF

No postprocessing will be done.

SMOOTH

Smoothing will be done. Node locations may change.

CLEAN

Smoothing and cleanup will be done. Existing elements may be deleted, and node locations may change (default).

RETAIN

Flag indicating whether quadrilateral elements must be retained in the refinement of an all-quadrilateral mesh. (The Mechanical APDL program ignores the *RETAIN* argument when you are refining anything other than a quadrilateral mesh.)

ON

The final mesh will be composed entirely of quadrilateral elements, regardless of the element quality (default).

OFF

The final mesh may include some triangular elements in order to maintain element quality and provide transitioning.

Notes

AREFINE (p. 178) performs local mesh refinement around the specified areas. By default, the indicated elements are split to create new elements with 1/2 the edge length of the original elements (*LEVEL* = 1).

AREFINE (p. 178) refines all area elements and tetrahedral volume elements that are adjacent to the specified areas. Any volume elements that are adjacent to the specified areas, but are not tetrahedra (for example, hexahedra, wedges, and pyramids), are not refined.

You cannot use mesh refinement on a solid model that contains initial conditions at nodes (**IC (p. 921)**), coupled nodes (**CP (p. 421)** family of commands), constraint equations (**CE (p. 297)** family of commands), or boundary conditions or loads applied directly to any of its nodes or elements. This applies to nodes and elements anywhere in the model, not just in the region where you want to request mesh refinement. See Revising Your Model in the *Modeling and Meshing Guide* for additional restrictions on mesh refinement.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Modify Mesh>Refine At>Areas

AREMESH, *LCOMB*, *ANGLE*

Generates an area in which to create a new mesh for rezoning.

SOLUTION (p. 38): Rezoning (p. 46)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LCOMB

Specifies how to combine adjacent line segments:

0

Line segments combined by connecting ends to ends. This value is the default.

-1

No line segments combined.

ANGLE

The maximum angle (in degrees) allowed for connecting two line segments together. The default value is 30. This value is valid only when *LCOMB* = 0.

Notes

Issue the **AREMESH (p. 180)** command *after* issuing a **REMESH (p. 1581)**,START command and *before* issuing a **REMESH (p. 1581)**,FINISH command.

The **AREMESH (p. 180)** command cannot account for an open area (or "hole") inside a completely enclosed region. Instead, try meshing around an open area by selecting two adjoining regions; for more information, see Hints for Remeshing Multiple Regions .

Menu Paths

Main Menu>Solution>Manual Rezoning>Create Remesh Zone(s)>Create Rezone Area

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AREVERSE, *ANUM*, *NOEFLIP*

Reverses the normal of an area, regardless of its connectivity or mesh status.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ANUM

Area number of the area whose normal is to be reversed. If *ANUM* = ALL, the normals of all selected areas will be reversed. If *ANUM* = P, graphical picking is enabled. A component name may also be substituted for *ANUM*.

NOEFLIP

Indicates whether you want to change the normal direction of the existing elements on the reversed area(s) so that they are consistent with each area's new normal direction.

0

Make the normal direction of existing elements on the reversed area(s) consistent with each area's new normal direction (default).

1

Do not change the normal direction of existing elements on the reversed area(s).

Notes

You cannot use the **AREVERSE (p. 181)** command to change the normal direction of any element that has a body or surface load. We recommend that you apply all of your loads only *after* ensuring that the element normal directions are acceptable. Also, you cannot use this command to change the normal direction for areas attached to volumes because IGES and ANF data is unchanged by reversal. Reversed areas that are attached to volumes need to be reversed again when imported.

Real constants (such as nonuniform shell thickness and tapered beam constants) may be invalidated by an element reversal.

See Revising Your Model in the *Modeling and Meshing Guide* for more information.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Reverse Normals>of Areas

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AROTAT, *NL1*, *NL2*, *NL3*, *NL4*, *NL5*, *NL6*, *PAX1*, *PAX2*, *ARC*, *NSEG*

Generates cylindrical areas by rotating a line pattern about an axis.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1, NL2, NL3, . . . , NL6

List of lines in the pattern to be rotated (6 maximum if using keyboard entry of *NL1* to *NL6*). The lines must lie in the plane of the axis of rotation. If *NL1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). If *NL1* = ALL, all selected lines will define the pattern to be rotated. A component name may also be substituted for *NL1*.

PAX1, PAX2

Keypoints defining the axis about which the line pattern is to be rotated.

ARC

Arc length (in degrees). Positive follows right-hand rule about *PAX1-PAX2* vector. Defaults to 360°.

NSEG

Number of areas (8 maximum) around circumference. Defaults to minimum number required for 90° -maximum arcs, that is, 4 for 360°, 3 for 270°, etc.

Notes

Generates cylindrical areas (and their corresponding keypoints and lines) by rotating a line pattern (and its associated keypoint pattern) about an axis. Keypoint patterns are generated at regular angular locations, based on a maximum spacing of 90°. Line patterns are generated at the keypoint patterns. Arc lines are also generated to connect the keypoints circumferentially. Keypoint, line, and area numbers are automatically assigned, beginning with the lowest available values (**NUMSTR (p. 1301)**). Adjacent lines use a common keypoint. Adjacent areas use a common line.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Extrude>Lines>About Axis

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ARSCALE, *NA1*, *NA2*, *NINC*, *RX*, *RY*, *RZ*, *KINC*, *NOELEM*, *IMOVE*

Generates a scaled set of areas from a pattern of areas.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1*, *NA2*, *NINC

Set of areas, *NA1* to *NA2* in steps of *NINC*, that defines the pattern to be scaled. *NA2* defaults to *NA1*, *NINC* defaults to 1. If *NA1* = ALL, *NA2* and *NINC* are ignored and the pattern is defined by all selected areas. If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1* (*NA2* and *NINC* are ignored).

RX*, *RY*, *RZ

Scale factors to be applied to the X, Y, and Z keypoint coordinates in the active coordinate system. (*RR*, *R* θ, *RZ* for cylindrical; *RR*, *R* θ, *R* Φ for spherical). Note that the *R* θ and *R* Φ scale factors are interpreted as angular *offsets*. For example, if CSYS = 1, *RX*, *RY*, *RZ* input of (1.5,10,3) would scale the specified keypoints 1.5 times in the radial and 3 times in the Z direction, while adding an offset of 10 degrees to the keypoints. Zero, blank, or negative scale factor values are assumed to be 1.0. Zero or blank angular offsets have no effect.

KINC

Increment to be applied to keypoint numbers for generated set. If zero, the lowest available keypoint numbers will be assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies whether nodes and elements are also to be generated:

0

Nodes and elements associated with the original areas will be generated (scaled) if they exist.

1

Nodes and elements will *not* be generated.

IMOVE

Specifies whether areas will be moved or newly defined:

0

Additional areas will be generated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Original areas will be *moved* to new position (*KINC* and *NOELEM* are ignored). Use only if the old areas are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Generates a scaled set of areas (and their corresponding keypoints, lines, and mesh) from a pattern of areas. The MAT, TYPE, REAL, and ESYS attributes are based on the areas in the pattern and not the current settings. Scaling is done in the active coordinate system. Areas in the pattern could have been generated in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Scale>Areas

ARSYM, *Ncomp*, *NA1*, *NA2*, *NINC*, *KINC*, *NOELEM*, *IMOVE*

Generates areas from an area pattern by symmetry reflection.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ncomp

Symmetry key:

X

X symmetry (default).

Y

Y symmetry.

Z

Z symmetry.

NA1*, *NA2*, *NINC

Reflect areas from pattern beginning with *NA1* to *NA2* (defaults to *NA1*) in steps of *NINC* (defaults to 1). If *NA1* = ALL, *NA2* and *NINC* are ignored and the pattern is all selected areas (**ASEL (p. 192)**). If *Ncomp* = P, use graphical picking to specify areas and ignore *NL2* and *NINC*. A component name may also be substituted for *NA1* (*NA2* and *NINC* are ignored).

KINC

Keypoint increment between sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NOELEM

Specifies whether nodes and elements are also to be generated:

0

Generate nodes and elements associated with the original areas, if they exist.

1

Do not generate nodes and elements.

IMOVE

Specifies whether areas will be moved or newly defined:

0

Generate additional areas.

1

Move original areas to new position retaining the same keypoint numbers (*KINC* and *NOELEM* are ignored). Valid only if the old areas are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Generates a reflected set of areas (and their corresponding keypoints, lines and mesh) from a given area pattern by a symmetry reflection (see analogous node symmetry command, **NSYM (p. 1289)**). The MAT, TYPE, REAL, ESYS, and SECNUM attributes are based upon the areas in the pattern and not upon the current settings. Reflection is done in the active coordinate system by changing a particular coordinate sign. The active coordinate system must be a Cartesian system. Areas in the pattern may have been generated in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended. Areas are generated as described in the **AGEN (p. 107)** command.

See the **ESYM (p. 684)** command for additional information about symmetry elements.

Menu Paths

Main Menu>Preprocessor>Modeling>Reflect>Areas

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ASBA, *NA1*, *NA2*, *SEP0*, *KEEP1*, *KEEP2*

Subtracts areas from areas.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1

Area (or areas, if picking is used) to be subtracted from. If ALL, use all selected areas. Areas specified in this argument are not available for use in the *NA2* argument. If P, graphical picking is enabled (valid only in the GUI) and remaining fields are ignored. A component name may also be substituted for *NA1*.

NA2

Area (or areas, if picking is used) to subtract. If ALL, use all selected areas (except those included in the *NA1* argument). A component name may also be substituted for *NA2*.

SEP0

Behavior if the intersection of the *NA1* areas and the *NA2* areas is a line or lines:

(blank)

The resulting areas will share line(s) where they touch.

SEPO

The resulting areas will have separate, but coincident line(s) where they touch.

KEEP1

Specifies whether *NA1* areas are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NA1* areas after **ASBA (p. 186)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NA1* areas after **ASBA (p. 186)** operation (override **BOPTN (p. 269)** command settings).

KEEP2

Specifies whether *NA2* areas are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DELETE

Delete *NA2* areas after **ASBA (p. 186)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NA2* areas after **ASBA (p. 186)** operation (override **BOPTN (p. 269)** command settings).

Notes

Generates new areas by subtracting the regions common to both *NA1* and *NA2* areas (the intersection) from the *NA1* areas. The intersection can be an area(s) or line(s). If the intersection is a line and *SEP0* is blank, the *NA1* area is divided at the line and the resulting areas will be connected, sharing a common line where they touch. If *SEP0* is set to SEPO, *NA1* is divided into two unconnected areas with separate lines where they touch. See Solid Modeling in the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated. **ASBA (p. 186)**,ALL,ALL will have no effect since all the areas (in *NA1*) will be unavailable as *NA2* areas.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Subtract>With Options>Areas

---

ASBL, *NA*, *NL*, - - , *KEEPA*, *KEEPL*

Subtracts lines from areas.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA

Area (or areas, if picking is used) to be subtracted from. If ALL, use all selected areas. If P, graphical picking is enabled (valid only in the GUI) and remaining fields are ignored. A component name may also be substituted for *NA*.

NL

Line (or lines, if picking is used) to subtract. If ALL, use all selected lines. A component name may also be substituted for *NL*.

- -

Unused field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KEEPA

Specifies whether *NA* areas are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NA* areas after **ASBL (p. 187)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NA* areas after **ASBL (p. 187)** operation (override **BOPTN (p. 269)** command settings).

KEEPL

Specifies whether *NL* lines are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NL* lines after **ASBL (p. 187)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NL* lines after **ASBL (p. 187)** operation (override **BOPTN (p. 269)** command settings).

Notes

Generates new areas by subtracting the regions common to both the areas and lines (the intersection) from the *NA* areas. The intersection will be a line(s). See Solid Modeling in the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>Area by Line

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>With Options>Area by Line

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ASBV, *NA*, *NV*, *SEPO*, *KEEPA*, *KEEPV*

Subtracts volumes from areas.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA

Area (or areas, if picking is used) to be subtracted from. If ALL, use all selected areas. If P, graphical picking is enabled (valid only in the GUI) and remaining fields are ignored. A component name may also be substituted for *NA*.

NV

Volume (or volumes, if picking is used) to subtract. If ALL, use all selected volumes. A component name may also be substituted for *NV*.

SEPO

Behavior if the intersection of the areas and the volumes is a line or lines:

(blank)

The resulting areas will share line(s) where they touch.

SEPO

The resulting areas will have separate, but coincident line(s) where they touch.

KEEPA

Specifies whether *NA* areas are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NA* areas after **ASBV (p. 189)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NA* areas after **ASBV (p. 189)** operation (override **BOPTN (p. 269)** command settings).

KEEPV

Specifies whether *NV* volumes are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DELETE

Delete volumes after **ASBV (p. 189)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep volumes after **ASBV (p. 189)** operation (override **BOPTN (p. 269)** command settings).

Notes

Generates new areas by subtracting the regions common to both *NA* areas and *NV* volumes (the intersection) from the *NA* areas. The intersection can be an area(s) or line(s). If the intersection is a line and *SEPO* is blank, the *NA* area is divided at the line and the resulting areas will be connected, sharing a common line where they touch. If *SEPO* is set to SEPO, *NA* is divided into two unconnected areas with separate lines where they touch. See Solid Modeling in the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>Area by Volume

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>With Options>Area by Volume

Main Menu>Preprocessor>Modeling>Operate>Divide>Area by Volu

ASBW, *NA*, *SEPO*, *KEEP*

Subtracts the intersection of the working plane from areas (divides areas).

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA

Area (or areas, if picking is used) to be subtracted from. If *NA* = ALL, use all selected areas. If *NA* = P, graphical picking is enabled (valid only in the GUI). A component name may also be input for *NA*.

SEPO

Behavior of the created boundary.

(blank)

The resulting areas will share line(s) where they touch.

SEPO

The resulting areas will have separate, but coincident line(s).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KEEP

Specifies whether *NA* areas are to be deleted.

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NA* areas after **ASBW (p. 190)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NA* areas after **ASBW (p. 190)** operation (override **BOPTN (p. 269)** command settings).

Notes

Generates new areas by subtracting the intersection of the working plane from the *NA* areas. The intersection will be a line(s). The working plane must not be in the same plane as the *NA* area(s). If *SEPO* is blank, the *NA* area is divided at the line and the resulting areas will be connected, sharing a common line where they touch. If *SEPO* is set to SEPO, *NA* is divided into two unconnected areas with separate lines. The SEPO option may cause unintended consequences if any keypoints exist along the cut plane. See Solid Modeling in the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Issuing the **ASBW (p. 190)** command under certain conditions may generate a topological degeneracy error. Do not issue the command if:

- A sphere or cylinder has been scaled. (A cylinder must be scaled unevenly in the XY plane.)
- A sphere or cylinder has not been scaled but the work plane has been rotated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Divide>Area by WrkPlane

Main Menu>Preprocessor>Modeling>Operate>Divide>Area by WrkPlane

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ASCRES, *Opt*

Specifies the output type for an acoustic scattering analysis.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Opt

Output option:

TOTAL

Output the total pressure field (default).

SCAT

Output the scattered pressure field.

Notes

Use the **ASCRES (p. 192)** command to specify the output type for an acoustic scattering analysis.

The scattered option (*Opt* = SCAT) provides a scattered pressure output, p_{sc}, required for calculating target strength (TS).

The default behavior (*Opt* = TOTAL) provides a sum of the incident and scattering fields, $p^{total} = p^{inc} + p^{sc}$.

Issue the **AWAVE (p. 213)** command to define the incident pressure p^{inc}. If the **AWAVE (p. 213)** command is defined with *Opt2* = INT, only the total pressure field is output regardless of the **ASCRES (p. 192)**,*Opt* command.

Menu Paths

This command cannot be accessed from a menu.

ASEL, *Type*, *Item*, *Comp*, *VMIN*, *VMAX*, *VINC*, *KSWP*

Selects a subset of areas.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

S

Select a new set (default)

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

ALL

Restore the full set.

NONE

Unselect the full set.

INVE

Invert the current set (selected becomes unselected and vice versa).

STAT

Display the current select status.

The following fields are used only with *Type* = S, R, A, or U:

Item

Label identifying data. Valid item labels are shown in Table 103: ASEL - Valid Item and Component Labels (p. 195). Some items also require a component label. If *Item* = PICK (or simply "P"), graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). Defaults to AREA.

Comp

Component of the item (if required). Valid component labels are shown in Table 103: ASEL - Valid Item and Component Labels (p. 195).

VMIN

Minimum value of item range. Ranges are area numbers, coordinate values, attribute numbers, etc., as appropriate for the item. A component name (as specified on the **CM (p. 356)** command) may also be substituted for *VMIN* (*VMAX* and *VINC* are ignored). If *Item* = MAT, TYPE, REAL, or ESYS and if *VMIN* is positive, the absolute value of *Item* is compared against the range for selection; if *VMIN* is negative, the signed value of *Item* is compared. See the **ALIST (p. 113)** command for a discussion of signed attributes.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VMAX

Maximum value of item range. *VMAX* defaults to *VMIN*.

VINC

Value increment within range. Used only with integer ranges (such as for area numbers). Defaults to 1. *VINC* cannot be negative.

KSWP

Specifies whether only areas are to be selected:

0

Select areas only.

1

Select areas, as well as keypoints, lines, nodes, and elements associated with selected areas. Valid only with *Type* = S.

Command Default

All areas are selected.

Notes

Selects a subset of areas. For example, to select those areas with area numbers 1 through 7, use **ASEL (p. 192)**,S,AREA,,1,7. The selected subset is then used when the ALL label is entered (or implied) on other commands, such as **ALIST (p. 113)**,ALL. Only data identified by area number are selected. Data are flagged as selected and unselected; no data are actually deleted from the database.

In a cyclic symmetry analysis, area hot spots can be modified. Consequently, the result of an area selection may be different before and after the **CYCLIC (p. 462)** command.

If *Item* = ACCA, the command selects only those areas that were created by concatenation. The *KSWP* field is processed, but the *Comp*, *VMIN*, *VMAX*, and *VINC* fields are ignored.

This command is valid in any processor.

For Selects based on non-integer numbers (coordinates, results, etc.), items that are within the range VMIN-*Toler* and VMAX+*Toler* are selected. The default tolerance *Toler* is based on the relative values of VMIN and VMAX as follows:

- If VMIN = VMAX, *Toler* = 0.005 x VMIN.
- If VMIN = VMAX = 0.0, *Toler* = 1.0E-6.
- If VMAX ≠ VMIN, *Toler* = 1.0E-8 x (VMAX-VMIN).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Use the **SELTOL (p. 1710)** (p. 1710) command to override this default and specify *Toler* explicitly.

Table 103: ASEL - Valid Item and Component Labels

Valid Item and Component Labels ASEL (p. 192), *Type*	*Item*, *Comp*, *VMIN*, *VMAX*, *VINC*, *KSWP*	
Item	**Comp**	**Description**
AREA		Area number.
EXT		Area numbers on exterior of selected volumes (ignore remaining fields).
LOC	X, Y, Z	X, Y, or Z center (picking "hot spot" location in the active coordinate system).
HPT		Area number (selects only areas with associated hard points).
MAT		Material number associated with the area.
TYPE		Element type number associated with the area.
REAL		Real constant set number associated with the area.
ESYS		Element coordinate system associated with the area.
SECN		Section number associated with the area.
ACCA		Concatenated areas (selects only areas that were created by area concatenation (**ACCAT (p. 90)**)).

Menu Paths

Utility Menu>Select>Entities

ASIFILE, *Opt*, *Fname*, *Ext*, *Oper*, *kDim*, *kOut*, *LIMIT*, --, *ResOpt*

Writes or reads one-way acoustic-structural coupling data.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Opt

Command behavior option:

WRITE

Write the structural results to the specified file.

READ

Read the structural results from the specified file. This option is invalid during **/POST1 (p. 1461)** postprocessing.

Fname

File name and directory path of a one-way acoustic-structural coupling data file (248 characters maximum, including the characters needed for the directory path). An unspecified directory path

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

defaults to the working directory; in this case, you can use all 248 characters for the file name (defaults to `jobname`).

Ext

File name extension of the one-way acoustic-structural coupling data file (defaults to `.asi`).

Oper

Command operation:

NOMAP

No mapping occurs between the structural and acoustic models when reading the structural results from the specified file (default).

MAP

Maps the results from the structural to the acoustic model. (See "Notes" (p. 197).)

kDim

Interpolation criteria. Valid only when *Oper* = MAP.

If *kDim* = 2 or 0, two-dimensional interpolation is applied (that is, interpolate occurs on a surface).

kOut

Outside region results. Valid only when *Oper* = MAP.

If *kOut* = 0, use the value(s) of the nearest region point for points outside of the region.

If *kOut* = 1, set results extrapolated outside of the region to zero.

LIMIT

Number of nearby nodes considered for interpolation. Valid only when *Oper* = MAP.

Minimum = 5. Default = 20.

Lower values reduce processing time; however, some distorted or irregular meshes require a higher value to encounter three nodes for triangulation.

--

Unused field.

ResOpt

Transient results option:

ACEL

Output or input the particle acceleration in a transient analysis (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VELO

Output or input the particle velocity in a transient analysis.

Notes

The **ASIFILE (p. 195)** command writes to, or reads from, a file containing one-way acoustic-structural coupling data.

Results data on the one-way coupling interface (defined by the **SF (p. 1733)**,,FSIN command) in the structural model are written to the one-way coupling result data file during the structural solution.

By default, one-way coupling results data are read into the acoustic model as the velocity (harmonic) or acceleration (transient) excitation during the sequential acoustic solution. If the transient is to be solved with the velocity potential formulation in acoustics, set *ResOpt* = VELO to write/read the results data as velocity excitation.

If *Oper* = NOMAP, both structural and acoustic models must share the same node number on the one-way coupling interface.

If *Oper* = MAP:

- The one-way coupling interface must be defined in the acoustic model (**SF (p. 1733)**,,FSIN) such that it corresponds to the field-surface interface number (FSIN) in the structural model.
- The output points are correct only if they are within the boundaries set via the specified input points.
- Calculations for out-of-bound points require much more processing time than do points that are within bounds.
- For each point in the acoustic destination mesh, the command searches all possible triangles in the structural source mesh to find the best triangle containing each point, then performs a linear interpolation inside this triangle. For faster and more accurate results, consider your interpolation method and search criteria carefully (see *LIMIT*).

You can also write an `.asi` file during postprocessing of the structural model. In the POST1 postprocessor (**/POST1 (p. 1461)**), issue the command **ASIFILE (p. 195)**,WRITE,*Fname*,*Ext* to output results on selected surface nodes of the structural model. In the subsequent acoustic analysis, apply the **SF (p. 1733)**,,FSIN,1 command on the selected nodes of the acoustic model, and issue the **ASIFILE (p. 195)**,READ,*Fname*,*Ext* command to read the `.asi` file.

One-way coupling excitation can be applied to multiple frequencies or time steps.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ASKIN, *NL1*, *NL2*, *NL3*, *NL4*, *NL5*, *NL6*, *NL7*, *NL8*, *NL9*

Generates an area by "skinning" a surface through guiding lines.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

The first guiding line forming the skinned area. If *NL1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NL1*. If *NL1* is negative, the line beginnings and ends will be used to direct the skinning of the remaining lines (see "Changing the ASKIN Algorithm" (p. 198) below).

NL2, NL3, NL4, . . . , NL9

The additional guiding lines for the skinned area (up to 9 total lines, including *NL1*, if using keyboard entry). If negative (and *NL1* is negative), the line beginning and end will be temporarily interchanged for the skinning operation (see "Changing the ASKIN Algorithm" (p. 198) below).

Notes

Generates an area by "skinning" a surface through specified guiding lines. The lines act as a set of "ribs" over which a surface is "stretched." Two opposite edges of the area are framed by the first (*NL1*) and last (*NLn*) guiding lines specified. The other two edges of the area are framed by splines-fit lines which the program automatically generates through the ends of all guiding lines. The interior of the area is shaped by the interior guiding lines. Once the area has been created, only the four edge lines will be attached to it. In rare cases, it may be necessary to change the default algorithm used by the **ASKIN (p. 198)** command (see "Changing the ASKIN Algorithm" (p. 198) below).

Changing the **ASKIN (p. 198)** Algorithm

When skinning from one guiding line to the next, the program can create the transition area in one of two ways: one more spiraled and one less spiraled ("flatter"). By default, the program attempts to produce the flatter transition, instead of the more spiraled transition. This algorithm can be changed by inputting *NL1* as a negative number, in which case the program connects all the keypoints at the line "beginnings" (**/PSYMB (p. 1552)**,LDIR command) as one edge of the area, and all the line "ends" as the opposite edge, irrespective of the amount of spiraling produced in each transition area.

To further control the geometry of the area (if *NL1* is negative), the beginning and end of any specified line (other than *NL1*) can be temporarily interchanged (for the skinning operation only) by inputting that line number as negative. See Solid Modeling in the *Modeling and Meshing Guide* for an illustration.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Areas>Arbitrary>By Skinning

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ASLL, *Type*, *ARKEY*

Selects those areas containing the selected lines.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of area select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

ARKEY

Specifies whether all contained area lines must be selected (**LSEL (p. 1074)**):

0

Select area if any of its lines are in the selected line set.

1

Select area only if all of its lines are in the selected line set.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ASLV, *Type*

Selects those areas contained in the selected volumes.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of area select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

ASOL, *Lab*, *Opt*

Specifies the acoustic solver with scattered field formulation.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Acoustic solver specification (no default):

SCAT

Set acoustic solver to the scattered field formulation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Opt

Option identifying an acoustic solver status:

OFF

Deactivate the specified acoustic solver (default).

ON

Activate the specified acoustic solver.

Notes

Use the **ASOL (p. 200)** command to activate the specified acoustic solution process.

The scattered option (*Lab* = SCAT) sets the acoustic solver to the scattered-pressure field formulation.

Issue the **AWAVE (p. 213)** command to define the incident pressure p^{inc}. If the **AWAVE (p. 213)** command is defined with *Opt2* = INT, the acoustic solver is set to the scattered field formulation regardless of the **ASOL (p. 200)** command issued.

Menu Paths

This command cannot be accessed from a menu.

/**ASSIGN**,*Ident*,*Fname*,*Ext*,*--*,*LGkey*

Reassigns a file name to a Mechanical APDL file identifier.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ident

Mechanical APDL file name identifier. Valid identifiers are: cms, emat, erot, esav, full, LN07, LN09, LN11, LN20, LN21, LN22, LN25, LN31, LN32, mode, osav, rdsp , rmg, rst, rstp, rth, seld, and sscr. See File Management and Files for file descriptions. If blank, list currently reassigned files.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Ext

Filename extension (eight-character maximum).

--

Unused field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LGkey

Key to specify local or global file name control for the specified file identifier in a distributed-memory parallel processing run. For more information on local and global files, see File Handling Conventions in the *Parallel Processing Guide*.

BOTH

Reassign the file name for both the local and global files (default).

LOCAL

Reassign the file name for only the local files.

GLOBAL

Reassign the file name for only the global file.

Notes

The reassignment of file names is valid only if it is done before the file is used. All file reassignments are retained (not cleared) even if the database is cleared (**/CLEAR (p. 350)**) or the Jobname is changed (**/FILNAME (p. 757)**). Assigned files may be overwritten. If file name arguments (*Fname*, *Ext*, `--`) are blank, the default Mechanical APDL assignment is restored. Use **SEOPT (p. 1715)** for SUB files and **SEEXP (p. 1705)** for DSUB files.

This command is valid only at the Begin level.

This command also checks to ensure that the path/file is valid and can be written by the user. If it is not valid, an error message will be returned. Ensure that the directory exists prior to using **/ASSIGN (p. 201)** command.

Menu Paths

Utility Menu>File>File Options

ASUB, *NA1*, *P1*, *P2*, *P3*, *P4*

Generates an area using the shape of an existing area.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NA1

Existing area number whose shape is to be used. If *P1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI).

P1

Keypoint defining starting corner of area.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

P2

Keypoint defining second corner of area.

P3

Keypoint defining third corner of area.

P4

Keypoint defining fourth corner of area (defaults to *P3*).

Notes

The new area will overlay the old area. Often used when the area to be subdivided consists of a complex shape that was not generated in a single coordinate system. Keypoints and any corresponding lines must lie on the existing area. Missing lines are generated to lie on the given area. The active coordinate system is ignored.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Areas>Arbitrary>Overlaid on Area

---

ASUM, *LAB*

Calculates and prints geometry statistics of the selected areas.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LAB

Controls the degree of tessellation used in the calculation of area properties. If *LAB* = DEFAULT, area calculations will use the degree of tessellation set through the **/FACET (p. 731)** command. If *LAB* = FINE, area calculations are based on a finer tessellation.

Notes

Calculates and prints geometry statistics (area, centroid location, moments of inertia, volume, etc.) associated with the selected areas. **ASUM (p. 203)** should only be used on perfectly flat areas.

Geometry items are reported in the global Cartesian coordinate system. A unit thickness is assumed unless the areas have a non-zero total thickness defined by real constant or section data.

For layered areas, a unit density is always assumed. For single-layer areas, a unit density is assumed unless the areas have a valid material (density).

The thickness and density are associated to the areas via the **AATT (p. 85)** command.

Items calculated via **ASUM (p. 203)** and later retrieved via a ***GET (p. 797)** or ***VGET (p. 2118)** command are valid only if the model is not modified after issuing the **ASUM (p. 203)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Setting a finer degree of tessellation will provide area calculations with greater accuracy, especially for thin, hollow models. However, using a finer degree of tessellation requires longer processing.

For very narrow (sliver) areas, such that the ratio of the minimum to the maximum dimension is less than 0.01, the **ASUM (p. 203)** command can provide erroneous area information. To ensure that the calculations are accurate, subdivide such areas so that the ratio of the minimum to the maximum is at least 0.05.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Calc Geom Items>Of Areas

---

ATAN, *IR*, *IA*, - - , - - , *Name*, - - , - - , *FACTA*

Forms the arctangent of a complex variable.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to *NV* (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA

Reference number of the complex variable to be operated on.

- -, - -

Unused fields.

Name

Thirty-two character name for identifying the variable on the printout and displays. Embedded blanks are compressed upon output.

- -, - -

Unused fields.

FACTA

Scaling factor (positive or negative) applied to variable *IA* (defaults to 1.0). Usually *FACTA* should be set to 1. *FACTA* may affect the position of the angle by a multiple of π, resulting in a quadrant change.

Notes

Forms the arctangent of a complex variable according to the operation:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IR = ATAN(*FACTA* X *b*/*a*)

where *a* and *b* are the real and imaginary parts, respectively, of the complex variable *IA* (which is of the form *a* + *ib*). The arctangent represents the phase angle (in radians), and is valid only for a harmonic analysis (**ANTYPE (p. 162)**,HARMIC).

Since the scaling factor is applied uniformly to *b*/*a*, applying *any* positive or negative scaling factor will not affect the size of the phase angle, with the exception that a negative scaling factor will change the results quadrant by π. The magnitude of a complex number is still obtained through the **ABS (p. 89)** command. See POST26 - Data Operations in the *Mechanical APDL Theory Reference* for details.

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Arctangent

ATRAN, *KCNTO*, *NA1*, *NA2*, *NINC*, *KINC*, *NOELEM*, *IMOVE*

Transfers a pattern of areas to another coordinate system.

PREP7 (p. 22): Areas (p. 27)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCNTO

Reference number of coordinate system where the pattern is to be transferred. Transfer occurs from the active coordinate system. The coordinate system type and parameters of *KCNTO* must be the same as the active system.

NA1, NA2, NINC

Transfer area pattern beginning with *NA1* to *NA2* (defaults to *NA1*) in steps of *NINC* (defaults to 1). If *NA1* = ALL, *NA2* and *NINC* are ignored and the pattern is all selected areas (**ASEL (p. 192)**). If *NA1* = P, graphical picking is enabled and all remaining arguments are ignored (valid only in the GUI). A component name may also be substituted for *NA1* (*NA2* and *NINC* are ignored).

KINC

Keypoint increment between sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies whether elements and nodes are also to be generated:

0

Generate nodes and elements associated with the original areas, if they exist.

1

Do not generate nodes and elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IMOVE

Specifies whether to redefine the existing areas:

0

Generate additional areas.

1

Move original areas to new position retaining the same keypoint numbers (*KINC* and *NOELEM* are ignored). Valid only if the old areas are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Transfers a pattern of areas (and their corresponding lines, keypoints and mesh) from one coordinate system to another (see analogous node **TRANSFER (p. 2011)** command). The MAT, TYPE, REAL, and ESYS attributes are based upon the areas in the pattern and not upon the current settings. Coordinate systems may be translated and rotated relative to each other. Initial pattern may be generated in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended. Coordinate and slope values are interpreted in the active coordinate system and are transferred directly. Areas are generated as described in the **AGEN (p. 107)** command.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Transfer Coord>Areas

---

ATYPE

Specifies "Analysis types" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Analysis Type

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/AUTO, *WN*

Resets the focus and distance specifications to "automatically calculated."

GRAPHICS (p. 16): Views (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

Notes

Focus point and distance will be automatically calculated during next display. Settings may still be changed with the **/FOCUS (p. 771)** and **/DIST (p. 536)** commands after this command has been issued. See also the **/USER (p. 2061)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Pan, Zoom, Rotate

Utility Menu>PlotCtrls>View Settings>Automatic Fit Mode

AUTOTS, *Key*

Specifies whether to use automatic time stepping or load stepping.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Automatic time stepping key:

OFF

Do not use automatic time stepping.

ON

Use automatic time stepping (default).

AUTO

The program determines whether to use automatic time stepping (used by Workbench).

Command Default

Automatic time stepping is on by default.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Specifies whether to use automatic time stepping (or load stepping) over this load step. If *Key* = ON, both time step prediction and time step bisection will be used.

Bisection does not occur with **THOPT (p. 1997)**,QUASI since it uses only one equilibrium iteration per substep. To ensure bisection, use the iterative QUASI method (**THOPT (p. 1997)**,QUASI,,,,,,1).

You cannot use automatic time stepping (**AUTOTS (p. 207)**), line search (**LNSRCH (p. 1057)**), or the DOF solution predictor (**PRED (p. 1476)**) with the arc-length method (**ARCLEN (p. 175)**, **ARCTRM (p. 177)**). If you activate the arc-length method after you set **AUTOTS (p. 207)**, **LNSRCH (p. 1057)**, or **PRED (p. 1476)**, a warning message appears. If you choose to proceed with the arc-length method, the program disables your automatic time stepping, line search, and DOF predictor settings, and the time step size is controlled by the arc-length method internally.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Sol'n Controls>Basic

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>Time - Time Step

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>Time and Substeps

Main Menu>Solution>Analysis Type>Sol'n Controls>Basic

Main Menu>Solution>Load Step Opts>Time/Frequenc>Time and Substeps

---

/AUX2

Enters the binary file dumping processor.

AUX2 (p. 61): Binary File Dump (p. 61)
SESSION (p. 11): Processor Entry (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Enters the binary file-dumping processor (auxiliary processor AUX2), used for dumping the contents of certain Mechanical APDL binary files for visual examination.

This command is valid only at the Begin Level.

Menu Paths

Utility Menu>File>List>Binary Files

Utility Menu>List>Files>Binary Files

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/AUX3

Enters the results file editing processor.

AUX3 (p. 61): Results Files (p. 61)
SESSION (p. 11): Processor Entry (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Enters the results-file editing processor (auxiliary processor AUX3), used for editing Mechanical APDL results files.

A pending **DELETE (p. 513)** is processed when **FINISH (p. 758)** or **/EOF (p. 645)** is issued. To cancel a pending **DELETE (p. 513)**, issue **UNDELETE (p. 2052)**.

This command is valid only at the Begin Level.

Menu Paths

This command cannot be accessed from a menu.

/AUX12

Enters the radiation processor.

AUX12 (p. 62): General Radiation (p. 62)
SESSION (p. 11): Processor Entry (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Enters the radiation processor (auxiliary processor AUX12). This processor supports the Radiation Matrix and the Radiosity Solver methods.

This command is valid only at the Begin Level.

Menu Paths

Main Menu>Radiation Matrix

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/AUX15

Enters the IGES file transfer processor.

AUX15 (p. 63): IGES (p. 63)
POST1 (p. 51): Controls (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Enters the IGES file-transfer processor (auxiliary processor AUX15), used to read an IGES data file into the Mechanical APDL program.

This command is valid only at the Begin Level.

Menu Paths

Utility Menu>File>Import

AVPRIN, *KEY*, *EFFNU*

Specifies how principal and vector sums are to be calculated.

POST1 (p. 51): Controls (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Averaging key:

0

Average the component values from the elements at a common node, then calculate the principal or vector sum from the averaged components (default).

1

Calculate the principal or vector sum values on a per element basis, then average these values from the elements at a common node.

EFFNU

Effective Poisson's ratio used for computing the von Mises equivalent strain (EQV). This command option is intended for use with line elements or in load case operations (**LCOPER (p. 1026)**); the program automatically selects the most appropriate effective Poisson's ratio, as discussed below.

Command Default

Average components at common node before principal or vector sum calculation except for the von Mises equivalent strain (EQV), see below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Selects the method of combining components for certain derived nodal results when two or more elements connect to a common node. The methods apply to the calculations of derived nodal principal stresses, principal strains, and vector sums for selects, sorts, and output (**NSEL (p. 1266)**, **NSORT (p. 1283)**, **PRNSOL (p. 1505)**, **PLNSOL (p. 1425)**, etc.). The calculation of these nodal results excludes beam and pipe elements.

This command also defines the effective Poisson's ratio (*EFFNU*) used for equivalent strain calculations. If you use *EFFNU*, the default effective Poisson's ratios shown below will be overridden for all elements by the *EFFNU* value. To return to the default settings, issue the **RESET (p. 1598)** command. The default value for *EFFNU* is:

- Poisson's ratio as defined on the **MP (p. 1160)** commands for EPEL and EPTH
- 0.5 for EPPL and EPCR
- 0.5 if the referenced material is hyperelastic
- 0.0 for line elements (includes beam, link, and pipe elements, as well as discrete elements), cyclic symmetry analysis, mode superposition analyses (with *MSUPkey* = YES on the **MXPAND (p. 1203)** command), and load case operations (**LCOPER (p. 1026)**).
- For multistage analysis, a value of *EFFNU* must always be specified.

If *EFFNU* is specified, the calculation of von Mises equivalent strain (EQV) is performed according to the *KEY* setting. However, if *EFFNU* is not specified, or if the **AVPRIN (p. 210)** command is not issued, the von Mises equivalent strain is calculated using the average of the equivalent strains from the elements at a common node (behavior of *KEY* =1) irrespective of the value of the averaging KEY.

For a random vibration (PSD) analysis (for more details, see Review the Results in the *Structural Analysis Guide*):

- Issuing either **AVPRIN (p. 210)**,0 or **AVPRIN (p. 210)**,1 calculates the principal stresses using the appropriate averaging method. They are then used to determine SEQV. The output will have non-zero values for the principal stresses.
- If **AVPRIN (p. 210)** is not issued, the Segalman-Fulcher method is used to calculate SEQV. This method does not calculate principal stresses, but directly calculates SEQV from the component stresses; therefore, the output will have zero values for the principal stresses.

This command is also valid in POST26, where applicable.

See Combined Stresses and Strains in the *Mechanical APDL Theory Reference* for more information.

AVRES, *KEY*, *Opt*

Specifies how results data will be averaged when PowerGraphics is enabled.

POST1 (p. 51): Controls (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Averaging key.

1

Average results at all common subgrid locations.

2

Average results at all common subgrid locations except where material type (**MAT (p. 1111)**) discontinuities exist. (Default.)

3

Average results at all common subgrid locations except where real constant (**REAL (p. 1579)**) discontinuities exist.

4

Average results at all common subgrid locations except where material type (**MAT (p. 1111)**) or real constant (**REAL (p. 1579)**) discontinuities exist.

Opt

Option to determine how results data are averaged.

(blank)

Average surface results data using only the exterior element faces (default).

FULL

Average surface results data using the exterior face and interior element data.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **AVRES (p. 212)** command specifies how results data will be averaged at subgrid locations that are common to 2 or more elements. The command is valid only when PowerGraphics is enabled (via the **/GRAPHICS (p. 866)**,POWER command).

With PowerGraphics active (**/GRAPHICS (p. 866)**,POWER), the averaging scheme for surface data with interior element data included (**AVRES (p. 212)**,,FULL) and multiple facets per edge (**/EFACET (p. 602)**,2 or **/EFACET (p. 602)**,4) will yield differing minimum and maximum contour values depending on the Z-Buffering options (**/TYPE (p. 2034)**,,6 or **/TYPE (p. 2034)**,,7). When the Section data is not included in the averaging schemes (**/TYPE (p. 2034)**,,7), the resulting absolute value for the midside node is significantly smaller.

PowerGraphics does not average your stresses across discontinuous surfaces. The normals for various planes and facets are compared to a tolerance to determine continuity. The *ANGLE* value you specify in the **/EDGE (p. 594)** command is the tolerance for classifying surfaces as continuous or "coplanar."

The command affects nodal solution contour plots (**PLNSOL (p. 1425)**), nodal solution printout (**PRNSOL (p. 1505)**), and subgrid solution results accessed through the Query Results function (under General Postprocessing) in the GUI.

The command has no effect on the nodal degree of freedom solution values (UX, UY, UZ, TEMP, etc.).

For cyclic symmetry mode-superposition harmonic solutions, **AVRES (p. 212)**,,FULL is not supported. Additionally, averaging does not occur across discontinuous surfaces, and the *ANGLE* value on the **/EDGE (p. 594)** command has no effect.

The section-based (**MAT (p. 1111)**) discontinuity in shells is accommodated via **/ESHAPE (p. 665)**.

The command is also available in **/SOLU (p. 1821)**.

Menu Paths

Main Menu>General Postproc>Options for Outp

Utility Menu>List>Results>Options

AWAVE,*Wavenum*,*Wavetype*,*Opt1*,*Opt2*,*VAL1*,*VAL2*,*VAL3*,*VAL4*,*VAL5*,*VAL6*,*VAL7*,*VAL8*,*VAL9*,*VAL10*,*VAL11*,*VAL12*,*VAL13*

Specifies input data for an acoustic incident wave.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Wavenum

Wave number. You specify the integer number for an acoustic incident wave inside or outside the model. The number must be between 1 and 20.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Wavetype

Wave type:

PLAN

Planar incident wave

MONO

Monopole or pulsating sphere incident wave

DIPO

Dipole incident wave

BACK

Back enclosed loudspeaker

BARE

Bare loudspeaker

STATUS

Displays the status of the acoustic wave settings if *Wavenum* = a number between 1 and 20 or ALL.

DELE

Deletes the acoustic wave settings if *Wavenum* = a number between 1 and 20 or ALL.

Opt1

PRES

Pressure

VELO

Velocity

Opt2

EXT

Incident wave outside the model.

INT

Incident wave inside the model. This option is only available for pure scattered pressure formulation.

For *Wavetype* = PLAN, only *Opt2* = EXT is available.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL1, VAL2, VAL3, . . . , VAL13

If *Wavetype* = PLAN, MONO, DIPO, BACK, or BARE:

VAL1

Amplitude of pressure or normal velocity to the sphere surface.

VAL2

Phase angle of the applied pressure or velocity (in degrees). Defaults to 0 degrees.

If *Wavetype* = PLAN:

VAL3

Incident φ angle from x axis toward y axis.

VAL4

Incident θ angle from z axis toward y axis.

VAL5

Not used.

If *Wavetype* = MONO, DIPO, BACK, or BARE:

VAL3 - VAL5

Global Cartesian coordinate values of source position.

If *Wavetype* = PLAN, MONO, DIPO, BACK, or BARE:

VAL6

Mass density of base medium (defaults to 1.2041 kg/m3).

VAL7

Speed of sound in base medium (defaults to 343.24 m/s).

VAL8

Radius of pulsating sphere (not used for *Wavetype* = PLAN).

VAL9

Dipole length (only available for *Wavetype* = DIPO, BARE).

VAL10 - VAL12

Unit vector of dipole axis from the positive to the negative. Only available for *Wavetype* = DIPO, BARE.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL13

Port number if the incident power is required on the port

Notes

Use the **ASOL (p. 200)** command to activate the scattered field algorithm and the **ASCRES (p. 192)** command for output control with the scattered field algorithm. Refer to Acoustics in the *Theory Reference* for more information about pure scattered field formulation.

Menu Paths

This command cannot be accessed from a menu.

/AXLAB,*Axis*,*Lab*

Labels the X and Y axes on graph displays.

GRAPHICS (p. 16): Graphs (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Axis

Axis specifier:

X

Apply label to X axis.

Y

Apply label to Y axis.

Lab

Axis label (user defined text up to 30 characters long). Leave blank to reestablish the default for *Axis* axis.

Command Default

Labels are determined by the program.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Graphs>Modify Axes

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

B Commands

/BATCH, *Lab*

Sets the program mode to "batch."

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Specifies listing mode during a batch run:

LIST

The batch output will include a listing of the input file.

(blank)

Suppress input data listing.

Command Default

Interactive mode.

Notes

Sets the program mode to "batch" when included as the first line on an input file of Mechanical APDL commands. For convenience, this command is automatically recorded on the log file (`Jobname.log`) at the beginning of an interactive Mechanical APDL session so that the log file can be reused later for batch input.

For instructions on starting a batch job from the command line in Linux and Windows, see Batch Mode in the *Operations Guide*.

To export graphics files in batch mode, you must issue the **/SHOW (p. 1785)** command before commands that produce a graphical output (for example, **PLNSOL (p. 1425)**, **PLESOL (p. 1401)**). For more details, see External Graphics Options in the *Basic Analysis Guide*.

Caution:

This command should not be entered directly in an interactive Ansys session since all subsequent keyboard input is simply copied to a file, without further processing or prompts from the program (use the "system break" to exit the Ansys program if this occurs).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The recommended method for choosing batch mode, rather than using the **/BATCH (p. 217)** command, is to select the **Batch** simulation environment from the **Product Launcher** task in the Ansys launcher, or the batch mode entry option on the Ansys execution command when entering the program.

This command is valid only at the Begin Level.

Menu Paths

This command cannot be accessed from a menu.

BCSOPTION, --,*Memory_Option*,*Memory_Size*,--,--,*Solve_Info*

Sets memory option for the sparse solver.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

--

Unused field

Memory_Option

Memory allocation option:

DEFAULT

Use the default memory allocation strategy for the sparse solver. The default strategy attempts to run in the INCORE memory mode. If there is not enough available physical memory when the solver starts to run in the INCORE memory mode, the solver will then attempt to run in the OUTOFCORE memory mode.

INCORE

Use a memory allocation strategy in the sparse solver that will attempt to obtain enough memory to run with the entire factorized matrix in memory. This option uses the most amount of memory and should avoid doing any I/O. By avoiding I/O, this option achieves optimal solver performance. However, a significant amount of memory is required to run in this mode, and it is only recommended on machines with a large amount of memory. If the allocation for in-core memory fails, the solver will automatically revert to out-of-core memory mode.

OUTOFCORE

Use a memory allocation strategy in the sparse solver that will attempt to allocate only enough work space to factor each individual frontal matrix in memory, but will store the entire factorized matrix on disk. Typically, this memory mode results in poor performance due to the potential bottleneck caused by the I/O to the various files written by the solver.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FORCE

This option, when used in conjunction with the *Memory_Size* option, allows you to force the sparse solver to run with a specific amount of memory. This option is only recommended for the advanced user who understands sparse solver memory requirements for the problem being solved, understands the physical memory on the system, and wants to control the sparse solver memory usage.

Memory_Size

Initial memory size allocation for the sparse solver in GB. This argument allows you to tune the sparse solver memory and is not generally required. Although there is no upper limit for *Memory_Size*, the *Memory_Size* setting should always be well within the physical memory available, but not so small as to cause the sparse solver to run out of memory. Warnings and/or errors from the sparse solver will appear if this value is set too low. If the FORCE memory option is used, this value is the amount of memory allocated for the entire duration of the sparse solver solution.

--,--

Unused fields

Solve_Info

Solver output option:

OFF

Turns off additional output printing from the sparse solver (default).

PERFORMANCE

Turns on additional output printing from the sparse solver, including a performance summary and a summary of file I/O for the sparse solver. Information on memory usage during assembly of the global matrix (that is, creation of the `Jobname.full` file) is also printed with this option.

Command Default

Automatic memory allocation is used.

Notes

This command controls options related to the sparse solver in all analysis types where the sparse solver can be used. It also controls the Block Lanczos eigensolver in a modal or buckling analysis.

The sparse solver runs from one large work space (that is, one large memory allocation). The amount of memory required for the sparse solver is unknown until the matrix structure is preprocessed, including equation reordering. The amount of memory allocated for the sparse solver is then dynamically adjusted to supply the solver what it needs to compute the solution.

If you have a very large memory system, you may want to try selecting the INCORE memory mode for larger jobs to improve performance. When running the sparse solver on a machine with very slow I/O

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

performance (for example, slow hard drive speed), you may want to try using the INCORE memory mode to achieve better performance. However, doing so may require much more memory compared to running in the OUTOFCORE memory mode.

Running with the INCORE memory mode is best for jobs which comfortably fit within the limits of the physical memory on a given system. If the sparse solver work space exceeds physical memory size, the system will be forced to use virtual memory (or the system page/swap file). In this case, it is typically more efficient to run with the OUTOFCORE memory mode. Assuming the job fits comfortably within the limits of the machine, running with the INCORE memory mode is often ideal for jobs where repeated solves are performed for a single matrix factorization. This occurs in a modal or buckling analysis or when doing multiple load steps in a linear, static analysis.

For repeated runs with the sparse solver, you may set the initial sparse solver memory allocation to the amount required for factorization. This strategy reduces the frequency of allocation and reallocation in the run to make the INCORE option fully effective. If you have a very large memory system, you may use the *Memory_Size* argument to increase the maximum size attempted for in-core runs.

Menu Paths

This command cannot be accessed from a menu.

BETAD, *VALUE*

Defines the stiffness matrix multiplier for damping.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VALUE

Stiffness matrix multiplier for damping.

Notes

This command defines the stiffness matrix multiplier β used to form the viscous damping matrix $[C]=\beta[K]$, where $[K]$ is the stiffness matrix.

Values of β can also be input as a material property (**MP (p. 1160)**,BETD or **TB (p. 1899)**,SDAMP,,,,BETD). If BETD in either form is included, the BETD value is added to the **BETAD (p. 220)** value as appropriate. (See Material Damping in the *Material Reference* and Damping Matrices in the *Theory Reference*.) Damping is not used in static (**ANTYPE (p. 162)**,STATIC) or buckling (**ANTYPE (p. 162)**,BUCKLE) analyses.

This command is also valid in PREP7.

BF, *Node*, *Lab*, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6*, *MESHFLAG*

Defines a nodal body-force load.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Node

Node to which body load applies. If *Node* = ALL, apply to all selected nodes (**NSEL (p. 1266)**). A component name may also be substituted for *Node*.

Lab

Valid body load label. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*.

Discipline	Body Load Label	Label Description
Structural	TEMP	Temperature
	FREQ	Frequency (harmonic analyses only)
	FLUE	Fluence
	FPBC	Floquet periodic boundary condition
Thermal	HGEN	Heat generation rate (updated by volume changes when large-deflection effects are included (**NLGEOM (p. 1231)**,ON))
	VELO	Velocity for mass transport
Magnetic	TEMP	Temperature
	VELO	Velocity or angular velocity
	MVDI	Magnetic virtual displacements flags
Electric	TEMP	Temperature
	CHRGD	Charge density
Acoustic	MASS	Mass source; mass source rate; or power source in an energy diffusion solution for room acoustics
	IMPD	Impedance sheet
	SPRE	Static pressure
	TEMP	Temperature
	VELO	Velocity or acceleration
	PORT	Interior acoustics port
	FPBC	Floquet periodic boundary condition
	VMEN	Mean flow velocity

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discipline	Body Load Label	Label Description
	UFOR	Force potential
	SFOR	Shear force for viscous-thermal acoustics or poroelastic acoustics
	HFLW	Volumetric heat source for viscous-thermal acoustics
Poromechanics	FSOU	Fluid flow source
Diffusion	TEMP	Temperature
	DGEN	Diffusing substance generation rate
	VELO	Transport velocity

VAL1*, *VAL2*, *VAL3*, *VAL4*, *VAL5*, *VAL6

Value associated with the *Lab* item or table name reference for tabular boundary conditions. Use only *VAL1* for TEMP, FLUE, HGEN, DGEN, MVDI, CHRGD, PORT, and SPRE.

Tabular input is supported for certain labels (see Notes (p. 228) for details). To specify a table, enclose the table name in percent signs (%) (e.g., **BF (p. 221)**,*Node*,TEMP,%*tabname*%). Use the ***DIM (p. 530)** command to define a table.

If *Lab* = MASS for acoustics:

VAL1

Mass source with units of kg/(m^3*s) in a harmonic analysis or in a transient analysis solved with the velocity potential formulation; or mass source rate with units of kg/(m^3*s^2) in a transient analysis solved with the pressure formulation; or power source with units of watts in an energy diffusion solution for room acoustics

VAL2

Phase angle in degrees

VAL3

Not used

VAL4

Not used

VAL5

Not used

VAL6

Not used

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If *Lab* = VELO for acoustics (velocity components in a harmonic analysis or in a transient analysis solved with the velocity potential formulation; or acceleration components in a transient analysis solved with the pressure formulation):

VAL1

X component

VAL2

Y component

VAL3

Z component

VAL4

X-component phase angle in degrees

VAL5

Y-component phase angle in degrees

VAL6

Z-component phase angle in degrees

If *Lab* = VELO for electromagnetics (velocity and angular velocity components in the global Cartesian coordinate system):

VAL1

Velocity component in the X direction

VAL2

Velocity component in the Y direction

VAL3

Velocity component in the Z direction

VAL4

Angular velocity about the X axis (rad/sec)

VAL5

Angular velocity about the Y axis (rad/sec)

VAL6

Angular velocity about the Z axis (rad/sec)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If *Lab* = VELO for thermal (velocity components in the global Cartesian coordinate system):

VAL1

Mass transport velocity component in X direction

VAL2

Mass transport velocity component in Y direction

VAL3

Mass transport velocity component in Z direction

VAL4

Not used

VAL5

Not used

VAL6

Not used

If *Lab* = VELO for diffusion (transport velocity):

VAL1

Transport velocity component in X direction

VAL2

Transport velocity component in Y direction

VAL3

Transport velocity component in Z direction

VAL4

Not used

VAL5

Not used

VAL6

Not used

If *Lab* = IMPD:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL1

Resistance in $N \cdot s/m^3$

VAL2

Reactance in $N \cdot s/m^3$

VAL3

Not used

VAL4

Not used

VAL5

Not used

VAL6

Not used

If *Lab* = FPBC:

VAL1

Phase shift (product of phase constant and period in unit radian); or Floquet boundary flag (set *VAL1* = YES) for a modal analysis that solves the eigenvalues with a specified frequency (*FREQMOD* on the **MODOPT (p. 1140)** command)

VAL2

Attenuation (product of attenuation constant and period); not used if *VAL1* = YES

VAL3

Not used

VAL4

Not used

VAL5

Not used

VAL6

Not used

If *Lab* = VMEN:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL1

Mean flow velocity component in the X direction

VAL2

Mean flow velocity component in the Y direction

VAL3

Mean flow velocity component in the Z direction

VAL4

Not used

VAL5

Not used

VAL6

Not used

If *Lab* = UFOR:

VAL1

Real part of complex force potential

VAL2

Imaginary part of complex force potential

VAL3

Not used

VAL4

Not used

VAL5

Not used

VAL6

Not used

If *Lab* = SFOR:

VAL1

X component of shear force for viscous-thermal acoustics or poroelastic acoustics

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL2

Y component of shear force for viscous-thermal acoustics or poroelastic acoustics

VAL3

Z component of shear force for viscous-thermal acoustics or poroelastic acoustics

VAL4

X-component phase angle in degrees

VAL5

Y-component phase angle in degrees

VAL6

Z-component phase angle in degrees

If *Lab* = HFLW:

VAL1

Real part of volumetric heat source for viscous-thermal acoustics

VAL2

Imaginary part of volumetric heat source for viscous-thermal acoustics

VAL3

Not used

VAL4

Not used

VAL5

Not used

VAL6

Not used

MESHFLAG

Specifies how to apply nodal body-force loading on the mesh. Valid in a nonlinear adaptivity analysis when *Lab* = HGEN or TEMP, and *Node* is not a component name.

0 – Nodal body-force loading occurs on the current mesh (default).

1 – Nodal body-force loading occurs on the initial mesh for nonlinear adaptivity.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Defines a nodal body-force load (such as temperature in a structural analysis, heat generation rate in a thermal analysis, etc.). Nodal body loads default to the **BFUNIF (p. 259)** values, if they were previously specified.

Table names are valid for *Lab* value (*VALn*) inputs in these cases only:

- *VAL1* = %*tabname*% for:

  temperatures (TEMP), diffusing substance generation rates (DGEN), and heat generation rates (HGEN).

- *VAL1* = %*tabname1*% and *VAL2* = %*tabname2*% for:

  mass source, mass source rate, or power source (MASS); the Floquet periodic boundary condition (FPBC); the force potential (UFOR); and the volumetric heat source (HFLW).

- *VAL1* = %*tabname1*%, *VAL2* = %*tabname2*%, and *VAL3* = %*tabname3*% for:

  mean flow velocities (VMEN).

- *VAL1* = %*tabname1*%, *VAL2* = %*tabname2*%, *VAL3* = %*tabname3*%, *VAL4* = %*tabname4*%, *VAL5* = %*tabname5*%, and *VAL6* = %*tabname6*% for:

  velocities or accelerations (VELO); and shear force (SFOR).

The heat generation rate loads specified with the **BF (p. 221)** command are multiplied by the weighted nodal volume of each element adjacent to that node. This yields the total heat generation at that node.

In a modal analysis, the Floquet periodic boundary condition (FPBC) is only valid for the acoustic elements FLUID30, FLUID220, and FLUID221.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

Graphical picking is available only via the listed menu paths.

Body load labels VELO, MASS, SPRE, FPBC, VMEN, UFOR, SFOR, and HFLW cannot be accessed from a menu.

This command is also valid in PREP7.

---

BFA,*Area*,*Lab*,*VAL1*,*VAL2*,*VAL3*,*VAL4*

Defines a body-force load on an area.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Area

Area to which body load applies. If ALL, apply to all selected areas (**ASEL (p. 192)**). A component name may also be substituted for *Area*.

Lab

Valid body load label. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*.

Discipline	Body Load Label	Label Description
Structural	TEMP	temperature
	FLUE	fluence
Thermal	HGEN	heat generation rate

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discipline	Body Load Label	Label Description
Magnetic	TEMP	temperature
	JS	current densities
Electric	TEMP	temperature
	CHRGD	charge density
Acoustic	IMPD	impedance sheet
	TEMP	temperature

VAL1, VAL2, VAL3

Value associated with the *Lab* item or a table name for specifying tabular boundary conditions. Use only *VAL1* for TEMP, FLUE, HGEN, CHRGD. For *Lab* = JS in magnetics, use *VAL1*, *VAL2*, and *VAL3* for the X, Y, and Z components. For *Lab* = IMPD in acoustics, *VAL1* is the resistance and *VAL2* is the reactance in ohms/square. When specifying a table name, you must enclose the table name in percent signs (%), e.g., **BFA (p. 229)**,*Area*,*Lab*,%*tabname*%. Use the ***DIM (p. 530)** command to define a table.

VAL4

If *Lab* = JS, *VAL4* is the phase angle in degrees.

Notes

Defines a body-force load (such as temperature in a structural analysis, heat generation rate in a thermal analysis, etc.) on an area. Body loads may be transferred from areas to area elements (or to nodes if area elements do not exist) with the **BFTRAN (p. 259)** or **SBCTRAN (p. 1647)** commands. Body loads default to the value specified on the **BFUNIF (p. 259)** command, if it was previously specified.

You can specify a table name only when using temperature (TEMP) and heat generation rate (HGEN) body load labels.

Body loads specified by the **BFA (p. 229)** command can conflict with other specified body loads. See Resolution of Conflicting Body Load Specifications in the *Basic Analysis Guide* for details.

Graphical picking is available only via the listed menu paths.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in PREP7.

BFADELE,*AREA*,*Lab*

Deletes body-force loads on an area.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AREA

Area at which body load is to be deleted. If ALL, delete for all selected areas (**ASEL (p. 192)**). A component name may also be substituted for *AREA*.

Lab

Valid body load label. If ALL, use all appropriate labels. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*. See the **BFA (p. 229)** command for labels.

Notes

Deletes body-force loads (and all corresponding finite element loads) for a specified area and label. Body loads may be defined on an area with the **BFA (p. 229)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Graphical picking is available only via the listed menu paths.

This command is also valid in PREP7.

BFALIST, *AREA*, *Lab*

Lists the body-force loads on an area.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AREA

Area at which body load is to be listed. If ALL (or blank), list for all selected areas (**ASEL (p. 192)**). If *AREA* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *AREA*.

Lab

Valid body load label. If ALL, use all appropriate labels. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*. See the **BFA (p. 229)** command for labels.

Notes

Lists the body-force loads for the specified area and label. Body loads may be defined on an area with the **BFA (p. 229)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Body Loads>On All Areas

Utility Menu>List>Loads>Body Loads>On Picked Areas

BFCUM, *Lab*, *Oper*, *FACT*, *TBASE*

Specifies that nodal body-force loads are to be accumulated.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid body load label. If ALL, use all appropriate labels.

Discipline	Body Load Label	Label Description
Structural	TEMP	temperature
	FLUE	fluence
Thermal	HGEN	heat generation rate

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discipline	Body Load Label	Label Description
Magnetic	TEMP	temperature
	JS	current densities
	MVDI	magnetic virtual displacements flag
Electric	TEMP	temperature
	CHRGD	charge density
Diffusion	DGEN	diffusing substance generation rate

Oper

Accumulation key:

REPL

Subsequent values replace the previous values (default).

ADD

Subsequent values are added to the previous values.

IGNO

Subsequent values are ignored.

FACT

Scale factor for the nodal body load values. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor. The scale factor is not applied to body load phase angles.

TBASE

Used (only with *Lab* = TEMP) to calculate the temperature used in the add or replace operation (see *Oper*) as:

Temperature = *TBASE* + *FACT** (*T* - *TBASE*)

where *T* is the temperature specified on subsequent **BF (p. 221)** commands. *TBASE* defaults to zero.

Command Default

Replace previous values.

Notes

Allows repeated nodal body-force loads to be replaced, added, or ignored. Nodal body loads are applied with the **BF (p. 221)** command. Issue the **BFLIST (p. 255)** command to list the nodal body loads. The operations occur when the next body loads are defined. For example, issuing the **BF (p. 221)** command

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

with a temperature of 250 after a previous **BF (p. 221)** command with a temperature of 200 causes the new value of the temperature to be 450 with the add operation, 250 with the replace operation, or 200 with the ignore operation. A scale factor is also available to multiply the next value before the add or replace operation. A scale factor of 2.0 with the previous "add" example results in a temperature of 700. The scale factor is applied even if no previous values exist. Issue **BFCUM (p. 233)**,STAT to show the current label, operation, and scale factors. Solid model boundary conditions are not affected by this command, but boundary conditions on the FE model are affected.

Note:

FE boundary conditions may still be overwritten by existing solid model boundary conditions if a subsequent boundary condition transfer occurs.

BFCUM (p. 233) does not work for tabular boundary conditions.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Settings>Replace vs Add>Nodal Body Ld

Main Menu>Solution>Define Loads>Settings>Replace vs Add>Nodal Body Ld

---

BFDELE, *Node*, *Lab*

Deletes nodal body-force loads.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Node

Node at which body load is to be deleted. If ALL, delete for all selected nodes (**NSEL (p. 1266)**). If *Node* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). You can substitute a component name for *Node*.

Lab

Valid body load label. If ALL, use all appropriate labels. See **BF (p. 221)**.

Notes

Deletes nodal body-force loads for a specified node and label. Nodal body loads are defined via **BF (p. 221)**.

This command is also valid in PREP7.

BFE, *Elem*, *Lab*, *STLOC*, *VAL1*, *VAL2*, *VAL3*, *VAL4*

Defines an element body-force load.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Elem

The element to which body load applies. If ALL, apply to all selected elements (**ESEL (p. 661)**). A component name may also be substituted for *Elem*.

Lab

Valid body load label. Valid labels are also listed for each element type in the *Element Reference* under "Body Loads" in the input table.

Discipline	Body Load Label	Label Description
Structural	TEMP	Temperature
	FREQ	Frequency (harmonic analyses only)
	FLUE	Fluence
	FORC	Body-force density
Thermal	HGEN	Heat generation rate (updated by volume changes when large-deflection effects are included (**NLGEOM (p. 1231)**,ON))
Magnetic	EF	Electric field
	TEMP	Temperature
	JS	Current density
	MVDI	Magnetic virtual displacements flag
Electric	TEMP	Temperature
	CHRGD	Charge density
Field volume interface	FVIN	Field volume interface flag
Poromechanics	FSOU	Fluid flow source
Diffusion	TEMP	Temperature
	DGEN	Diffusing substance generation rate

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

STLOC

Starting location for entering *VAL* data, below. For example, if *STLOC* = 1, data input in the *VAL1* field applies to the first element body load item available for the element type, *VAL2* applies to the second element item, etc. If *STLOC* = 5, data input in the *VAL1* field applies to the fifth element item, etc. Defaults to 1.

VAL1, VAL2, VAL3, VAL4

For *Lab* = TEMP, FLUE, DGEN, HGEN, and CHRGD, *VAL1*--*VAL4* represent body load values at the starting location and subsequent locations (usually nodes) in the element. *VAL1* can also represent a table name for use with tabular boundary conditions. Enter only *VAL1* for a uniform body load across the element. For nonuniform loads, the values must be input in the same order as shown in the input table for the element type. Values initially default to the **BFUNIF (p. 259)** value (except for CHRGD which defaults to zero). For subsequent specifications, a blank leaves a previously specified value unchanged; if the value was not previously specified, the default value as described in the *Element Reference* is used.

For *Lab* = JS and *STLOC* = 1, *VAL1*, *VAL2* and *VAL3* are the X, Y, and Z components of current density (in the element coordinate system), and *VAL4* is the phase angle.

For *Lab* = EF and *STLOC* = 1, *VAL1*, *VAL2*, and *VAL3* are the X, Y, and Z components of electric field (in the global Cartesian coordinate system).

If *Lab* = FVIN in a unidirectional Mechanical APDL to Ansys CFX analysis, *VAL2* is the volume interface number (not available from within the GUI), and *VAL1*, *VAL3*, and *VAL4* are not used.

For *Lab* = FORC and *STLOC* = 1, *VAL1*, *VAL2*, and *VAL3* are the real X, Y, and Z components of force density (in the global Cartesian coordinate system).

For analyses that allow complex input, if *Lab* = FORC and *STLOC* = 4, *VAL1*, *VAL2*, and *VAL3* are the imaginary X, Y, and Z components of force density (in the global Cartesian coordinate system).

Notes

Defines an element body-force load (such as the temperature in a structural analysis or the heat-generation rate in a thermal analysis). Body loads and element specific defaults are described for each element type in the *Element Reference*. If both the **BF (p. 221)** and **BFE (p. 237)** commands are used to apply a body-force load to an element, the **BFE (p. 237)** command takes precedence.

Body-Force Density (FORC)

Imaginary values for FORC loading via **BFE (p. 237)** is supported by current-technology solid elements (PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, and SOLID285) and reinforcing elements (REINF263, REINF264, and REINF265). Use only for modal or harmonic analyses. Large-deflection effects must be disabled (**NLGEOM (p. 1231)**,OFF).

Heat-Generation Loading (HGEN)

The following topics for applying HGEN loading via the **BFE (p. 237)** command are available:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

On Layered Thermal Solid Elements

For HGEN loading on layered thermal solid elements SOLID278 / SOLID279 (KEYOPT(3) = 1 or 2), or layered thermal shell elements SHELL131 / SHELL132 (KEYOPT(3) = 1), *STLOC* refers to the *layer* number (not the node). In such cases, specify *VAL1* through *VAL4* to specify the heat-generation values for the appropriate layers. Heat generation is constant over the layer.

On Reinforcing Elements

For HGEN loading on reinforcing elements REINF263, REINF264, and REINF265, *STLOC* refers to the corner locations of the reinforcing members (individual reinforcings):

- REINF263 and REINF264: Specify *VAL1* and *VAL2* for each member. For tables, specify *VAL1* only.
- REINF265: Specify *VAL1*, *VAL2*, *VAL3*, and *VAL4* for each member. For tables, specify *VAL1* only.

For FORC loading on reinforcing elements, *STLOC* refers to real (*STLOC* = 1) or imaginary (*STLOC* = 4) components.

When using the standard method for defining reinforcing, this is the only way to apply a body load (HGEN or FORC) on the reinforcing members created after generating the REINF*nnn* reinforcing elements (**EREINF (p. 656)**). If applying FORC loading, Mechanical APDL applies a uniform load to all reinforcing members if there are multiple members in selected elements.

When using the mesh-independent method for defining reinforcing, you can apply a body load on the reinforcing members in the same way. The *preferred* method, however, is to apply loads on the MESH200 elements (via **BFE (p. 237)** or **BF (p. 221)** for HGEN, BFE for FORC) *before* generating the REINF*nnn* reinforcing elements (**EREINF (p. 656)**). Mechanical APDL maps the loads from the MESH200 elements to the newly generated REINF*nnn* reinforcing elements automatically. If you need to apply the loads *after* generating the reinforcing elements, apply them to MESH200 elements and issue **BFPORT (p. 257)** to transfer the loads to the reinforcing members.

Specifying a Table

You can specify a table name (*VAL1*) when using temperature (TEMP), diffusing substance generation rate (DGEN), heat generation rate (HGEN), and current density (JS) body load labels.

For the body-force-density label (FORC), you can specify a table for any of the *VAL1* through *VAL3* arguments. Both 1D and 2D tables are valid; however, only 1D tables are valid in mode-superposition harmonic and mode-superposition transient analyses.

Enclose the table name (*tabname*) in percent signs (%), for example:

BFE (p. 237),*Elem*, *Lab*,*STLOC*,%*tabname*%

Use the ***DIM (p. 530)** command to define a table. For information on primary variables for each load type, see Applying Loads Using Tabular Input in the *Basic Analysis Guide*.

For *Lab* = TEMP, each table defines *NTEMP* temperatures, as follows:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- For layered elements, *NTEMP* is the number of layer interface corners that allow temperature input.
- For non-layered elements, *NTEMP* is the number of corner nodes.

The temperatures apply to element items with a starting location of *STLOC* + *n*, where n is the value field location (*VALn*) of the table name input.

For layered elements, a single **BFE (p. 237)** command returns temperatures for one layer interface. Multiple **BFE (p. 237)** commands are necessary for defining all layered temperatures.

For beam, pipe and elbow elements that allow multiple temperature inputs per node, define the tabular load for the first node only (Node I), as loads on the remaining nodes are applied automatically. For example, to specify a tabular temperature load on a PIPE288 element with the through-wall-gradient option (KEYOPT(1) = 0), the **BFE (p. 237)** command looks like this:

BFE (p. 237),*Elem*,TEMP,1,%*tabOut*%, %*tabIn%*

where %*tabOut*% and %*tabIn*% and are the tables applied to the outer and inner surfaces of the pipe wall, respectively.

When a tabular function load is applied to an element, the load does not vary according to the positioning of the element in space.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

Other Information

Graphical picking is available only via the listed menu paths.

This command is also valid in PREP7.

BFECUM, *Lab*, *Oper*, *FACT*, *TBASE*

Specifies whether to ignore subsequent element body force loads.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid body load label. If ALL, use all appropriate labels.

Discipline	Body Load Label	Label Description
Structural	TEMP	temperature
	FLUE	fluence
Thermal	HGEN	heat generation rate
Magnetic	TEMP	temperature
	JS	current densities
	MVDI	magnetic virtual displacements flag
Electric	TEMP	temperature
	CHRGD	charge density
Diffusion	DGEN	diffusing substance generation rate

Oper

Replace or ignore key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

REPL

Subsequent values replace the previous values (default).

IGNO

Subsequent values are ignored.

FACT

Scale factor for the element body load values. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor. The scale factor is not applied to body load phase angles.

TBASE

Used (only with *Lab* = TEMP) to calculate the temperature used in the add or replace operation (see *Oper*) as:

Temperature = *TBASE* + *FACT** (*T* - *TBASE*)

where *T* is the temperature specified on subsequent **BFE (p. 237)** commands. *TBASE* defaults to zero.

Command Default

Replace previous values.

Notes

Allows repeated element body-force loads to be replaced or ignored. Element body loads are applied with the **BFE (p. 237)** command. Issue the **BFELIST (p. 244)** command to list the element body loads. The operations occur when the next body loads are defined. For example, issuing the **BFE (p. 237)** command with a temperature value of 25 after a previous **BFE (p. 237)** command with a temperature value of 20 causes the new value of that temperature to be 25 with the replace operation, or 20 with the ignore operation. A scale factor is also available to multiply the next value before the replace operation. A scale factor of 2.0 with the previous "replace" example results in a temperature of 50. The scale factor is applied even if no previous values exist. Issue **BFECUM (p. 241)**,STAT to show the current label, operation, and scale factors.

BFECUM (p. 241) does not work for tabular boundary conditions.

This command is also valid in PREP7.

---

BFELIST, *ELEM*, *Lab*

Lists the element body-force loads.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element at which body load is to be listed. If ALL (or blank), list for all selected elements (**ESEL (p. 661)**). If *ELEM* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *ELEM*.

Lab

Valid body load label. If ALL (or blank), use all appropriate labels. See **BFE (p. 237)** command for labels.

Notes

Lists the element body-force loads for the specified element and label. Element body loads may be defined with the **BFE (p. 237)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Body Loads>On All Elements
Utility Menu>List>Loads>Body Loads>On Picked Elems

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BFESCAL, *Lab*, *FACT*, *TBASE*

Scales element body-force loads.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid body load label. If ALL, use all appropriate labels.

Discipline	Body Load Label	Label Description
Structural	TEMP	temperature
	FLUE	fluence
Thermal	HGEN	heat generation rate
Magnetic	TEMP	temperature
	JS	current densities
	MVDI	magnetic virtual displacements flag
Electric	TEMP	temperature
	CHRGD	charge density
Diffusion	DGEN	diffusing substance generation rate

FACT

Scale factor for the element body load values. Zero (or blank) defaults to 1.0. Use a small number for a "zero" scale factor. The scale factor is not applied to body load phase angles.

TBASE

Base temperature for temperature difference. Used only with *Lab* = TEMP. Scale factor is applied to the temperature difference (*T* - *TBASE*) and then added to *TBASE*. *T* is the current temperature.

Notes

Scales element body-force loads on the selected elements in the database. Issue the **BFELIST (p. 244)** command to list the element body loads. Solid model boundary conditions are not scaled by this command, but boundary conditions on the FE model are scaled. (Note that such scaled FE boundary conditions may still be overwritten by unscaled solid model boundary conditions if a subsequent boundary condition transfer occurs.)

BFESCAL (p. 245) does not work for tabular boundary conditions.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Operate>Scale FE Loads>Elem Body Lds

Main Menu>Solution>Define Loads>Operate>Scale FE Loads>Elem Body Lds

---

BFINT,*Fname1*,*Ext1*,--,*Fname2*,*Ext2*,--,*KPOS*,*Clab*,*KSHS*,*TOLOUT*,*TOLHGT*

Activates the body force interpolation operation.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname1

File name and directory path (248 characters maximum, including directory) from which to read data for interpolation. If you do not specify a directory path, it will default to your working directory and you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext1

Filename extension (eight-character maximum).

The extension defaults to NODE if *Fname1* is blank.

--

Unused field.

Fname2

File name and directory path (248 characters maximum, including directory) to which **BF** commands are written. If you do not specify a directory path, it will default to your working directory and you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext2

Filename extension (eight-character maximum).

The extension defaults to BFIN if *Fname2* is blank.

--

Unused field.

KPOS

Position on *Fname2* to write block of **BF** commands:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Beginning of file (overwrite existing file).

1

End of file (append to existing file).

Clab

Label (8 characters maximum, including the colon) for this block of **BF** commands in *Fname2*. This label is appended to the colon (:). Defaults to BF*n*, where *n* is the cumulative iteration number for the data set currently in the database.

KSHS

Shell-to-solid submodeling key:

0

Solid-to-solid or shell-to-shell submodel.

1

Shell-to-solid submodel.

TOLOUT

Extrapolation tolerance about elements, based on a fraction of the element dimension. Submodel nodes outside the element by more than *TOLOUT* are not accepted as candidates for DOF extrapolation. Defaults to 0.5 (50%).

TOLHGT

Height tolerance above or below shell elements, in units of length. Used only for shell-to-shell submodeling (*KSHS* = 0). Submodel nodes off the element surface by more than *TOLHGT* are not accepted as candidates for DOF interpolation or extrapolation. Defaults to 0.0001 times the maximum element dimension.

Caution:

Relaxing this tolerance to allow submodel nodes to be found may cause poor submodel results.

Notes

File *Fname1* should contain a node list for which body forces are to be interpolated (**NWRITE (p. 1305)**). File *Fname2* is created, and contains interpolated body forces written as a block of nodal **BF (p. 221)** commands.

Body forces are interpolated from elements having TEMP as a valid body force or degree of freedom, and only the label TEMP is written on the nodal **BF (p. 221)** commands. Interpolation is performed for all nodes on file *Fname1* using the results data currently in the database. For layered elements, use the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LAYER (p. 1015) command to select the locations of the temperatures to be used for interpolation. Default locations are the bottom of the bottom layer and the top of the top layer.

The block of **BF (p. 221)** commands begins with an identifying colon label command and ends with a **/EOF (p. 645)** command. The colon label command has the form :*Clab*. Interpolation from multiple results sets can be performed by looping through the results file in a user-defined macro. Additional blocks can be appended to *Fname2* by using *KPOS* and unique colon labels. Issue **/INPUT (p. 948)**, with the appropriate colon label, to read the block of commands.

If the model has coincident (or very close) nodes, **BFINT (p. 246)** must be applied to each part of the model separately to ensure that the mapping of the nodes is correct. For example, if nodes belonging to two adjacent parts linked by springs are coincident, the operation should be performed on each part of the model separately.

Menu Paths

Main Menu>General Postproc>Submodeling>Interp Body Forc

BFK, *Kpoi*, *Lab*, *VAL1*, *VAL2*, *VAL3*, *PHASE*

Defines a body-force load at a keypoint.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Kpoi

Keypoint to which body load applies. If ALL, apply to all selected keypoints (**KSEL (p. 995)**). A component name may also be substituted for *Kpoi*.

Lab

Valid body load label. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*.

Discipline	Body Load Label	Label Description
Structural	TEMP	temperature
	FLUE	fluence
Thermal	HGEN	heat generation rate
Magnetic	TEMP	temperature
	JS	current densities
	MVDI	magnetic virtual displacements flag
Electric	TEMP	temperature
	CHRGD	charge density

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discipline	Body Load Label	Label Description
Acoustic	JS	mass source or mass source rate
	TEMP	temperature

All keypoints on a given area (or volume) must have the same **BFK (p. 248)** table name for the tables to be transferred to interior nodes.

VAL1*, *VAL2*, *VAL3

Value associated with the *Lab* item or a table name for specifying tabular boundary conditions. Use only *VAL1* for TEMP, FLUE, HGEN, MVDI and CHRGD. For magnetics, use *VAL1*, *VAL2*, and *VAL3* for the X, Y, and Z components of JS. For acoustics, if *Lab* = JS, use *VAL1* for mass source in a harmonic analysis or mass source rate in a transient analysis, and ignore*VAL2* and *VAL3*. When specifying a table name, you must enclose the table name in percent signs (%), e.g., **BFK (p. 248)**,*Kpoi*,*Lab*,%*tabname*%. Use the ***DIM (p. 530)** command to define a table.

PHASE

Phase angle in degrees associated with the JS label.

Notes

Defines a body-force load (such as temperature in a structural analysis, heat generation rate in a thermal analysis, etc.) at a keypoint. Body loads may be transferred from keypoints to nodes with the **BFTRAN (p. 259)** or **SBCTRAN (p. 1647)** commands. Interpolation will be used to apply loads to the nodes on the lines between keypoints. All keypoints on a given area (or volume) must have the same **BFK (p. 248)** specification, with the same values, for the loads to be transferred to interior nodes in the area (or volume). If only one keypoint on a line has a **BFK (p. 248)** specification, the other keypoint defaults to the value specified on the **BFUNIF (p. 259)** command.

You can specify a table name only when using temperature (TEMP) and heat generation rate (HGEN) body load labels.

Body loads specified by the **BFK (p. 248)** command can conflict with other specified body loads. See Resolution of Conflicting Body Load Specifications in the *Basic Analysis Guide* for details.

Graphical picking is available only via the listed menu paths.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in PREP7.

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KPOI

Keypoint at which body load is to be listed. If ALL (or blank), list for all selected keypoints (**KSEL (p. 995)**). If *KPOI* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *KPOI*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Lab

Valid body load label. If ALL, use all appropriate labels. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*. See the **BFK (p. 248)** command for labels.

Notes

Lists the body-force loads for the specified keypoint and label. Keypoint body loads may be defined with the **BFK (p. 248)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Body Loads>On All Keypoints

Utility Menu>List>Loads>Body Loads>On Picked KPs

BFL, *Line*, *Lab*, *VAL1*, *VAL2*, *VAL3*, *VAL4*

Defines a body-force load on a line.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Line

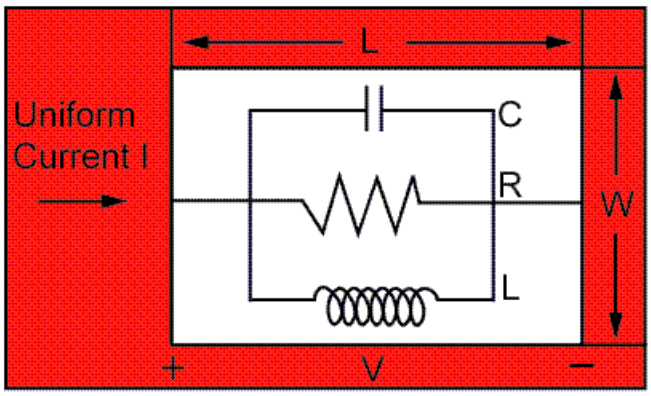
Line to which body load applies. If ALL, apply to all selected lines (**LSEL (p. 1074)**). A component name may also be substituted for *Line*.

Lab

Valid body load label. Load labels are listed under "Body loads" in the input table for each element type in the *Element Reference*.

Discipline	Body Load Label	Label Description
Structural Thermal	TEMP	temperature
	FLUE	fluence
	HGEN	heat generation rate
Magnetic	TEMP	temperature
Electric	TEMP	temperature
	CHRGD	charge density
Acoustic	JS	mass source or mass source rate
	TEMP	temperature

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



VAL1, VAL2, VAL3

Value associated with the *Lab* item or a table name for specifying tabular boundary conditions. Use only *VAL1* for TEMP, FLUE, HGEN, and CHRGD. For acoustics, if *Lab* = JS, use *VAL1* for mass source in a harmonic analysis or mass source rate in a transient analysis, and ignore*VAL2* and *VAL3*. When specifying a table name, you must enclose the table name in percent signs (%), for example, **BFL (p. 252)**,*Line*,*Lab*,%*tabname*%. Use the ***DIM (p. 530)** command to define a table.

VAL4

If *Lab* = JS, *VAL4* is the phase angle in degrees.

Figure 1: RCL Lumped Circuit

Notes

Defines a body-force load (such as temperature in a structural analysis, heat generation rate in a thermal analysis, etc.) on a line. Body loads may be transferred from lines to line elements (or to nodes if line elements do not exist) with the **BFTRAN (p. 259)** or **SBCTRAN (p. 1647)** commands.

You can specify a table name only when using temperature (TEMP) and heat generation rate (HGEN) body load labels.

Body loads specified by the **BFL (p. 252)** command can conflict with other specified body loads. See Resolution of Conflicting Body Load Specifications in the *Basic Analysis Guide* for details.

Graphical picking is available only via the listed menu paths.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Electric>Boundary>Temperature>On Lines

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

---

BFLDELE, *LINE*, *Lab*

Deletes body-force loads on a line.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LINE

Line at which body load is to be deleted. If ALL, delete for all selected lines (**LSEL (p. 1074)**). A component name may also be substituted for *LINE*.

Lab

Valid body load label. If ALL, use all appropriate labels. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*. See the **BFL (p. 252)** command for labels.

Notes

Deletes body-force loads (and all corresponding finite element loads) for a specified line and label. Body loads may be defined on a line with the **BFL (p. 252)** command.

Graphical picking is available only via the listed menu paths.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BFLIST, *Node*, *Lab*

Lists the body-force loads on nodes.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Node

Node at which body load is to be listed. If ALL (or blank), list for all selected nodes (**NSEL (p. 1266)**). If *Node* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). You can substitute a component name for *Node*.

Lab

Valid body load label. If ALL (or blank), use all appropriate labels. (See **BF (p. 221)**.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Lists the body-force loads for the specified node and label. Nodal body loads are defined via **BF (p. 221)**.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Body Loads>On All Nodes

Utility Menu>List>Loads>Body Loads>On Picked Nodes

BFLLIST, *LINE*, *Lab*

Lists the body-force loads on a line.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LINE

Line at which body load is to be listed. If ALL (or blank), list for all selected lines (**LSEL (p. 1074)**). If *LINE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *LINE*.

Lab

Valid body load label. If ALL, use all appropriate labels. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*. See the **BFL (p. 252)** command for labels.

Notes

Lists the body-force loads for the specified line and label. Body loads may be defined on a line with the **BFL (p. 252)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Body Loads>On All Lines

Utility Menu>List>Loads>Body Loads>On Picked Lines

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BFPORT, *Cmname*

Transfers a thermal body-force load (HGEN) from selected MESH200 elements to reinforcing elements.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Cmname

Component name containing a list of selected MESH200 elements.

Notes

This command transfers a thermal body-force load (HGEN) from selected MESH200 elements to associated reinforcing elements or members (individual reinforcings). The association is established via **EREINF (p. 656)** using the mesh-independent method for defining reinforcing.

Issue this command *after* issuing **EREINF (p. 656)**.

Select MESH200 elements by issuing this command and specifying the component, or by issuing **ESEL (p. 661)**. (If you specify a component name, **ESEL (p. 661)** is ignored.)

This command supports a thermal body-force load (HGEN) only.

To define the thermal body-force load on MESH200 elements, issue **BFE (p. 237)** or **BF (p. 221)**.

This command is also valid in PREP7.

Menu Paths

This command cannot be accessed from a menu.

BFSCALE, *Lab*, *FACT*, *TBASE*

Scales body-force loads at nodes.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid body load label. If ALL, use all appropriate labels.

Discipline	Body Load Label	Label Description
Structural	TEMP	temperature
	FLUE	fluence
Thermal	HGEN	heat generation rate

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discipline	Body Load Label	Label Description
Magnetic	TEMP	temperature
	JS	current densities
	MVDI	magnetic virtual displacements flag
Electric	TEMP	temperature
	CHRGD	charge density
Diffusion	DGEN	diffusing substance generation rate

FACT

Scale factor for the nodal body load values. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor. The scale factor is not applied to body load phase angles.

TBASE

Base temperature for temperature difference. Used only with *Lab* = TEMP. Scale factor is applied to the temperature difference (*T* - *TBASE*) and then added to *TBASE*. *T* is the current temperature.

Notes

Scales body-force loads in the database on the selected nodes. Issue the **BFLIST (p. 255)** command to list the nodal body loads. Solid model boundary conditions are not scaled by this command, but boundary conditions on the FE model are scaled.

Note:

Such scaled FE boundary conditions may still be overwritten by unscaled solid model boundary conditions if a subsequent boundary condition transfer occurs.

BFSCALE (p. 257) does not work for tabular boundary conditions.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Operate>Scale FE Loads>Nodal Body Ld

Main Menu>Solution>Define Loads>Operate>Scale FE Loads>Nodal Body Ld

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BFTRAN

Transfers solid model body-force loads to the finite element model.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Body loads are transferred from selected keypoints and lines to selected nodes and from selected areas and volumes to selected elements. The **BFTRAN (p. 259)** operation is also done if the **SBCTRAN (p. 1647)** command is either explicitly issued or automatically issued upon initiation of the solution calculations (**SOLVE (p. 1822)**).

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Operate>Transfer to FE>Body Loads

Main Menu>Solution>Define Loads>Operate>Transfer to FE>Body Loads

BFUNIF, *Lab*, *VALUE*

Assigns a uniform body-force load to all nodes.

SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid body load label. If ALL, use all appropriate labels.

Discipline	Body Load Label	Label Description
Structural	TEMP	temperature
	FLUE	fluence
Thermal	HGEN	heat generation rate
	TEMP	initial temperature
Diffusion	DGEN	diffusing substance generation rate

VALUE

Uniform value associated with *Lab* item, or table name when specifying tabular boundary conditions. To specify a table, enclose the table name in percent signs (%), for example, **BFUNIF (p. 259)**,*Lab*,%*tabname*%.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Set TEMP to the reference temperature (**TREF (p. 2013)** but not **MP (p. 1160)**,REFT), and FLUE and HGEN to zero.

Notes

In a transient or nonlinear thermal analysis, the uniform temperature is used during the first iteration of a solution as follows: (a) as the starting nodal temperature except where temperatures are explicitly specified (**D (p. 483)**, **DK (p. 541)**), and (b) to evaluate temperature-dependent material properties. In a structural analysis, the uniform temperature is used as the *default* temperature for thermal strain calculations and material property evaluation except where body load temperatures are specified (**BF (p. 221)**, **BFE (p. 237)**, **BFK (p. 248)**, **LDREAD (p. 1036)**). In other scalar field analyses, the uniform temperature is used for material property evaluation.

An alternate command, **TUNIF (p. 2027)**, may be used to set the uniform temperature instead of **BFUNIF (p. 259)**,TEMP. Since **TUNIF (p. 2027)** (or **BFUNIF (p. 259)**,TEMP) is step-applied in the first iteration, you should use **BF (p. 221)**, ALL, TEMP, Value to ramp on a uniform temperature load.

You can specify a table name only when using temperature (TEMP), heat generation rate (HGEN), and diffusing substance generation rate (DGEN) body load labels. When using TEMP, you can define a one-dimensional table that varies with respect to time (TIME) only. When defining this table, enter TIME as the primary variable. No other primary variables are valid.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Fluid/ANSYS>Heat Generat>Uniform Heat Gen

Main Menu>Solution>Define Loads>Apply>Thermal>Heat Generat>Uniform Heat Gen

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BFV, *Volu*, *Lab*, *VAL1*, *VAL2*, *VAL3*, *PHASE*

Defines a body-force load on a volume.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Volu

Volume to which body load applies. If ALL, apply to all selected volumes (**VSEL (p. 2163)**). A component name may also be substituted for *Volu*.

Lab

Valid body load label. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*.

Discipline	Body Load Label	Label Description
Structural	TEMP	temperature
	FLUE	fluence
Thermal	HGEN	heat generation rate
Magnetic	TEMP	temperature
	JS	current densities
Electric	TEMP	temperature
	CHRGD	charge density
Acoustic	JS	mass source or mass source rate
	TEMP	temperature

VAL1, VAL2, VAL3

Value associated with the *Lab* item or a table name for specifying tabular boundary conditions. Use only *VAL1* for TEMP, FLUE, HGEN, and CHRGD. Use *VAL1*, *VAL2*, and *VAL3* for the X, Y, and Z components of JS. For *Lab* = JS in magnetics, use *VAL1*, *VAL2*, and *VAL3* for the X, Y, and Z components. For acoustics, if *Lab* = JS, use *VAL1* for mass source in a harmonic analysis or mass source rate in a transient analysis, and ignore*VAL2* and *VAL3*. When specifying a table name, you must enclose the table name in percent signs (%), e.g., **BFV (p. 261)**,*Volu*,*Lab*,%*tabname*%. Use the ***DIM (p. 530)** command to define a table.

PHASE

Phase angle in degrees associated with the JS label.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Defines a body-force load (such as temperature in a structural analysis, heat generation rate in a thermal analysis, etc.) on a volume. Body loads may be transferred from volumes to volume elements (or to nodes if volume elements do not exist) with the **BFTRAN (p. 259)** or **SBCTRAN (p. 1647)** commands. Body loads default to the value specified on the **BFUNIF (p. 259)** command, if it was previously specified.

You can specify a table name only when using temperature (TEMP) and heat generation rate (HGEN) body load labels.

Body loads specified by the **BFV (p. 261)** command can conflict with other specified body loads. See Resolution of Conflicting Body Load Specifications in the *Basic Analysis Guide* for details.

Graphical picking is available only via the listed menu paths.

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

This command is also valid in PREP7.

BFVDELE, *VOLU*, *Lab*

Deletes body-force loads on a volume.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VOLU

Volume at which body load is to be deleted. If ALL, delete for all selected volumes (**VSEL (p. 2163)**). A component name may also be substituted for *VOLU*.

Lab

Valid body load label. If ALL, use all appropriate labels. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*. See the **BFV (p. 261)** command for labels.

Notes

Deletes body-force loads (and all corresponding finite element loads) for a specified volume and label. Body loads may be defined on a volume with the **BFV (p. 261)** command.

Graphical picking is available only via the listed menu paths.

This command is also valid in PREP7.

Menu Paths

BFVLIST, *VOLU*, *Lab*

Lists the body-force loads on a volume.

SOLUTION (p. 38): Solid Body Loads (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VOLU

Volume at which body load is to be listed. If ALL (or blank), list for all selected volumes (**VSEL (p. 2163)**). If *VOLU* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *VOLU*.

Lab

Valid body load label. If ALL, use all appropriate labels. Load labels are listed under "Body Loads" in the input table for each element type in the *Element Reference*. See the **BFV (p. 261)** command for labels.

Notes

Lists the body-force loads for the specified volume and label. Body loads may be defined on a volume with the **BFV (p. 261)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Body Loads>On All Volumes

Utility Menu>List>Loads>Body Loads>On Picked Volumes

BIOOPT

Specifies "Biot-Savart options" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Biot Savart Options

BIOT, *Label*

Calculates the Biot-Savart source magnetic field intensity.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Controls the Biot-Savart calculation:

NEW

Calculate the magnetic source field intensity (H_s) from the selected set of source elements to the selected set of nodes. Overwrite any existing H_s field values.

SUM

Calculate the H_s field from the selected set of source elements to the selected set of nodes. Accumulate with any existing H_s field values.

Command Default

Calculate the H_s field upon encountering the first **SOLVE (p. 1822)** command to produce a source field.

Notes

Calculates the Biot-Savart source magnetic field intensity (H_s) at the selected nodes from the selected source elements. The calculation is done at the time the **BIOT (p. 265)** command is issued.

Source elements include primitives described by element SOURC36, and coupled-field elements SOLID5, LINK68, and SOLID98. Current conduction elements do not have a solved-for current distribution from which to calculate a source field until after the first substep. Inclusion of a current conduction element H_s field will require a subsequent **BIOT (p. 265)**,SUM command (with SOURC36 elements unselected) and a **SOLVE (p. 1822)** command.

The units of H_s are as specified by the current **EMUNIT (p. 632)** command setting.

This command is also valid in PREP7.

Distributed-Memory Parallel (DMP) Restriction

When used with SOLID5, LINK68, or SOLID98, the **BIOT (p. 265)** command is not supported in a DMP solution.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Main Menu>Solution>Load Step Opts>Magnetics>Options Only>Biot-Savart

---

BLC4,*XCORNER*,*YCORNER*,*WIDTH*,*HEIGHT*,*DEPTH*

Creates a rectangular area or block volume by corner points.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XCORNER, YCORNER

Working plane X and Y coordinates of one corner of the rectangle or block face.

WIDTH

The distance from *XCORNER* on or parallel to the working plane X-axis that, together with *YCORNER*, defines a second corner of the rectangle or block face.

HEIGHT

The distance from *YCORNER* on or parallel to the working plane Y-axis that, together with *XCORNER*, defines a third corner of the rectangle or block face.

DEPTH

The perpendicular distance (either positive or negative based on the working plane Z direction) from the working plane representing the depth of the block. If *DEPTH* = 0 (default), a rectangular area is created on the working plane.

Notes

Defines a rectangular area anywhere on the working plane or a hexahedral volume with one face anywhere on the working plane. A rectangle will be defined with four keypoints and four lines. A volume will be defined with eight keypoints, twelve lines, and six areas, with the top and bottom faces parallel to the working plane. See the **BLC5 (p. 267)**, **RECTNG (p. 1580)**, and **BLOCK (p. 268)** commands for alternate ways to create rectangles and blocks.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Areas>Rectangle>By 2 Corners

Main Menu>Preprocessor>Modeling>Create>Volumes>Block>By 2 Corners & Z

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BLC5,*XCENTER*,*YCENTER*,*WIDTH*,*HEIGHT*,*DEPTH*

Creates a rectangular area or block volume by center and corner points.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XCENTER, YCENTER

Working plane X and Y coordinates of the center of the rectangle or block face.

WIDTH

The total distance on or parallel to the working plane X-axis defining the width of the rectangle or block face.

HEIGHT

The total distance on or parallel to the working plane Y-axis defining the height of the rectangle or block face.

DEPTH

The perpendicular distance (either positive or negative based on the working plane Z direction) from the working plane representing the depth of the block. If *DEPTH* = 0 (default), a rectangular area is created on the working plane.

Note:

If you are working with a model imported from an IGES file (import option set to DEFAULT), you must supply a value for *DEPTH* or the command is ignored.

Notes

Defines a rectangular area anywhere on the working plane or a hexahedral volume with one face anywhere on the working plane by specifying the center and corner points. A rectangle will be defined with four keypoints and four lines. A volume will be defined with eight keypoints, twelve lines, and six areas, with the top and bottom faces parallel to the working plane. See the **BLC4 (p. 266)**, **RECTNG (p. 1580)**, and **BLOCK (p. 268)** commands for alternate ways to create rectangles and blocks.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BLOCK,*X1*,*X2*,*Y1*,*Y2*,*Z1*,*Z2*

Creates a block volume based on working plane coordinates.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

X1, X2

Working plane X coordinates of the block.

Y1, Y2

Working plane Y coordinates of the block.

Z1, Z2

Working plane Z coordinates of the block.

Notes

Defines a hexahedral volume based on the working plane. The block must have a spatial volume greater than zero (that is, this volume primitive command cannot be used to create a degenerate volume as a means of creating an area.) The volume will be defined with eight keypoints, twelve lines, and six areas, with the top and bottom faces parallel to the working plane. See the **BLC4 (p. 266)** and **BLC5 (p. 267)** commands for alternate ways to create blocks.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Volumes>Block>By Dimensions

BOOL

Specifies "Booleans" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>List>Status>Preprocessor>Solid Model

BOPTN, *Lab*, *Value*

Specifies Boolean operation options.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Default/status key:

DEFA

Resets settings to default values.

STAT

Lists status of present settings.

Option to be controlled:

KEEP

Delete or keep input entity option.

NUMB

Output numbering warning message option.

NWARN

No effect warning message option.

VERSION

Boolean compatibility option.

Value

Option settings if *Lab* = KEEP:

NO

Delete entities used as input with a Boolean operation (default). Entities will not be deleted if meshed or if attached to a higher entity.

YES

Keep input solid modeling entities.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Option settings if *Lab* = NUMB:

0

No warning message will be produced if the output entities of a Boolean operation are numbered based on geometry (default).

1

A warning message will be produced if the output entities of a Boolean operation are numbered based on geometry. (With geometric numbering, re-use of the input with altered dimensions may not produce the same numbering, and later operations in the input may fail or produce unexpected results.)

Option settings if *Lab* = NWARN:

0

A warning message will be produced if a Boolean operation has no effect (default).

1

No warning or error messages will be generated if a Boolean operation has no effect.

-1

An error message will be produced if a Boolean operation has no effect.

Option settings if *Lab* = VERSION:

RV52

Activate the Revision 5.2 compatibility option (default). The 5.2 option can produce different numbering of the entities produced by Boolean operations than the 5.1 option. See Notes below.

RV51

Activate the Revision 5.1 compatibility option. The 5.1 option can produce different numbering of the entities produced by Boolean operations than the 5.2 option. See "Notes" (p. 270) below.

Command Default

Input entities will be deleted, and operations with no effect (that is, operations which are valid but which do not cause a change in the input entities, such as adding two non-touching areas) will produce a warning message. The Revision 5.2 Boolean compatibility option will be used.

Notes

Boolean operations at Revision 5.2 may produce a different number of entities than previous revisions of Mechanical APDL. When running input files created in earlier versions of Mechanical APDL, match the Boolean compatibility option (VERSION) to the revision originally used. For instance, if you are running

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Revision 5.2 and are reading an input file (**/INPUT (p. 948)**) created at Revision 5.1, it is recommended that you set VERSION to RV51 before reading the input.

See the *Modeling and Meshing Guide* for further details on the functions of the RV51 and RV52 labels.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Settings

BSAX, *VAL1*, *VAL2*, *T*

Specifies the axial strain and axial force relationship for beam sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAL1

Axial strain component (ε).

VAL2

Axial force component (N).

T

Temperature.

Notes

The behavior of beam elements is governed by the generalized-stress/generalized-strain relationship of the form:

$$\begin{bmatrix} N \\ M_1 \\ M_2 \\ \tau \\ S_1 \\ S_2 \end{bmatrix} = \begin{bmatrix} AE(\varepsilon,T) & & & & & \\ & I_1E(\kappa_1,T) & & 0 & & \\ & & I_2E(\kappa_2,T) & & & \\ & & & JG(\chi,T) & & \\ & 0 & & & A_1G(\gamma_1,T) & \\ & & & & & A_2G(\gamma_2,T) \end{bmatrix} \begin{bmatrix} \varepsilon \\ \kappa_1 \\ \kappa_2 \\ \chi \\ \gamma_1 \\ \gamma_2 \end{bmatrix}$$

The **BSAX (p. 271)** command, one of several nonlinear general beam section commands, specifies the relationship of axial strain and axial force for a beam section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

Unspecified values default to zero, with the exception of temperature. If the temperature is unspecified, the values become temperature-independent.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Related commands are **BSM1 (p. 273)**, **BSM2 (p. 274)**, **BSTQ (p. 278)**, **BSS1 (p. 276)**, **BSS2 (p. 277)**, **BSMD (p. 272)**, and **BSTE (p. 278)**.

For complete information, see Using Nonlinear General Beam Sections in the *Structural Analysis Guide*.

Menu Paths

Main Menu>Preprocessor>Sections>Beam>NL Generalized

BSMD, *DENS*, *T*

Specifies mass per unit length for a nonlinear general beam section.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DENS

Mass density.

T

Temperature.

Notes

The **BSMD (p. 272)** command, one of several nonlinear general beam section commands, specifies the mass density (assuming a unit area) for a beam section. The value specified is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

If *DENS* is unspecified, it defaults to zero. If the temperature is unspecified, *DENS* becomes temperature-independent.

Related commands are **BSAX (p. 271)**, **BSM1 (p. 273)**, **BSM2 (p. 274)**, **BSTQ (p. 278)**, **BSS1 (p. 276)**, **BSS2 (p. 277)**, and **BSTE (p. 278)**.

For complete information, see Using Nonlinear General Beam Sections in the *Structural Analysis Guide*.

Menu Paths

Main Menu>Preprocessor>Sections>Beam>NL Generalized

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BSM1, *VAL1*, *VAL2*, *T*

Specifies the bending curvature and moment relationship in plane XZ for beam sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAL1

Curvature component (κ_1).

VAL2

Bending moment component (M_1).

T

Temperature.

Notes

The behavior of beam elements is governed by the generalized-stress/generalized-strain relationship of the form:

$$\begin{bmatrix} N \\ M_1 \\ M_2 \\ \tau \\ S_1 \\ S_2 \end{bmatrix} = \begin{bmatrix} AE(\varepsilon,T) & & & & & \\ & I_1E(\kappa_1,T) & & & 0 & \\ & & I_2E(\kappa_2,T) & & & \\ & & & JG(\chi,T) & & \\ & 0 & & & A_1G(\gamma_1,T) & \\ & & & & & A_2G(\gamma_2,T) \end{bmatrix} \begin{bmatrix} \varepsilon \\ \kappa_1 \\ \kappa_2 \\ \chi \\ \gamma_1 \\ \gamma_2 \end{bmatrix}$$

The **BSM1 (p. 273)** command, one of several nonlinear general beam section commands, specifies the bending curvature and moment for plane XZ of a beam section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

Unspecified values default to zero, with the exception of temperature. If the temperature is unspecified, the values become temperature-independent.

Related commands are **BSAX (p. 271)**, **BSM2 (p. 274)**, **BSTQ (p. 278)**, **BSS1 (p. 276)**, **BSS2 (p. 277)**, **BSMD (p. 272)**, and **BSTE (p. 278)**.

For complete information, see Using Nonlinear General Beam Sections in the *Structural Analysis Guide* .

BSM2, *VAL1*, *VAL2*, *T*

Specifies the bending curvature and moment relationship in plane XY for beam sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAL1

Curvature component (κ_2).

VAL2

Bending moment component (M_2).

T

Temperature.

Notes

The behavior of beam elements is governed by the generalized-stress/generalized-strain relationship of the form:

$$\begin{bmatrix} N \\ M_1 \\ M_2 \\ \tau \\ S_1 \\ S_2 \end{bmatrix} = \begin{bmatrix} AE(\varepsilon,T) & & & & & \\ & I_1E(\kappa_1,T) & & & 0 & \\ & & I_2E(\kappa_2,T) & & & \\ & & & JG(\chi,T) & & \\ & 0 & & & A_1G(\gamma_1,T) & \\ & & & & & A_2G(\gamma_2,T) \end{bmatrix} \begin{bmatrix} \varepsilon \\ \kappa_1 \\ \kappa_2 \\ \chi \\ \gamma_1 \\ \gamma_2 \end{bmatrix}$$

The **BSM2 (p. 274)** command, one of several nonlinear general beam section commands, specifies the bending curvature and moment relationship for plane XY of a beam section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

Unspecified values default to zero, with the exception of temperature. If the temperature is unspecified, the values become temperature-independent.

Related commands are **BSAX (p. 271)**, **BSM1 (p. 273)**, **BSTQ (p. 278)**, **BSS1 (p. 276)**, **BSS2 (p. 277)**, **BSMD (p. 272)**, and **BSTE (p. 278)**.

BSPLIN, *P1*, *P2*, *P3*, *P4*, *P5*, *P6*, *XV1*, *YV1*, *ZV1*, *XV6*, *YV6*, *ZV6*

Generates a single line from a spline fit to a series of keypoints.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

P1, P2, P3, . . . , P6

Keypoints through which a spline is fit. At least two keypoints must be defined. If *P1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

The following fields are used only if specified end slopes are desired; otherwise, zero curvature end slopes will be automatically calculated. The slope vector is parallel to a vector pointing from the origin of the active coordinate system (**CSYS (p. 441)**) to the position in space that XV, YV, ZV represents in that system.

XV1, YV1, ZV1

Orientation point of an outward vector tangent to line at *P1*. Vector coordinate system has its origin at the keypoint. Coordinate interpretation corresponds to the active coordinate system type, that is, X is R for cylindrical, etc. Defaults to zero curvature slope.

XV6, YV6, ZV6

Orientation point of an outward vector tangent to a line at *P6* (or the last keypoint specified if fewer than six specified). Defaults to zero curvature slope.

Notes

One line is generated between keypoint *P1* and the last keypoint entered. The line will pass through each entered keypoint. Solid modeling in a toroidal coordinate system is not recommended.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BSS1, *VAL1*, *VAL2*, *T*

Specifies the transverse shear strain and force relationship in plane XZ for beam sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAL1

Transverse shear strain component (γ_1).

VAL2

Transverse shear force component (S_1).

T

Temperature.

Notes

The behavior of beam elements is governed by the generalized-stress/generalized-strain relationship of the form:

$$\begin{bmatrix} N \\ M_1 \\ M_2 \\ \tau \\ S_1 \\ S_2 \end{bmatrix} = \begin{bmatrix} AE(\varepsilon,T) & & & & & \\ & I_1E(\kappa_1,T) & & & 0 & \\ & & I_2E(\kappa_2,T) & & & \\ & & & JG(\chi,T) & & \\ & 0 & & & A_1G(\gamma_1,T) & \\ & & & & & A_2G(\gamma_2,T) \end{bmatrix} \begin{bmatrix} \varepsilon \\ \kappa_1 \\ \kappa_2 \\ \chi \\ \gamma_1 \\ \gamma_2 \end{bmatrix}$$

The **BSS1 (p. 276)** command, one of several nonlinear general beam section commands, specifies the transverse shear strain and transverse shear force relationship for plane XZ of a beam section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

Unspecified values default to zero, with the exception of temperature. If the temperature is unspecified, the values become temperature-independent.

Related commands are **BSAX (p. 271)**, **BSM1 (p. 273)**, **BSM2 (p. 274)**, **BSTQ (p. 278)**, **BSS2 (p. 277)**, **BSMD (p. 272)**, and **BSTE (p. 278)**.

For complete information, see Using Nonlinear General Beam Sections in the *Structural Analysis Guide*
.

BSTE, *ALPHA*, *T*

Specifies a thermal expansion coefficient for a nonlinear general beam section.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ALPHA

Coefficient of thermal expansion for the cross section.

T

Temperature.

Notes

The **BSTE (p. 278)** command, one of several nonlinear general beam section commands, specifies a thermal expansion coefficient for a beam section. The value specified is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

If *ALPHA* is unspecified, it defaults to zero. If the temperature is unspecified, *ALPHA* becomes temperature-independent.

Related commands are **BSAX (p. 271)**, **BSM1 (p. 273)**, **BSM2 (p. 274)**, **BSTQ (p. 278)**, **BSS1 (p. 276)**, **BSS2 (p. 277)**, and **BSMD (p. 272)**.

For complete information, see Using Nonlinear General Beam Sections in the *Structural Analysis Guide*.

Menu Paths

Main Menu>Preprocessor>Sections>Beam>NL Generalized

BSTQ, *VAL1*, *VAL2*, *T*

Specifies the cross section twist and torque relationship for beam sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAL1

Twist component (χ).

VAL2

Torque component (τ).

T

Temperature.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The behavior of beam elements is governed by the generalized-stress/generalized-strain relationship of the form:

$$\begin{bmatrix} N \\ M_1 \\ M_2 \\ \tau \\ S_1 \\ S_2 \end{bmatrix} = \begin{bmatrix} AE(\varepsilon,T) & & & & & \\ & I_1E(\kappa_1,T) & & 0 & & \\ & & I_2E(\kappa_2,T) & & & \\ & & & JG(\chi,T) & & \\ & 0 & & & A_1G(\gamma_1,T) & \\ & & & & & A_2G(\gamma_2,T) \end{bmatrix} \begin{bmatrix} \varepsilon \\ \kappa_1 \\ \kappa_2 \\ \chi \\ \gamma_1 \\ \gamma_2 \end{bmatrix}$$

The **BSTQ (p. 278)** command, one of several nonlinear general beam section commands, specifies the cross section twist and torque relationship for a beam section. The section data defined is associated with the section most recently defined (via the **SECTYPE (p. 1697)** command).

Unspecified values default to zero, with the exception of temperature. If the temperature is unspecified, the values become temperature-independent.

Related commands are **BSAX (p. 271)**, **BSM1 (p. 273)**, **BSM2 (p. 274)**, **BSS1 (p. 276)**, **BSS2 (p. 277)**, **BSMD (p. 272)**, and **BSTE (p. 278)**.

For complete information, see Using Nonlinear General Beam Sections in the *Structural Analysis Guide*.

Menu Paths

Main Menu>Preprocessor>Sections>Beam>NL Generalized

BTOL, *PTOL*

Specifies the Boolean operation tolerances.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

PTOL

Point coincidence tolerance. Points within this distance to each other will be assumed to be coincident during Boolean operations. Loosening the tolerance will increase the run time and storage requirements, but will allow more Boolean intersections to succeed. Defaults to 0.10E-4.

Command Default

PTOL = 0.10E-4.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Use **BTOL (p. 279)**,DEFA to reset the setting to its default value. Use **BTOL (p. 279)**,STAT to list the status of the present setting.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Settings

BUCOPT,*Method*,*NMODE*,*SHIFT*,*LDMULTE*,*RangeKey*

Specifies buckling analysis options.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Method

Mode extraction method to be used for the buckling analysis:

LANB

Block Lanczos

SUBSP

Subspace iteration

See Eigenvalue and Eigenvector Extraction in the *Mechanical APDL Theory Reference* for more information on these two methods.

NMODE

Number of buckling modes (that is, eigenvalues or load multipliers) to extract (defaults to 1).

SHIFT

By default, this value acts as the initial shift point about which the buckling modes are calculated (defaults to 0.0).

When *RangeKey* = RANGE, this value acts as the lower bound of the load multiplier range of interest (*LDMULTE* is the upper bound).

LDMULTE

Boundary for the load multiplier range of interest (defaults to ∞).

When *RangeKey* = CENTER, the *LDMULTE* value determines the lower and upper bounds of the load multiplier range of interest (-*LDMULTE*, +*LDMULTE*).

When *RangeKey* = RANGE, the *LDMULTE* value is the upper bound for the load multiplier range of interest (*SHIFT* is the lower bound).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RangeKey

Key used to control the behavior of the eigenvalue extraction method (defaults to CENTER):

CENTER

Use the CENTER option control (default); the program computes *NMODE* buckling modes centered around *SHIFT* in the range of (-*LDMULTE*, +*LDMULTE*).

RANGE

Use the RANGE option control; the program computes *NMODE* buckling modes in the range of (*SHIFT*, *LDMULTE*).

Notes

Specifies buckling analysis (**ANTYPE (p. 162)**,BUCKLE) options. Additional options used only for the Block Lanczos (LANB) eigensolver are specified by the **LANBOPTION (p. 1007)** command. For more difficult buckling problems, you can specify an alternative version of the Block Lanczos eigensolver (**LANBOPTION (p. 1007)**,,,ALT1).

Eigenvalues from a buckling analysis can be negative and/or positive. The program sorts the eigenvalues from the most negative to the most positive values. The minimum buckling load factor may correspond to the smallest eigenvalue in absolute value, or to an eigenvalue within the range, depending on your application (that is, linear perturbation buckling analysis or purely linear buckling analysis).

It is recommended that you request an additional few buckling modes beyond what is needed in order to enhance the accuracy of the final solution. It is also recommended that you input a non zero *SHIFT* value and a reasonable *LDMULTE* value (that is, a smaller *LDMULTE* that is closer to the last buckling mode of interest) when numerical problems are encountered.

When using the RANGE option, defining a range that spans zero is not recommended. If you are seeking both negative and positive eigenvalues, it is recommended that you use the CENTER option.

This command is also valid in PREP7. If used in SOLUTION, this command is valid only within the first load step.

C Commands

C***,*Comment*

Places a comment in the output.

SESSION (p. 11): List Controls (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Comment

Comment string, up to 75 characters.

Notes

The output from this command consists of two lines -- a blank line followed by a line containing C*** and the comment. This command is similar to **/COM (p. 404)** except that the comment produced by **C*** (p. 283)** is more easily identified in the output.

Another way to include a comment is to precede it with a ! character (on the same line). The ! may be placed anywhere on the line, and any input following it is ignored as a comment. No output is produced by such a comment, but the comment line is included on the log file. This is a convenient way to annotate the log file.

This command is valid anywhere.

Menu Paths

This command cannot be accessed from a menu.

CALC

Specifies "Calculation settings" as the subsequent status topic.

POST1 (p. 51): Status (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Utility Menu>List>Status>General Postproc>Calculations

CAMPBELL,*Action*

Prepares the result file for a subsequent Campbell diagram of a prestressed structure.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Campbell action:

NONE

Do not prepare the result file. This option is the default behavior.

RSTP

Prepare the result file (`Jobname.rstp`) for a subsequent Campbell diagram of a prestressed structure.

Notes

For an analysis involving a prestressed structure, the **CAMPBELL (p. 284)** command specifies whether or not to prepare the result file to support a Campbell diagram analysis (**PRCAMP (p. 1469)** or **PLCAMP (p. 1392)**).

To prestress a structure, the program performs a static solution before the linear perturbation modal solution. For specific information about rotating structures, see Considerations for Rotating Structures.

The **CAMPBELL (p. 284)** command requires that modal and static analyses be performed alternately. It works only when the number of static analyses is the same as the number of modal analyses. Any number of analyses can be performed, but the same number of each (static and modal) is expected. The modal solutions are appended in the results file (`Jobname.rstp`).

For an example of **CAMPBELL (p. 284)** command usage, see Example 5.1: Commands used in a Campbell Diagram Analysis of a Prestressed Structure in the *Rotordynamic Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CBDOF,*Fname1*,*Ext1*,--,*Fname2*,*Ext2*,--,*KPOS*,*Clab*,*KSHS*,*TOLOUT*,*TOLHGT*,*TOLTHK*

Activates cut-boundary interpolation (for submodeling).

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname1

File name and directory path (248 characters maximum, including directory) from which to read boundary node data. If no specified directory path exists, the path defaults to your working directory and you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext1

Filename extension (eight-character maximum).

The extension defaults to NODE if *Fname1* is blank.

--

Unused field.

Fname2

File name and directory path (248 characters maximum, including directory) to which cut-boundary **D** commands are written. If no specified directory path exists, the path defaults to your working directory and you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext2

Filename extension (eight-character maximum).

The extension defaults to CBDO if *Fname2* is blank.

--

Unused field.

KPOS

Position on *Fname2* to write block of **D (p. 483)** commands:

0

Beginning of file (overwrite existing file).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

End of file (append to existing file).

Clab

Label (eight characters maximum, including the colon) for this block of **D (p. 483)** commands on *Fname2*. his label is appended to the colon (:). Defaults to CB*n*, where *n* is the cumulative iteration number for the data set currently in the database. For imaginary data (see *KIMG* on the ***SET (p. 1720)** command), *Clab* defaults to CI*n*.

KSHS

Shell-to-solid submodeling key:

0

Solid-to-solid or shell-to-shell submodel.

1

Shell-to-solid submodel.

TOLOUT

Extrapolation tolerance about elements, based on a fraction of the element dimension. Submodel nodes outside the element by more than *TOLOUT* are not accepted as candidates for DOF extrapolation. Defaults to 0.5 (50 percent).

TOLHGT

Height tolerance above or below shell elements, in units of length. Used only for shell-to-shell submodeling (*KSHS* = 0). Submodel nodes off the element surface by more than *TOLHGT* are not accepted as candidates for degree-of-freedom interpolation or extrapolation. Defaults to 0.0001 times the maximum element dimension.

TOLTHK

Height tolerance above or below shell elements, based on a fraction of the shell element thickness. Used only for shell-to-solid submodeling (KSHS = 1). Submodel nodes off the element surface by more than *TOLTHK* are not accepted as candidates for DOF interpolation or extrapolation. Defaults to 0.1 times the average shell thickness.

Notes

File *Fname1* should contain a node list for which boundary conditions are to be interpolated (**NWRITE (p. 1305)**). File *Fname2* is created to contain interpolated boundary conditions written as a block of **D (p. 483)** commands.

Boundary conditions are written for the active degree-of-freedom set for the element from which interpolation is performed. Interpolation occurs on the selected set of elements. The block of **D (p. 483)** commands begins with an identifying colon label and ends with a **/EOF (p. 645)** command. The colon label is of the form :*Clab* (described above).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Interpolation from multiple results sets can be performed by looping through the results file in a user-defined macro. Additional blocks can be appended to *Fname2* by using *KPOS* and unique colon labels. To read the block of commands, issue the **/INPUT (p. 948)** command with the appropriate colon label.

If the model has coincident (or very close) nodes, the **CBDOF (p. 285)** must be applied to each part of the model separately to ensure that the mapping of the nodes is correct. For example, if nodes belonging to two adjacent parts linked by springs are coincident, the operation should be performed on each part of the model separately.

Resume the coarse model database at the beginning of the cut-boundary procedure. The database should have been saved after the first coarse model solution, as the number of nodes in the database and the results file must match, and internal nodes are sometimes created during the solution.

This command cannot be used to interpolate the magnetic edge-flux (AZ) degree of freedom.

Caution:

Relaxing the *TOLHGT* or *TOLTHK* tolerances to allow submodel nodes to be "found" can produce poor submodel results.

Menu Paths

Main Menu>General Postproc>Submodeling>Interpolate DOF

CBMD, *ROW*, $C_{(R)(R)}$, $C_{(R)(R+1)}$, $C_{(R)(R+2)}$, $C_{(R)(R+3)}$, $C_{(R)(R+4)}$, $C_{(R)(R+5)}$

Specifies preintegrated section mass matrix for composite-beam sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ROW

Row number of the matrix.

$C_{(R)(R)}$, ..., $C_{(R)(R+5)}$

Upper triangle of the cross-section mass matrix **[C]**.

Notes

With a unit beam length, the section mass matrix relates the resultant forces and torques to accelerations and angular accelerations as follows (applicable to the local element coordinate system):

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$\begin{bmatrix} N_x \\ N_y \\ N_z \\ M_x \\ M_y \\ M_z \end{bmatrix} = \begin{bmatrix} C_{11}(T) & C_{12}(T) & C_{13}(T) & C_{14}(T) & C_{15}(T) & C_{16}(T) \\ & C_{22}(T) & C_{23}(T) & C_{24}(T) & C_{25}(T) & C_{26}(T) \\ & & C_{33}(T) & C_{34}(T) & C_{35}(T) & C_{36}(T) \\ & & & C_{44}(T) & C_{45}(T) & C_{46}(T) \\ & & & & C_{55}(T) & C_{56}(T) \\ & & & & & C_{66}(T) \end{bmatrix} \begin{bmatrix} A_x \\ A_y \\ A_z \\ R_x \\ R_y \\ R_z \end{bmatrix}$$

The **CBMD (p. 287)** command, one of several composite beam section commands, specifies the section mass matrix (submatrix [***C***] data) for a composite beam section. The section data defined is associated with the section most recently defined (**SECTYPE (p. 1697)**) at the specified temperature (**CBTMP (p. 290)**).

Unspecified values default to zero.

Related commands are **CBTMP (p. 290)**, **CBTE (p. 289)**, and **CBMX (p. 288)**.

For complete information, see Using Preintegrated Composite Beam Sections.

Menu Paths

Main Menu>Preprocessor>Sections>Beam>Composite Sections

CBMX, *ROW*, $S_{(R)(R)}$, $S_{(R)(R+1)}$, $S_{(R)(R+2)}$, $S_{(R)(R+3)}$, $S_{(R)(R+4)}$, $S_{(R)(R+5)}$, $S_{(R)(R+6)}$

Specifies preintegrated cross-section stiffness for composite beam sections.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ROW

Row number of the matrix.

$S_{(R)(R)}$, . . . , $S_{(R)(R+6)}$

Upper triangle of the cross-section stiffness matrix **[S]**.

Notes

The behavior of beam elements is governed by the generalized-stress/generalized-strain relationship of the form:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$\begin{bmatrix} N \\ M_1 \\ M_2 \\ \tau \\ S_1 \\ S_2 \\ B_m \end{bmatrix} = \begin{bmatrix} S_{11}(T) & S_{12}(T) & S_{13}(T) & S_{14}(T) & S_{15}(T) & S_{16}(T) & S_{17}(T) \\ & S_{22}(T) & S_{23}(T) & S_{24}(T) & S_{25}(T) & S_{26}(T) & S_{27}(T) \\ & & S_{33}(T) & S_{34}(T) & S_{35}(T) & S_{36}(T) & S_{37}(T) \\ & & & S_{44}(T) & S_{45}(T) & S_{46}(T) & S_{47}(T) \\ & & & & S_{55}(T) & S_{56}(T) & S_{57}(T) \\ & & & & & S_{66}(T) & S_{67}(T) \\ & & & & & & S_{77}(T) \end{bmatrix} \begin{bmatrix} \varepsilon \\ \kappa_1 \\ \kappa_2 \\ \chi \\ \gamma_1 \\ \gamma_2 \\ B_k \end{bmatrix}$$

Notes

The **CBMX (p. 288)** command, one of several composite beam section commands, specifies the cross-section stiffness matrix (submatrix [***S***] data) for a composite beam section. The section data defined is associated with the section most recently defined (**SECTYPE (p. 1697)**) at the specified temperature (**CBTMP (p. 290)**).

Unspecified values default to zero.

Related commands are **CBTMP (p. 290)**, **CBTE (p. 289)**, and **CBMD (p. 287)**.

For complete information, see Using Preintegrated Composite Beam Sections.

Menu Paths

Main Menu>Preprocessor>Sections>Beam>Composite Sections

CBTE, *ALPHA*

Specifies a thermal expansion coefficient for a composite beam section.

PREP7 (p. 22): Cross Sections (p. 35)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ALPHA

Coefficient of thermal expansion for the cross section.

Notes

The **CBTE (p. 289)** command, one of several composite beam section commands, specifies a thermal expansion coefficient for a beam section. The value specified is associated with the section most recently defined (**SECTYPE (p. 1697)**) at the specified temperature (**CBTMP (p. 290)**).

Unspecified values default to zero.

Related commands are **CBTMP (p. 290)**, **CBMX (p. 288)**, and **CBMD (p. 287)**.

For complete information, see Using Preintegrated Composite Beam Sections.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Sections>Beam>Composite Sections

CBTMP, *TEMP*

Specifies a temperature for composite-beam input.

PREP7 (p. 22): Data Tables (p. 24)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TEMP

Temperature value.

Notes

The **CBTMP (p. 290)** command, one of several composite beam-section commands, specifies a temperature to be associated with the data input via subsequent **CBMX (p. 288)** (preintegrated cross-section stiffness), **CBMD (p. 287)** (preintegrated section mass), or **CBTE (p. 289)** (thermal-expansion) commands.

The specified temperature remains active until the next **CBTMP (p. 290)** command is issued.

An unspecified temperature value defaults to zero.

For complete information, see Using Preintegrated Composite Beam Sections.

Menu Paths

Main Menu>Preprocessor>Sections>Beam>Composite Sections

CDOPT, *Option*

Specifies format to be used for archiving geometry.

PREP7 (p. 22): Database (p. 22)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

IGES

Write solid model geometry information using IGES format (default).

ANF

Write solid model geometry information using Ansys Neutral File (ANF) format.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

STAT

Print out the current format setting.

Notes

This command controls your solid model geometry format for **CDWRITE (p. 293)** operations. The ANF option affects only the COMB and SOLID options of the **CDWRITE (p. 293)** command. All other options remain unaffected.

This option setting is saved in the database.

Menu Paths

Main Menu>Preprocessor>Archive Model>Read

Main Menu>Preprocessor>Archive Model>Write

CDREAD,*Option*,*Fname*,*Ext*,--,*Fnamei*,*Exti*

Reads a file of solid model and database information into the database.

PREP7 (p. 22): Database (p. 22)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Selects which data to read:

ALL

Read all geometry, material property, load, and component data (default). Solid model geometry and loads will be read from the file *fnamei.exti*. All other data will be read from the file *fname.ext*.

DB

Read all database information contained in file *Fname.Ext*. This file should contain all information mentioned above except the solid model loads. If reading a .cdb file written with the GEOM option of the **CDWRITE (p. 293)** command, element types (**ET (p. 686)**) compatible with the connectivity of the elements on the file must be defined prior to reading.

SOLID

Read the solid model geometry and solid model loads from the file *Fnamei.Exti*. This file could have been written by the **CDWRITE (p. 293)** or **IGESOUT (p. 932)** command.

COMB

Read the combined solid model and database information from the file *Fname.Ext*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to `Jobname`.

Ext

Filename extension (eight-character maximum).

The extension defaults to `.cdb` if *Fname* is blank.

--

Unused field.

Fnamei

Name of the IGES file and its directory path (248 characters maximum, including directory). If you do not specify a directory path, it will default to your working directory and you can use all 248 characters for the file name.

The file name defaults to *Fname*. Used only if *Option* = ALL or SOLID.

Exti

Filename extension (eight-character maximum).

Defaults to IGES if *Fnamei* is blank.

Notes

This command causes coded files of solid model (in IGES format) and database (in command format) information to be read. These files are normally written by the **CDWRITE (p. 293)** or **IGESOUT (p. 932)** command. Note that the active coordinate system in these files has been reset to Cartesian (**CSYS (p. 441)**,0).

If a set of data exists prior to the **CDREAD (p. 291)** operation, that data set is offset upward to allow the new data to fit without overlap. The **NOOFFSET (p. 1250)** command allows this offset to be ignored on a set-by-set basis, causing the existing data set to be overwritten with the new data set.

When you write the geometry data using the **CDWRITE (p. 293)**,GEOM option, you use the **CDREAD (p. 291)**,DB option to read the geometry information.

Using the **CDREAD (p. 291)**,COMB option will not write **NUMOFF (p. 1299)** commands to offset entity ID numbers if there is no solid model in the database.

Multiple `.cdb` file imports cannot have elements with real constants in one file and section definitions in another. The section attributes will override the real constant attributes. If you use **CDREAD (p. 291)** to import multiple CDB files, define all of the elements using only real constants, or using only section definitions. Combining real constants and section definitions is not recommended.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If a radiosity mapping data file (`.rsm` file) was saved by the previous **CDWRITE (p. 293)** command, that mapping file must be present in the directory along with the coded geometry file in order for radiosity surface elements (SURF251, SURF252) to be correctly mapped onto the model when **CDREAD (p. 291)** is issued.

If you issue **CDWRITE (p. 293)** to import a `.cdb` file containing a user-defined element, manually insert **USRELEM (p. 2065)** and **USRDOF (p. 2064)** commands in the `.cdb` file to provide the user-defined element characteristics. Insert the two commands *after* the **ET (p. 686)** command (defining the user-defined element) and *before* the EBLOCK command. (If multiple element types are defined in the `.cdb` file, insert the **TYPE (p. 2036)** command to select the user-defined element. Place it *before* **USRELEM (p. 2065)** and **USRDOF (p. 2064)**.)

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Archive Model>Read

CDWRITE, *Option*,*Fname*,*Ext*,--,*Fnamei*, *Exti*,*Fmat*,--,*Key*

Writes geometry and load database items to a file.

PREP7 (p. 22): Database (p. 22)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Selects which data to write:

ALL

Write all appropriate geometry, material property, load, and component data (default). Two files will be produced. *Fname.Ext* will contain all data items mentioned in "Notes" (p. 295), except the solid model data. *Fnamei.Exti* will contain the solid model geometry and solid model loads data in the form of IGES commands. This option is not valid when **CDOPT (p. 290)**,ANF is active.

COMB

Write all data mentioned, but to a single file, *Fname.Ext*. Solid model geometry data will be written in either IGES or ANF format as specified in the **CDOPT (p. 290)** command, followed by the remainder of the data in the form of Mechanical APDL commands. More information on these (IGES/ANF) file formats is provided in "Notes" (p. 295).

DB

Write all database information except the solid model and solid model loads to *Fname.Ext* in the form of Mechanical APDL commands. This option is not valid when **CDOPT (p. 290)**,ANF is active.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SOLID

Write only the solid model geometry and solid model load data. This output will be in IGES or ANF format, as specified in the **CDOPT (p. 290)** command. More information on these (IGES/ANF) file formats is provided in "Notes" (p. 295).

GEOM

Write only element and nodal geometry data. Neither solid model geometry nor element attribute data will be written. One file, *Fname.Ext*, will be produced. Use **CDREAD (p. 291)**,DB to read in a file written with this option. Element types (**ET (p. 686)**) compatible with the connectivity of the elements on the file must first be defined before reading the file in with **CDREAD (p. 291)**,DB.

CM

Write only node and element component and geometry data to *Fname.Ext*.

MAT

Write only material property data (both linear and nonlinear) to *Fname.Ext* .

LOAD

Write only loads for current load step to *Fname.Ext*.

SECT

Write only section data to *Fname.Ext*. Pretension sections are not included.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Ext

Filename extension (eight-character maximum).

The extension defaults to CDB if *Fname* is blank.

--

Unused field.

Fnamei

Name of the IGES file and its directory path (248 characters maximum, including directory). If you do not specify a directory path, it will default to your working directory and you can use all 248 characters for the file name.

The file name defaults to *Fname*. Used only if *Option* = ALL or SOLID. Previous data on this file, if any, is overwritten.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Exti

Filename extension (eight-character maximum).

The extension defaults to IGES in all cases, except when **CDOPT (p. 290)**,ANF is active and **CDWRITE (p. 293)**, *Option* = SOLID. In this case *Exti* = ANF.

Fmat

Format of the output file (defaults to BLOCKED).

BLOCKED

Blocked format. This format allows faster reading of the output file. The time savings is most significant when BLOCKED is used to read `.cdb` files associated with very large models.

UNBLOCKED

Unblocked format.

--

Unused field.

Key

Format key required for Multistage workflow in Workbench.

DUPL

Ensures the correct numbering offsets are applied when writing a `.cdb` file for automatic sector mesh duplication.

Notes

Load data includes the current load step only. Loads applied to the solid model (if any) are automatically transferred to the finite element model when this command is issued. **CDWRITE (p. 293)** writes out solid model loads for meshed models only. If the model is not meshed, the solid model loads cannot be saved. Component data include component definitions, but not assembly definitions. Appropriate **NUMOFF (p. 1299)** commands are included at the beginning of the file; this is to avoid overlap of an existing database when the file is read in.

Solution control commands are typically not written to the file unless you specifically change a default solution setting.

CDWRITE (p. 293) does not support the **GSBDATA (p. 876)** and **GSGDATA (p. 877)** commands, and these commands are not written to the file.

The data may be reread (on a different machine, for example) with the **CDREAD (p. 291)** command. Caution: When the file is read in, the **NUMOFF (p. 1299)**,MAT command may cause a mismatch between material definitions and material numbers referenced by certain loads and element real constants. See **NUMOFF (p. 1299)** for details. Also, be aware that the files created by the **CDWRITE (p. 293)** command explicitly set the active coordinate system to Cartesian (**CSYS (p. 441)**,0).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You should generally use the blocked format (*Fmat* = BLOCKED) when writing out model data with **CDWRITE (p. 293)**. This is a compressed data format that greatly reduces the time required to read large models through the **CDREAD (p. 291)** command. The blocked and unblocked formats are described in The CDWRITE (CDB) File Format in the *Programmer's Reference*.

If you use **CDWRITE (p. 293)** in any of the derived products (Ansys Mechanical Pro, Ansys Mechanical Premium), then before reading the file, you must edit the `Jobname.cdb` file to remove commands that are not available in the respective component product.

The **CDWRITE (p. 293)** command does not support (for beam meshing) any line operation that relies on solid model associativity. For example, meshing the areas adjacent to the meshed line, plotting the line that contains the orientation nodes, or clearing the mesh from the line that contains orientation nodes may not work as expected. For more information about beam meshing, see Meshing Your Solid Model in the *Modeling and Meshing Guide*.

If you issue **CDWRITE (p. 293)** to write a `.cdb` file containing a user-defined element, manually insert **USRELEM (p. 2065)** and **USRDOF (p. 2064)** commands in the `.cdb` file to provide the user-defined element characteristics. Insert the two commands *after* the **ET (p. 686)** command (defining the user-defined element) and *before* the EBLOCK command. (If multiple element types are defined in the `.cdb` file, insert the **TYPE (p. 2036)** command to select the user-defined element. Place it *before* **USRELEM (p. 2065)** and **USRDOF (p. 2064)**.)

If radiosity surface elements (SURF251 or SURF252) are present in the model, a radiosity mapping data file, *Fname*`.RSM`, is also saved when the **CDWRITE (p. 293)** command is issued. For more information, see Advanced Radiosity Options in the *Thermal Analysis Guide*.

IGES and ANF File Formats for Solid Model Geometry Information

The format used for solid model geometry information is determined by the current **CDOPT (p. 290)** command setting. The default format is IGES.

IGES option (default) to write solid model information (**CDOPT (p. 290)**, IGS):

- Before writing solid model entities, select all corresponding lower level entities (**ALLSEL (p. 114)**,BELOW,ALL).
- Section properties assigned to areas, lines and other solid model entities are not maintained when the model is exported.
- If you issue **CDWRITE (p. 293)** after generating a beam mesh with orientation nodes, the database file will contain all of the nodes for every beam element, including the orientation nodes; however, the orientation keypoints that were specified for the line (**LATT (p. 1014)**) are no longer associated with the line and won't be written out to the geometry file. All associativity between the line and the orientation keypoints is lost.
- For beam meshing, this option does not support any line operation that relies on solid model associativity. For example, meshing the areas adjacent to the meshed line, plotting the line that contains the orientation nodes, or clearing the mesh from the line that contains orientation nodes may not work as expected.
- Concatenated lines are not written. The line segments that make up the concatenated lines are written; however, if the command encounters an area that contains a concatenated line, the write operation halts (that area cannot be recreated during the read operation). If your model has areas

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

that contain concatenated lines, you must first list these and then unconcatenate them before issuing the **CDWRITE (p. 293)** command. Similarly, hardpoint information cannot be written.

ANF option to write solid model information (**CDOPT (p. 290)**, ANF):

- Writes all model information in the database (regardless of select status) to the archive file; however, when you restore the database using this archived file, the select status of entities is also restored.
- Restores all line attributes, including orientation keypoints. It also writes out any components (not assemblies) that consist of solid model entities.
- Halts **CDWRITE (p. 293)** when a concatenated line or an area that contains a concatenated line is detected. You must delete the concatenated lines before issuing **CDWRITE (p. 293)**. Similarly, hardpoint information cannot be written.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Archive Model>Write

CE,*NEQN*,*CONST*,*NODE1*,*Lab1*,*C1*,*NODE2*,*Lab2*,*C2*,*NODE3*,*Lab3*,*C3*

Defines a constraint equation relating degrees of freedom.

PREP7 (p. 22): Constraint Equations (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NEQN

Set equation reference number:

n

Arbitrary set number.

HIGH

The highest defined constraint equation number. This option is especially useful when adding nodes to an existing set.

NEXT

The highest defined constraint equation number plus one. This option automatically numbers coupled sets so that existing sets are not modified.

The default value is HIGH.

CONST

Constant term of equation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NODE1

Node for first term of equation. If *-NODE1*, this term is deleted from the equation.

Lab1

Degree of freedom label for first term of equation. Structural labels: UX, UY, or UZ (displacements); ROTX, ROTY, or ROTZ (rotations, in radians). Thermal labels: TEMP, TBOT, TE2, TE3, . . ., TTOP (temperature). Electric labels: VOLT (voltage). Magnetic labels: MAG (scalar magnetic potential); AZ (vector magnetic potential). Diffusion label: CONC (concentration).

C1

Coefficient for first node term of equation. If zero, this term is ignored.

NODE2, Lab2, C2

Node, label, and coefficient for second term.

NODE3, Lab3, C3

Node, label, and coefficient for third term.

Notes

Repeat the **CE (p. 297)** command to add additional terms to the same equation. To change only the constant term, repeat the command with no node terms specified. Only the constant term can be changed during solution, and only with the **CECMOD (p. 300)** command.

Linear constraint equations may be used to relate the degrees of freedom of selected nodes in a more general manner than described for nodal coupling (**CP (p. 421)**). The constraint equation is of the form:

$$\text{Constant} = \sum_{I=1}^{N} (\text{Coefficient}(I) * U(I))$$

where U(I) is the degree of freedom (displacement, temperature, etc.) of term (I). The following example is a set of two constraint equations, each containing three terms:

0.0 = 3.0* (1 UX) + 3.0* (4 UX) + (-2.0)* (4 ROTY)

2.0 = 6.0* (2 UX) + 10.0* (4 UY) + 1.0* (3 UZ)

The first unique degree of freedom in the equation is eliminated in terms of all other degrees of freedom in the equation. A unique degree of freedom is one which is not specified in any other constraint equation, coupled node set, specified displacement set, or master degree of freedom set. It is recommended that the first term of the equation be the degree of freedom to be eliminated. The first term of the equation cannot contain a master degree of freedom, and no term can contain coupled degrees of freedom. The same degree of freedom may be specified in more than one equation but care must be taken to avoid over-specification (over-constraint).

The degrees of freedom specified in the equation (that is, UX, UY, ROTZ, etc.) must also be included in the model (as determined from the element types (**ET (p. 686)**)). Also, each node in the equation must be defined on an element (any element type containing that degree of freedom will do).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For buckling and modal analyses, the constant term of the equation will not be taken into account (that is, *CONST* is always zero).

Note that under certain circumstances a constraint equation generated by **CE (p. 297)** may be modified during the solution. See Program Modification of Constraint Equations for more information.

Menu Paths

Main Menu>Preprocessor>Coupling / Ceqn>Constraint Eqn

CECHECK, *ItemLab*, *Tolerance*, *DOF*

Check constraint equations and couplings for rigid body motions.

PREP7 (p. 22): Database (p. 22)
SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ItemLab

Item indicating what is to be checked:

CE

Check constraint equations only

CP

Check couplings only

ALL

Check both CE and CP

Tolerance

Allowed amount of out-of-balance for any constraint equation or coupled set. The default value of 1.0e-6 is usually good.

DOF

Specifies which DOF is to be checked. Default is RIGID, the usual option. Other choices are individual DOF such as UX, ROTZ, etc. or THERM. The THERM option will check the constraint equations or coupled sets for free thermal expansions, whereas the individual DOFs check under rigid body motions. ALL is RIGID and THERM.

Notes

This command imposes a rigid body motion on the nodes attached to the constraint equation or coupled set and makes sure that no internal forces are generated for such rigid body motions. Generation of internal forces by rigid body motions usually indicates an error in the equation specification (possibly due to nodal coordinate rotations). The THERM option does a similar check to see that no internal forces

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

are created by the equations if the body does a free thermal expansion (this check assumes a single isotropic coefficient of expansion).

Menu Paths

This command cannot be accessed from a menu.

CECMOD, *NEQN*, *CONST*

Modifies the constant term of a constraint equation during solution.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NEQN

Reference number of constraint equation.

CONST

New value of the constant term of equation.

Notes

Other terms of the constraint equation cannot be changed during the solution phase, but must be defined or changed within PREP7 prior to the solution. See the **CE (p. 297)** command for details.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Modify ConstrEqn

Main Menu>Solution>Load Step Opts>Other>Modify ConstrEqn

CECYCMS, *CycLowNod*, *CycHighNod*, *--*, *KMAP*, *TOLER*, *--*, *KPRINT*, *UsrNMap*

Generates the constraint equations for a multistage cyclic symmetry analysis.

PREP7 (p. 22): Constraint Equations (p. 34)
SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

CycLowNod

The name of a component for the nodes located on the low angle edge of the sector (up to 256 characters enclosed in single quotes).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The sector is that of the current stage (*Sname*) specified with **MSOPT (p. 1195)**,NEW,*Sname* or **MSOPT (p. 1195)**,MODIFY,*Sname*. If blank and if the array parameter of edge node pairs does not exist (no user-defined or default for *UsrNMap*), the default component name is '*_Sname*_CYCLOW_NOD'.

CycHighNod

The name of a component for the nodes located on the high angle edge of the sector (up to 256 characters enclosed in single quotes).

The sector is that of the current stage (*Sname*) specified with **MSOPT (p. 1195)**,NEW,*Sname* or **MSOPT (p. 1195)**,MODIFY,*Sname*. If blank and if the array parameter of edge node pairs does not exist (no user-defined or default for *UsrNMap*), the default component name is '*_Sname*_CYCHIGH_NOD'.

--

Unused field.

KMAP

Option to use mapping when creating cyclic symmetry constraint equations. This option is ignored if you specify *UsrNMap*.

ON

Use mapping to relate low and high sector boundary DOFs when applying cyclic symmetry constraint equations.

OFF

Use matching node pairs from low and high sector boundaries to apply cyclic symmetry constraint equations (default).

TOLER

Tolerance for determining if one node on the low edge boundary matches the corresponding node on the high edge boundary after the nodes are rotated.

If positive

TOLER is absolute (length units, defaults to 1e-4). If the distance of the nodes is smaller than this absolute tolerance, the nodes are matched.

If negative

TOLER is relative. Considering the diagonal of an imaginary box enclosing the model, *TOLER* is a fraction of the length of that diagonal. Nodes within the relative tolerance are matched.

--

Unused field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KPRINT

Option to print the table of matched nodes (*KMAP* = OFF) or mapped nodes and elements (*KMAP* = ON).

0

Do not print the table (default).

1

Print the table. If edge nodes are mapped (*KMAP* = ON) and a high edge node is matching a low edge node, the third column labeled "MAPPED" lists the node number. (See Snippets of Table Printed with *KPRINT* = 1 on **CECYCMS (p. 300)** (p. 303)).

UsrNMap

Option for matching node pairs between low and high edges.

Input the name of an existing array parameter or a numerical key:

<name>

Name of a user-defined array parameter that specifies the matching node pairs. The node pairs in the parameter may be input in any order, but the low edge node must be the first entry in each pair. (See Example: **CECYCMS (p. 300)** with a User-defined Array Parameter for *UsrNMap* (p. 303).)

0 (*or* blank)

If the default array parameter named *_Sname*_CYCNODPAIR already exists, it is used to specify the matching node pairs (default).

If this array parameter does not exist, nodes are paired automatically, and the array parameter named *_Sname*_CYCNODPAIR is created.

1

Nodes are paired automatically, and the array parameter named *_Sname*_CYCNODPAIR is created. If it exists, it is deleted and re-created.

-1

Nodes are paired automatically without creating or using an array parameter.

Notes

CECYCMS (p. 300), **CEIMS (p. 306)**, and **MSOPT (p. 1195)** are commands used in a multistage cyclic symmetry analysis.

If edge node pairs are matched (*KMAP* = OFF) and an array parameter is not specified for *UsrNMap*, components are used for the cyclic edge nodes. You must specify those components using the **CM (p. 356)** command and ensure that they contain base sector nodes only. See Building the Model for a more

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

detailed discussion and Example Usage (p. 303) for examples demonstrating the use of **CECYCMS (p. 300)** in multistage cyclic symmetry analyses.

Snippets of Table Printed with *KPRINT* = 1 on CECYCMS (p. 300)

- If *KMAP* = OFF, matched nodes are printed:

```
*****  CECYCMS - NODE PAIRS  *****
          nLow =       305 nHigh =       293
          nLow =       477 nHigh =       471
          nLow =       478 nHigh =       472
          nLow =       479 nHigh =       473
          nLow =       480 nHigh =       474
          nLow =       481 nHigh =       475
          nLow =       482 nHigh =       476
          nLow =       279 nHigh =       270
          nLow =       601 nHigh =       615
```

- If *KMAP* = ON, matched mapped nodes and elements are printed:

```
********* MAPPED NODES AND ELEMENTS *********
            NODE    ELEMENT    MATCHED NODE
            262        481          271
            263        487          272
            264        493          273
            265        499          274
            266        505          275
            267        511          276
            268        517          277
            269        523          278
```

Example: CECYCMS (p. 300) with a User-defined Array Parameter for *UsrNmap*

```
*DIM,MYMAP,ARRAY,2,10          ! specifying 10 low-high edge node pairs
*set,mymap(1, 1), 107, 108     ! low node 107 <> high node 108
*set,mymap(1, 2), 147, 211     ! low node 147 <> high node 211
…
CECYCMS,,, ,,, ,,MYMAP
```

Example Usage

Example: Static Analysis of a Compressor Model with 4 Axial Stages Without a Duplicate Sector

Example: Linear Perturbation Modal Analysis of a Simplified Model with 2 Axial Stages and a Non-planar Interstage Boundary

Example: Modal Analysis of Turbomachinery Stage Modeled as 2 Radial Stages with Offset Cyclic Edge Starting Points

Example: Mutistage Multiharmonic Modal Analysis of a Hollow Cylinder Modeled Using 2 Stages

Example: Multiharmonic Linear Perturbation Modal Analysis of a Simplified Model with 3 Axial Stages

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CEDELE, *NEQN1*, *NEQN2*, *NINC*, *Nsel*

Deletes constraint equations.

PREP7 (p. 22): Constraint Equations (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NEQN1*, *NEQN2*, *NINC

Delete constraint equations from *NEQN1* to *NEQN2* (defaults to *NEQN1*) in steps of *NINC* (defaults to 1). If *NEQN1* = ALL, *NEQN2* and *NINC* will be ignored all constraint equations will be deleted.

Nsel

Additional node selection control:

ANY

Delete equation set if *any* of the selected nodes are in the set (default).

ALL

Delete equation set only if *all* of the selected nodes are in the set.

Menu Paths

Main Menu>Preprocessor>Coupling / Ceqn>Del Constr Eqn

CEFILTER, *TermKey*

Controls the automatic solution termination of models having constraint equations with too many terms.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TermKey

Enables or disables the solution termination if a model has constraint equations with too many terms:

ON

Automatically terminates the simulation with an error message (see Notes) upon encountering a model that has constraint equations with too many terms (default).

OFF

Disables automatic termination, and instead allows the solution to continue even if a model has constraint equations with too many terms.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

A model with one or more constraint equations with too many terms is ill-posed, requires excessive memory allocation and solution times, and may never converge. By default, the program automatically terminates the simulation of such models with an error message stating that there were too many constraint equation terms. One reason this can occur is the misuse of Remote Points in the Mechanical Application, which create MPC equations. Best practice is to revise your model to have constraint equations with less terms.

If, instead, you wish to allow the solution to continue with increased solution time and memory requirements without changing your model, issue **CEFILTER (p. 304)**,OFF to bypass the automatic termination.

Menu Paths

This command cannot be accessed from a menu.

CEINTF, *TOLER*, *DOF1*, *DOF2*, *DOF3*, *DOF4*, *DOF5*, *DOF6*, *MoveTol*

Generates constraint equations at an interface.

PREP7 (p. 22): Constraint Equations (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TOLER

Tolerance about selected elements, based on a fraction of the element dimension (defaults to 0.25 (25%)). Nodes outside the element by more than the tolerance are not accepted as being on the interface.

DOF1*, *DOF2*, *DOF3*, . . . , *DOF6

Degrees of freedom for which constraint equations are written. Defaults to all applicable DOFs. *DOF1* accepts ALL as a valid label, in which case the rest are ignored (all DOFs are applied).

MoveTol

The allowed "motion" of a node (see Note below). This distance is in terms of the element coordinates (-1.0 to 1.0). A typical value is 0.05. Defaults to 0 (do not move). *MoveTol* must be less than or equal to *TOLER*.

Notes

This command can be used to "tie" together two regions with dissimilar mesh patterns by generating constraint equations that connect the selected nodes of one region to the selected elements of the other region. At the interface between regions, nodes should be selected from the more dense mesh region, A, and the elements selected from the less dense mesh region, B. The degrees of freedom of region A nodes are interpolated with the corresponding degrees of freedom of the nodes on the region B elements, using the shape functions of the region B elements. Constraint equations are then written that relate region A and B nodes at the interface.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The *MoveTol* field lets the nodes in the previously mentioned region A change coordinates when slightly inside or outside the elements of region B. The change in coordinates causes the nodes of region A to assume the same surface as the nodes associated with the elements of region B. The constraint equations that relate the nodes at both regions of the interface are then written.

Solid elements with six degrees of freedom should only be interfaced with other six degree-of-freedom elements. The region A nodes should be near the region B elements. A location tolerance based on the smallest region B element length may be input. Stresses across the interface are not necessarily continuous. Nodes in the interface region should not have specified constraints.

Use the **CPINTF (p. 425)** command to connect nodes by coupling instead of constraint equations. Use the **EINTF (p. 614)** command to connect nodes by line elements. See also the **NSEL (p. 1266)** and **ESEL (p. 661)** commands for selecting nodes and elements. See the *Mechanical APDL Theory Reference* for a description of 3D space used to determine if a node will be considered by this command.

As an alternative to the **CEINTF (p. 305)** command, you can use contact elements and the internal multipoint constraint (MPC) algorithm to tie together two regions having dissimilar meshes. See Solid-Solid and Shell-Shell Assemblies for more information.

Menu Paths

Main Menu>Preprocessor>Coupling / Ceqn>Adjacent Regions

CEIMS,*TOLER*,--,*Sname1*,*Sname2*,*KPRINT*,--,--,--,--,*IntF1Nod*,*IntF2Nod*

Generates constraint equations at the interstage boundary in a multistage cyclic symmetry analysis.

PREP7 (p. 22): Constraint Equations (p. 34)
SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Note:

CEIMS (p. 306) command is not part of the **CYCLIC (p. 462)** procedure for cyclic symmetry analysis. This command is used in a multistage cyclic symmetry analysis (see also **MSOPT (p. 1195)**) to generate interstage constraint equations.

TOLER

Tolerance for determining if selected nodes are on the interface. *TOLER* is a fraction of the element dimension (defaults to 0.25 (25%)). Nodes outside the element by more than the tolerance are not accepted as being on the interface.

--

Unused field.

Sname1

The name of the first stage or part. For details on required node and element selections, see Node and Element Selection Requirements (p. 307).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Sname2

The name of the second stage or part. For details on required node and element selections, see Node and Element Selection Requirements (p. 307).

KPRINT

Option to print mapped nodes and elements.

0 (*or* OFF)

Do not print mapped nodes and elements (default).

1 (*or* ON)

Print mapped nodes and elements.

--, --, --, --

Unused fields.

IntF1Nod

The name of the interstage nodal component of the first stage or sector part to be tied to the second stage or part named *IntF2Nod*. It is optional to specify *IntF1Nod* (see Node and Element Selection Requirements (p. 307)), but if used, *IntF2Nod* must also be specified.

IntF2Nod

The name of the interstage nodal component of the second stage or sector part to be tied to the first stage or part named *IntF1Nod*. It is optional to specify *IntF2Nod* (see Node and Element Selection Requirements (p. 307)), but it used, *IntF1Nod* must also be specified.

Notes

This command can be used to generate constraint equations to tie the interface nodes of two cyclic sector parts.

Mapping is performed so mesh patterns at the interface of both parts can be different.

This command is supported for the following degrees of freedom (DOFs) at the interstage boundary: UX, UY, UZ, ROTX, ROTY, ROTZ. Since only 3D elements are supported, UX, UY, and UZ are required. Note that if rotational DOFs are included, all three of them must be present.

Node and Element Selection Requirements

You can specify the interface nodes in one of two ways:

1. If you specify *IntF1Nod* and *IntF2Nod* nodal components, there are no other node or element selection requirements.

2. Otherwise, prior to issuing CEIMS:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- the **nodes** at the interface of the first cyclic sector part (*Sname1*, part having the largest cyclic sector angle) must be selected*, and*
- the **elements** at the interface of the second cyclic sector part (*Sname2*, part having the smallest cyclic sector angle) must be selected.

For cyclic sector parts, select only base sector quantities (not duplicate sector ones). See also the **NSEL (p. 1266)** and **ESEL (p. 661)** commands for selecting nodes and elements.

The degrees of freedom of the first part interface nodes are interpolated with the corresponding degrees of freedom of the nodes of the second part interface elements using the shape functions of those elements.

Constraint equations are created between interface nodes. Those nodes should not have any other constraints defined, but if so they must be compatible.

Example Usage

Example: Static Analysis of a Compressor Model with 4 Axial Stages Without a Duplicate Sector

Example: Linear Perturbation Modal Analysis of a Simplified Model with 2 Axial Stages and a Non-planar Interstage Boundary

Example: Modal Analysis of Turbomachinery Stage Modeled as 2 Radial Stages with Offset Cyclic Edge Starting Points

Example: Mutistage Multiharmonic Modal Analysis of a Hollow Cylinder Modeled Using 2 Stages

Example: Multiharmonic Linear Perturbation Modal Analysis of a Simplified Model with 3 Axial Stages

Menu Paths

This command cannot be accessed from a menu.

CELIST,*NEQN1*,*NEQN2*,*NINC*,*Option*

Lists the constraint equations.

PREP7 (p. 22): Constraint Equations (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NEQN1*, *NEQN2*, *NINC

List constraint equations from *NEQN1* to *NEQN2* (defaults to *NEQN1*) in steps of *NINC* (defaults to 1). If *NEQN1* = ALL (default), *NEQN2* and *NINC* are ignored and all constraint equations are listed.

Option

Options for listing constraint equations:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANY

List equation set if *any* of the selected nodes are in the set (default). Only externally-generated constraint equations are listed.

ALL

List equation set only if *all* of the selected nodes are in the set. Only externally-generated constraint equations are listed.

INTE

List internally-generated constraint equations that are associated with MPC-based contact. Constraint equations are listed only if *all* the nodes in the set are selected.

CONV

Convert internal constraint equations to external constraint equations. Internal constraint equations are converted only if *all* of the nodes in the set are selected.

Notes

This command is valid in any processor. However, the INTE and CONV options are only valid in the Solution processor after a **SOLVE (p. 1822)** command has been issued.

Menu Paths

Utility Menu>List>Other>Constraint Eqns>All CE nodes selected

Utility Menu>List>Other>Constraint Eqns>Any CE node selected

CENTER, *NODE*, *NODE1*, *NODE2*, *NODE3*, *RADIUS*

Defines a node at the center of curvature of 2 or 3 nodes.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Number to be assigned to the node generated at the center of curvature.

NODE1, NODE2, NODE3

Three nodes used to calculated the center of curvature, as described under *RADIUS*.

RADIUS

Used to control the interpretation of *NODE1*, *NODE2* and *NODE3*:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

NODE1, *NODE2* and *NODE3* lie on a circular arc. The program will calculate the center of curvature (and radius) (default).

≠0

NODE1 and *NODE2* are the endpoints of an arc, and *RADIUS* is the radius of curvature. The program will locate the center of curvature on the *NODE3* side of the *NODE1-NODE2* line if *RADIUS* > 0, and opposite to *NODE3* if *RADIUS* < 0.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Nodes>At Curvature Ctr

---

CEQN

Specifies "Constraint equations" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Constraint Eqns

CERIG, *INDEPEND*, *DEPEND*, *Ldof*, *Ldof2*, *Ldof3*, *Ldof4*, *Ldof5*

Defines a rigid region.

PREP7 (p. 22): Constraint Equations (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

INDEPEND

Retained (or independent) node for this rigid region. If *INDEPEND* = P, then graphical picking of the independent and dependent nodes is enabled (first node picked will be the independent node, and subsequent nodes picked will be dependent nodes), and subsequent fields are ignored (valid only in GUI).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DEPEND

Removed (or dependent) node for this rigid region. If ALL, dependent nodes are all selected nodes.

Ldof

Degrees of freedom associated with equations:

ALL

All applicable degrees of freedom (default). If 3D, generate 6 equations based on UX, UY, UZ, ROTX, ROTY, ROTZ; if 2D, generate 3 equations based on UX, UY, ROTZ.

UXYZ

Translational degrees of freedom. If 3D, generate 3 equations based on the dependent nodes' UX, UY, and UZ DOFs and the independent node's UX, UY, UZ, ROTX, ROTY, and ROTZ DOFs. If 2D, generate 2 equations based on the dependent nodes UX and UY DOFs and the independent nodes UX, UY, and ROTZ DOFs. No equations are generated for the rotational coupling.

RXYZ

Rotational degrees of freedom. If 3D, generate 3 equations based on ROTX, ROTY, ROTZ; if 2D, generate 1 equation based on ROTZ. No equations are generated for the translational coupling.

UX

Dependent translational UX degree of freedom only.

UY

Dependent translational UY degree of freedom only.

UZ

Dependent translational UZ degree of freedom only.

ROTX

Dependent rotational ROTX degree of freedom only.

ROTY

Dependent rotational ROTY degree of freedom only.

ROTZ

Dependent rotational ROTZ degree of freedom only.

Ldof2*, *Ldof3*, *Ldof4*, *Ldof5

Additional degrees of freedom. Used only if more than one degree of freedom are required and *Ldof* is not ALL, UXYZ, or RXYZ.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Defines a rigid region (link, area or volume) by automatically generating constraint equations to relate nodes in the region. Nodes in the rigid region must be assigned a geometric location before this command is used. Also, nodes must be connected to elements having the required degree of freedom set (see *Ldof* above). Generated constraint equations are based on small deflection theory. Generated constraint equations are numbered beginning from the highest previously defined equation number (*NEQN*) plus 1. Equations, once generated, may be listed (**CELIST (p. 308)**) or modified (**CE (p. 297)**) as desired. Repeat the **CERIG (p. 310)** command for additional rigid region equations.

This command generates the constraint equations needed for defining rigid lines in 2D or 3D space. Multiple rigid lines relative to a common point are used to define a rigid area or a rigid volume. In 2D space, with *Ldof* = ALL, three equations are generated for each pair of constrained nodes. These equations define the three rigid body motions in global Cartesian space, that is, two in-plane translations and one in-plane rotation. These equations assume the X-Y plane to be the active plane with UX, UY, and ROTZ degrees of freedom available at each node. Other types of equations can be generated with the appropriate *Ldof* labels.

Six equations are generated for each pair of constrained nodes in 3D space (with *Ldof* = ALL). These equations define the six rigid body motions in global Cartesian space. These equations assume that UX, UY, UZ, ROTX, ROTY, and ROTZ degrees of freedom are available at each node.

The UXYZ label allows generating a partial set of rigid region equations. This option is useful for transmitting the bending moment between elements having different degrees of freedom at a node. With this option only two of the three equations are generated for each pair of constrained nodes in 2D space. In 3D space, only three of the six equations are generated. In each case the rotational coupling equations are not generated. Similarly, the RXYZ label allows generating a partial set of equations with the translational coupling equations omitted.

Applying this command to a large number of dependent nodes may result in constraint equations with a large number of coefficients. This may significantly increase the peak memory required during the process of element assembly. If real memory or virtual memory is not available, consider reducing the number of dependent nodes.

Note that under certain circumstances the constraint equations generated by **CERIG (p. 310)** may be modified during the solution. See Program Modification of Constraint Equations for more information.

CERIG (p. 310) is restricted to small-deflection analysis (large-deflection is not supported). As an alternative to the **CERIG (p. 310)** command, you can define a similar type of rigid region using contact elements and the internal multipoint constraint (MPC) algorithm. See Surface-Based Constraints for more information.

CERIG (p. 310) cannot be deleted using **CEDELE (p. 304)**,ALL and then regenerated in the second or higher load steps if the **LSWRITE (p. 1087)** and **LSSOLVE (p. 1085)** procedure is used. **CERIG (p. 310)** writes constraint equations directly into load step files. Deleting constraint equations (**CEDELE (p. 304)**,ALL) cannot always maintain the consistency among load steps.

Menu Paths

Main Menu>Preprocessor>Coupling / Ceqn>Rigid Region

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CESEL, *Type*, - - , - - , *VMIN*, *VMAX*, *VINC*

Selects constraint equations via predefined reference numbers.

PREP7 (p. 22): Constraint Equations (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Select a new set (default).

A

Select an additional set and add it to the current set.

U

Unselect a set from the current set.

ALL

Restore the full set.

NONE

Unselect the full set.

INVE

Invert the current set (selected becomes unselected and vice versa).

STAT

Display the current select status.

- - , - -

Unused fields.

The following fields are used only with *Type* = S, A, or U:

VMIN

Minimum value of constraint equation reference number range.

VMAX

Maximum value of constraint equation reference number range. *VMAX* defaults to *VMIN*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VINC

Value increment within the specified range. Defaults to 1.

Command Default

All constraint equations are selected.

Notes

The **CESEL (p. 313)** command selects sets of constraint equations (**CE (p. 297)**) via specified reference numbers. *VMIN*, *VMAX*, and *VINC* must be positive integer values.

For example, the following command selects a new set of constraint equations based on reference numbers 1 through 7:

```
CESEL,S,,,1,7,1
```

Data are flagged as selected and unselected; no data are actually deleted from the database.

Use **CELIST (p. 308)** to list constraint equations and their reference numbers. If a constraint equation is selected but involves unselected nodes, that constraint equation will not be listed by the **CELIST (p. 308)** command, and the solver ignores it.

Internal constraint equations are not affected by this command.

This command is also valid in POST1.

Menu Paths

This command cannot be accessed from a menu.

CESGEN, *ITIME*, *INC*, *NSET1*, *NSET2*, *NINC*

Generates a set of constraint equations from existing sets.

PREP7 (p. 22): Constraint Equations (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITIME*, *INC

Do this generation operation a total of *ITIME*s, incrementing all nodes in the existing sets by *INC* each time after the first. *ITIME* must be >1 for generation to occur.

NSET1*, *NSET2*, *NINC

Generate sets from sets beginning with *NSET1* to *NSET2* (defaults to *NSET1*) in steps of *NINC* (defaults to 1). If *NSET1* is negative, *NSET2* and *NINC* are ignored and the last |*NSET1*| sets (in sequence from maximum set number) are used as the sets to be repeated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Generates additional sets of constraint equations (with same labels) from existing sets. Node numbers between sets may be uniformly incremented.

Menu Paths

Main Menu>Preprocessor>Coupling / Ceqn>Gen w/Same DOF

CFACT, *RFACTA*, *IFACTA*, *RFACTB*, *IFACTB*, *RFACTC*, *IFACTC*

Defines complex scaling factors to be used with operations.

POST26 (p. 58): Controls (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RFACTA

Real portion of the complex scale factor used in place of *FACTA*.

IFACTA

Imaginary portion of the complex scale factor used in place of *FACTA*.

RFACTB

Real portion of the complex scale factor used in place of *FACTB*.

IFACTB

Imaginary portion of the complex scale factor used in place of *FACTB*.

RFACTC

Real portion of the complex scale factor used in place of *FACTC*.

IFACTC

Imaginary portion of the complex scale factor used in place of *FACTC*.

Command Default

Use the real factors as described with the operation command.

Notes

Defines complex scale factors to be used with the operations (**ADD (p. 95)**, **PROD (p. 1515)**, etc.). If this command is supplied, these complex factors override any real factors (*FACTA*, *FACTB*, *FACTC*) supplied on the operation commands. Factors are typically involved in scaling a specified variable, such as in the term *FACTA* x *IA* of the **ADD (p. 95)** command to scale variable *IA* before the ADD operation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When the **CFACT (p. 315)** command is active, defaults are as follows: 1) if the complex factor is not specified, but the variable upon which it acts (such as *IA*) is specified, the factor defaults to 1.0+*i*0.0; 2) if the variable upon which the factor operates is not specified, but the factor is specified, the variable defaults to 1.0 so that the term in the operation becomes the complex factor itself; 3) if neither the factor nor the variable number is supplied, the term is omitted from the operation. Once the operation (such as the **ADD (p. 95)** command) has been processed, the **CFACT (p. 315)** command becomes inactive and must be specified again if it is to be used.

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Complx ScaleFact

---

*CFCLOS

Closes the "command" file.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

---

*CFOPEN, *Fname*, *Ext*, --, *Loc*

Opens a "command" file.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to CMD if *Fname* is blank.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

--

Unused field.

Loc

Determines whether existing file will be overwritten or appended:

(blank) --

The existing file will be overwritten.

APPEND --

The file will be appended to the existing file.

Notes

Mechanical APDL commands specified by the ***CFWRITE (p. 318)** command are written to the file opened by ***CFOPEN (p. 316)**. Data processed with the ***VWRITE (p. 2174)** command are also written to this file if the file is open when the ***VWRITE (p. 2174)** command is issued.

Issue the ***CFCLOS (p. 316)** command to close the command file.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

/CFORMAT, *NFIRST*, *NLAST*

Controls the graphical display of alphanumeric character strings for parameters, components, assemblies, and tables.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFIRST

Display the first *n* characters of the parameter, component, assembly, or table name, up to 32. Defaults to 32.

NLAST

Display the last *n* characters of the parameter, component, assembly, or table name, up to 32. Defaults to 0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Use this command to control the length of the character string that is shown in the graphics window for a parameter, component, assembly, or table name.

The total number of characters (*NFIRST* + *NLAST* +3) cannot exceed 32.

If *NFIRST* is greater than zero and *NLAST* = 0, only the *NFIRST* characters are displayed, followed by an ellipsis.

If *NFIRST* = 0 and *NLAST* is greater than zero, only the *NLAST* characters are displayed, preceded by an ellipsis (...).

If both *NFIRST* and *NLAST* are greater than zero, the name will be shown as *NFIRST*, followed by an ellipsis (...), followed by *NLAST*, up to a maximum of 32 characters.

For example, if *NFIRST* = 6 and *NLAST* = 3, and the character string is LENGTHOFSIDEONE, then it will appear in the graphics window as LENGTH...ONE.

If the actual length of the character string is less than the specified combination of *NFIRST* + *NLAST* +3, then the actual string will be used.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Size and Shape

***CFWRITE**, *Command*

Writes a Mechanical APDL command (or similar string) to a "command" file.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Command

Command or string to be written. The standard command form of a label followed by arguments separated by commas is assumed. *Command* may be a parameter assignment (for example, ***CFWRITE (p. 318)**, A = 5).

Notes

Writes a Mechanical APDL command (or similar string) to the file opened via ***CFOPEN (p. 316)**. The *Command* string is not executed (except that numeric and character parameter substitution and operations (with imbedded *, /, >, etc. characters) are performed before writing).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When used with ***GET (p. 797)** results and parameter substitution, a command can be created from results and then read back into the Mechanical APDL program (or used elsewhere). For example, if the command ***CFWRITE (p. 318)**,BF,NNUM,TEMP,TVAL is used in a do-loop, where TVAL is a parameter value returned from the ***GET (p. 797)** operation and NNUM is a specified or returned parameter value, a series of **BF (p. 221)** commands, with numerical values substituted for the two parameters, will be written.

To create a file without parameter substitution, issue ***CREATE (p. 434)**.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

CGLOC, *XLOC*, *YLOC*, *ZLOC*

Specifies the origin location of the acceleration coordinate system.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XLOC*, *YLOC*, *ZLOC

Global Cartesian X, Y, and Z coordinates of the acceleration coordinate system origin.

Notes

Specifies the origin location of the acceleration coordinate system with respect to the global Cartesian system. The axes of this acceleration coordinate system are parallel to the global Cartesian axes.

A structure may be rotating about the global Cartesian origin (**OMEGA (p. 1324)**, **DOMEGA (p. 571)**), which may in turn be rotating about another point (the origin of the acceleration coordinate system), introducing Coriolis effects. The location of this point (relative to the global Cartesian origin) is specified with this **CGLOC (p. 319)** command. For example, if Y is vertical and the global system origin is at the surface of the earth while the acceleration system origin is at the center of the earth, *YLOC* should be -4000 miles (or equivalent) if the rotational effects of the earth are to be included. The rotational velocity of the global Cartesian system about this point is specified with the **CGOMGA (p. 320)** command, and the rotational acceleration is specified with the **DCGOMG (p. 501)** command.

The rotational velocities and accelerations are mainly intended to include mass effects in a static (**ANTYPE (p. 162)**,STATIC) analysis. If used in dynamic analyses, no coupling exists between the user input terms and the time history response of the structure. See Acceleration Effect in the *Mechanical APDL Theory Reference* for details. Related commands are **ACEL (p. 92)**, **CGOMGA (p. 320)**, **DCGOMG (p. 501)**, **DOMEGA (p. 571)**, and **OMEGA (p. 1324)**.

See Analysis Tools in the *Theory Reference* for more information.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

---

CGOMGA, *CGOMX*, *CGOMY*, *CGOMZ*

Specifies the rotational velocity of the global origin.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

CGOMX*, *CGOMY*, *CGOMZ

Rotational velocity of the global origin about the acceleration system X, Y, and Z axes.

Notes

Specifies the rotational velocity of the global origin about each of the acceleration coordinate system axes. The location of the acceleration coordinate system is defined with the **CGLOC (p. 319)** command. Rotational velocities may be defined in these analysis types:

- Static (**ANTYPE (p. 162)**,STATIC)
- Harmonic (**ANTYPE (p. 162)**,HARMIC) -- full, VT [1], Krylov [1], or mode-superposition [2]
- Transient (**ANTYPE (p. 162)**,TRANS) -- full or mode-superposition [2]
- Substructuring (**ANTYPE (p. 162)**,SUBSTR)
- Modal (**ANTYPE (p. 162)**,MODAL)

1. Loads for VT and Krylov methods are supported as long as they are not:
   - complex tabulated loads (constant or trapezoidal loads in tabulated form are supported)
   - used in conjunction with Rotordynamics (**CORIOLIS (p. 417)**,on).
2. In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

See Acceleration Effect in the *Mechanical APDL Theory Reference* for details. Units are radians/time. Related commands are **ACEL (p. 92)**, **CGLOC (p. 319)**, **DCGOMG (p. 501)**, **DOMEGA (p. 571)**, and **OMEGA (p. 1324)**.

See Analysis Tools in the *Theory Reference* for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **CGOMGA (p. 320)** command supports tabular boundary conditions (%*TABNAME_X*%, %*TABNAME_Y*%, and %*TABNAME_Z*%) for *CGOMGA_X*, *CGOMGA_Y*, and *CGOMGA_Z* input values (***DIM (p. 530)**) for full transient and harmonic analyses.

This command is also valid in PREP7.

---

CGROW,*Action*,*Par1*,*Par2*,*Par3*,*Par4*

Specifies crack-growth options in a fracture analysis.

PREP7 (p. 22): Data Tables (p. 24)
SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Specifies the action for defining or manipulating crack-growth data:

NEW (p. 322)

Initiate a new set of crack-growth simulation data (default).

CID (p. 323)

Specify the crack-calculation (**CINT (p. 334)**) ID for energy-release rates to be used in the fracture criterion calculation.

CGID (p. 323)

Activate an existing crack-growth ID to modify its crack-growth settings via subsequent **CGROW (p. 321)** commands.

FCOPTION (p. 323)

Specify the fracture criterion for crack-growth/delamination.

CSFL (p. 324)

Specify a crack-surface load for crack-growth.

CPATH (p. 325)

Specify the element component for crack-growth.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DTIME (p. 325)

Specify the initial time step for crack-growth.

DTMIN (p. 325)

Specify the minimum time step for crack-growth.

DTMAX (p. 325)

Specify the maximum time step for crack-growth.

FCRAT (p. 325)

Fracture criterion ratio (fc).

STOP (p. 326)

Stops the analysis when the specified criterion (*Par1*) is reached.

METHOD (p. 326)

Define the method of crack propagation.

FCG (p. 327)

Specifies fatigue crack-growth.

SOPT (p. 328)

Specifies crack-growth solution options.

RMCONT (p. 330)

Specifies remeshing control options for mesh coarsening.

NPLOAD (p. 331)

Specifies nonproportional loading control options for fatigue crack-growth.

Command Specification for *Action* = NEW

CGROW (p. 321), NEW, *Par1*

Par1 –

Crack-growth data set ID (integer value).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specification for *Action* = CID

CGROW (p. 321), CID, *Par1*

Par1 –

Contour-integral calculation (**CINT (p. 334)**) ID for energy-release rates to be used in fracture criterion calculation.

Command Specification for *Action* = CGID

CGROW (p. 321), CGID, *Par1*

Par1 –

Crack-growth data set ID (integer value).

Command Specification for *Action* = FCOPTION

CGROW (p. 321), FCOPTION, *Par1*, *Par2*, *Par3*

Par1 –

MTAB – Crack-growth fracture criterion used with the material data table (**TB (p. 1899)**,CGCR (p. 1912)).

GTC – Defines the critical energy-release rate, a simple fracture criterion used for the VCCT method.

KIC – Defines the critical stress-intensity factor. Valid for the SMART method only.

JIC – Defines the critical J-integral. Valid for the SMART method only.

Par2 –

For *Par1* = MTAB: Material ID for the material data table.

For I*Par1* = GTC: Critical energy-release rate value.

For *Par1* = KIC: Critical stress-intensity factor value.

For *Par1* = JIC: Critical J-integral value.

Par3 –

For *Par1* = MTAB, KIC, or JIC: Specifies the fracture-parameter contour to use for SMART crack-growth evaluation. Default = 2.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specification for *Action* = CSFL

CGROW (p. 321), CSFL, *Par1*, *Par2*, *Par3*

Par1 –

Crack-surface load options:

PRES – New crack-surface pressure load.

CZM – Entire crack-surface enhanced by INTER204 3D 16-node cohesive elements (generated automatically during the first remeshing around the associated crack). See "Notes" (p. 332).

Par2 –

When *Par1* = PRES:

When *Par1* = CZM: A valid material ID (defined via **TB (p. 1899)**,CZM,,,,BILI, **TB (p. 1899)**,CZM,,,,CEXP, or **TB (p. 1899)**,CZM,,,,CLIN [default]). If zero or an invalid value is specified, the program uses **TB (p. 1899)**,CZM,,,,CLIN as the default cohesive model type and sets reasonable CZM parameters based on the solid elements around the crack fronts/surfaces. For more information, see Enhancing Crack Surfaces with Cohesive Zone Elements in the *Fracture Analysis Guide*.

Par3 –

When *Par1* = PRES:

New crack-surface load value, or the name of a table for specifying tabular load values for crack-growth.

The new crack-surface load is always assumed to be constant. If *Par1* = PRES, *Par3* specifies a constant pressure load.

To specify a table (***DIM (p. 530)**), enclose the table name within "%" characters (**%*tablename*%**). Only one table can be specified for a crack-growth set, and time is the only primary variable supported.

When *Par1* = CZM:

A valid local coordinate system (LCS) ID (**LOCAL (p. 1059)**).

If zero or an invalid value is specified, the program creates an internal LCS and assigns it to the ESYS attributes of CZM elements inserted on crack surfaces. This behavior applies only when the material ID (*MAT_ID*) for *Par3* is associated with **TB (p. 1899)**,CZM when *TBOPT* = FRIC or REXP. For more information, see Enhancing Crack Surfaces with Cohesive Zone Elements in the *Fracture Analysis Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specification for *Action* = CPATH

CGROW (p. 321), CPATH, *Par1*

Par1 –

Interface element component for crack path (VCCT method only). (Component name must be 32 characters or less.)

Command Specification for *Action* = DTIME

CGROW (p. 321), DTIME, *Par1*

Par1 –

Initial time step when crack-growth is detected.

Command Specification for *Action* = DTMIN

CGROW (p. 321), DTMIN, *Par1*

Par1 –

Minimum time step allowed when crack-growth is detected.

Command Specification for *Action* = DTMAX

CGROW (p. 321), DTMAX, *Par1*

Par1 –

Maximum time step allowed when crack-growth is detected.

Command Specification for *Action* = FCRAT

CGROW (p. 321), FCRAT, *Par1*

Par1 –

Fracture criterion ratio (f_c, where f_c is generally around 1). The recommended ratio is 0.95 to 1.05. The default is 1.00.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specification for *Action* = STOP

CGROW (p. 321), STOP, *Par1*, *Par2*

***Par1* –**

CEMX – Stops the analysis when the crack extension for any crack-front node reaches the maximum value (*Par2*).

CNMX – Stops the analysis when the maximum number of fatigue cycles exceeds the specified limit (*Par2*). Valid only for SMART crack-growth analysis.

FBOU – Stops the analysis when the crack extension reaches the free boundary. Valid only for SMART crack-growth analysis.

KMAX – Stops the analysis when the maximum equivalent stress-intensity factor exceeds the specified limit (*Par2*). Valid only for SMART crack-growth analysis.

DN – Stops the analysis when the fatigue-cycle increment number is less than or equal to the specified limit (*Par2*). Valid only for SMART crack-growth analysis.

***Par2* –**

When *Par1* = CEMX, the value of maximum crack extension allowed.

When *Par1* = CNMX, the maximum number of fatigue cycles allowed.

When *Par1* = KMAX, the value of the maximum equivalent stress-intensity factor allowed.

When *Par1* = DN, the minimum limit for fatigue-cycle increment. Default = 0.

Command Specification for *Action* = METHOD

CGROW (p. 321), METHOD, *Par1*

***Par1*, *Par2* –**

VCCT – Use VCCT to grow the crack (default).

XFEM – Use XFEM to grow the crack.

SMART– Use SMART to grow the crack.

***Par2* –**

REME – Remeshing-based SMART crack-growth method (the default and only option). Valid only when *Par1* = SMART.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specification for *Action* = FCG

CGROW (p. 321), FCG, *Par1*,*Par2*,*Par3*

***Par1* –**

METH – Fatigue crack-growth method.

DAMX – Maximum crack-growth increment (XFEM method only).

DAMN – Minimum crack-growth increment (XFEM method only).

SRAT – Stress ratio.

DKTH – Threshold value of equivalent stress-intensity-factor range (SIFS).

DN – Incremental number of cycles.

***Par2* –**

Method – LC or CBC method. Valid only when *Par1* = METH.

VALUE – Value for the specified *Par1*. Valid only when *Par1* = DAMX, DAMN, SRAT, DKTH, or DN.

For *Par1* = SRAT or DKTH, *Par2* can be a constant or table. To specify a table (***DIM (p. 530)**), enclose the table name within "%" characters (%*tablename*%). Only one table can be specified for a crack-growth set, and time is the only primary variable supported.

***Par3* –**

Valid only for SMART crack-growth analysis when *Par1* = DKTH.

MIN *or* MAX *or* AVER *or* blank (default) – The minimum, maximum, or average stress-intensity-factor range (ΔK), respectively. The program calculates the range over the entire crack-front, then uses the result to evaluate the threshold criterion. The entire crack is arrested if the specified minimum, maximum, or average ΔK is below the threshold (*Par2*). Partial crack-growth does not occur.

If *Par3* is unspecified (default), the program evaluates threshold criterion at each crack-front node individually and ensures that the crack is arrested locally at any node where ΔK is below the threshold (*Par2*). If some nodes have ΔK less than the threshold and others have ΔK greater than the threshold, partial crack-growth occurs at the crack-front.

Example 2: Using CGROW, FCG, DKTH, *Par2*, *Par3*

If *Par3* = MIN, the program selects the minimum ΔK from the ΔK values calculated at all crack-front nodes for the corresponding crack ID. If the minimum ΔK does not exceed the threshold (*Par2*), there is no crack extension at the entire crack-front.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specification for *Action* = SOPT

CGROW (p. 321),SOPT,*Par1*,*Par2*,*Par3*,*Par4*

Par1 **–**

SCN – Use a single number of cycles for all cracks in a multicrack analysis (even if each crack has separate loading) (default).

MCN – Allow a separate cycle count for *each* crack in a multicrack analysis (available only if each crack has separate loading).

MXAN – Specifies the maximum limit of the crack-growth kinking angle.

MNAN – Specifies the cut-off value for the minimum crack-growth kinking angle.

DAMX – Specifies the maximum limit of crack-growth increment.

DAMN – Specifies the minimum limit of crack-growth increment.

SPLO – Specifies spectrum fatigue loading.

KEQV – Specifies the method for the equivalent stress-intensity factor calculation.

KANG – Specifies the method for the kink angle calculation.

Par2 **–**

For *Par1* = MXAN:

Value (in degrees) of the maximum limit of the crack-growth kinking angle. If **CGROW (p. 321)**,SOPT,MXAN,*Par2* is not issued (or *Par2* is unspecified), the program uses a default kinking-angle limit of 20 degrees. *Par2* = 0 forces mode-I crack propagation.

For *Par1* = MNAN:

Cut-off value (in degrees) for the minimum crack-growth kinking angle. Default = 1.

For *Par1* = DAMX:

Value to determine the maximum crack-growth increment. Default: *da*max = 1.5 * *ESIZE*, where *ESIZE* is the reference-element size at the crack-front at any substep.

For *Par1* = DAMN:

Value to determine the minimum crack-growth increment. Default: *da*min = 0.

For *Par1* = SPLO:

WEIG -- Defines the damage weight average method for the crack-growth direction (default).

DMAX -- Defines the dominative load point (maximum damage) method for the crack-growth direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For *Par1* = KEQV:

MTS -- Maximum tangential stress criterion (default).

RICHARD -- Richard approximation function.

POOK -- Pook criterion.

EMPS -- Empirical function based on square root of sum of squares.

For *Par1* = KANG:

MTS -- Maximum tangential stress criterion (default).

RICHARD -- Richard approximation function.

Par3 **–**

For *Par1* = DAMX or DAMN:

ABSO – Indicates that *Par2* is the absolute value (default). The corresponding limit (*da*max or *da*min) is *Par2*.

MULT – Indicates that *Par2* is a multiplier of the reference-element size (*ESIZE*) at the crack-front at any substep. The corresponding limit (*da*max or *da*min) is *Par2* * *ESIZE*.

For information about controlling the element size (*ESIZE*) at the crack-front, see **CGROW (p. 321)**,RMCONT,ESIZE and **CGROW (p. 321)**,RMCONT,CMULT.

For *Par1* = KEQV and *Par2* = RICHARD or EMPS:

α_1– multiplicative factor in $K2$ term in the corresponding function for equivalent SIF.

For *Par1* = KANG and *Par2* = RICHARD:

A – coefficient of first order term in the Richard function for the kink angle.

Par4 **–**

For *Par1* = DAMN:

0 – Sets the crack increments (Δa) less than *da*min (specified via *Par2*) as Δa = *da*min. It is the default option if *Par2* > 0.

1 – Sets the crack increments (Δa) less than *da*min as $\Delta a = 0$.

If *Par2* = 0, the program sets any crack increment (Δa) less than two percent of the reference-element size at the crack-front as $\Delta a = 0$.

For *Par1* = KEQV and *Par2* = RICHARD or EMPS:

α_2– multiplicative factor in $K3$ term in the corresponding function for the equivalent SIF.

For *Par1* = KANG and *Par2* = RICHARD:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

B – coefficient of second order term in the Richard function for the kink angle.

Command Specification for *Action* = RMCONT

CGROW (p. 321),RMCONT,*Par1*,*Par2*,*Par3*,*Par4*,*Par5*

Valid in a SMART crack-growth analysis only.

Par1 –

COARSE – Controls mesh-coarsening.

ESIZE – Controls element sizing and crack-increment size.

CMULT – Controls the crack-growth increment multiplier.

Par2 –

For *Par1* = COARSE:

CONS – Remeshing occurs with conservative mesh-coarsening (default).

MODE – Remeshing occurs with moderate mesh-coarsening.

AGGR – Remeshing occurs with aggressive mesh-coarsening.

For *Par1* = ESIZE:

Crack-front reference element-size value, *or* the table name for specifying tabular element size values as a function of solution time.

For *Par1* = CMULT:

Crack-front element-size multiplier function:

TIME – Controls the crack-growth increment multiplier via the beginning and end of the solution time.

CEMX – Controls the crack-growth increment multiplier via the beginning and end of the accumulated maximum crack extension.

RMNU – Controls the crack-growth increment multiplier via the beginning and end of the number of remeshing steps.

TABLE – The name of the table for controlling the crack-growth increment multiplier.

Par3 - Par5 –

For *Par1* = ESIZE and *Par2* = *VALUE* or %*tablename*% and *Par3* = COMP:

Par4 = Name of the node or element component ($\leq$ 32 characters).

For *Par1* = ESIZE and *Par2* = *VALUE* or %*tablename*% and *Par3* = NODE:

Par4 = Node ID.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For *Par1* = ESIZE and *Par2* = *VALUE* or %*tablename*% and *Par3* = ELEM:

Par4 = Element ID.

For *Par1* = CMULT and *Par2* = TIME:

Par3 = *VALUE* – Maximum value of the crack-growth multiplier value.

Par4 = *VALUE* – Time at the beginning of the crack-increment control function.

Par5 = *VALUE* – Time at the end of the crack-increment control function.

For *Par1* = CMULT and *Par2* = CEMX:

Par3 = *VALUE* – Maximum value of the crack-growth multiplier value.

Par4 = *VALUE* – Accumulated maximum crack extension at the beginning of the crack-increment control function.

Par5 = *VALUE* – Accumulated maximum crack extension at the end of the crack-increment control function.

For *Par1* = CMULT and *Par2* = RMNU:

Par3 = *VALUE* – Maximum value of the crack-growth multiplier value.

Par4 = *VALUE* – Remeshing number at the beginning of the crack-increment control function.

Par5 = *VALUE* – Remeshing number at the end of the crack-increment control function.

For *Par1* = CMULT and *Par2* = TABLE:

Par3 = %*tablename*% – Controls the crack-growth increment multiplier via the tabular data in the specified table.

To specify a table (***DIM (p. 530)**), enclose the table name *tablename* within % characters. You can specify one table per crack-growth set, and time is the only valid variable.

Command Specification for *Action* = NPLOAD

CGROW (p. 321),NPLOAD,*Par1*,*Par2*,*Par3*

Valid in a SMART fatigue crack-growth analysis using nonproportional loading.

***Par1* –**

METHOD – Specifies the nonproportional solution method.

DIRECTION – Specifies the nonproportional crack-growth-direction method.

***Par2* –**

For *Par1* = METHOD:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DKEF – Specifies the effective stress-intensity-factor range method.

DKMO – Specifies the stress-intensity-factor range method based on mode separation.

TKEF – Specifies the total effective stress-intensity-factor method.

TKMO – Specifies the total stress-intensity-factor method based on mode separation.

For *Par1* = DIRECTION:

KMAX – Specifies the maximum-load method for the crack-growth direction.

KMIN – Specifies the minimum-load method for the crack-growth direction.

KLOC – Specifies the local kink-tip stress-intensity-factor method.

Par3 **–**

For *Par2* = KLOC:

w – Parameter-fitting value between 0 and 1. Default = 0.5.

Notes

When *Action* = NEW, the **CGROW (p. 321)** command initializes a crack-growth simulation set. Subsequent **CGROW (p. 321)** commands define the parameters necessary for the simulation.

For multiple cracks, issue multiple **CGROW (p. 321)**,NEW commands (and any subsequent **CGROW (p. 321)** commands necessary to define the parameters) for *each crack*.

For SMART-based crack-growth:

- *Action* = CPATH has no effect.
- *Action* = STOP affects both SMART-based static and fatigue crack-growth analyses.
- When *Action* = CSFL with *Option* = CZM, the remeshing for cracks associated with this option is enforced at the end of the first load step and the first substep whether or not the crack grows at this moment. On original crack surfaces (defined via **CINT (p. 334)**,SURF), INTER204 elements are initialized fully damaged, as they are used for crack-closure only and do not contribute bonding tractions on crack surfaces. The cohesive tractions on the new open crack surface are defined via the cohesive zone material model type (**TB (p. 1899)**,CZM) and **CGROW (p. 321)**,CSFL,CZM. This option can be combined with **ADPCI (p. 98)** to initialize a crack with cohesive effect.

For VCCT-based crack-growth:

- Crack-growth element components must use the crack tip nodes as the starting nodes of the crack path.
- Fracture criteria (*Action* = FCOPTION) use energy-release rates calculated via VCCT technology (**CINT (p. 334)**,TYPE,VCCT). For information about the fracture criteria available, see Fracture Criteria in the *Fracture Analysis Guide* or **TB (p. 1899)**,CGCR (p. 1912).

For XFEM-based crack-growth:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The crack specification originates via the **XFENRICH (p. 2193)**, **XFDATA (p. 2192)**, or **XFCRKMESH (p. 2191)** command.
- *Action* = CPATH, DTMIN, or DTMAX has no effect.
- *Action* = STOP affects fatigue crack-growth analysis only.

Menu Paths

This command cannot be accessed from a menu.

CHECK, *Sele*, *Levl*

Checks current database items for completeness.

PREP7 (p. 22): Database (p. 22)
SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Sele

Specifies which elements are to be checked:

(blank)

Check all data.

ESEL

Check only elements in the selected set and unselect any elements not producing geometry check messages. The remaining elements (those producing check messages) can then be displayed and corrected. A null set results if no elements produce a message. Issue **ESEL (p. 661)**,ALL to select all elements before proceeding.

Levl

Used only with *Sele* = ESEL:

WARN

Select elements producing warning and error messages.

ERR

Select only elements producing error messages (default).

Notes

This command will not work if **SHPP (p. 1787)**,OFF has been set. A similar, automatic check of all data is done before the solution begins.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If the "Check Elements" option is invoked through the GUI (menu path **Main Menu> Preprocessor> Meshing> Check Elems**), the **CHECK (p. 333)**,ESEL logic is used to highlight elements in the following way: good elements are blue, elements having warnings are yellow, and bad (error) elements are red.

Note:

The currently selected set of elements is not changed by this GUI function.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Meshing>Check Mesh>Individual Elm>Select Warning/Error Elements

---

CHKMSH, *Comp*

Checks area and volume entities for previous meshes.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Comp

Name of component containing areas or volumes.

Notes

CHKMSH (p. 334) invokes a predefined Mechanical APDL macro that checks areas and volumes to find out if they were previously meshed. This macro name will appear in the log file (`Jobname.log`) prior to area and volume meshing operations initiated through the GUI. This command is not intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for use via **/INPUT (p. 948)**).

Menu Paths

This command cannot be accessed from a menu.

CINT, *Action*, *Par1*, *Par2*, *Par3*, *Par4*, *Par5*, *Par6*, *Par7*

Defines parameters associated with fracture-parameter calculations.

PREP7 (p. 22): Special Purpose (p. 37)
SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Specifies action for defining or manipulating initial crack data:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NEW

Initiate a new calculation and assign an ID. (p. 336)

CTNC

Define the crack-tip node component. (p. 336)

SURF

Define the crack-surface node components. (p. 337)

CENC

Define the crack-extension node component, the crack-tip node, and the crack-extension direction. (p. 337)

TYPE

Define the type of calculation to perform. (p. 337)

DELE

Delete the **CINT (p. 334)** object associated with the specified ID. (p. 339)

NCON

Specify the number of contours to calculate in the contour-integral calculation. (p. 339)

SYMM

Indicate whether the crack is on a symmetrical line or plane. (p. 339)

NORM

Define the crack-plane normal. (p. 340)

UMM

Enable or disable the unstructured-mesh method (UMM). (p. 339)

EDIR

Crack-assist extension direction. (p. 340)

PLOT

Plots the crack-front and crack-tip coordinate system. (p. 341)

LIST

List the **CINT** commands issued, or the elements used (p. 341), in fracture-parameter calculations.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CXFE

Define the crack-tip element or crack-front element set. (p. 341) Valid for XFEM-based crack-growth analysis only.

RADIUS

Define the radius at which the given value is to be evaluated. (p. 342) Valid for XFEM-based crack-growth analysis only.

RSWEEP

Define the minimum and maximum sweep angle from existing crack direction. (p. 342) Valid for XFEM-based crack-growth analysis only.

INIT

SMART crack-initiation ID (p. 342).

CSFL

Convert initial-stress data to crack-surface traction loading (p. 342).

Command Specification for *Action* = NEW

CINT (p. 334), NEW, *Par1*

Par1 --

CINT (p. 334) ID number.

Command Specifications for *Action* = CTNC

CINT (p. 334), CTNC, *Par1*, *Par2*, *Par3*

Par1 --

Crack-tip node component name (must be 32 characters or less).

Par2 --

Crack-extension direction calculation-assist node. Any node on the open side of the crack.

Par3 --

Crack front's end-node crack-extension direction override flag:

0 --

Align the extension direction with the edges attached at the two end nodes of the crack front (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1 --

Align the extension direction to be perpendicular to the crack front.

Command Specifications for *Action* = SURF

CINT (p. 334), SURF, *Par1*, *Par2*

***Par1* --**

Crack-surface node component 1 (top or bottom crack face). (Component name must be 32 characters or less.)

***Par2* --**

Crack-surface node component 2 (top or bottom crack face, but the *opposite* of *Par1*). (Component name must be 32 characters or less.)

Command Specifications for *Action* = CENC

CINT (p. 334), CENC, *Par1*, *Par2*, *Par3*, *Par4*, *Par5*, *Par6*, *Par7*

***Par1* --**

Crack-extension node component name (**CM (p. 356)**). (Must be 32 characters or less.)

***Par2* --**

Crack-tip node. The crack-tip node defaults to the first node of the crack-extension node component.

***Par3*, *Par4* --**

Coordinate system number (*Par3*) and the number of the axis that is coincident with the crack direction (*Par4*). When these parameters are defined, *Par5*, *Par6* and *Par7* are ignored.

***Par5*, *Par6*, *Par7* --**

Global x, y, and z components of the crack-extension direction vector. (*Par3* and *Par4* must be blank.)

Command Specifications for *Action* = TYPE

CINT (p. 334), TYPE, *Par1*, *Par2*

***Par1* --**

Type of calculation to perform:

JINT --

Calculate J-integral (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SIFS --

Calculate stress-intensity factors.

TSTRESS --

Calculate T-stress.

MFOR --

Calculate material forces.

CSTAR --

Calculate C*-integral.

VCCT --

Calculate energy-release rate using the VCCT method.

PSMAX --

Calculate circumferential stress at the location where $\sigma_{r\theta}$=0 when sweeping around the crack tip at the given radius. Valid in an XFEM-based crack-growth analysis only.

STTMAX --

Calculate maximum circumferential stress when sweeping around the crack tip at the given radius. Valid in an XFEM-based crack-growth analysis only.

Par2 **--**

Auxiliary stress fields and strategy for **3D** stress-intensity factors (*Par1* = SIFS) calculations:

0 --

The plane-strain auxiliary fields are used at the interior nodes along the crack front. The stress-intensity factors at the end nodes of the crack front are set to copy the stress-intensity factors at the adjacent nodes. (Default.)

1 --

The plane-stress auxiliary fields are used over the entire crack front.

2 --

The plane-strain auxiliary fields are used over the entire crack front.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specifications for *Action* = DELE

CINT (p. 334), DELE, *Par1*

Par1 **--**

CINT (p. 334) ID (default = ALL).

Command Specifications for *Action* = NCON

CINT (p. 334), NCON, *Par1*

Par1 **--**

Number of contours to be calculated.

Command Specifications for *Action* = SYMM

CINT (p. 334), SYMM, *Par1*

Par1 **--**

OFF, 0, *or* NO --

No symmetry (default).

ON, 1, *or* YES --

Symmetric about the crack line/plane.

Command Specifications for *Action* = UMM

CINT (p. 334), UMM, *Par1*

Par1 **--**

OFF, 0, *or* NO --

Disable the unstructured-mesh method (UMM) (default).

ON, 1, *or* YES --

Enable the UMM.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specifications for *Action* = NORM

CINT (p. 334), NORM, *Par1*, *Par2*

Par1 --

Coordinate system number (default = 0, global Cartesian).

Par2 --

Axis of coordinate system (default = 2, global Cartesian Y-axis).

Command Specifications for *Action* = EDIR

CINT (p. 334), EDIR, *ITYPE*, *Par2*, *Par3*, *Par4*, *Par5*

ITYPE --

Input type for the crack-assist extension direction. Valid values are CS (coordinate system number) or COMP (component x or y extension direction).

Par2 --

If *ITYPE* = CS, the coordinate system number.

If *ITYPE* = COMP, the x component of the crack-assist extension direction.

Par3 --

If *ITYPE* is CS, the axis representing the crack-assist extension direction.

If *ITYPE* = COMP, the y component of the crack-assist extension direction.

Par4 --

For *ITYPE* = CS, this value is not specified.

For *ITYPE* = COMP, the z component of the crack-assist extension direction.

Par5 --

A reference node on the crack front attached to the crack-assist extension direction. To accurately calculate and flip the crack-extension directions, the crack-assist extension direction defined at this node is rotated as the tangent along the crack front rotates. This capability is useful when the crack-extension directions vary by more than 180 degrees along the crack front.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specifications for *Action* = PLOT

CINT (p. 334), PLOT, *Par1*, *Par2*

Par1 --

Crack ID.

Par2 --

0 -- Disable plotting of crack-tip coordinate system.

1 -- Enable plotting of crack-tip coordinate system (default).

Color codes are white for the crack-extension direction, green for the crack normal, and blue for the direction tangential to the crack front. To clear or delete the plots, issue **/ANNOT (p. 145)**.

Command Specifications for *Action* = LIST

CINT (p. 334), LIST, *CRACKID*, *Par2*, *Par3*, *Par4*

CrackID --

Crack ID. Default = ALL.

Par2 --

No value -- Lists the **CINT (p. 334)** commands issued for the crack. *Par3* and *Par4* are ignored.

ELEM -- Lists the elements used in the fracture-parameter calculation.

Par3 --

Node number on the crack front/tip. Default = ALL. Valid only when *Par2* =ELEM.

Par4 --

Contour number around the crack front/tip. Default = ALL. Valid only when *Par2* =ELEM.

Command Specifications for *Action* = CXFE

CINT (p. 334), CXFE, *Par1*

Par1 --

Crack-tip element number or crack-front component name. (Component name must be 32 characters or less.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specifications for *Action* = RADIUS

CINT (p. 334), RADIUS, *Par1*

Par1 --

Radius at which a value is evaluated (used with **CINT (p. 334)**,TYPE,PSMAX or **CINT (p. 334)**,TYPE,STTMAX only).

Command Specifications for *Action* = RSWEEP

CINT (p. 334), RSWEEP, *Par1*, *Par2*, *Par3*

Par1 --

Number of intervals for the sweep.

Par2 --

Minimum angle of the sweep.

Par3 --

Maximum angle of the sweep

Command Specifications for *Action* = INIT

CINT (p. 334), INIT, *Par1*

Par1 --

ADPCI (p. 98) ID number. The data associated with the **ADPCI (p. 98)** ID is connected to the **CINT (p. 334)** data set to define crack-initiation analysis details (such as crack location and shape, initiation criteria, etc.).

Command Specifications for *Action* = CSFL

CINT (p. 334), CSFL, INIS, STRE

Initial-stress data (mesh-independent) are converted to a traction load acting on the crack-surfaces (specified via **CINT (p. 334)**,SURF). The traction is applied as a step load for all substeps.

The initial-stress data points are specified at various spatial locations in the global Cartesian coordinate system (**CSYS (p. 441)**). The data is required in the vicinity of the crack surfaces only. The program interpolates the initial stress at the centroid of each element face of the crack surfaces, then determines the equivalent traction at the element face based on its orientation.

For more information, see Table 2.2: Material and Load Support for Fracture-Parameter Calculation and Superposition Principle: Initial Stress vs. Crack-Face Traction in the *Fracture Analysis Guide*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Initiate a new calculation via the *Action* = NEW parameter. Subsequent **CINT (p. 334)** commands (with parameters other than NEW) define the input required for the fracture-parameter calculations.

The simplest method is to define crack information via *Action* = CTNC; however, this method limits you to only one node for a given location along the crack front. Use the CTNC option only when all nodes that define the crack front lie in a single plane.

For *Action*= SURF, *Par1* and *Par2* can be the top or bottom crack-face node component. No order is required, provided that if one value the top crach-face node component, the other must be the bottom, and vice-versa. This option is valid only with **CGROW (p. 321)** for crack-growth simulation.

To define crack information at multiple locations along the crack front, use *Action* = CENC. You can issue **CINT (p. 334)**,CENC, *Par1*, etc. multiple times to define the crack-extension node component, the crack tip, and the crack-extension directions at multiple locations along the crack front.

Although you can vary the sequence of your definitions, all specified crack-tip nodes must be at the crack front, and no crack-tip node can be omitted.

You can define the crack-extension direction directly by specifying either *Action* = CENC or *Action* = NORM.

The crack-assist extension direction (*Action* = EDIR) provides a generic extension direction when *Action* = CTNC. It helps to define crack-extension directions based on the connectivity of the crack-front elements. For a 2D case when the crack tangent cannot be calculated, the program uses the provided crack-assist extension direction directly.

For an XFEM-based crack-growth analysis:

- *Action* = CTNC, CENC, NCON, SYMM, UMM, or EDIR have no effect.
- *Action* = CXFE, RADIUS, or RSWEEP are XFEM-specific and invalid for any other type of crack-growth analysis.
- For **CINT (p. 334)**,TYPE, only *Par1* = PSMAX or STTMAX are valid. Other *Par1* values have no effect.

The stress-intensity factors calculation (**CINT (p. 334)**,TYPE,SIFS) applies only to isotropic linear elasticity. Use only one material type for the crack-tip elements that are used for the calculations.

When calculating energy release rates (**CINT (p. 334)**,TYPE,VCCT), do not restrict the results from being written to the database (**/CONFIG (p. 410)**,NOELDB,1) after solution processing; otherwise, incorrect and potentially random results are possible.

Fracture-parameter calculations based on domain integrations such as stress-intensity factors, J-integral, or material force are not supported when contact elements exist inside the domain. The calculations may become path-dependent unless the contact pressure is negligible.

For *Action* = UMM, the default value can be OFF or ON depending on the element type. The **CINT (p. 334)** command overrides the default setting for the given element.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **CINT (p. 334)** command supports only strain data for initial state (**INISTATE (p. 938)**,SET,DTYP,EPEL). Other initial-state capabilities are not supported.

For more information about using the **CINT (p. 334)** command, including supported element types and material behavior, see Calculating Fracture Parameters in the *Fracture Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

CIRCLE, *PCENT*, *RAD*, *PAXIS*, *PZERO*, *ARC*, *NSEG*

Generates circular arc lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

PCENT

Keypoint defining the center of the circle (in the plane of the circle). If *PCENT* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

RAD

Radius of the circle. If *RAD* is blank and *PCENT* = P, the radius is the distance from *PCENT* to *PZERO*.

PAXIS

Keypoint defining axis of circle (along with *PCENT*). If *PCENT* = P and *PAXIS* is omitted, the axis is normal to the working plane.

PZERO

Keypoint defining the plane normal to circle (along with *PCENT* and *PAXIS*) and the zero degree location. Need not be in the plane of the circle. This value is not required if *PAXIS* is defined along the Y axis (that is, a circle in the XZ plane).

ARC

Arc length (in degrees). Positive follows right-hand rule about *PCENT*-*PAXIS* vector. Defaults to 360°.

NSEG

Number of lines around circumference (defaults to minimum required for 90°-maximum arcs, that is, 4 for 360°). Number of keypoints generated is *NSEG* for 360° or *NSEG* + 1 for less than 360°.

Notes

Generates circular arc lines (and their corresponding keypoints). Keypoints are generated at regular angular locations (based on a maximum spacing of 90°). Arc lines are generated connecting the keypoints. Keypoint and line numbers are automatically assigned, beginning with the lowest available values

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(**NUMSTR (p. 1301)**). Adjacent lines use a common keypoint. Line shapes are generated as arcs, regardless of the active coordinate system. Line shapes are invariant with coordinate system after they are generated.

Main Menu>Preprocessor>Modeling>Create>Lines>Arcs>Full Circle

---

CISOL, *n*, *ID*, *node*, *Cont*, *Dtype*

Stores fracture parameter information in a variable.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

n

Arbitrary reference number or name assigned to this variable. Number must be >1 but </= NUMVAR.

ID

Crack ID number.

node

Crack tip node number.

Cont

Contour number.

Dtype

Data type to output:

JINT

J-integral

IIN1

Interaction integral 1

IIN2

Interaction integral 2

IIN3

Interaction integral 3

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

K1

Mode 1 stress-intensity factor

K2

Mode 2 stress-intensity factor

K3

Mode 3 stress-intensity factor

G1

Mode 1 energy release rate

G2

Mode 2 energy release rate

G3

Mode 3 energy release rate

GT

Total energy release rate

MFTX

Total material force X

MFTY

Total material force Y

MFTZ

Total material force Z

CEXT

Crack extension

CJUMP,*Option*,*Input1*,*Input2*,*Input3*,*Input4*,*Input5*,*Input6*,*Input7*,*Input8*

Initiates a cycle-jump analysis.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Option to be applied:

CRIT

Jump criterion.

INTENT

Declaration of cycle jump analysis intent. For an analysis that begins with a standard solution, specify before the first **SOLVE (p. 1822)** command.

MINCYC

Minimum number of cycles before a jump is allowed (and, if desired, the empirical adjustment of minimum intermediate cycles).

INICYC

Minimum number of initial cycles before a jump is allowed.

MAXJUMP

Maximum allowable jump.

RELTIME

Relative time.

CONTROL

Control-variable selection.

CNMT

Material-ID-dependent jump control.

ADCR

Material-ID- and/or control-variable-dependent jump criteria.

CALC

Jump-calculation option.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PERC

Statistical-jump calculation.

OUTP

Diagnostic information output.

Input1

Additional input according to the specified *Option*:

Option	***Input1 =***	***Input2 =***	***Input3, ..., Input8 =***
CRIT	Value of jump criterion.	---	---
INTENT	---	---	---
MINCYC	Minimum number of cycles. Default = 3.	Increase of minimum intermediate cycles. Default = 0.	Decrease of minimum intermediate cycles. Default = 0.
INICYC	Initial number of cycles. Default = 3.	---	---
MAXJUMP	Maximum allowable number of cycles to jump. No default.	---	---
RELTIME	Relative time. Default = time value corresponding to the absolute maximum load for a defined load cycle.	---	---
CONTROL	S – Stress (default).	---	---
	EPPL – Plastic strain.	---	---
	DOF – Degrees of freedom.	---	---
	SVAR – State variables.	MAT	*Input3* = Material ID
		SEL	*Input3*,...,*Input8* = State variable values assigned to six locations.
CNMT	*Input1*,*Input2*,...,*Input6* = Material ID values assigned to six locations.		
ADCR	MAT - Material.	Material ID.	Jump-criterion value.
	CONT - Control variable.	Control-variable label.	
CALC	1 - Slope-based jump calculation (default).	---	---
	2 -Variable-based jump calculation.		
PERC	Percentile value of the cumulative frequency.		
OUTP	---	---	---

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Cycle jump analysis is disabled.

Notes

When *Option* = CONTROL, any input of a control variable replaces the default (S). If stress is also needed in combination with another control variable (or variables), you must specify it explicitly.

CJUMP (p. 347) requires a corresponding cyclic loading analysis (**CLOAD (p. 351)**).

For more information, see Cycle-Jump Analysis in the *Advanced Analysis Guide*.

This command is also valid in PREP7 (**/PREP7 (p. 1479)**).

Menu Paths

This command cannot be accessed from a menu.

/CLABEL, *WN*, *KEY*

Specifies contour labeling.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

KEY

Labeling key:

0 or 1

Label contours with legend or color (default).

-1

No contour labeling.

N

Same as 1 except show alphabetic legend only on every *N*th element.

Command Default

Show contour line labels.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Labels contours for identification with alphabetic legend for vector displays and color for raster displays. Number of contours is automatically reduced to 9 (or fewer) for clarity. Use **/CONTOUR (p. 415)** command to increase (24 maximum for alphabetic labeling; no limit for color labeling).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Contours>Contour Labeling

/CLEAR, *Read*

Clears the database.

DATABASE (p. 13): Set Up (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Read

File read option:

START

Reread `start.ans` file (default).

NOSTART

Do not reread `start.ans` file.

Notes

The **/CLEAR (p. 350)** command resets the database to the conditions present at the beginning of the problem.

The command is typically used between multiple analyses in the same run, or between passes of a multipass analysis (such as between substructure generation, use, and expansion passes).

The command sets the import and Boolean options back to the default, deletes all items from the database, and sets memory values to zero for items derived from database information. (All files remain intact.) The command also resets the jobname to match the currently open session `.log` and `.err` files, returning the jobname to its original value or to the most recent value specified via **/FILNAME (p. 757)** with *KEY* = 1.

After the database is cleared, the `start.ans` file is reread (by default) unless *Read* = NOSTART.

Additional commands cannot be stacked (via the $ separator) on the same line as the **/CLEAR (p. 350)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Use caution when placing the **/CLEAR (p. 350)** command within branching constructs (for example, those using ***DO (p. 567)** or ***IF (p. 927)** commands), as the command deletes all parameters including the looping parameter for do-loops. (To preserve your iteration parameter, issue a **PARSAV (p. 1352)** command *prior* to **/CLEAR (p. 350)**, then *follow* **/CLEAR (p. 350)** with a **PARRES (p. 1351)** command.)

This command is valid in any processor. Issuing this command at any point clears the database.

Menu Paths

Utility Menu>File>Clear & Start New

CLOAD, *Option*, *Input1*

Initiates a cyclic-loading analysis.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Option to be applied:

DEFINE

Mark tabular array as a cyclic-loading table.

CYCNUM

Total number of cycles.

CYCTIME

Cycle time.

TSTEP

Enable time-point-range time-stepping.

OUTR

Select time points for output.

MSUB

Multicycle cyclic-loading.

Input1

Additional input according to the specified *Option*:

Option	*Input1* =
DEFINE	BEGIN – Begin marking tabular array as cyclic load table.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Option	***Input1 =***
	END – End marking tabular array as cyclic load table.
CYCNUM	Total number of cycles.
CYCTIME	Time length of each cycle.
TSTEP	---
OUTR	Set cycle frequency for results. Default = 1.
MSUB	Number of subcycles in a multicycle cyclic loading analysis.

Command Default

Cyclic load analysis is disabled.

Notes

For more information, see Cyclic-Loading Analysis in the *Advanced Analysis Guide*.

This command is also valid in PREP7 (**/PREP7 (p. 1479)**).

Menu Paths

This command cannot be accessed from a menu.

CLOCAL, *KCN, KCS, XL, YL, ZL, THXY, THYZ, THZX, PAR1, PAR2*

Defines a local coordinate system relative to the active coordinate system.

DATABASE (p. 13): Coordinate System (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Arbitrary reference number assigned to this coordinate system. Must be greater than 10. A coordinate system previously defined with this number will be redefined.

KCS

Coordinate system type:

0 or CART

Cartesian

1 or CYLIN

Cylindrical (circular or elliptical)

2 or SPHE

Spherical (or spheroidal)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3 or TORO

Toroidal

XL, YL, ZL

Location (in the active coordinate system) of the origin of the new coordinate system (R, θ, Z for cylindrical, R, θ,Φ for spherical or toroidal).

THXY

First rotation about local Z (positive X toward Y).

THYZ

Second rotation about local X (positive Y toward Z).

THZX

Third rotation about local Y (positive Z toward X).

PAR1

Used for elliptical, spheroidal, or toroidal systems. If *KCS* = 1 or 2, *PAR1* is the ratio of the ellipse Y-axis radius to X-axis radius (defaults to 1.0 (circle)). If *KCS* = 3, *PAR1* is the major radius of the torus.

PAR2

Used for spheroidal systems. If *KCS* = 2, *PAR2* = ratio of ellipse Z-axis radius to X-axis radius (defaults to 1.0 (circle)).

Notes

Defines and activates a local coordinate system by origin location and orientation angles relative to the active coordinate system. This local system becomes the active coordinate system, and is automatically aligned with the active system (that is, x is radial if a cylindrical system is active, etc.). Nonzero rotation angles (degrees) are relative to this automatic rotation. See the **CS (p. 435)**, **CSKP (p. 438)**, **CSWPLA (p. 440)**, and **LOCAL (p. 1059)** commands for alternate definitions. Local coordinate systems may be displayed with the **/PSYMB (p. 1552)** command.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CLOG, *IR*, *IA*, - -, - -, *Name*, - -, - -, *FACTA*, *FACTB*

Forms the common log of a variable

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA

Reference number of the variable to be operated on.

--,--

Unused fields.

Name

Thirty-two character name for identifying the variable on printouts and displays. Embedded blanks are compressed for output.

--,--

Unused fields.

FACTA

Scaling factor applied to variable *IA* (defaults to 1.0).

FACTB

Scaling factor (positive or negative) applied to the operation (defaults to 1.0).

Notes

Forms the common log of a variable according to the operation:

$$IR = FACTB * \text{LOG}(FACTA \times IA)$$

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Common Log

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/CLOG, *Fname*, *Ext*, --

Copies the session log file to a named file.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path to which the log file is to be copied (248 characters maximum, including directory). If you do not specify a directory path, it will default to your working directory and you can use all 248 characters for the file name.

Ext

Filename extension (eight-character maximum).

--

Unused field.

Notes

This command is valid in any processor, but only during an interactive run.

Menu Paths

This command cannot be accessed from a menu.

CLRMSHLN

Clears meshed entities.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

When you use the GUI method to set the number of elements on specified lines, and any of those lines is connected to one or more meshed lines, areas, or volumes, the program gives you the option to clear the meshed entities. This occurs only when you perform this operation via the GUI; the program does not provide such an option when you use the command method (**LESIZE (p. 1041)**).

If you activate the mesh clearing option, the program invokes a Mechanical APDL macro, **CLRMSHLN (p. 355)**, that clears the meshed entities. This macro name will appear in the log file (`Jobname.log`). This macro is for the Mechanical APDL program's internal use only. This command is not intended to be typed in directly in a Mechanical APDL session, although it can be included in an input file for batch input or for use via **/INPUT (p. 948)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

CM,*Cname*,*Entity*,--,*KOPT*

Groups geometry items into a component.

DATABASE (p. 13): Components (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Cname

An alphanumeric name used to identify this component. *Cname* may be up to 256 characters, beginning with a letter and containing only letters, numbers, dots (.) and underscores (_). Component names beginning with an underscore (for example, _LOOP) are reserved for use by Mechanical APDL and should be avoided. Components named "ALL," "STAT," and "DEFA" are not permitted. Overwrites a previously defined name.

Entity

Label identifying the type of geometry items to be grouped:

VOLU

Volumes.

AREA

Areas.

LINE

Lines.

KP

Keypoints.

ELEM

Elements.

NODE

Nodes.

--

Reserved for future use.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KOPT

Controls how element component contents are updated during nonlinear mesh adaptivity analysis:

0 – Component is not updated during remeshing and therefore contains only initial mesh elements (default).

1 – Component is updated during remeshing to contain the updated elements.

This argument is valid only for nonlinear mesh adaptivity analysis with *Entity* = ELEM, and for solid element components only.

Notes

Components may be further grouped into assemblies (**CMGRP (p. 365)**). The selected items of the specified entity type will be stored as the component. Use of this component in the select command (**CMSEL (p. 374)**) causes all these items to be selected at once, for convenience.

A component is a grouping of some geometric entity that can then be conveniently selected or unselected. A component may be redefined by reusing a previous component name. The following entity types may belong to a component: nodes, elements, keypoints, lines, areas, and volumes. A component may contain only 1 entity type, but an individual item of any entity may belong to any number of components. Once defined, the items contained in a component may then be easily selected or unselected (**CMSEL (p. 374)**). Components may be listed (**CMLIST (p. 366)**), modified (**CMMOD (p. 368)**) and deleted (**CMDELE (p. 362)**). Components may also be further grouped into assemblies (**CMGRP (p. 365)**). Other entities associated with the entities in a component (for example, the lines and keypoints associated with areas) may be selected by the **ALLSEL (p. 114)** command.

An item will be deleted from a component if it has been deleted by another operation (see the **KMODIF (p. 985)** command for an example). Components are automatically updated to reflect deletions of one or more of their items. Components are automatically deleted and a warning message is issued if all their items are deleted. Assemblies are also automatically updated to reflect deletions of one or more of their components or subassemblies, but are not deleted if all their components and subassemblies are deleted.

For nonlinear mesh adaptivity analysis, an extra option is available to update the element component contents automatically during the analysis, applicable in cases where the remeshing region overlaps the defined solid element component region. By enabling the option, the component element boundary is maintained, and the validity of the defined component is guaranteed during the entire analysis run; therefore, the component can be used during both solution and postprocessing.

Components are often used as input to other commands. Some commands restrict the component name to 32 characters. For those commands, this limitation is documented within the command description.

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Comp/Assembly>Create Component

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CMACEL, *CM_NAME*, *CMACEL_X*, *CMACEL_Y*, *CMACEL_Z*

Specifies the translational acceleration of an element component

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

CM_NAME

The name of the element component.

CMACEL_X*, *CMACEL_Y*, *CMACEL_Z

Acceleration of the element component *CM_NAME* in the global Cartesian X, Y, and Z axis directions, respectively.

Notes

The **CMACEL (p. 358)** command specifies the translational acceleration of the element component in each of the global Cartesian (X, Y, and Z) axis directions.

Components for which you want to specify acceleration loading must consist of elements only. The elements you use cannot be part of more than one component, and elements that share nodes cannot exist in different element components. You cannot apply the loading to an assembly of element components.

To simulate gravity (by using inertial effects), accelerate the structure in the direction opposite to gravity. For example, apply a positive *CMACELY* to simulate gravity acting in the negative Y direction. Units are length/time^2.

You can define the acceleration for the following analyses types:

- Static (**ANTYPE (p. 162)**,STATIC)
- Harmonic (**ANTYPE (p. 162)**,HARMIC), full, VT [1], Krylov [1], or mode-superposition [2] method
- Transient (**ANTYPE (p. 162)**,TRANS), full or mode-superposition [2] method
- Substructure (**ANTYPE (p. 162)**,SUBSTR)

1. Loads for VT and Krylov methods are supported as long as they are not:
   - complex tabulated loads (constant or trapezoidal loads in tabulated form are supported)
   - used in conjunction with Rotordynamics (**CORIOLIS (p. 417)**,on).
2. In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

Accelerations are combined with the element mass matrices to form a body-force load vector term. Units of acceleration and mass must be consistent to give a product of force units.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **CMACEL (p. 358)** command supports tabular boundary conditions (%*TABNAME_X*%, %*TABNAME_Y*%, and %*TABNAME_Z*%) for *CMACEL_X*, *CMACEL_Y*, and *CMACEL_Z* input values (***DIM (p. 530)**) as a function of both time and frequency for full transient and harmonic analyses.

Related commands for inertia loads are **ACEL (p. 92)**, **CGLOC (p. 319)**, **CGOMGA (p. 320)**, **DCGOMG (p. 501)**, **DOMEGA (p. 571)**, **OMEGA (p. 1324)**, **CMOMEGA (p. 368)**, and **CMDOMEGA (p. 362)**.

See Analysis Tools in the *Theory Reference* for more information.

This command is also valid in **/PREP7 (p. 1479)**.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Structural>Inertia>Gravity>On Components

Main Menu>Solution>Define Loads>Apply>Structural>Inertia>Gravity>On Components

---

/**CMAP**,*Fname*,*Ext*,*--*,*Keyword*,*NCNTR*

Changes an existing or creates a new color mapping table.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

If blank, restore color map.

Ext

Filename extension (eight-character maximum).

--

Unused field.

Keyword

Keyword indicating the disposition of the color map file.

(blank)

Loads existing color map file.

CREATE

Starts the CMAP utility and modifies or creates the specified file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SAVE

Writes the active color map to the specified file, which can be imported into future sessions.

NCNTR

Number of contours to be defined. Default = 9 (even if an existing file is being modified). Maximum = 128.

Command Default

Use predefined Mechanical APDL color map table.

Notes

Reads the color map file (RGB index specifications) to change from current specifications. Only one color map may be active at a time.

For 2D drivers (especially Win32c), modifying the color map can produce anomalies, including legend/contour disagreement.

When *Keyword* equals CREATE, the 2D drivers (X11c and Win32c) display the CMAP utility with an additional contour color picker called CONTOURS. Colors selected via the CONTOURS picker affect result contour displays (such as stresses). No other drivers offer the CONTOURS picker in the CMAP utility.

Changing the color map using the **/CMAP (p. 359)** command changes the meaning of the color labels on the **/COLOR (p. 400)** command. See **/COLOR (p. 400)** for other color controls.

This command is valid anywhere.

Menu Paths

Utility Menu>PlotCtrls>Style>Colors>Default Color Map

CMATRIX, *SYMFAC*, *Condname*, *NUMCOND*, *GRNDKEY*, *Capname*

Performs electrostatic field solutions and calculates the self and mutual capacitances between multiple conductors.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SYMFAC

Geometric symmetry factor. Capacitance values are scaled by this factor which represents the fraction of the total device modeled. Defaults to 1.

Condname

Alpha-numeric prefix identifier used in defining named conductor components.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NUMCOND

Total Number of Components. If a ground is modeled, it is to be included as a component. If a ground is not modeled, but infinite elements are used to model the far-field ground, a named component for the far-field ground is not required.

GRNDKEY

Ground key:

0

Ground is one of the components, which is not at infinity.

1

Ground is at infinity (modeled by infinite elements).

Capname

Array name for computed capacitance matrix. Defaults to **CMATRIX (p. 360)**.

Notes

To invoke the **CMATRIX (p. 360)** macro, the exterior nodes of each conductor must be grouped into individual components using the **CM (p. 356)** command. Each set of independent components is assigned a component name with a common prefix followed by the conductor number. A conductor system with a ground must also include the ground nodes as a component. The ground component is numbered last in the component name sequence.

A ground capacitance matrix relates charge to a voltage vector. A ground matrix cannot be applied to a circuit modeler. The lumped capacitance matrix is a combination of lumped "arrangements" of voltage differences between conductors. Use the lumped capacitance terms in a circuit modeler to represent capacitances between conductors.

Enclose all name-strings in single quotes in the **CMATRIX (p. 360)** command line.

See the *Mechanical APDL Theory Reference* for details.

This command does not support multiframe restarts.

Menu Paths

Main Menu>Solution>Solve>Electromagnet>Static Analysis>Capac Matrix

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CMDELE, *Name*

Deletes a component or assembly definition.

DATABASE (p. 13): Components (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Name

Name of the component or assembly whose definition is to be removed.

Notes

Entities contained in the component, or the components within the assembly, are unaffected. Only the grouping relationships are deleted. Assemblies are automatically updated to reflect deletion of their components or subassemblies, but they are not automatically deleted when all their components or subassemblies are deleted.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Meshing>Size Cntrls>ManualSize>Layers>Picked Lines

Utility Menu>Select>Comp/Assembly>Delete Comp/Assembly

CMDOMEGA, *CM_NAME*, *DOMEGAX*, *DOMEGAY*, *DOMEGAZ*, *X1*, *Y1*, *Z1*, *X2*, *Y2*, *Z2*

Specifies the rotational acceleration of an element component about a user-defined rotational axis.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

***CM_NAME*,**

The name of the element component.

DOMEGAX*, *DOMEGAY*, *DOMEGAZ

If the *X2*, *Y2*, *Z2* fields are not defined, *DOMEGAX*, *DOMEGAY*, and *DOMEGAZ* specify the components of the rotational acceleration vector in the global Cartesian X, Y, Z directions.

If the *X2*, *Y2*, *Z2* fields are defined, only *DOMEGAX* is required. *DOMEGAX* specifies the scalar rotational acceleration about the rotational axis. The rotational direction of *DOMEGAX*is designated either positive or negative, and is determined by the "right hand rule."

X1*, *Y1*, *Z1

If the *X2*, *Y2*, *Z2* fields are defined, *X1*, *Y1*, and *Z1* define the coordinates of the beginning point of the rotational axis vector. Otherwise, *X1*, *Y1*, and *Z1* are the coordinates of a point through which the rotational axis passes.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X2, Y2, Z2

The coordinates of the end point of the rotational axis vector.

Notes

Specifies the rotational acceleration components *DOMEGAX*, *DOMEGAY*, and *DOMEGAZ* of an element component *CM_NAME* about a user-defined rotational axis. The rotational axis can be defined either as a vector passing through a single point, or a vector connecting two points.

You can define the rotational acceleration and rotational axis with the **CMDOMEGA (p. 362)** command for these analyses:

- Static (**ANTYPE (p. 162)**,STATIC)
- Harmonic (**ANTYPE (p. 162)**,HARMIC) -- full, VT [1], Krylov [1], or mode-superposition [2]
- Transient (**ANTYPE (p. 162)**,TRANS) -- full or mode-superposition [2]
- Substructuring (**ANTYPE (p. 162)**,SUBSTR)
- Modal (**ANTYPE (p. 162)**,MODAL)

1. Loads for VT and Krylov methods are supported as long as they are not:
   - complex tabulated loads (constant or trapezoidal loads in tabulated form are supported)
   - used in conjunction with Rotordynamics (**CORIOLIS (p. 417)**,on).
2. In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

Rotational velocities are combined with the element mass matrices to form a body force load vector term. Units are radians/time^2.

The **CMDOMEGA (p. 362)** command supports tabular boundary conditions (%*TABNAME_X*%, %*TABNAME_Y*%, and %*TABNAME_Z*%) for *DOMEGAX*, *DOMEGAY*, and *DOMEGAZ* input values (***DIM (p. 530)**) for full transient and harmonic analyses. In this case, if the end point is specified (*X2*, *Y2*, *Z2*), the rotational velocity axis must be along the global X-, Y-, or Z-axis.

Related commands are **ACEL (p. 92)**, **CGLOC (p. 319)**, **CGLOC (p. 319)**, **OMEGA (p. 1324)**, **CMOMEGA (p. 368)**, **DCGOMG (p. 501)**, **DOMEGA (p. 571)**.

See Analysis Tools in the *Theory Reference* for more information.

You can use the **CMDOMEGA (p. 362)** command in conjunction with any one of the following two groups of commands, but not with both groups simultaneously:

GROUP ONE: **OMEGA (p. 1324)**, **DOMEGA (p. 571)**.

GROUP TWO: **CGOMGA (p. 320)**, **DCGOMG (p. 501)**, **CGLOC (p. 319)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Components for which you want to specify rotational loading must consist of elements only. The elements you use cannot be part of more than one component, and elements that share nodes cannot exist in different element components. You cannot apply the loading to an assembly of element components.

See Acceleration Effect in the *Mechanical APDL Theory Reference* for more information.

This command is also valid in PREP7.

CMEDIT,*Aname*,*Oper*,*Cnam1*,*Cnam2*,*Cnam3*,*Cnam4*,*Cnam5*,*Cnam6*,*Cnam7*

Edits an existing assembly.

DATABASE (p. 13): Components (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Aname

Name of the assembly to be edited.

Oper

Operation label:

ADD

To add more components. The level of any assembly to be added must be lower than that of the assembly *Aname* (see **CMGRP (p. 365)** command).

DELE

To remove components.

Cnam1, Cnam2, Cnam3, . . . , Cnam7

Names of components and assemblies to be added to or deleted from the assembly.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Comp/Assembly>Edit Assembly

CMGRP,*Aname*,*Cnam1*,*Cnam2*,*Cnam3*,*Cnam4*,*Cnam5*,*Cnam6*,*Cnam7*,*Cnam8*

Groups components and assemblies into an assembly.

DATABASE (p. 13): Components (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Aname

An alphanumeric name used to identify this assembly. *Aname* may be up to 256 characters, beginning with a letter and containing only letters, numbers, dots (.), and underscores (_). Overwrites a previously defined *Aname* (and removes it from higher level assemblies, if any).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cnam1, Cnam2, Cnam3, . . . , Cnam8

Names of existing components or other assemblies to be included in this assembly.

Notes

Groups components and other assemblies into an assembly identified by a name. **CMGRP (p. 365)** is used for the initial definition of an assembly. An assembly is used in the same manner as a component. Up to 5 levels of assemblies within assemblies may be used.

An assembly is a convenient grouping of previously defined components and other assemblies. Assemblies may contain components only, other assemblies, or any combination. A component may belong to any number of assemblies. Up to 5 levels of nested assemblies may be defined. Components and assemblies may be added to or deleted from an existing assembly by the **CMEDIT (p. 365)** command. Once defined, an assembly may be listed, deleted, selected, or unselected using the same commands as for a component. Assemblies are automatically updated to reflect deletions of one or more of their components or lower-level assemblies. Assemblies are not automatically deleted when all their components or subassemblies are deleted.

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Comp/Assembly>Create Assembly

CMLIST, *Name*, *Key*, *Entity*

Lists the contents of a component or assembly.

DATABASE (p. 13): Components (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Name

Name of the component or assembly to be listed (if blank, list all selected components and assemblies). If *Name* is specified, then *Entity* is ignored.

Key

Expansion key:

0

Do not list individual entities in the component.

1 or EXPA

List individual entities in the component.

Entity

If *Name* is blank, then the following entity types can be specified:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VOLU

List the volume components only.

AREA

List the area components only.

LINE

List the line components only.

KP

List the keypoint components only

ELEM

List the element components only.

NODE

List the node components only.

Notes

This command is valid in any processor. For components, it lists the type of geometric entity. For assemblies, it lists the components and/or assemblies that make up the assembly.

Examples of possible usage:

CMLIST (p. 366) - List all selected components.

CMLIST (p. 366), , EXPA - List all selected components and for each component list the underlying entity ID's.

CMLIST (p. 366),*Name* - List the specified component.

CMLIST (p. 366),*Name*,EXPA - List specified component along with all underlying entity ID's.

CMLIST (p. 366), , EXPA,*Entity* - List all selected components of specified entity type. For each component also list the underlying entity ID's.

Menu Paths

Utility Menu>List>Components

Utility Menu>List>Other>Components

Utility Menu>Select>Comp/Assembly>List Comp/Assembly

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CMMOD, *Cname*, *Keyword*, *Value*

Modifies the specification of a component.

DATABASE (p. 13): Components (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Cname

Name of the existing component or assembly to be modified.

Keyword

The label identifying the type of value to be modified.

NAME - Modify the NAME of the component

Value

If *Keyword* is NAME, then the value is the alphanumeric label to be applied. See the **CM (p. 356)** command for naming convention details. If a component named *Value* already exists, the command will be ignored and an error message will be generated.

Notes

The naming conventions for components, as specified in the **CM (p. 356)** command, apply for **CMMOD (p. 368)** (256 characters, "ALL", "STAT" and "DEFA" are not allowed, etc.). However, if you choose a component name that is already designated for another component, an error message will be issued and the command will be ignored.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

CMOMEGA, *CM_NAME*, *OMEGAX*, *OMEGAY*, *OMEGAZ*, *X1*, *Y1*, *Z1*, *X2*, *Y2*, *Z2*

Specifies the rotational velocity of an element component about a user-defined rotational axis.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

CM_NAME

The name of the element component.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OMEGAX, OMEGAY, OMEGAZ

If the *X2*, *Y2*, *Z2* fields are not defined, *OMEGAX*, *OMEGAY*, and *OMEGAZ* specify the components of the rotational velocity vector in the global Cartesian X, Y, Z directions.

If the *X2*, *Y2*, *Z2* fields are defined, only *OMEGAX* is required. *OMEGAX* specifies the scalar rotational velocity about the rotational axis. The rotational direction of *OMEGAX* is designated either positive or negative, and is determined by the "right hand rule."

X1, Y1, Z1

If the *X2*, *Y2*, *Z2* fields are defined,*X1*, *Y1*, and *Z1* define the coordinates of the beginning point of the rotational axis vector. Otherwise, *X1*, *Y1*, and *Z1* are the coordinates of a point through which the rotational axis passes.

X2, Y2, Z2

The coordinates of the end point of the rotational axis vector.

Notes

Specifies the rotational velocity components *OMEGAX*, *OMEGAY*, and *OMEGAZ* of an element component *CM_NAME* about a user-defined rotational axis. The rotational axis can be defined either as a vector passing through a single point or a vector connecting two points.

You can define the rotational velocity and rotational axis for these analysis types:

- Static (**ANTYPE (p. 162)**,STATIC)
- Harmonic (**ANTYPE (p. 162)**,HARMIC) -- full, VT [1], Krylov [1], or mode-superposition [2]
- Transient (**ANTYPE (p. 162)**,TRANS) -- full or mode-superposition [2]
- Substructuring (**ANTYPE (p. 162)**,SUBSTR)
- Modal (**ANTYPE (p. 162)**,MODAL)

1. Loads for VT and Krylov methods are supported as long as they are not:
   - complex tabulated loads (constant or trapezoidal loads in tabulated form are supported)
   - used in conjunction with Rotordynamics (**CORIOLIS (p. 417)**,on).
2. In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

Rotational velocities are combined with the element mass matrices to form a body-force load vector term. Units are radians/time. Related commands are **ACEL (p. 92)**, **CGLOC (p. 319)**, **CGLOC (p. 319)**, **CGOMGA (p. 320)**, **CMDOMEGA (p. 362)**, **DCGOMG (p. 501)**, **DOMEGA (p. 571)**.

See Analysis Tools in the *Theory Reference* for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can use the **CMOMEGA (p. 368)** command in conjunction with either one of the following two groups of commands, but not with both groups simultaneously:

GROUP ONE: **OMEGA (p. 1324)**, **DOMEGA (p. 571)**.

GROUP TWO: **CGOMGA (p. 320)**, **DCGOMG (p. 501)**, **CGLOC (p. 319)**.

Components for which you want to specify rotational loading must consist of elements only. The elements you use cannot be part of more than one component, and elements that share nodes cannot exist in different element components. You cannot apply the loading to an assembly of element components.

If you have applied the Coriolis effect (**CORIOLIS (p. 417)**) using a stationary reference frame, the **CMOMEGA (p. 368)** command takes the gyroscopic damping matrix into account for the elements listed under *"Stationary Reference Frame"* in the notes section of the **CORIOLIS (p. 417)** command. Mechanical APDL verifies that the rotation vector axis is parallel to the axis of the element; if not, the gyroscopic effect is not applied. If you issue a **CMOMEGA (p. 368)** command when the Coriolis or gyroscopic effect is present, a subsequently issued **OMEGA (p. 1324)** command has no effect.

The **CMOMEGA (p. 368)** command supports tabular boundary conditions (%*TABNAME_X*%, %*TABNAME_Y*%, and %*TABNAME_Z*%) for *OMEGAX*, *OMEGAY*, and *OMEGAZ* input values (***DIM (p. 530)**) for modal, full transient, and full harmonic analyses. In this case, if the end point is specified (*X2*, *Y2*, *Z2*), the rotational velocity axis must be along the global X-, Y-, or Z-axis.

The load interpolation setting (**KBC (p. 970)**) applies to the rotational velocity, in particular the *OMGSQRDKEY* option for quadratic interpolation.

---

CMPLOT,*Label*,*Entity*,*Keyword*

Plots the entities contained in a component or assembly.

DATABASE (p. 13): Components (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Name of the component or assembly to be plotted.

(blank)

All selected components and assemblies are plotted (default). If fewer than 11 components are selected, then all are plotted. If more than 11 components are selected, then only the first 11 are plotted.

ALL

All selected components are plotted. If number of selected components is greater than 11, then the legend showing component names will not be shown.

N

Next set of defined components and assemblies is plotted.

P

Previous set of defined components and assemblies is plotted.

Cname

The specified component or assembly is plotted.

SetNo.

The specified set number is plotted.

Entity

If *Label* is BLANK or ALL, then the following entity types can be specified:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VOLU

Plot the volume components only.

AREA

Plot the area components only.

LINE

Plot the line components only.

KP

Plot the keypoint components only.

ELEM

Plot the element components only.

NODE

Plot the node components only.

Keyword

For *Keyword* = ALL, plot the specified component name in the *Label* field in the context of all entities of the same type. Not valid if *Label* field is BLANK or ALL.

Notes

Components are plotted with their native entities. For assemblies, all native entities for the underlying component types are plotted simultaneously. Although more components can be plotted, the legend displays only 11 at a time. When more than eleven are plotted, the legend is not displayed.

Possible usage:

CMPLOT (p. 371),*CNAME* - Plots the specified component (if selected).

CMPLOT (p. 371),*CNAME*, ALL - Plot component in the context of all other selected entity components of the same type as the component.

CMPLOT (p. 371) - Plot the first eleven selected components.

CMPLOT (p. 371),ALL - Plot all selected components.

CMPLOT (p. 371),N or **CMPLOT (p. 371)**,P - Plot next or previous set of eleven components.

CMPLOT (p. 371),ALL,*Entity* - Plot all selected components of type specified in *Entity*.

CMPLOT (p. 371), ,*Entity* - Plot components of type specified in *Entity*, from the first eleven components.

CMPLOT (p. 371),N,*Entity* - Plot components of type specified in *Entity*, if any, from the next set of eleven components (substitute P for N to plot from previous set).

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Utility Menu>Plot>Components>Selected Components

CMROTATE, *CM_Name*, *ROTATX*, *ROTATY*, *ROTATZ*, *X1*, *Y1*, *Z1*, *X2*, *Y2*, *Z2*

Specifies the rotational velocity of an element component in a brake-squeal analysis.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

CM_Name

The name of the element component.

ROTATX, ROTATY, ROTATZ

If the *X2*, *Y2*, *Z2* fields are not defined, *ROTATX*, *ROTATY*, and *ROTATZ* specify the components of the rotational angle vector in the global Cartesian X, Y, Z directions.

If the *X2*, *Y2*, *Z2* fields are defined, only *ROTATX* is required. *ROTATX* specifies the scalar rotational velocity about the rotational axis. The rotational direction of *ROTATX* is designated either positive or negative, and is determined by the "right hand rule."

X1, Y1, Z1

If the *X2*, *Y2*, *Z2* fields are defined, *X1*, *Y1*, and *Z1* define the coordinates of the beginning point of the rotational axis vector. Otherwise, *X1*, *Y1*, and *Z1* are the coordinates of a point through which the rotational axis passes.

X2, Y2, Z2

The coordinates of the end point of the rotational axis vector.

Notes

The **CMROTATE (p. 373)** command specifies the rotational motion velocity components *ROTATX*, *ROTATY*, and *ROTATZ* of an element component *CM_Name* about a user-defined rotational axis. The rotational axis can be defined either as a vector passing through a single point or a vector connecting two points. **CMROTATE (p. 373)** can be used in static analyses (**ANTYPE (p. 162)**,STATIC) and modal analyses (**ANTYPE (p. 162)**,MODAL).

This command sets the constant rotational velocity on the nodes of the specified element component, despite any deformation at the nodes. This feature is primarily used for generating sliding contact at frictional contact interfaces in a brake-squeal analysis. This type of analysis typically involves surface-to-surface contact between the brake pad and the rotating disk. The applicable contact elements, therefore, are CONTA174 and CONTA175.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A brake-squeal analysis generally involves a linear perturbation modal analysis subsequent to a large-deformation static analysis with the Newton-Raphson option set as **NROPT (p. 1261)**,UNSYM. Therefore, **CMROTATE (p. 373)** is not applicable for multiple load step solves using the **LSSOLVE (p. 1085)** command.

The load interpolation setting (**KBC (p. 970)**) applies to the rotational velocity, in particular the *OMG-SQRDKEY* option for quadratic interpolation.

This command is also valid in PREP7.

Menu Paths

This command cannot be accessed from a menu.

CMSEL, *Type*, *Name*, *Entity*

Selects a subset of components and assemblies.

DATABASE (p. 13): Components (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

ALL

Also select all components.

NONE

Unselect all components.

Name

Name of component or assembly whose items are to be selected (valid only if *Type* = S, R, A, or U).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Graphical picking is enabled if *Type* is blank and *Name* = PICK (or simply "P").

Entity

If *Name* is blank, then the following entity types can be specified:

VOLU

Select the volume components only.

AREA

Select the area components only.

LINE

Select the line components only.

KP

Select the keypoint components only.

ELEM

Select the element components only.

NODE

Select the node components only.

Notes

Selecting by component is a convenient adjunct to individual item selection (for example, **VSEL (p. 2163)**, **ESEL (p. 661)**, etc.). **CMSEL (p. 374)**, ALL allows you to select components **in addition** to other items you have already selected.

If *Type* = R for an assembly selection (**CMSEL (p. 374)**,R,<*assembly-name*>), the reselect operation is performed on each component in the assembly in the order in which the components make up the assembly. Thus, if one reselect operation results in an empty set, subsequent operations will also result in empty sets. For example, if the first reselect operation tries to reselect node 1 from the selected set of nodes 3, 4, and 5, the operation results in an empty set (that is, no nodes are selected). Since the current set is now an empty set, if the second reselect operation tries to reselect any nodes, the second operation also results in an empty set, and so on. This is equivalent to repeating the command **CMSEL (p. 374)**,R,<*component-name*> once for each component making up the assembly.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Structural>Displacement>On Joint Elems

Main Menu>Preprocessor>Loads>Define Loads>Apply>Structural>Force/Moment>On Joint Elems

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Main Menu>Solution>Define Loads>Apply>Structural>Displacement>On Joint Elems

Main Menu>Solution>Define Loads>Apply>Structural>Force/Moment>On Joint Elems

Utility Menu>Select>Comp/Assembly>Select Comp/Assembly

CMSFILE,*Option*,*Fname*,*Ext*,*CmsKey*

Specifies a list of component mode synthesis (CMS) results files for plotting results on the assembly.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Specifies the command operation:

ADD

Add the specified component results file (*Fname*) to the list of files to plot. This option is the default.

DELETE

Remove the specified component results file (*Fname*) from the list of files to plot.

LIST

List all specified component results files.

CLEAR

Clear all previous files added.

ALL

Add *all* component results (`.rst`) files from the working directory to the list of files to plot.

Fname

The file name (with full directory path) of the component results file. The default file name is the `Jobname` (specified via the **/FILNAME (p. 757)** command).

Ext

The file name (*Fname*) extension. The default extension is `.rst`.

CmsKey

Valid only when adding a results file (*Option* = ADD or ALL), this key specifies whether or not to check the specified `.rst` file to determine if it was created via a CMS expansion pass:

ON

Check (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

Do not check.

Command Default

If issued with no arguments, the **CMSFILE (p. 376)** command uses these defaults:

CMSFILE (p. 376),ADD,*Jobname*,rst,ON

The command adds the component results file `Jobname.rst`.

Notes

The **CMSFILE (p. 376)** command specifies the list of component mode synthesis (CMS) results files to include when plotting the mode shape of an assembly.

During postprocessing (**/POST1 (p. 1461)**) of a CMS analysis, issue the **CMSFILE (p. 376)** command to point to component results files of interest. (You can issue the command as often as needed to include all or some of the component results files.) Issue the **SET (p. 1724)** command to acquire the frequencies and mode shapes from substeps for all specified results files. Execute a plot (**PLNSOL (p. 1425)**) or print (**PRNSOL (p. 1505)**) operation to display the mode shape of the entire assembly.

When you specify a results file to add to the plot list, the default behavior of the command (*CmsKey* = ON) is to first verify that the file is from a CMS analysis and that the frequencies of the result sets on the file match the frequencies on the first file in the list. If *CmsKey* = OFF, you can add any `.rst` file to the list of files to plot, even if the file was not expanded via a CMS expansion pass.

If *CmsKey* = ON (default), output from the command appears as: `ADD CMS FILE = filename.rst`. If *CmsKey* = OFF, output from the command appears as: `ADD FILE = filename.rst`.

If *Option* = DELETE or CLEAR, you must clear the database (**/CLEAR (p. 350)**), then re-enter the post-processor (**/POST1 (p. 1461)**) and issue a **SET (p. 1724)** command for the change to take effect on subsequent plots.

Clearing the database does *not* clear the list of files specified via the **CMSFILE (p. 376)** command. Specify *Option* = CLEAR to clear the list of files.

Menu Paths

Main Menu>General Postproc>Data & File Opts

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CMSOPT,*Cmsmeth*,*NMODE*,*FREQB*,*FREQE*,*Fbddef*,*FBDVAL*,*IOkey*,--,--,*Elcalc*,--,*Eigmeth*,*nStartVN*

Specifies component mode synthesis (CMS) analysis options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 381)

Cmsmeth

The component mode synthesis method to use. This value is required.

FIX

Fixed-interface method.

FREE

Free-interface method.

RFFB

Residual-flexible free-interface method.

NMODE

The number of normal modes extracted and used in the superelement generation. This value is required; the minimum is 1.

FREQB

Beginning, or lower end, of frequency range of interest. This value is optional.

The program always sets this value to zero if the residual-flexible free-interface method (*Cmsmeth* = RFFB) or the free-interface method (*Cmsmeth* = FREE) is specified via **RESVEC (p. 1603)**.

FREQE

Ending, or upper end, of frequency range of interest. This value is optional.

Fbddef

In a free-interface (*Cmsmeth* = FREE) or residual-flexible free-interface (*Cmsmeth* = RFFB) CMS analysis, the method to use for defining free body modes:

FNUM

The number (*FDBVAL*) of rigid body modes in the calculation.

FTOL

Employ a specified tolerance (*FDBVAL*) to determine rigid body modes in the calculation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FAUTO

Automatically determine rigid body modes in the calculation. This method is the default.

RIGID

If no rigid body modes exist, define your own via the **RIGID (p. 1609)** command.

FBDVAL

In a free-interface CMS analysis (*Cmsmeth* = FREE), the number of rigid body modes if *Fbddef* = FNUM (where the value is an integer from 0 through 6), *or* the tolerance to employ if *Fbddef* = FTOL (where the value is a positive real number representing rad/sec). This value is required only when *Fbddef* = FNUM or *Fbddef* = FTOL; otherwise, any specified value is ignored.

IOkey

Output key to control writing of the complete transformation matrix on the `.cms` file to the `.tcms` file (FIX or FREE methods) or body properties to the `.EXB` file (FIX method).

CMS

Write the complete transformation matrix of the nodal component on the `.cms` file. For more information, see CMS File Format in the *Programmer's Reference*.

TCMS

Write the transformation matrix of the nodal component defined via **OUTPR (p. 1332)** to a `.tcms` file. For more information, see TCMS File Format in the *Programmer's Reference*.

EXB

Write a body property input file (`.EXB` file) containing the condensed substructure matrices and other body properties for use with AVL EXCITE. For more information, see Ansys Interface to AVL EXCITE in the *Substructuring Analysis Guide*.

--,--

Unused fields.

Elcalc

Element calculation key:

NO

Do not calculate element results (default).

YES

Calculate element results and write them to the `.cms` file for the expansion pass.

--

Unused field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Eigmeth

Mode extraction method to be used for the symmetric eigenvalue problem during the generation pass:

LANB

Block Lanczos algorithm (default).

SUBS

Subspace algorithm.

SNODE

Supernode algorithm.

nStartVN

Node number to be assigned to the first virtual node created to store the generalized coordinates. See "Notes" (p. 380) for more information.

Command Default

Issuing the **CMSOPT (p. 378)** command with no arguments is invalid. You must specify at least the CMS method (*Cmsmeth*) and the number of modes (*NMODE*). In a free-interface (*Cmsmeth* = FREE) or residual-flexible free-interface (*Cmsmeth* = RFFB) CMS analysis, the default method for determining rigid body modes is FAUTO (automatic).

Notes

CMS supports damping matrix reduction when a damping matrix exists. Set the matrix generation key to 3 (**SEOPT (p. 1715)**,*Sename*,*SEMATR*) to generate and then reduce stiffness, mass, and damping matrices.

CMS does not support the **SEOPT (p. 1715)**,,,,,RESOLVE command. Instead, the program sets the expansion method for the expansion pass (*EXPMTH*) to BACKSUB.

By default, the static constraint modes are not written to the `.cms` file for the fixed-interface and free-interface methods. Issue *IOkey* = CMS to write them.

If *IOkey* = TCMS, the transformation matrix is printed out and written to the `.tcms` file when the **OUTPR (p. 1332)** command is issued with *ITEM* = NSOL and *FREQ* not equal to NONE. In addition, the transformation matrix is printed out when *SEPR* is equal to 1 or 2 on **SEOPT (p. 1715)**. In interactive sessions, the transformation matrix is not output if the model has more than 10 elements.

For information about the component modes stored in the `.cms` or `.tcms` file, refer to Component Modes Storage.

If *Elcalc* = YES, the element results of the component modes included in the transformation matrix of the CMS method are calculated and written to the `.cms` file. This can significantly reduce the computation time of the The CMS Use and Expansion Passes in the *Substructuring Analysis Guide*. For limit-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ations and available element results, see Calculating the Element Results in the *Substructuring Analysis Guide*.

Select a *nStartVN* value to offset the virtual node numbers from the other node numbers used in the model; otherwise, the program selects *nStartVN* to fulfill that condition. In the case of multiple superelements, if *nStartVN* is defined during each generation pass, then in the use pass, the virtual nodes of all imported superelements are gathered and renumbered from the *nStartVN* value specified for the first encountered superelement (first **SE (p. 1651)** command). *nStartVN* can also be defined in the use pass via **SE (p. 1651)**. (If *nStartVN* is defined by both the **CMSOPT (p. 378)** and **SE (p. 1651)** commands, the larger number prevails.)

For more information, see Component Mode Synthesis in the *Substructuring Analysis Guide*.

This command is also valid in **/PREP7 (p. 1479)**.

Product Restrictions

Ansys Mechanical Enterprise PrepPost

Only **CMSOPT (p. 378)**,FIX,,,,,,EXB is supported.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>Analysis Options

CMWRITE, *Fname*, *Ext*, --, --, *Fmat*

Writes node and element components and assemblies to a file.

DATABASE (p. 13): Components (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to CM if *Fname* is blank.

--

Unused field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Fmat

Format of the output file (defaults to BLOCKED).

BLOCKED

Blocked format. This format allows faster reading of the file.

UNBLOCKED

Unblocked format.

Menu Paths

This command cannot be accessed from a menu.

CNCHECK, *Option*, *RID1*, *RID2*, *RINC*, *InterType*, *TRlevel*, *Val1*, *Val2*, *Val3*

Provides and/or adjusts the initial status of contact pairs.

PREP7 (p. 22): Database (p. 22)
SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Option to be performed:

DETAIL

List all contact pair properties (default).

SUMMARY

List only the open/closed status for each contact pair.

POST

Execute a partial solution to write the initial contact configuration to the `jobname.rcn` file.

ADJUST

Physically move contact nodes to the target in order to close a gap or reduce penetration. The initial adjustment is converted to structural displacement values (UX, UY, UZ) and stored in the `jobname.rcn` file.

MORPH

Physically move contact nodes to the target in order to close a gap or reduce penetration, and also morph the underlying solid mesh. The initial adjustment of contact nodes and repositioning of solid element nodes due to mesh morphing are converted to structural displacement values (UX, UY, UZ) and stored in the `jobname.rcn` file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TADJUST

Physically move target body to the contact surface in order to close a gap or reduce penetration. The initial adjustment is converted to structural displacement values (UX, UY, UZ) and stored in the `jobname.rcn` file.

RESET

Reset target element and contact element key options and real constants to their default values. This option is not valid for general contact.

AUTO

Automatically sets certain real constants and key options to recommended values or settings in order to achieve better convergence based on overall contact pair behaviors. This option is not valid for general contact.

TRIM

Trim contact pair (remove certain contact and target elements).

OVER

When a rigid beam or a weld joint connects to a rigid surface constraint or a rigid body, automatically convert the rigid beam elements (MPC184) to rigid target or contact elements.

In addition, if *Val1* = 1 is set, when a Lagrange-multiplier-based joint element connects a rigid surface constraint or a rigid body, also switch to the penalty method (KEYOPT(2) = 1 of MPC184).

UNSE

Unselect certain contact and target elements.

SPLIT

Split base (original) contact pairs into smaller sub-pairs at the preprocessing (**/PREP7 (p. 1479)**) level. The main intent of this option is to achieve better scalability in a distributed-memory parallel (DMP) run. The splitting operation may create additional overlapping contact elements at the split boundaries. Contact pairs can only be split once. Repeated use of this option results in no further splitting for those contact pairs already split.

DMP

This option is similar to the SPLIT, but it is more automatic and contact pair-splitting is done at the solution level (**SOLVE (p. 1822)**) of the first load step, not at the preprocessing level. This option is activated only in a distributed-memory parallel (DMP) run. For this option, *TRlevel*, *InterType*, and *Val1* are valid. All other arguments are ignored.

MERGE

Merge all contact sub-pairs that were previously split (by prior *Option* = SPLIT or DMP operations) back to their original pairs. Any contact and target elements deleted due to

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the trim logic of the splitting operation cannot be recovered by the MERGE operation. All other arguments are ignored.

RID1, *RID2*, *RINC*

The meanings of *RID1*, *RID2*, and *RINC* vary depending on the contact type or the *Option* specified, as described below. *RID1* accepts tabular input for some *Option* values. *RID1*, *RID2*, *RINC* are ignored when *Option* = DMP.

Pair-Based Contact

For pair-based contact, the range of real constant pair IDs for which *Option* will be performed. If *RID2* is not specified, it defaults to *RID1*. If no value is specified, all contact pairs in the selected set of elements are considered.

General Contact

For general contact (*InterType* = GCN), *RID1* and *RID2* are section IDs associated with general contact surfaces instead of real constant IDs. If *RINC* = 0, the *Option* is performed between the two sections, *RID1* and *RID2*. If *RINC* > 0, the *Option* is performed among all specified sections (*RID1* to *RID2* with increment of *RINC*).

Contact Splitting

For contact splitting at the preprocessing level (*Option* = SPLIT only), *RID1*, *RID2*, and *RINC* are used as follows:

- If *RID1*, *RID2*, and *RINC* are non-zero and positive, split the contact pairs from real constant pair ID number *RID1* to *RID2* in increments of *RINC*. In this case, if *TRlevel* is non-zero, it will only be applied to these specified pairs.
- If *RID1* is zero or blank, *TRlevel* will take affect for all contact pairs in the model from largest to smallest.
- If *RID1*, *RID2*, *RINC*, and *TRlevel* are not defined, the program automatically determines the number of sub-pairs for splitting each contact pair.

Tabular Input for *RID1*

RID1 accepts tabular input in the form of a 2D array when *Option* = ADJUST, MORPH or TADJUST. In this case, *RID2*, *RINC*, *Val1*, *Val2*, and *Val3* are ignored. For more information, see Physically Moving Contact Nodes Toward the Target Surface in the *Contact Technology Guide*.

InterType

The type of contact interface (pair-based versus general contact) to be considered; or the type of contact pair to be trimmed, unselected, or auto-set.

The following labels specify the type of contact interface:

(blank)

Include all contact definitions (pair-based and general contact).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

GCN

Include general contact definitions only (not valid when *Option* = RESET or AUTO).

The following labels specify the type of contact pairs to be trimmed/unselected/auto-set (used only when *Option* = TRIM, UNSE, or AUTO, and only for pair-based contact definitions):

ANY

All types (default).

MPC

MPC-based contact pairs (KEYOPT(2) = 2).

BOND

Bonded contact pairs (KEYOPT(12) = 3, 5, 6).

NOSP

No separation contact pairs (KEYOPT(12) = 2, 4).

SMAL

Small sliding contact pairs (KEYOPT(18) = 1).

SELF

Self contact pairs (target surface completely overlaps contact surface).

INAC

Inactive contact pairs (symmetric contact pairs for MPC contact or KEYOPT(8) = 2).

The following labels specify the type of contact pairs to be split, and are used only when *Option* = DMP or SPLIT, and only for pair-based contact definitions:

(blank)

All types.

MPC

MPC-based contact pairs (KEYOPT(2) = 2).

BOND

Bonded contact pairs (KEYOPT(12) = 3, 5, 6).

NOSP

No separation contact pairs (KEYOPT(12) = 2, 4).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SMAL

Small sliding contact pairs (KEYOPT(18) = 1).

TRlevel

This argument is either the trimming level for trimming contact pairs, or the number of sub-pairs for contact splitting or executing a partial solution.

Trimming level (used only when *Option* = TRIM, UNSE, or MORPH):

(blank)

Normal trimming (default): remove/unselect contact and target elements which are in far-field.

AGGRE

Aggressive trimming: remove/unselect contact and target elements which are in far-field, and certain elements in near-field.

Number of sub-pairs used for contact splitting (used only when *Option* = SPLIT or DMP):

(blank)

The program automatically chooses the number of sub-pairs for splitting in order to achieve better scalability in a DMP run.

N

Input a non-zero positive number to indicate the maximum number of sub-pairs for splitting the largest contact pair in the model. All other smaller contact pairs will be split following this number proportionally. The number you input may not always be honored. Splitting may result in a fewer number of sub-pairs basing on many factors.

Effect of initial interface treatment used for or executing a partial solution (when *Option* = POST):

(blank)

The program follows settings of KEYOPT(9) of contact element type for every contact pair to report numerical penetration/gap.

1

The program ignores settings of KEYOPT(9) of contact element type for every contact pair to report geometrical penetration/gap.

The remaining arguments, *Val1*, *Val2*, and *Val3*, are parameters that control initial contact adjustment. They are only valid when *Option* = ADJUST, MORPH, TADJUST, OVER, DMP, or SPLIT. The meaning of these arguments varies depending on the *Option* setting.

When *Option* = ADJUST or MORPH, *Val1*, *Val2*, and *Val3* are *CGAP*, *CPEN*, and *IOFF*, respectively:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CGAP

Control parameter for opening gap; must be greater than zero. Close the opening gap if the value of the gap is smaller than the *CGAP* value. *CGAP* defaults to 0.25*PINB (where PINB is the pinball radius) for bonded and no-separation contact. Otherwise, it defaults to the value of real constant ICONT.

CPEN

Control parameter for initial penetration. *CPEN* must be greater than zero. Close the initial penetration if the value of the penetration is smaller than the *CPEN* value. *CPEN* defaults to 0.25*PINB (where PINB is the pinball radius) for any type of interface behavior (either bonded or standard contact).

IOFF

Control parameter for initial adjustment. Input a positive value to adjust the contact nodes towards the target surface with a constant interference distance equal to *IOFF*. Input a negative value to adjust the contact node towards the target surface with a uniform gap distance equal to the absolute value of *IOFF*.

When *Option* = TADJUST, *Val1* and *Val2* are *PMAX* and *PMIN*, respectively (*Val3* is not used):

PMAX

Upper limit of initial allowable penetration.

PMIN

Lower limit of initial allowable penetration.

When *Option* = SPLIT or DMP, *Val1* is the label that specifies the type of contact pairs to be trimmed (only for pair-based contact definitions):

(blank)

The program automatically deletes inactive contact pairs defined by auto-asymmetric selection (KEYOPT(8) = 2). If *Option* = DMP, the program also trims split contact pairs that are associated with bonded contact (KEYOPT(12) = 5 or 6) or small sliding contact (KEYOPT(18) = 1).

TRIM

The program automatically deletes inactive contact pairs defined by auto-asymmetric selection (KEYOPT(8) = 2), and also trims all split contact pairs.

Notes

The **CNCHECK (p. 382)** command provides information for surface-to-surface, node-to-surface, and line-to-line contact pairs (element types TARGE169, TARGE170, CONTA172, CONTA174, CONTA175, CONTA177). All contact and target elements of interest, along with the solid elements and nodes attached to them, must be selected for the command to function properly. For performance reasons, the program uses a subset of nodes and elements based on the specified contact regions (*RID1*, *RID2*, *RINC*) when executing the **CNCHECK (p. 382)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CNCHECK (p. 382) is available in both the PREP7 and SOLUTION processors, but only before the first solve operation (that is, only before the first load step or the first substep).

If the contact and target elements were generated through mesh commands (**AMESH (p. 121)**, **LMESH (p. 1057)**, etc.) instead of the **ESURF (p. 682)** command, you must issue **MODMSH (p. 1138)**,DETACH before **CNCHECK (p. 382)**. Otherwise, **CNCHECK (p. 382)** will not work correctly.

The following additional notes are available:

Option = POST

Option = ADJUST or MORPH

Option = TADJUST

Option = RESET

Option = AUTO

Removing or Unselecting Contact and Target Elements (Option = TRIM/UNSEL)

Option = SPLIT, DMP, or MERGE

Option = POST

The command **CNCHECK (p. 382)**,POST solves the initial contact configuration in one substep. After issuing this command, you can postprocess the contact result items as you would for any other converged load step. However, only the contact status, contact penetration or gap, and contact pressure will have meaningful values. Other contact quantities (friction stress, sliding distance, chattering) will be available but are not useful.

Initial contact results obtained and listed from **CNCHECK (p. 382)**,DETAIL, **CNCHECK (p. 382)**,POST, and the actual solution may not be always consistent with each other. The discrepancy is mainly due to applied boundary conditions and solution options. Contact results from **CNCHECK (p. 382)**,POST are, in general, closer to what the solution will provide than those from **CNCHECK (p. 382)**,DETAIL.

To inspect the real geometric penetration and gap, specify *TRLEVEL*=1. The program will set KEYOPT(9) = 0 internally during the execution of **CNCHECK (p. 382)**,POST.

Because *Option* = POST forces a solve operation, the PrepPost (PP) license (p. 2) does not work with **CNCHECK (p. 382)**,POST.

If **CNCHECK (p. 382)**,POST is issued within the solution processor, the **SOLVE (p. 1822)** command that solves the first load step of your analysis should appear in a different step, as shown in the following example:

```
/SOLU
CNCHECK,POST
FINISH
. . .

/SOLU
SOLVE
FINISH
. . .
```

CNCHECK (p. 382),POST writes initial contact results to a file named `jobname.rcn`. The command should be issued *before* defining analysis type, solution options, and boundary conditions. If the command is issued later, a segmentation violation error may occur. When postprocessing the initial contact state,

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

you need to explicitly read results from this file using the **FILE (p. 752)** and **SET (p. 1724)**,FIRST commands in POST1 to properly read the corresponding contact data. Otherwise, the results may be read improperly. The following example shows a valid command sequence for plotting the initial contact gap:

```
/SOLU
CNCHECK,POST
FINISH
/POST1
FILE,Jobname,RCN
SET,FIRST
PLNSOL,CONT,GAP,0,1
FINISH
. . .
```

Option = ADJUST or MORPH

You can issue **CNCHECK (p. 382)**,ADJUST to physically move contact nodes to the target surface. Alternatively, you can issue **CNCHECK (p. 382)**,MORPH to physically move contact nodes to the target surface and then morph the underlying mesh to improve the mesh quality. See Physically Moving Contact Nodes Toward the Target Surface in the *Contact Technology Guide* for more information. Similar to the POST option, if **CNCHECK (p. 382)**,ADJUST or **CNCHECK (p. 382)**,MORPH is issued within the solution processor, the **SOLVE (p. 1822)** command that solves the first load step of your analysis should appear in a different step:

```
/SOLU
CNCHECK,ADJUST
FINISH
. . .

/SOLU
SOLVE
FINISH
. . .
```

After issuing the **CNCHECK (p. 382)**,ADJUST command, the initial adjustment is converted to structural displacement values (UX, UY, UZ) and stored in a file named `jobname.rcn`. Similarly, the **CNCHECK (p. 382)**,MORPH command converts the initial adjustment of contact nodes as well as the morphing adjustment of solid element nodes to structural displacement values (UX, UY, UZ) and stores them in the `jobname.rcn` file. You can use this file to plot or list nodal adjustment vectors or create a contour plot of the adjustment magnitudes via the displacements. When postprocessing the nodal adjustment values, you need to explicitly read results from this file using the **FILE (p. 752)** and **SET (p. 1724)**,FIRST commands in POST1 to properly read the corresponding contact data. Otherwise, the results may be read improperly.

Note:

The `jobname.rcn` file contains information generated from the **CNCHECK (p. 382)**,POST, **CNCHECK (p. 382)**,ADJUST, **CNCHECK (p. 382)**,MORPH, or **CNCHECK (p. 382)**, TADJUST command. If multiple commands are issued in the same analysis, the file is overwritten by the last **CNCHECK (p. 382)** command.

Option = TADJUST

You can issue **CNCHECK (p. 382)**,TADJUST to physically move the target body to the contact surface. This command tries to establish initial contact with penetration in a range specified by *PMAX* and *PMIN*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Similar to the ADJUST and MORPH options, the initial adjustment is converted to structural displacement values (UX, UY, UZ) and stored in the `jobname.rcn` file. This option accepts tabular input in the *RID1* field.

You can specify either a positive or negative value for *PMIN* and *PMAX*. The program interprets a positive value as a scaling factor and interprets a negative value as the absolute value.

For more information, see Physically Moving the Target Body Toward the Contact Surface in the *Contact Technology Guide*.

Option = RESET

The command **CNCHECK (p. 382)**,RESET allows you to reset all but a few key options and real constants associated with the specified contact pairs (*RID1*, *RID2*, *RINC*) to their default values. This option is only valid for pair-based contact definitions.

The following key options and real constants remain unchanged when this command is issued:

Element type	Key options not affected by RESET	Real constants not affected by RESET
TARGE169, TARGE170	KEYOPT(2), KEYOPT(3)	R1, R2
CONTA172	KEYOPT(1), KEYOPT(3)	R1, R2
CONTA174, CONTA175, CONTA177	KEYOPT(1)	R1, R2

Option = AUTO

The command **CNCHECK (p. 382)**,AUTO automatically changes certain default or undefined key options and real constants to optimized settings or values. The changes are based on overall contact pair behaviors. In general, this command improves convergence for nonlinear contact analysis. This option is only valid for pair-based contact definitions.

The tables below list typical KEYOPT and real constant settings implemented by **CNCHECK (p. 382)**,AUTO. The actual settings implemented for your specific model may vary from what is described here. You should always verify the modified settings by issuing **CNCHECK (p. 382)**,DETAIL to list current contact pair properties.

KEYOPT	Description	Default (0 or blank)	CNCHECK,AUTO
1	Selects DOF set	Structural DOFs	Automatic selection based on DOFs of underlying elements.
2	Contact algorithm	Augmented Lagrange	1- Penalty for rigid-rigid contact [1].
4	Location of contact detection point	Gauss point	2 - Normal to target surface if KEYOPT(2) > 1.
5	CNOF/ICONT adjustment	No adjustment	1 - Auto CNOF if tiny gap exists.
6	Contact stiffness variation	Use default range	1 - Nominal refinement for opening contact or underlying elements

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

			having **TB (p. 1899)** plasticity. *or* 2 - Aggressive refinement for opening contact and underlying elements having **TB (p. 1899)** plasticity.
7	Element level time increment control	No control	1 - Automatic bisection for self contact. *or* 4 - Impact constraint for opening contact and transient analyses.
8	Assymetric contact selection	No action	2 - Auto selection if KEYOPT(2) > 1.
9	Effect of initial penetration or gap	Include all	1 - Exclude if KEYOPT(5) = 1, or if ICONT was previously specified.
10	Contact stiffness update	Between load steps	0 - Between iterations except when underlying elements are superelements. [2]

1. Set to 0 if KEYOPT(2) > 1 for debonding.

2. Set to 1 if underlying elements are superelements, or if KEYOPT(9) = 2 was previously specified.

Real Constants		Description	Default	CNCHECK,AUTO
No.	Name			
3	FKN	Normal penalty stiffness factor	1	Set to 5 if KEYOPT(9) = 2 (ramp initial penetration) and KEYOPT(10) > 0.
6	PINB	Pinball region	see [1]	Cut in half if spurious contact is detected or contact searching is slow.
14	TCC	Thermal contact conductance	0	Calculated as a function of highest conductivity of underlying element and overall model size.
19	ECC	Electric contact conductance	0	Calculated as a function of highest permitivity or lowest resistivity of underlying element and overall model size.
26	MCC	Magnetic contact permeance	0	Calculated as a function of highest emissivity of underlying element and overall model size.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

37	PCC	Pore fluid contact permeability coefficient	0	Calculated as a function of highest permitivity of underlying element and overall model size.

1. PINB default depends on contact behavior (rigid vs. flexible target), **NLGEOM (p. 1231)**,ON or OFF, KEYOPT(9) setting, KEYOPT(12) setting, and the value of real constant CNOF (see Defining the Pinball Region (PINB)).

CNCHECK (p. 382),AUTO also sets **PRED (p. 1476)**,OFF for the case of a force-distributed constraint defined via MPC contact.

Removing or Unselecting Contact and Target Elements (*Option* = TRIM/UNSEL)

You can issue **CNCHECK (p. 382)**,TRIM or **CNCHECK (p. 382)**,UNSEL to remove or unselect contact and target elements which are in far-field (that is, open and not near contact), or even in near-field if aggressive trimming logic is used (*TRlevel* = AGGRE).

Option = SPLIT, DMP, or MERGE

The SPLIT, DMP, and MERGE options are intended for use in a distributed-memory parallel (DMP) run. Use the command **CNCHECK (p. 382)**,SPLIT or **CNCHECK (p. 382)**,DMP to split large contact pairs into smaller sub-pairs so that the smaller contact pairs can be distributed into different cores, thereby improving performance. This functionality is not the same as manually splitting contact pairs during the modeling process. The program splitting logic performs the necessary exchange of data on the boundaries between the split contact pairs to ensure that the results with and without splitting are essentially identical.

The command **CNCHECK (p. 382)**,MERGE can be used to merge the sub-pairs together again, which is useful for postprocessing the contact results based on the original contact pair geometry. However, caution must be taken when a downstream analysis is performed since the MERGE operation may alter the database.

For more information, see Solving Large Contact Models in a Distributed-Memory Parallel Environment in the *Contact Technology Guide*.

Menu Paths

Main Menu> Preprocessor> Modeling> Create> Contact Pair

CNKMOD, *ITYPE*, *KNUM*, *VALUE*

Modifies contact element key options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITYPE

Contact element type number as defined on the **ET (p. 686)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KNUM

Number of the KEYOPT to be modified (KEYOPT(*KNUM*)).

VALUE

Value to be assigned to the KEYOPT.

Notes

The **CNKMOD (p. 392)** command has the same syntax as the **KEYOPT (p. 979)** command. However, it is valid only in the SOLUTION processor. The command can be used to modify certain contact element KEYOPT values between load steps in any analysis, including restarts and linear perturbation analyses, as shown in the table below.

KEYOPT	Valid in Linear Perturbation	Valid between load steps in other analyses (including restart)
KEYOPT(3)	YES	NO
KEYOPT(12)	YES	YES
KEYOPT(15)	NO	YES

In a multiframe restart, **CNKMOD (p. 392)** must be issued again during each subsequent restart run.

Modifying KEYOPT(12)

A common use for the **CNKMOD (p. 392)** command is to modify contact interface behavior between load steps in a restart analysis, a linear perturbation analysis, or other types of analyses. This enables you to control the contact status locally per contact pair. The key options that control contact interface behavior are: KEYOPT(12) of CONTA172, CONTA174, CONTA175, and CONTA177; and KEYOPT(10) of CONTA178.

You can change KEYOPT(12) to any value. For example, you can change from standard contact to bonded contact or vice-versa. If an open gap exists at the end of the previous load step and the contact status is adjusted to sliding or sticking due to a bonded or no-separation contact behavior definition, the program considers it as near-field contact when executing **CNKMOD (p. 392)** in the subsequent load steps.

In a linear perturbation analysis, the **CNKMOD (p. 392)** command adjusts the contact status from the linear perturbation base analysis (at the point of restart) as described in the table below. It enables you to take points in the base analysis that are near contact (within the pinball region) and modify them to be treated as in-contact in the perturbation analysis (see the "1 - near-field" row with KEYOPT(12) values set to 4 or 5). You can also take points that are sliding in the base analysis and treat them as sticking in the perturbation analysis, irrespective of the MU value (see the "2 - sliding" row with KEYOPT(12) values set to 1,3, 5, or 6).

Table 104: Contact Status Adjusted in Linear Perturbation Analysis via CNKMOD

Contact Status from the Base Analysis	CNKMOD,*ITYPE*,12,*Value*	
	KEYOPT(12) Value	Adjusted Contact Status

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Solution at the Restart Point		
0 - far-field	any	0 - far-field
1 - near-field	0, 1, 2, 3, 6	1 - near-field
	4	1 - near-field (if outside of the adjusted pinball region)
		2 - sliding (if inside of the adjusted pinball region)
	5	1 - near-field (if outside of the adjusted pinball region)
		3 - sticking (if inside of the adjusted pinball region)
2 - sliding	0, 2, 4	2 - sliding
	1, 3, 5, 6	3 - sticking
3 - sticking	any	3 - sticking

If an open gap exists at the end of the previous load step and the contact status is adjusted as sliding or sticking due to a bonded or no-separation contact behavior definition, the program considers it a near-field contact when executing **CNKMOD (p. 392)** in the subsequent load steps.

In the linear perturbation analysis procedure, contact status can also be controlled or modified via the **PERTURB (p. 1378)** command. The contact status always follows local controls defined by the **CNKMOD (p. 392)** command first, and is then adjusted by the global sticking or bonded setting (*ContKey* = STICKING or BONDED) on the **PERTURB (p. 1378)** command.

Modifying KEYOPT(3)

Another use for the **CNKMOD (p. 392)** command is to change the units of normal contact stiffness (contact element real constant FKN) in a linear perturbation modal analysis that is used to model brake squeal. For contact elements CONTA172 and CONTA174, KEYOPT(3) controls the units of normal contact stiffness. You can issue the command **CNKMOD (p. 392)**,*ITYPE*,3,1 during the first phase of the linear perturbation analysis in order to change the units of normal contact stiffness from FORCE/LENGTH^3 (in the base analysis) to FORCE/LENGTH. Note that KEYOPT(3) = 1 is valid only when a penalty-based algorithm is used (KEYOPT(2) = 0 or 1) and the absolute normal contact stiffness value is explicitly specified (that is, a negative value input for real constant FKN).

Modifying KEYOPT(15)

KEYOPT(15) controls the effect of contact stabilization damping for contact elements CONTA172, CONTA174, CONTA175, and CONTA177. You can use **CNKMOD (p. 392)** to activate or deactivate the contact

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

stabilization damping between load steps. For example, the command **CNKMOD (p. 392)**,*ITYPE*,15,1 deactivates the contact stabilization damping.

Menu Paths

This command cannot be accessed from a menu.

CNTR,*Option*,*Key*

Redirects contact pair output quantities to a text file.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Output option:

OUT

Contact output control.

Key

Control key:

NO

Write contact information to the output file or to the screen (default).

YES

Write contact information to the Jobname.cnm file.

Command Default

Contact pair output quantities are written to the output file (Jobname.out) or to the screen, as specified by the **/OUTPUT (p. 1334)** command.

Notes

Issue the command **CNTR (p. 395)**,OUT,YES to redirect contact pair output quantities to the Jobname.cnm file.

To ensure that the contact information is written to Jobname.cnm, reissue **CNTR (p. 395)**,OUT,YES each time you reenter the solution processor (**/SOLU (p. 1821)**).

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CNVTOL, *Lab*, *VALUE*, *TOLER*, *NORM*, *MINREF*

Sets convergence values for nonlinear analyses.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid convergence labels.

Discipline	Displacement Convergence		Force Convergence	
	Label	Label Description	Label	Label Description
Structural	U	Displacements	F	Forces
	ROT	Rotations	M	Moments
	HDSP	Hydrostatic Pressure	DVOL	Volume
	JOINT[a]	Joint Element Constraint Check		
	COMP[b]	Volumetric Compatibility Check		
	ENGY	System Energy Error Norm	ENGY	Energy Error[c]
Nonlocal field	GFV	Gradient Field Degree of Freedom	GFRS	Gradient Field Residual
Thermal	TEMP	Temperature	HEAT	Heat Flow
Fluid	PRES	Pressures	FLOW	Fluid Flow
	V	Velocity	VF	Fluid Force
Electric	VOLT	Voltage	AMPS or CHRG	Current Flow or Charge
	EMF	Electromotive Force	CURT	Current Flow
Magnetic	MAG	Scalar Potential	FLUX	Scalar Flux
	A	Vector Potential	CSG	Current Segments
Diffusion	CONC	Concentration	RATE	Diffusion Flow Rate

[a] JOINT specifies a tolerance for the joint element constraint check and is applicable to MPC184 joint elements. It is a nonlinear element convergence status value, not a displacement convergence value. *TOLER* is the only other valid argument when *Lab* = JOINT.

[b] COMP specifies a tolerance for the volumetric compatibility check in current-technology plane and solid elements (18x elements). It is a nonlinear element convergence status value, not a displacement convergence value. *TOLER* is the only other valid argument when *Lab* = COMP.

[c] ENGY specifies the convergence criterion for structural analysis based on the system of total energy accuracy. It is a combination of force and displacement criterion. The default energy error criterion is generally more relaxed than the default force criterion. Use ENGY to achieve a moderately accurate solution with a smaller number of iterations compared to the force convergence criterion.

VALUE

Typical reference value for the specified convergence label (*Lab*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VALUE defaults to the maximum of a program calculated reference or *MINREF*. For degrees of freedom, the reference is based upon the selected *NORM* and the current total degree-of-freedom value. For forcing quantities, the reference is based upon the selected *NORM* and the applied loads.

If *VALUE* is negative, the convergence criterion based on the specified label is removed, including the default convergence criterion value. The convergence criterion for all other labels remain as they were (either a default value or a previously specified value).

TOLER

Tolerance value used for the specified *Lab* convergence label. Default values are described below.

- If **CNVTOL (p. 396)** is issued with a *Lab* value specified but no *TOLER* value, the default tolerance values are:
  - 0.05 (5%) for displacement (U).
  - 1.0E-7 for the joint element constraint check (JOINT). This value rarely needs to be changed. A loose tolerance value may lead to inaccurate or incorrect solutions. When *Lab* = JOINT, *VALUE*, *NORM*, and *MINREF* are ignored.
  - 1.0E-3 for the volumetric compatibility check (COMP). When *Lab* = COMP, *VALUE*, *NORM*, and *MINREF* are ignored.
  - 0.05 for energy error (ENGY).
  - For all other *Lab* labels, the default tolerance value is 0.005 (0.5%).
- If **CNVTOL (p. 396)** is not issued, the *TOLER* defaults are as follows:
  - 0.005 (0.5%) for force (F) and moment (M)
  - 1.0E-4 (0.01%) for volume (DVOL)
  - 0.05 (5%) for displacement (U)
  - 0.05 (5%) for hydrostatic pressure (HDSP)
  - 1.0 for temperature (TEMP) when the iterative QUASI solver is used (**THOPT (p. 1997)**,QUASI,,,,,,1)
  - 1.0E-3 (0.1%) for acoustics pressure (PRES) and 1.E-3 (0.1%) for acoustic velocity potential using the degree of freedom PRES.

If you choose to specify a *TOLER* value, it must be greater than zero and less than 1. This is true for all *Lab* labels.

The program may adjust the force convergence tolerance if you do not explicitly set a value via **CNVTOL (p. 396)**. See Notes (p. 399) for details.

NORM

Specifies norm selection:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Infinite norm (check each degree of freedom separately) (default for *Lab* = U and for *Lab* = TEMP when the iterative QUASI solver is used (**THOPT (p. 1997)**,QUASI,,,,,,1).

The infinite norm is also used for the energy error criterion (ENGY) and is the only option available for ENGY.

1

L1 norm (check absolute value sum).

2

L2 norm (check SRSS value) (default, except for *Lab* = U).

3

Infinite norm (check each degree of freedom separately). The reference is calculated using the infinite norm of the displacement increment of the substep. Valid only for *Lab* = U.

MINREF

The minimum value allowed for the program-calculated reference value. If negative, no minimum is enforced. Used only if *VALUE* is blank. Default values are as follows:

- maximum of 0.01 or internally calculated minimum reference value for force (F), moment (M)
- a small factor times the average element length of the model for displacement (U) convergence
- 0.01 for volume (DVOL) convergence
- 1.0E-4 for gradient field residual (GFRS)
- 1.0E-6 for heat flow (HEAT)
- 1.0E-6 for diffusion flow (RATE)
- 1.0E-12 for charge (CHRG)
- 1.0E-6 for hydrostatic pressure (HDSP)
- 1.0 for temperature (TEMP) when the iterative QUASI solver is used (**THOPT (p. 1997)**,QUASI,,,,,,1)
- 1.0 for energy error convergence (ENGY)
- 1.0E-5 for acoustics pressure (PRES)
- 0.0 otherwise

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

For static or transient analysis, check the out-of-balance load for any active degree of freedom using the default *VALUE*, *TOLER*, *NORM*, and *MINREF*. Also check the translational displacement convergence in most cases. For harmonic magnetic analysis, check the out-of-balance of the degrees of freedom. The energy criterion convergence check is off by default.

Notes

This command is usually not needed because the default convergence criteria are sufficient for most nonlinear analyses. In rare cases, you may need to use this command to diagnose convergence difficulties.

Values may be set for the degrees of freedom and/or the out-of-balance load for the corresponding forcing quantities.

Issuing **CNVTOL (p. 396)** to set a convergence criterion for a specific convergence label (*Lab*) does not affect the convergence criterion for any other label. All other convergence criteria will remain at their default setting or at the value set by a previous **CNVTOL (p. 396)** command.

If **CNVTOL (p. 396)** is not issued for any force convergence label (F, M, DVOL, and so on as listed under the *Lab* argument), the default convergence tolerance for a particular force label is increased dynamically during the Newton-Raphson iterations in the range of 1 to 1.66 times the default value. For example, the F label default tolerance is 0.005. Therefore, the maximum convergence tolerance with the adjustment is 0.0083. This adjustment is not activated until the 8th or higher Newton-Raphson iteration. If you do not want the program to adjust the tolerance, issue **CNVTOL (p. 396)** to specify the convergence tolerance for the appropriate force label.

When using the Mechanical APDL graphical user interface (GUI), if a "Delete" operation in a Nonlinear Convergence Criteria dialog box writes this command to a log file (`Jobname.log` or `Jobname.lgw`), you will observe that *Lab* is blank, *VALUE* = -1, and *TOLER* is an integer number. In this case, the GUI has assigned a value of *TOLER* that corresponds to the location of a chosen convergence label in the dialog box's list. It is *not* intended that you type in such a location value for *TOLER* in an interactive session. However, a file that contains a GUI-generated **CNVTOL (p. 396)** command of this form can be used for batch input or with the **/INPUT (p. 948)** command.

Convergence norms specified with **CNVTOL (p. 396)** may be graphically tracked while the solution is in process using the Graphical Solution Tracking (GST) feature. Issue **/GST (p. 880)** to enable or disable GST. By default, GST is ON for interactive sessions and OFF for batch runs.

The energy convergence check (ENGY) is not available when the arc-length method (**ARCLEN (p. 175)**,ON) is used.

For more information on convergence calculations in a nonlinear analysis, see Convergence in the *Theory Reference*.

This command is also valid in PREP7.

/COLOR, *Lab*, *Clab*, *N1*, *N2*, *NINC*

Specifies the color mapping for various items.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Apply color to the items specified by the following labels:

AXES

Determines the color (specified in next argument, *Clab*) that the axes of a graph will be plotted in.

AXNUM

Determines the color (specified in next argument, *Clab*) that the numbering on the axes of a graph will be plotted in.

NUM

Discretely numbered items (such as element types, element materials, etc., as shown on the **/PNUM (p. 1457)** command). Also specify number (1 to 11) in the *N1* field. For example, **/COLOR (p. 400)**,NUM,RED,3 will assign the color red to all items having the discrete number 3 (material displays would show elements having material 3 as red).

OUTL

Outline of elements, areas, and volumes. Ex: **/COLOR (p. 400)**,OUTL,BLUE.

ELEM

Elements. Use *N1*, *N2*, *NINC* fields for element numbers.

LINE

Solid model lines. Use *N1*, *N2*, *NINC* fields for line numbers.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AREA

Solid model areas. Use *N1*, *N2*, *NINC* fields for area numbers.

VOLU

Solid model volumes. Use *N1*, *N2*, *NINC* fields for volume numbers.

ISURF

Isosurfaces (surfaces of constant stress, etc.). This option is particularly useful when capturing frames for animating a single isosurface value.

WBAK

Window background. Use *N1*, *N2*, *NINC* fields for window numbers. The options that you select using *Lab* = PBAK will supersede those applied using *Lab* = WBAK.

b.c.label

Boundary condition label. Enter U, ROT, TEMP, PRES, V, VOLT, MAG, A, EMF, CURR, F, M, HEAT, FLOW, VF, AMPS, FLUX, CSG, CURT, MAST, CP, CE, NFOR, NMOM, RFOR, RMOM, PATH. See the **/PBC (p. 1356)** command for boundary condition label definitions.

GRBAK

Graph background.

GRID

Graph grid lines.

AXLAB

Graph X and Y axis labels.

CURVE

Graph curves (identify curve numbers (1-10) in *N1*, *N2*, *NINC* fields).

CM

Component group. Use *N1* field for component name, ignore *N2* and *NINC*.

CNTR

Mechanical APDL contour stress colors. The maximum number of contours available is 128. The number of colors that can be specified interactively (GUI) is 9. (**/CONTOUR (p. 415)**, , 9). Any other setting will yield inconsistent results.

SMAX

Specifies that all stress values above the maximum value entered in **/CONTOUR (p. 415)** will be displayed in the color designated in the *Clab* field. Defaults to dark grey.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SMIN

Specifies that all stress values below the minimum value entered in **/CONTOUR (p. 415)** will be displayed in the color designated in the *Clab* field. Defaults to dark grey.

PBAK

Activates background shading options (see command syntax at end of argument descriptions below). The options that you select using *Lab* = PBAK will supersede those applied using *Lab* = WBAK.

Clab

Valid color labels are:

BLAC (0)

Black

MRED (1)

Magenta-Red

MAGE (2)

Magenta

BMAG (3)

Blue-Magenta

BLUE (4)

Blue

CBLU (5)

Cyan-Blue

CYAN (6)

Cyan

GCYA ((7)

Green-Cyan

GREE (8)

Green

YGRE (9)

Yellow-Green

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

YELL (10)

Yellow

ORAN (11)

Orange

RED (12)

Red

DGRA (13)

Dark Gray

LGRA (14)

Light Gray

WHIT (15)

White

N1, N2, NINC

Apply color to *Lab* items numbered *N1* to *N2* (defaults to *N1*) in steps of *NINC* (defaults to 1). If *N1* is blank, apply color to entire selected range. If *Lab* is CM, use component name for *N1* and ignore *N2* and *NINC*. If *N1* = P, graphical picking of elements, lines, areas and volumes is enabled; your can assign colors to the entities via the picker. When picking is enabled, the *Lab* and *Clab* fields are ignored.

If *Lab* = PBAK, the command format is **/COLOR (p. 400)**, PBAK,*Key_On_Off*, *KEY_TYPE*, *KEY_INDEX*.

The options that you select using *Lab* = PBAK will supersede those applied using *Lab* = WBAK.

Key_On_Off

Turns the background colors on and off. Acceptable values are ON (1) and OFF (0).

KEY_TYPE

Determines the type of background. Acceptable values are 0 (smooth shading left to right), 1 (smooth shading top to bottom), 2 (smooth shading right to left), 3 (smooth shading bottom to top), and -1 (textured image background)

KEY_INDEX

An integer value that corresponds to a background color or texture. If *Key_Type* is -1, the background will correspond to values specified in the **/TXTRE (p. 2029)** command. If *Key_Type* is any other acceptable value, the background will correspond to the color values listed above under *Clab*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Use the default color mapping.

Notes

Issue **/COLOR (p. 400)**,STAT to display the current color mapping. Issue **/COLOR (p. 400)**,DEFA to reset the default color mapping.

Note:

Color labels may also be reassigned any "color" with the **/CMAP (p. 359)** command.

This command is valid anywhere.

Menu Paths

Utility Menu>PlotCtrls>Style>Colors>BC Colors
Utility Menu>PlotCtrls>Style>Colors>Component Colors
Utility Menu>PlotCtrls>Style>Colors>Entity Colors
Utility Menu>PlotCtrls>Style>Colors>Graph Colors

Utility Menu>PlotCtrls>Style>Colors>Window Colors

/COM, *Comment*

Places a comment in the output.

SESSION (p. 11): List Controls (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Comment

Comment string, up to 75 characters.

Notes

The output from this command consists of the comment string. This command is similar to **C*** (p. 283)** except that the comment produced by **C*** (p. 283)** is more easily identified in the output. Parameter substitution within the comment occurs for every valid expression delimited by percent (%) signs. Enclosing such an expression in single quotes prevents parameter substitution.

Another way to include a comment is to precede it with a ! character (on the same line). The ! may be placed anywhere on the line, and any input following it is ignored as a comment. No output is produced by such a comment, but the comment line is included on the log file. This is a convenient way to annotate the log file.

This command is valid anywhere.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

---

*COMP,*Matrix*,*Algorithm*,*THRESHOLD*,*Val1*,*Val2*

Compresses a matrix using a specified algorithm.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Matrix

Name of the matrix to compress.

Algorithm

Algorithm or method to use:

SVD --

Singular value decomposition algorithm (default).

MGS --

Modified Gram-Schmidt algorithm.

SPARSE --

Compress a sparse matrix based on the threshold value.

THRESHOLD

Numerical threshold value used to manage the compression. The default value depends on the method of compression: 1E-7 for SVD; 1E-14 for MGS; 1E-16 for SPARSE.

Val1 and *Val2* are additional input used only for the SVD algorithm:

Val1

Name of the vector used to store the Σ values (see "Notes" (p. 406) below). This argument is optional.

Val2

Name of the dense matrix used to store the $\mathbf{V}^*$ output matrix (see "Notes" (p. 406) below). This argument is optional.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The SVD and MGS algorithms are only applicable to dense matrices that were created using the ***DMAT (p. 551)** command. Columns that are linearly dependent on others are removed, leaving the independent or basis vectors. The matrix is resized according to the new size determined by the algorithm.

For the SVD algorithm, the singular value decomposition of an input matrix $\mathbf{M}$ is a factorization of the form:

$$\mathbf{M}=\mathbf{U}\Sigma\mathbf{V}^{*}$$

Here, the $\mathbf{M}$ matrix is replaced by the $\mathbf{U}$ matrix, according to the specified threshold.

The SPARSE compression method is only applicable to sparse matrices that were created using the ***SMAT (p. 1801)** command. All terms that have an absolute value below the specified threshold, relative to the maximum value in the matrix, are removed from the original matrix. For example, given a sparse matrix having 100 as the largest term and *THRESHOLD* = 0.5, all terms having an absolute value below 0.5*100 = 50 are removed.

Menu Paths

This command cannot be accessed from a menu.

COMBINE, *FileType*, *NUM*

Combines distributed memory parallel (DMP) files.

AUX2 (p. 61): Binary File Manipulation (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FileType

Type of solution file to combine. There is no default; if (blank), the command is ignored.

RST

Structural results file (`.rst`)

RTH

Thermal results file (`.rth`)

RMG

Magnetics results file (`.rmg`)

RSTP

Linear perturbation results file (`.rstp`)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EMAT

Element matrix file (`.emat`).

ESAV

Element saved data file (`.esav`)

MODE

Modal results file (`.mode`)

MLV

Modal load vector file (`.mlv`)

IST

Initial state file (`.ist`)

FULL

Full matrix file (`.full`)

Reduced complex displacement file (`.`)

RDSP

Reduced displacement file (`.rdsp`)

RNNN

Multiframe restart files (`.r`*nnn*)

NUM

Number of `.r`*nnn* files to combine:

ALL

Combine all `.r`*nnn* files (default).

N

Combine only `.r`*n* files, where N is an integer from 1 to 999.

Notes

The **COMBINE (p. 406)** command is used within the AUX2 auxiliary processor to combine local solution files from a distributed memory parallel solution into a single, global file. Before using this command, you must enter the AUX2 processor by issuing the **/AUX2 (p. 208)** command.

In a distributed-memory parallel (DMP) solution, you can use the **DMPOPTION (p. 559)** command to bypass the file combination step, causing all individual local files to be kept on the local disks in the current working directory. Later on, you can start a new distributed memory parallel solution and use

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the **COMBINE (p. 406)** command to combine local files into a global file for a downstream solution or another operation (such as postprocessing with **/POST1 (p. 1461)**). For example, the command **COMBINE (p. 406)**,RST will combine local results files (`Jobname`*n*`.rst`) into a global results file (`Jobname.rst`).

The **COMBINE (p. 406)** command cannot be used to combine local files generated during a distributed memory parallel solution that used the frequency or cyclic harmonic index domain decomposition method (**DDOPTION (p. 508)**,FREQ or **DDOPTION (p. 508)**,CYCHI).

If **COMBINE (p. 406)**,RNNN is specified, all of the multiframe restart files named `Jobname.r001` to `Jobname.r999` will automatically be combined. To combine only one set of `.r`*nnn* restart files, place only that set of restart files in your current working directory, or use the *NUM* argument to specify which set of `.r`*nnn* files to combine.

When the **COMBINE (p. 406)** command is used in a subsequent distributed memory parallel (DMP) session, the number of processors must be the same as in the DMP solution that generated the files.

When running on a cluster, the local solution files must be available in the working directory on each node in the subsequent session. As an example, consider the following command line used to generate local solution files:

```
ansys241 -dis -machines machine1:4:machine2:1:machine3:2 -i input -o output
```

Different machines can be used in the subsequent session to combine these files. However, the total number of cores must remain unchanged (seven in the above case), and the local files must be copied to the working directory (or directories) on each of the machines used in the subsequent session.

Menu Paths

This command cannot be accessed from a menu.

COMPRESS

Deletes all specified sets.

AUX3 (p. 61): Results Files (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Issue this command to delete all sets specified with the **DELETE (p. 513)** command.

The **COMPRESS (p. 408)** command is valid only in the results file editing processor (auxiliary processor AUX3), and, like the other AUX3 commands, it only affects the data steps index (DSI), time (TIM), loadstep, substep and cumulative step iteration (LSP) records in the results file.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CON4, *XCENTER*, *YCENTER*, *RAD1*, *RAD2*, *DEPTH*

Creates a conical volume anywhere on the working plane.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XCENTER, YCENTER

Working plane X and Y coordinates of the center axis of the cone.

RAD1, RAD2

Radii of the faces of the cone. *RAD1* defines the bottom face and will be located on the working plane. *RAD2* defines the top face and is parallel to the working plane. A value of zero or blank for either *RAD1* or *RAD2* defines a degenerate face at the center axis (that is, the vertex of the cone). The same value for both *RAD1* and *RAD2* defines a cylinder instead of a cone.

DEPTH

The perpendicular distance (either positive or negative based on the working plane Z direction) from the working plane representing the depth of the cone. *DEPTH* cannot be zero (see "Notes" (p. 409) below).

Notes

Defines a solid conical volume with either the vertex or a face anywhere on the working plane. The cone must have a spatial volume greater than zero. (that is, this volume primitive command cannot be used to create a degenerate volume as a means of creating an area.) The face or faces will be circular (each area defined with four lines), and they will be connected with two areas (each spanning 180°). See the **CONE (p. 409)** command for an alternate way to create cones.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Primitives>Cone

Main Menu>Preprocessor>Modeling>Create>Volumes>Cone>By Picking

CONE, *RBOT*, *RTOP*, *Z1*, *Z2*, *THETA1*, *THETA2*

Creates a conical volume centered about the working plane origin.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RBOT, RTOP

Radii of the bottom and top faces of the cone. A value of zero or blank for either *RBOT* or *RTOP* defines a degenerate face at the center axis (that is, the vertex of the cone). The same value for both *RBOT* and *RTOP* defines a cylinder instead of a cone.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Z1, Z2

Working plane Z coordinates of the cone. The smaller value is always associated with the bottom face.

THETA1, THETA2

Starting and ending angles (either order) of the cone. Used for creating a conical sector. The sector begins at the algebraically smaller angle, extends in a positive angular direction, and ends at the larger angle. The starting angle defaults to 0° and the ending angle defaults to 360°. See the *Modeling and Meshing Guide* for an illustration.

Notes

Defines a solid conical volume centered about the working plane origin. The non-degenerate face (top or bottom) is parallel to the working plane but not necessarily coplanar with (that is, "on") the working plane. The cone must have a spatial volume greater than zero. (that is, this volume primitive command cannot be used to create a degenerate volume as a means of creating an area.) For a cone of 360°, top and bottom faces will be circular (each area defined with four lines), and they will be connected with two areas (each spanning 180°). See the **CON4 (p. 409)** command for an alternate way to create cones.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Volumes>Cone>By Dimensions

---

/CONFIG, *Lab*, *VAL*

Assigns values to Mechanical APDL configuration parameters.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Configuration parameter to be changed:

NORSTGM

Option to write or not write geometry data to the results file:

When *VAL* = 0, write geometry data (default).

When *VAL* = 1, does not write geometry data.

Useful when complex analyses are likely to create abnormally large files.

NBUF

The number of buffers (*VAL* = 1 to 32) per file in the solver. Default: *VAL* = 4.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LOCFL

File open and close actions:

When *VAL* = 0, global (default).

When *VAL* = 1, local.

Applies to `File.erot`, `File.esav`, and `File.emat`.

Typically used for large problems where locally closed files may be deleted earlier in the run via **/FDELE (p. 744)**.

SZBIO

Record size (*VAL* = 1024 to 4194304) of binary files (in integer words).

Default: *VAL* = 16384 (system-dependent).

FSPLIT

Defines split points for binary files. *VAL* is the file split point in megawords.

Default: *VAL* = Maximum file size for the system.

MXND

Maximum number of nodes.

Default: *VAL* = 100 at first encounter.

Dynamically expanded by doubling, even at first encounter, when the maximum is exceeded.

MXEL

Maximum number of elements. Default and expansion as for MXND.

MXKP

Maximum number of keypoints. Default and expansion as for MXND.

MXLS

Maximum number of lines. Default and expansion as for MXND.

MXAR

Maximum number of areas. Default and expansion as for MXND.

MXVL

Maximum number of volumes. Default and expansion as for MXND.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MXRL

Maximum number of sets of real constants (element attributes). Default and expansion as for MXND.

MXCP

Maximum number of sets of coupled degrees of freedom. Default and expansion as for MXND.

MXCE

Maximum number of constraint equations. Default and expansion as for MXND.

NOELDB

Option to write or not write results into the database after a solution.

When *VAL* = 0 (default), writes results into the database.

When *VAL* = 1, does not write results into the database.

NUMLV

Maximum number of load vectors written on `Jobname.mode` file when *MSUPkey* = YES on the **MXPAND (p. 1203)** command.

Default: *VAL* = 1000 at first encounter.

When the maximum is exceeded, the value is not expanded.

The NUMLV option is not supported for fast load vector generation (*FastLV* = ON on the **MODCONT (p. 1132)** command).

NUMSUBLV

Maximum number of load vectors written on `Jobname.sub` file in substructure/CMS generation pass.

Default: *VAL* = 31 at first encounter.

When the maximum is exceeded, the value is not expanded.

GRW_NBUF

Option to automatically grow the number of file buffers for most binary files (`.esav`, `.emat`, `.full`, and so on), with the exception of the results file and files written by the sparse and PCG equation solvers (for example, `.DSP`*xxxx* and `.pc`*n*).

When *VAL* = -1, the number of file buffers does not grow automatically for any file.

When *VAL* = 0 (default), the number of file buffers may or may not grow automatically. The logic is program-controlled.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When *VAL* = 1, the number of file buffers automatically grows for most binary files to reduce the amount of I/O. This option may require a significantly greater amount of memory than the default behavior (*VAL* = 0).

MEBA_LIC

Option to control automatic checkout of a Mechanical batch license during solution when the capability is not enabled, useful for PrepPost sessions:

When *VAL* = 0 (default), check out a license automatically when needed.

When *VAL* = 1, bypass automatic license checkout.

STAT

Displays current values set by the **/CONFIG (p. 410)** command.

VAL

Value (an integer number) assigned to the specified configuration parameter.

Notes

All configuration parameters have initial defaults, which in most cases do not need to be changed. Where a specially configured version of the Mechanical APDL program is desired, the parameters can be changed with this command.

Issue **/CONFIG (p. 410)**,STAT to display current values.

Define changes before the parameter is required.

These changes (and others) may also be incorporated into the `config.ans` file, read in upon execution of the program. (See The Configuration File in the *Basic Analysis Guide*.) If the same configuration parameter appears in both the configuration file and this command, this command overrides.

Distributed-memory parallel DMP solutions use the default FSPLIT value and force NOELDB = 1 for all results files. You cannot change the FSPLIT and NOELDB options for a DMP solution.

Menu Paths

Utility Menu>List>Status>Configuration

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CONJUG, *IR*, *IA*, - - , - - , *Name*, - - , - - , *FACTA*

Forms the complex conjugate of a variable.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA

Reference number of the variable to be operated on.

--,--

Unused fields.

Name

Thirty-two character name for identifying the variable on printouts and displays. Embedded blanks are compressed for output.

--,--

Unused fields.

FACTA

Scaling factor (positive or negative) applied to variable (default to 1.0).

Notes

Used only with harmonic analyses (**ANTYPE (p. 162)**,HARMIC).

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Complex Conjugat

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/CONTOUR, *WN*, *NCONT*, *VMIN*, *VINC*, *VMAX*

Specifies the uniform contour values on stress displays.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

NCONT

Number of contour values. *NCONT* defaults to 9 for X11 or WIN32 and to 128 for X11c or WIN32C. The default graphics window display for 3D devices is a smooth continuous shading effect that spans the maximum of 128 contours available. Use the **/DV3D (p. 584)** command to create defined banding for your contour values (values of 9 and 128 are displayed in smooth shading only). The legend, however, will display only nine color boxes, which span the full range of colors displayed in the graphics window.

VMIN

Minimum contour value. If *VMIN* = AUTO, automatically calculate contour values based upon *NCONT* uniformly spaced values over the min-max extreme range. Or, if *VMIN* = USER, set contour values to those of the last display (useful when last display automatically calculated contours).

VINC

Value increment (positive) between contour values. Defaults to (*VMAX*-*VMIN*)/*NCONT*.

VMAX

Maximum contour value. Ignored if both *VMIN* and *VINC* are specified.

Command Default

Nine contour values uniformly spaced between the extreme values, or no contours if the ratio of range to minimum value (or range to maximum if minimum = 0) is less than 0.001.

Notes

Values represent contour lines in vector mode, and the algebraic maximum of contour bands in raster mode.

Regardless of how many contours (*NCONT*) are specified, the *actual* number of contours appearing on your display depends also on the device name, whether the display is directed to the screen or to a file, the display mode (vector or raster), and the number of color planes. (All of those items are controlled via **/SHOW (p. 1785)**.) In any case, regardless of whether they are smoothed or banded, only 128 contours can be displayed.

For more information about changing the number of contours, see Creating Geometric Results Displays.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When the current Mechanical APDL graphics are *not* displayed as Multi-Plots:

If the current device is a 3D device (**/SHOW (p. 1785)**,3D), the model contours in all active windows are the same, even if separate **/CONTOUR (p. 415)** commands are issued for each active window.

Mechanical APDL maintains a single data structure (segment) containing one set of contours. The program displays the same segment in all windows. The view settings of each window constitute the only differences in the contour plots in the active windows.

This command is valid in any processor.

For alternate specifications, see **/CVAL (p. 450)**.

Menu Paths

Utility Menu>PlotCtrls>Style>Contours>Uniform Contours

/COPY,*Fname1*,*Ext1*,--,*Fname2*,*Ext2*,--,*DistKey*

Copies a file.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname1

File name to be copied and its directory path (248 characters maximum for both file name and directory). If you do not specify a directory path, it will default to your working directory and you can use all 248 characters for the file name.

The file name defaults to the current Jobname.

Ext1

Filename extension (eight-character maximum).

--

Unused field.

Fname2

File name to be created and its directory path (248 characters maximum for both file name and directory). If you do not specify a directory path, it will default to your working directory and you can use all 248 characters for the file name.

Fname2 defaults to *Fname1*.

Ext2

Filename extension (eight-character maximum).

Ext2 defaults to *Ext1*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

--

Unused field.

DistKey

Key that specifies which copy operation is performed on all processes in distributed-memory parallel mode :

0 (OFF or NO)

The program performs the copy operation only on the master process (default).

1 (ON or YES)

The program performs the copy operation locally on each process.

2 or BOTH

The program performs the copy operation for *Fname*.*Ext* on the master process and for *FnameN*.*Ext* on all processes.

Notes

The original file is untouched. Ex: **/COPY (p. 416)**,A,,,B copies file A to B in the same directory. **/COPY (p. 416)**,A,DAT,,,INP copies the file A.DAT to A.INP. See the *Operations Guide* for details. Mechanical APDL binary and ASCII files can be copied.

In distributed-memory parallel (DMP) mode, only the master process will copy *Fname1*.*Ext1* to *Fname2*.*Ext2* by default. However, when *DistKey* is set to 1 (or ON, or YES) or 2 (or BOTH), the command is executed by all processes. In this case, *Fname1* and *Fname2* will automatically have the process rank appended to them. This means *Fname1N*.*Ext1* will be copied to *Fname2N*.*Ext2* by all processes, where *N* is the DMP process rank. For more information see Differences in General Behavior in the *Parallel Processing Guide*.

Menu Paths

Utility Menu>File>File Operations>Copy

CORIOLIS,*Option*,*--*,*--*,*RefFrame*,*RotDamp*,*RotMass*

Applies the Coriolis effect to a rotating structure.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Flag to activate or deactivate the Coriolis effect:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1 (ON or YES)

Activate. This value is the default.

0 (OFF or NO)

Deactivate.

--,---

Unused fields.

RefFrame

Flag to activate or deactivate a stationary reference frame.

1 (ON or YES)

Activate.

0 (OFF or NO)

Deactivate. This value is the default.

RotDamp

Flag to activate or deactivate rotating damping effect.

1 (ON or YES)

Activate.

0 (OFF or NO)

Deactivate. This value is the default.

RotMass

Flag to activate or deactivate rotor mass summary printout (only supported for *RefFrame* = ON).

1 (ON or YES)

Activate.

0 (OFF or NO)

Deactivate. This value is the default.

Notes

The **CORIOLIS (p. 417)** command is used for linear analyses in either a rotating or a stationary reference frame, and performs differently according to the designated *RefFrame* value. The **CORIOLIS (p. 417)** command must be specified during the first step of the analysis. The rotational velocity must be defined using **OMEGA (p. 1324)** (when the whole model is rotating) or **CMOMEGA (p. 368)** (component based rotation). Specific restrictions and elements apply to each case, as follows:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Rotating Reference Frame (*RefFrame* = OFF)

The command applies the Coriolis effect in the following structural element types: MASS21, SHELL181, PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, BEAM188, BEAM189, SOLSH190, SHELL281, PIPE288 and PIPE289. It also applies this effect in the following coupled-field elements when structural degrees of freedom are present: PLANE222, PLANE223, SOLID225, SOLID226, and SOLID227.

The rotating damping effect (*RotDamp* = ON) is only supported by the COMBI214 element when stationary.

In a rotating reference frame, the Coriolis and spin-softening effects, as well as the centrifugal forces, contribute to the dynamics and are applied by default.

Stationary Reference Frame (*RefFrame* = ON)

The command activates the gyroscopic damping matrix in the following structural elements: MASS21, BEAM188, SHELL181, BEAM189, SOLID185, SOLID186, SOLID187, SOLSH190, SOLID272, SOLID273, SHELL281, PIPE288, PIPE289, and MATRIX50.

The rotating structure is assumed to be axisymmetric about the axis of rotation.

The rotating damping effect (*RotDamp* = ON) is supported by the elements listed above that generate a gyroscopic damping matrix. It is also supported by some specific elements (see Adding Damping in the *Rotordynamic Analysis Guide* for a complete list).

The rotor mass summary printout (*RotMass* = ON) is only supported for some of the elements that generate a gyroscopic damping matrix: MASS21, BEAM188, BEAM189, PIPE288, and PIPE289. The EMAT file is required (**EMATWRITE (p. 623)**,YES).

To include Coriolis effects in a linear perturbation (prestressed) analysis, follow the procedure detailed in Considerations for Rotating Structures.

In a nonlinear transient analysis in which the model is actually spinning (**ANTYPE (p. 162)**,TRANS and **NLGEOM (p. 1231)**,ON) the **CORIOLIS (p. 417)** command must not be used as any spinning motion applied through either the **IC (p. 921)** or **D (p. 483)** commands automatically includes nonlinear inertia terms such as the Coriolis effect.

To take into account variable bearings (COMBI214 elements with tabular user-defined characteristics), you must activate the Coriolis effect in a stationary reference frame. The gyroscopic effect coming from COMBI214 mass characteristics is not supported.

For more information about using the **CORIOLIS (p. 417)** command, see Rotating Structure Analysis in the *Advanced Analysis Guide* and also Overview of the Rotordynamic Analysis Process in the *Rotordynamic Analysis Guide*. For details about the Coriolis and gyroscopic effect element formulations, see the *Mechanical APDL Theory Reference*.

Elements with layered section properties do not support Coriolis effects (rotating and stationary reference frames).

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

COVAL, *TBLN01, TBLN02, SV1, SV2, SV3, SV4, SV5, SV6, SV7*

Defines PSD cospectral values.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TBLN01

First input PSD table number associated with this spectrum.

TBLN02

Second input PSD table number associated with this spectrum.

SV1, SV2, SV3, . . . , SV7

PSD cospectral values corresponding to the frequency points (**PSDFRQ (p. 1528)**).

Notes

Defines PSD cospectral values to be associated with the previously defined frequency points. Two table references are required since values are off-diagonal terms. Unlike autospectra (**PSDVAL (p. 1534)**), the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

cospectra can be positive or negative. The cospectral curve segment where there is a sign change is interpolated linearly (the rest of the curve segments use log-log interpolation). For better accuracy, choose as small a curve segment as possible wherever a sign change occurs.

Repeat **COVAL (p. 420)** command using the same table numbers for additional points. This command is valid for **SPOPT (p. 1837)**,PSD only.

This command is also valid in PREP7.

CP, *NSET*, *Lab*, *NODE1*, *NODE2*, *NODE3*, *NODE4*, *NODE5*, *NODE6*, *NODE7*, *NODE8*, *NODE9*, *NODE10*, *NODE11*, *NODE12*, *NODE13*, *NODE14*, *NODE15*, *NODE16*, *NODE17*

Defines (or modifies) a set of coupled degrees of freedom.

PREP7 (p. 22): Coupled DOF (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSET

Set reference number:

n

Arbitrary set number.

HIGH

The highest defined coupled set number will be used (default, unless *Lab* = ALL). This option is useful when adding nodes to an existing set.

NEXT

The highest defined coupled set number plus one will be used (default if *Lab* = ALL). This option automatically numbers coupled sets so that existing sets are not modified.

Lab

Degree of freedom label for coupled nodes (in the nodal coordinate system). Defaults to label previously defined with *NSET* if set *NSET* already exists. A different label redefines the previous label associated with *NSET*. Valid labels are: Structural labels: UX, UY, or UZ (displacements); ROTX, ROTY, or ROTZ (rotations) (in radians); HDSP (hydrostatic pressure). Thermal labels: TEMP, TBOT, TE2, TE3, . . ., TTOP (temperature). Fluid labels: PRES (pressure); VX, VY, or VZ (velocities). Electric labels: VOLT (voltage); EMF (electromotive force drop); CURR (current). Magnetic labels: MAG (scalar magnetic potential); AZ (vector magnetic potential); CURR (current). Diffusion label: CONC (concentration).

When *Lab* = ALL:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Sets are generated for *each* active degree of freedom (that is, one set for the UX degree of freedom, another set for UY, etc.), and *NSET* is incremented automatically to prevent overwriting existing sets.
- Existing sets are *not* modified. *NSET* must be a new set number *n* or NEXT.
- The degree of freedom set is determined according to all element types defined and the **DOF (p. 568)** command, if used.
- Hydrostatic pressure (HDSP) is not included.

NODE1, NODE2, NODE3, . . . , NODE17

List of nodes to be included in set. Duplicate nodes are ignored. If a node number is input as negative, the node is deleted from the coupled set. The first node in the list is the primary (retained) node, and the remaining nodes represent the removed degrees of freedom.

If *NODE1* = ALL, *NODE2* through *NODE17* are ignored and all selected nodes (**NSEL (p. 1266)**) are included in the set, and the node with the lowest node number becomes the primary node.

If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

A component name can be substituted for *NODE1*. The component consists of the node group to be coupled. The node with the lowest node number becomes the primary node among the node group. To display the generated and coupled node sets, issue the **CPLIST (p. 427)** command.

Notes

Do not include the same degree of freedom in more than one coupled set. Repeat **CP (p. 421)** command for additional nodes.

Coupling degrees of freedom into a set causes the results calculated for one member of the set to be the same for all members of the set. Coupling can be used to model various joint and hinge effects. A more general form of coupling can be done with constraint equations (**CE (p. 297)**). For structural analyses, a list of nodes is defined along with the nodal directions in which these nodes are to be coupled. As a result of this coupling, these nodes are forced to take the same displacement in the specified *nodal coordinate direction*. The amount of the displacement is unknown until the analysis is completed. A set of coupled nodes which are not coincident, or which are not along the line of the coupled displacement direction, may produce an applied moment which will not appear in the reaction forces. The actual degrees of freedom available for a particular node depends upon the degrees of freedom associated with element types (**ET (p. 686)**) at that node. For scalar field analysis, this command is used to couple nodal temperatures, pressures, voltages, etc.

A set of coupled nodes which are not coincident, or which are not along the line of the coupled displacement direction, produce an artificial moment constraint. If the structure rotates, a moment may be produced in the coupled set in the form of a force couple. This moment is in addition to the real reaction forces and may make it appear that moment equilibrium is not satisfied by just the applied forces and the reaction forces.

Additional sets of coupled nodes may be generated from a specified set. Degrees of freedom are coupled within a set but are not coupled between sets. No degree of freedom should appear in more than one coupled set. Such an appearance would indicate that at least two sets were in fact part of a single larger

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

set. The first degree of freedom of the coupled set is the "prime" degree of freedom. All other degrees of freedom in the coupled sets are eliminated from the solution matrices by their relationship to the prime degree of freedom. Forces applied to coupled nodes (in the coupled degree of freedom direction) will be summed and applied to the prime degree of freedom. Output forces are also summed at the prime degree of freedom. Degrees of freedom with specified constraints (**D (p. 483)**) should not be included in a coupled set (unless the degree of freedom is prime).

If master degrees of freedom are defined for coupled nodes, only the prime degree of freedom should be so defined. The use of coupled nodes reduces the set of coupled degrees of freedom to only one degree of freedom.

The removed degrees of freedom defined by the **CP (p. 421)** command cannot be included in any **CE (p. 297)** or **CERIG (p. 310)** command.

CPCYC, *Lab*, *TOLER*, *KCN*, *DX*, *DY*, *DZ*, *KNONROT*, *KMID*, *CEOPT*

Couples the two side faces of a cyclically symmetric model for loadings that are the same on every segment.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Degree of freedom label for coupled nodes (in the nodal coordinate system). If ALL, use all appropriate labels. Valid labels are: Structural labels: UX, UY, or UZ (displacements); ROTX, ROTY, or ROTZ (rotations, in radians). Thermal label: TEMP (temperature). Fluid label: PRES (pressure). Electric label: VOLT (voltage).

TOLER

Tolerance for coincidence (based on maximum coordinate difference in each global Cartesian direction for node locations and on angle differences for node orientations). Defaults to 0.0001. Only nodes within the tolerance are considered to be coincident for coupling.

KCN

In coordinate system *KCN*, two nodes are coupled when the coordinates of the first node (on the low boundary) plus the increments DX, DY, and DZ match the coordinates of the second node (on the high boundary).

DX, DY, DZ

Node location increments in the active coordinate system (DR, Dθ, DZ for cylindrical, DR, D θ, DΦ for spherical or toroidal).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KNONROT

When *KNONROT* = 0, the nodes on coupled sets are rotated into coordinate system *KCN* (see **NROTAT (p. 1264)** command description). When *KNONROT* = 1, the nodes are not rotated, and you should make sure that coupled nodal DOF directions are correct.

KMID

When *KMID* = 1, the midside nodes of the element edges are added to the coupled sets of the end nodes of edges with specified nodal DOFs, if the end nodes of an edge are coupled. By default (*KMID* = 0), the midside nodes are not included in the coupled sets.

CEOPT

When *CEOPT* = 1, the coupled sets are converted to constraint equations. Use this option to improve performance in a distributed-memory parallel (DMP) solution. By default (*CEOPT* = 0), the coupled sets are not converted to constraint equations.

Notes

Cyclic coupling requires identical node and element patterns on the low and high sector boundaries. The **MSHCOPY (p. 1189)** operation allows convenient generation of identical node and element patterns. See Using CPCYC and MSHCOPY Commands in the *Modeling and Meshing Guide* for more information.

Although developed initially for use with cyclically symmetric models, use of the **CPCYC (p. 423)** command is not limited to cyclic symmetry analyses.

Example Usage

Using CPCYC and MSHCOPY Commands

CPDELE, *NSET1*, *NSET2*, *NINC*, *Nsel*

Deletes coupled degree of freedom sets.

PREP7 (p. 22): Coupled DOF (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSET1*, *NSET2*, *NINC

Delete coupled sets from *NSET1* to *NSET2* (defaults to *NSET1*) in steps of *NINC* (defaults to 1). If *NSET1* = ALL, *NSET2* and *NINC* are ignored and all coupled sets are deleted.

Nsel

Additional node selection control:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANY

Delete coupled set if *any* of the selected nodes are in the set (default).

ALL

Delete coupled set only if *all* of the selected nodes are in the set.

Notes

See the **CP (p. 421)** command for a method to delete individual nodes from a set.

Menu Paths

Main Menu>Preprocessor>Coupling / Ceqn>Del Coupled Sets

Main Menu>Preprocessor>Modeling>Create>Circuit>Delete Elements

---

CPINTF, *Lab*, *TOLER*

Defines coupled degrees of freedom at an interface.

PREP7 (p. 22): Coupled DOF (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Degree of freedom label for coupled nodes (in the nodal coordinate system). If ALL, use all appropriate labels *except* HDSP. Valid labels are: Structural labels: UX, UY, or UZ (displacements); ROTX, ROTY, or ROTZ (rotations, in radians), HDSP (hydrostatic pressure). Thermal labels: TEMP, TBOT, TE2, TE3, . . ., TTOP (temperature). Fluid labels: PRES (pressure); VX, VY, or VZ (velocities). Electric labels: VOLT (voltage); EMF (electromotive force drop); CURR (current). Magnetic labels: MAG (scalar magnetic potential); AZ (vector magnetic potential); CURR (current). Diffusion label: CONC (concentration).

TOLER

Tolerance for coincidence (based on maximum coordinate difference in each global Cartesian direction for node locations and on angle differences for node orientations). Defaults to 0.0001. Only nodes within the tolerance are considered to be coincident for coupling.

Notes

Defines coupled degrees of freedom between coincident nodes (within a tolerance). May be used, for example, to "button" together elements interfacing at a seam, where the seam consists of a series of node pairs. One coupled set is generated for each selected degree of freedom for each pair of coincident nodes. For more than two coincident nodes in a cluster, a coupled set is generated from the lowest numbered node to each of the other nodes in the cluster. Coupled sets are generated only within (and not between) clusters. If fewer than all nodes are to be checked for coincidence, use the **NSEL (p. 1266)** command to select nodes. Coupled set reference numbers are incremented by one from the highest previous set number. Use **CPLIST (p. 427)** to display the generated sets. Only nodes having the same nodal coordinate system orientations ("coincident" within a tolerance) are included. Use the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CEINTF (p. 305) command to connect nodes by constraint equations instead of by coupling. Use the **EINTF (p. 614)** command to connect nodes by line elements instead of by coupling.

Menu Paths

Main Menu>Preprocessor>Coupling / Ceqn>Coincident Nodes

/CPLANE, *KEY*

Specifies the cutting plane for section and capped displays.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Specifies the cutting plane:

0

Cutting plane is normal to the viewing vector (**/VIEW (p. 2131)**) and passes through the focus point (**/FOCUS (p. 771)**) (default).

1

The working plane (**WPLANE (p. 2180)**) is the cutting plane.

Command Default

The cutting plane is normal to the viewing vector at the focus point.

Notes

Defines the cutting plane to be used for section and capped displays (**/TYPE (p. 2034)**,,(1, 5, or 7)).

This command is valid in any processor.

---

CPNGEN, *NSET*, *Lab*, *NODE1*, *NODE2*, *NINC*

Defines, modifies, or adds to a set of coupled degrees of freedom.

PREP7 (p. 22): Coupled DOF (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSET

Set reference number (**CP (p. 421)**).

Lab

Degree of freedom label (**CP (p. 421)**).

NODE1, NODE2, NINC

Include in coupled set nodes *NODE1* to *NODE2* in steps of *NINC* (defaults to 1). If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). If -*NODE1*, delete range of nodes from set instead of including. A component name may also be substituted for *NODE1* (*NODE2* and *NINC* are ignored).

Notes

Defines, modifies, or adds to a set of coupled degrees of freedom. May be used in combination with (or in place of) the **CP (p. 421)** command. Repeat **CPNGEN (p. 430)** command for additional nodes.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CPSEL, *Type*, - - , - - , *VMIN*, *VMAX*, *VINC*

Selects coupled degree-of-freedom sets via predefined reference numbers.

PREP7 (p. 22): Coupled DOF (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Select a new set (default).

A

Select an additional set and add it to the current set.

U

Unselect a set from the current set.

ALL

Restore the full set.

NONE

Unselect the full set.

INVE

Invert the current set (selected becomes unselected and vice versa).

STAT

Display the current select status.

- -, - -

Unused fields.

The following fields are used only with *Type* = S, A, or U:

VMIN

Minimum value of coupled DOF reference number range.

VMAX

Maximum value of coupled DOF reference number range. *VMAX* defaults to *VMIN*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VINC

Value increment within the specified range. Defaults to 1.

Command Default

All coupled sets are selected.

Notes

The **CPSEL (p. 431)** command selects coupled degree-of-freedom sets (**CP (p. 421)**) via specified reference numbers. *VMIN*, *VMAX*, and *VINC* must be positive integer values.

For example, the following command selects a new set of coupled degree-of-freedom sets based on reference numbers 1 through 7:

```
CPSEL,S,,,1,7,1
```

Data are flagged as selected and unselected; no data are actually deleted from the database.

Use **CPLIST (p. 427)** to list coupled degree-of-freedom sets and their reference numbers. If a coupled degree-of-freedom set is selected but involves unselected nodes, that coupled degree-of-freedom set will not be listed by the **CPLIST (p. 427)** command, and the solver ignores it.

Internally coupled degrees of freedom are not affected by this command.

This command is also valid in POST1.

Menu Paths

This command cannot be accessed from a menu.

CPSGEN, *ITIME*, *INC*, *NSET1*, *NSET2*, *NINC*

Generates sets of coupled nodes from existing sets.

PREP7 (p. 22): Coupled DOF (p. 34)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITIME*, *INC

Do this generation operation a total of *ITIME*s, incrementing all nodes in the existing sets by *INC* each time after the first. *ITIME* must be > 1 for generation to occur.

NSET1*, *NSET2*, *NINC

Generate sets from sets beginning with *NSET1* to *NSET2* (defaults to *NSET1*) in steps of *NINC* (defaults to 1). If *NSET1* is negative, *NSET2* and *NINC* are ignored and the last |*NSET1*| sets (in sequence from the maximum set number) are used as the sets to be repeated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Generates additional sets of coupled nodes (with the same labels) from existing sets. Node numbers between sets may be uniformly incremented.

Menu Paths

Main Menu>Preprocessor>Coupling / Ceqn>Gen w/Same DOF

CQC,*SIGNIF*,*Label*,*--*,*ForceType*

Specifies the complete quadratic mode combination method.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SIGNIF

Combine only those modes whose significance level exceeds the *SIGNIF* threshold. For single-point, multi-point, or DDAM response spectrum (*Spectype* = SPRS, MPRS, or DDAM on **SPOPT (p. 1837)**), the significance level of a mode is defined as the mode coefficient divided by the maximum mode coefficient of all modes. Any mode whose significance level is less than *SIGNIF* is considered insignificant and is not contributed to the mode combinations. The higher the *SIGNIF* threshold, the fewer the number of modes combined. *SIGNIF* defaults to 0.001. If *SIGNIF* is specified as 0.0, it is taken as 0.0. (This mode combination method is not valid for **SPOPT (p. 1837)**,PSD.)

Label

Label identifying the combined mode solution output.

DISP

Displacement solution (default). Displacements, stresses, forces, etc., are available.

VELO

Velocity solution. Velocities, "stress velocities," "force velocities," etc., are available.

ACEL

Acceleration solution. Accelerations, "stress accelerations," "force accelerations," etc., are available.

--

Unused field.

ForceType

Label identifying the forces to be combined:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

STATIC

Combine the modal static forces (default).

TOTAL

Combine the modal static plus inertial forces.

Notes

Damping is required for this mode combination method. The **CQC (p. 433)** command is also valid for PREP7.

Menu Paths

---

*CREATE, *Fname*, *Ext*, - -

Opens (creates) a macro file.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Do not use a directory path if file is to be read with the macro *Name* option of the ***USE (p. 2059)** command.

Ext

Filename extension (eight-character maximum).

Ext should not be used if file is to be read with the macro *Name* option of the ***USE (p. 2059)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- -

Unused field.

Notes

See the ***USE (p. 2059)** command for a discussion of macros. All commands following the ***CREATE (p. 434)** command, up to the ***END (p. 635)** command, are written to the specified file without being executed. An existing file of the same name, if any, will be overwritten. Parameter values are not substituted for parameter names in the commands when the commands are written to the file. Use ***CFWRITE (p. 318)** to create a file if this is desired. The resulting macro may be executed with a ***USE (p. 2059)** command (which also allows parameters to be passed into the macro) or a **/INPUT (p. 948)** command (which does not allow parameters to be passed in). Several macros may be stacked into a library file (***ULIB (p. 2051)**). You cannot use ***CREATE (p. 434)** within a DO loop.

This command is valid in any processor.

Menu Paths

Utility Menu>Macro>Create Macro

CS,*KCN*,*KCS*,*NORIG*,*NXAX*,*NXYPL*,*PAR1*,*PAR2*

Defines a local coordinate system by three node locations.

DATABASE (p. 13): Coordinate System (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Arbitrary reference number assigned to this coordinate system. Must be greater than 10. A coordinate system previously defined with this number will be redefined.

KCS

Coordinate system type:

0 or CART

Cartesian

1 or CYLIN

Cylindrical (circular or elliptical)

2 or SPHE

Spherical (or spheroidal)

3 or TORO

Toroidal

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NORIG

Node defining the origin of this coordinate system. If *NORIG* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NXAX

Node defining the positive x-axis orientation of this coordinate system.

NXYPL

Node defining the x-y plane (with *NORIG* and *NXAX*) in the first or second quadrant of this coordinate system.

PAR1

Used for elliptical, spheroidal, or toroidal systems. If *KCS* = 1 or 2, *PAR1* is the ratio of the ellipse Y-axis radius to X-axis radius (defaults to 1.0 (circle)). If *KCS* = 3, *PAR1* is the major radius of the torus.

PAR2

Used for spheroidal systems. If *KCS* = 2, *PAR2* = ratio of ellipse Z-axis radius to X-axis radius (defaults to 1.0 (circle)).

Notes

Defines and activates a local right-handed coordinate system by specifying three existing nodes: to locate the origin, to locate the positive x-axis, and to define the positive x-y plane. This local system becomes the active coordinate system. See the **CLOCAL (p. 352)**, **CSKP (p. 438)**, **CSWPLA (p. 440)**, and **LOCAL (p. 1059)** commands for alternate definitions. Local coordinate systems may be displayed with the **/PSYMB (p. 1552)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>WorkPlane>Local Coordinate Systems>Create Local CS>By 3 Nodes

---

CSCIR, *KCN*, *KTHET*, *KPHI*

Locates the singularity for non-Cartesian local coordinate systems.

DATABASE (p. 13): Coordinate System (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Number of the local coordinate system in which singularity location is to be changed. Must be greater than 10.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KTHET

Theta singularity location for cylindrical, spherical, and toroidal systems:

0

Singularity at ±180°.

1

Singularity at 0° (360°).

KPHI

Phi singularity location for toroidal systems:

0

Singularity in phi direction at ±180°.

1

Singularity in phi direction at 0° (360°).

Command Default

Singularities at ±180°.

Notes

Continuous closed surfaces (circles, cylinders, spheres, etc.) have a singularity (discontinuity) at θ = ±180°. For local cylindrical, spherical, and toroidal coordinate systems, this singularity location may be changed to 0° (360°).

An additional, similar singularity occurs in the toroidal coordinate system at Φ = ±180° and can be moved with *KPHI*. Additional singularities occur in the spherical coordinate system at Φ = ±90°, but cannot be moved.

This command is valid in any processor.

CSDELE, *KCN1*, *KCN2*, *KCINC*

Deletes local coordinate systems.

DATABASE (p. 13): Coordinate System (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN1, KCN2, KCINC

Delete coordinate systems from *KCN1* (must be greater than 10) to *KCN2* (defaults to *KCN1*) in steps of *KCINC* (defaults to 1). If *KCN1* = ALL, *KCN2* and *KCINC* are ignored and all coordinate systems are deleted.

Notes

This command is valid in any processor.

Menu Paths

Main Menu>General Postproc>Surface Operations>Create Surface>Sphere>At Node

Utility Menu>WorkPlane>Local Coordinate Systems>Delete Local CS

CSKP, *KCN*, *KCS*, *PORIG*, *PXAXS*, *PXYPL*, *PAR1*, *PAR2*

Defines a local coordinate system by three keypoint locations.

DATABASE (p. 13): Coordinate System (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Arbitrary reference number assigned to this coordinate system. Must be greater than 10. A coordinate system previously defined with this number will be redefined.

KCS

Coordinate system type:

0 or CART

Cartesian

1 or CYLIN

Cylindrical (circular or elliptical)

2 or SPHE

Spherical (or spheroidal)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3 or TORO

Toroidal

PORIG

Keypoint defining the origin of this coordinate system. If *PORIG* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

PXAXS

Keypoint defining the positive x-axis orientation of this coordinate system.

PXYPL

Keypoint defining the x-y plane (with *PORIG* and *PXAXS*) in the first or second quadrant of this coordinate system.

PAR1

Used for elliptical, spheroidal, or toroidal systems. If *KCS* = 1 or 2, *PAR1* is the ratio of the ellipse Y-axis radius to X-axis radius (defaults to 1.0 (circle)). If *KCS* = 3, *PAR1* is the major radius of the torus.

PAR2

Used for spheroidal systems. If *KCS* = 2, *PAR2* = ratio of ellipse Z-axis radius to X-axis radius (defaults to 1.0 (circle)).

Notes

Defines and activates a local right-handed coordinate system by specifying three existing keypoints: to locate the origin, to locate the positive x-axis, and to define the positive x-y plane. This local system becomes the active coordinate system. See the **CLOCAL (p. 352)**, **CS (p. 435)**, **CSWPLA (p. 440)**, and **LOCAL (p. 1059)** commands for alternate definitions. Local coordinate systems may be displayed with the **/PSYMB (p. 1552)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>WorkPlane>Local Coordinate Systems>Create Local CS>By 3 Keypoints

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CSLIST, *KCN1*, *KCN2*, *KCINC*

Lists coordinate systems.

DATABASE (p. 13): Coordinate System (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN1*, *KCN2*, *KCINC

List coordinate systems from *KCN1* to *KCN2* (defaults to *KCN1*) in steps of *KCINC* (defaults to 1). If *KCN1* = ALL (default), *KCN2* and *KCINC* are ignored and all coordinate systems are listed.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>List>Other>Local Coord Sys

CSWPLA, *KCN*, *KCS*, *PAR1*, *PAR2*

Defines a local coordinate system at the origin of the working plane.

DATABASE (p. 13): Coordinate System (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Arbitrary reference number assigned to this coordinate system. Must be greater than 10. A coordinate system previously defined with this number will be redefined.

KCS

Coordinate system type:

0 or CART

Cartesian

1 or CYLIN

Cylindrical (circular or elliptical)

2 or SPHE

Spherical (or spheroidal)

3 or TORO

Toroidal

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PAR1

Used for elliptical, spheroidal, or toroidal systems. If *KCS* = 1 or 2, *PAR1* is the ratio of the ellipse Y-axis radius to X-axis radius (defaults to 1.0 (circle)). If *KCS* = 3, *PAR1* is the major radius of the torus.

PAR2

Used for spheroidal systems. If *KCS* = 2, *PAR2* = ratio of ellipse Z-axis radius to X-axis radius (defaults to 1.0 (circle)).

Notes

Defines and activates a local right-handed coordinate system centered at the origin of the working plane. The coordinate system's local x-y plane (for a Cartesian system) or R-θ plane (for a cylindrical or spherical system) corresponds to the working plane. This local system becomes the active coordinate system. See the **CS (p. 435)**, **LOCAL (p. 1059)**, **CLOCAL (p. 352)**, and **CSKP (p. 438)** commands for alternate ways to define a local coordinate system. Local coordinate systems may be displayed with the **/PSYMB (p. 1552)** command.

This command is valid in any processor.

---

CSYS, *KCN*

Activates a previously defined coordinate system.

DATABASE (p. 13): Coordinate System (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Specifies the active coordinate system, as follows:

0 (default)

Cartesian

1

Cylindrical with global Cartesian Z as the axis of rotation

2

Spherical

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4 or WP

Working Plane

5

Cylindrical with global Cartesian Y as the axis of rotation

6

Cylindrical with global Cartesian X as the axis of rotation

11 or greater

Any previously defined local coordinate system

Notes

The **CSYS (p. 441)** command activates a previously defined coordinate system for geometry input and generation. The **LOCAL (p. 1059)**, **CLOCAL (p. 352)**, **CS (p. 435)**, **CSKP (p. 438)**, and **CSWPLA (p. 440)** commands also activate coordinate systems as they are defined. To set the active element coordinate system attribute pointer, issue the **ESYS (p. 685)** command.

The active coordinate system for files created via the **CDWRITE (p. 293)** command is Cartesian (**CSYS (p. 441)**,0).

This command is valid in any processor.

CSYS (p. 441),4 (or **CSYS (p. 441)**,WP) activates working plane tracking, which updates the coordinate system to follow working plane changes. To deactivate working plane tracking, activate *any other* coordinate system (for example, **CSYS (p. 441)**,0 or **CSYS (p. 441)**,11).

CSYS (p. 441),5 is a cylindrical coordinate system with global Cartesian Y as the axis of rotation. The local x, y and z axes are radial, θ, and axial (respectively). The R-Theta plane is the global X-Z plane, as it is for an axisymmetric model. Thus, at $\theta = 0.0$, **CSYS (p. 441)**,5 has a specific orientation: the local x is in the global +X direction, local y is in the global -Z direction, and local z (the cylindrical axis) is in the global +Y direction.

CSYS (p. 441),6 is a cylindrical coordinate system with global Cartesian X as the axis of rotation. The local x, y and z axes are axial, radial, and θ (respectively). The R-Theta plane is the global Y-Z plane, as it is for an axisymmetric model. Thus, at $\theta = 0.0$, **CSYS (p. 441)**,6 has a specific orientation: the local x is in the global -Z direction, local y is in the global +Y direction, and local z (the cylindrical axis) is in the global +X direction.

/**CTYPE**, *KEY*, *DOTD*, *DOTS*, *DSHP*, *TLEN*

Specifies the type of contour display.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Type of display:

0

Standard contour display.

1

Isosurface display.

2

Particle gradient display.

3

Gradient triad display.

DOTD

Maximum dot density for particle gradient display (*KEY* = 2). Density is expressed as dots per screen width (defaults to 30).

DOTS

Dot size for particle gradient display (*KEY* = 2). Size is expressed as a fraction of the screen width (defaults to 0.0 (single dot width)).

DSHP

Spherical dot shape precision for particle gradient display (*KEY* = 2). (3D options are supported only on 3D devices):

0

Flat 2D circular dot.

1

Flat-sided 3D polyhedron.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

n

3D sphere with *n* (>1) polygon divisions per 90° of radius.

TLEN

Maximum length of triads for gradient triad display (*KEY* = 3). Value is expressed as a fraction of the screen width (defaults to 0.067).

Command Default

Standard contour display.

Notes

Use **/CTYPE (p. 443)**,STAT to display the current settings. Only the standard contour display (**/CTYPE (p. 443)**,0) and the isosurface contour display (**/CTYPE (p. 443)**,1) are supported by PowerGraphics (**/GRAPHICS (p. 866)**,POWER).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Contours>Contour Style

CURR2D

Calculates current flow in a 2D conductor.

POST1 (p. 51): Magnetics Calculations (p. 55)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

CURR2D (p. 444) invokes a macro which calculates the total current flowing in a conducting body for a 2D planar or axisymmetric magnetic field analysis. The currents may be applied source currents or induced currents (eddy currents). The elements of the conducting region must be selected before this command is issued. The total current calculated by the macro is stored in the parameter TCURR. Also, the total current and total current density are stored on a per-element basis in the element table (**ETABLE (p. 687)**) with the labels TCURR and JT, respectively. Use the **PLETAB (p. 1411)** and **PRETAB (p. 1490)** commands to plot and list the element table items.

Menu Paths

Main Menu>General Postproc>Elec&Mag Calc>Element Based>Current

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CUTCONTROL, *Lab*, *VALUE*, *Option*

Controls time-step cutback during a nonlinear solution.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Specifies the criteria for causing a cutback. Valid labels are:

ALIMIT

Set the maximum edge-flux degree-of-freedom increment allowed within a time step. If the absolute value of the calculated increment within a time step exceeds *VALUE*, the program performs a cutback. If not specified, default *VALUE* = 1.0 x 10^{25}. This cutback trigger criterion is part of the physics limit set (p. 449).

CONCLIMIT

Set the maximum concentration degree-of-freedom increment allowed within a time step. If the absolute value of the calculated increment within a time step exceeds *VALUE*, the program performs a cutback. If not specified, default *VALUE* = 1.0 x 10^{25}. This cutback trigger criterion is part of the physics limit set (p. 449).

CRPLIMIT

Set values for calculating the maximum equivalent creep ratio allowed within a time step. If the calculated maximum creep ratio exceeds the defined creep-ratio limit, the program performs a cutback. For the first substep or the rebalance substeps after remeshing in nonlinear mesh adaptivity or rezoning, however, the user-defined maximum plastic-strain limit is ignored.

CUTBACKFACTOR

Key to set the cutback factor, a multiplier for reducing the time step interval to the fraction specified in *VALUE*, where 0 < *VALUE* < 1 (default is 0.5 if *VALUE* is not specified.) The option to change the cutback factor is valid only when automatic time stepping is on (**AUTOTS (p. 207)**,ON), which is the default.

DMGLIMIT

For damage models (such as generalized damage and anisotropic damage), the maximum allowable damage increment in a time step. If the calculated value exceeds *VALUE*, the program performs a cutback (bisection). If *VALUE* is unspecified, the program does not check the allowable damage increment.

DPPLMT

Set the maximum pore-pressure increment allowed within a time step. If the calculated maximum increment exceeds the specified limit, the program performs a cutback. This option has no default and is valid for coupled structural-pore-fluid-diffusion analysis only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DSPLIMIT

Set the maximum degree-of-freedom increment allowed within a time step. Considering all degrees of freedom at every node, if the absolute value of the maximum incremental degree-of-freedom solution within in a time step exceeds *VALUE*, the program performs a cutback. If not specified, default *VALUE* = 1.0 x 10^7.This cutback trigger criterion is the sole member of the DSPLIMIT set (p. 449).

EMFLIMIT

Set the maximum electromotive force degree-of-freedom increment allowed within a time step. If the absolute value of the calculated increment within a time step exceeds *VALUE*, the program performs a cutback. If not specified, default *VALUE* = 1.0 x 10^{25}. This cutback trigger criterion is part of the physics limit set (p. 449).

MAGLIMIT

Set the maximum scalar magnetic potential degree-of-freedom increment allowed within a time step. If the absolute value of the calculated increment within a time step exceeds *VALUE*, the program performs a cutback. If not specified, default *VALUE* = 1.0 x 10^{25}. This cutback trigger criterion is part of the physics limit set (p. 449).

MDMG

For regularized microplane damage models, the maximum allowable microplane homogenized damage increment in a time step. If the calculated value exceeds *VALUE*, the program performs a cutback (bisection). If *VALUE* is unspecified, the program does not check the allowable microplane homogenized damage increment.

PLSLIMIT

Maximum equivalent plastic strain allowed within a time-step (substep). If the calculated value exceeds *VALUE*, the program performs a cutback (bisection). Default: *VALUE* = 0.15 (15 percent)

If **CUTCONTROL (p. 445)** with *Lab* = PLSLIMIT is not issued, the minimum time step specified is reached, and the maximum plastic limit calculated from the solution exceeds 15 percent, the program generates a warning and continues the Newton iterations.

If **CUTCONTROL (p. 445)** with *Lab* = PLSLIMIT is issued, the minimum time step specified is reached, and the maximum plastic limit calculated exceeds the specified limit, the program generates an error and stops the Newton iterations. For the first substep or the rebalance substeps after remeshing in nonlinear mesh adaptivity or rezoning, however, the user-defined maximum plastic-strain limit is ignored.

PRESLIMIT

Set the maximum pressure degree-of-freedom increment allowed within a time step. If the absolute value of the calculated increment within a time step exceeds *VALUE*, the program performs a cutback. If not specified, default *VALUE* = 1.0 x 10^{25}. This cutback trigger criterion is part of the physics limit set (p. 449).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ROTLIMIT

Set the maximum rotation degree-of-freedom increment allowed within a time step. If the absolute value of the calculated increment within a time step exceeds *VALUE*, the program performs a cutback. If not specified, default *VALUE* = 1.0 x 10^7. This cutback trigger criterion is part of the physics limit set (p. 449).

TEMPLIMIT

Set the maximum temperature degree-of-freedom increment allowed within a time step. If the absolute value of the calculated increment within a time step exceeds *VALUE*, the program performs a cutback. If not specified, default *VALUE* = 1.0 x 10^{25}. This cutback trigger criterion is part of the physics limit set (p. 449) and is also valid for coupled structural-pore-fluid-diffusion-thermal analysis.

ULIMIT

Set the maximum translation degree-of-freedom increment allowed within a time step. If the absolute value of the calculated increment within a time step exceeds *VALUE*, the program performs a cutback. If not specified, default *VALUE* = 1.0 x 10^7. This cutback trigger criterion is part of the physics limit set (p. 449).

VOLTLIMIT

Set the maximum volt degree-of-freedom increment allowed within a time step. If the absolute value of the calculated increment within a time step exceeds *VALUE*, the program performs a cutback. If not specified, default *VALUE* = 1.0 x 10^{25}. This cutback trigger criterion is part of the physics limit set (p. 449).

VSLIMIT

For viscoelastic materials, the maximum equivalent viscous strain increment allowed within a time step. If the calculated value exceeds *VALUE* (default = 0.01), the program performs a cutback (bisection). If *VALUE* = 0, the program does not check the equivalent viscous strain increment.

Other Valid Labels:

NOITERPREDICT

If *VALUE* = 0 (default), the program predicts the number of iterations for nonlinear convergence and performs a cutback earlier than the number of iterations specified (**NEQIT (p. 1214)**). This is the recommended option.

If *VALUE* = 1, the solution iterates (if nonconvergent) to **NEQIT (p. 1214)** number of iterations before a cutback is invoked. It is sometimes useful for poorly-convergent problems, but rarely needed in general.

Bisection is also controlled by contact status change, plasticity or creep strain limit, and other factors. If any of these factors occur, bisection still occurs, regardless of the NOITERPREDICT setting.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NPOINT

Number of points in a cycle for a second order dynamic equation, used to control automatic time-stepping. If the number of solution points per cycle is less than *VALUE*, the program performs a cutback in time step size. Default: *VALUE* = 13 (linear analysis) or 5 (nonlinear analysis). A larger number of points yields a more accurate solution but also increases the solution run time.

This option works well for linear problems. For nonlinear analyses, other factors such as contact status changes and solution convergence rate can overwrite NPOINT. (See Automatic Time-Stepping in the *Theory Reference* for more information about automatic time-stepping.)

VALUE

Numeric value for the specified cutback criterion. For *Lab* = CRPLIMIT only, *VALUE* is the creep criteria for the creep ratio limit.

Option

Type of creep analysis. Valid for *Lab* = CRPLIMIT only.

IMPRATIO

Set the maximum creep ratio value for implicit creep. Default = 0.0 (no creep limit control). Any positive value is valid.

STSLIMIT

Stress threshold for calculating the creep ratio. For integration points with effective stress below this threshold, the creep ratio does not cause cutback. Default = 0.0. Any positive value is valid.

STNLIMIT

Elastic strain threshold for calculating the creep ratio. For integration points with effective elastic strain below this threshold, the creep ratio does not cause cutback. Default = 0.0. Any positive value is valid.

Notes

A cutback is a method for automatically reducing the step size when either the solution error is too large or the solution encounters convergence difficulties during a nonlinear analysis.

If a convergence failure occurs, the program reduces the time step interval to a fraction of its previous size and automatically continues the solution from the last successfully converged time step. If the reduced time step again fails to converge, the program again reduces the time step size and proceeds with the solution. This process continues until convergence is achieved or the minimum specified time step value is reached.

A cutback occurs when a trigger criteria is encountered. The magnitude of the time-step reduction is determined by the cutback factor. Both the trigger and the cutback factor can be specified via **CUTCONTROL (p. 445)**:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The trigger criteria can be specified for individual physics as detailed in *Lab* (p. 445) descriptions above.
- The cutback factor is 0.5 by default, and can be specified via the CUTBACKFACTOR (p. 445) label described above.

CUTCONTROL (p. 445) can be issued multiple times.

DSPLIMIT Set

DSPLIMIT is the sole label in the DSPLIMIT Set. It can be used to specify the cutback trigger criterion as a limit on the maximum degree-of-freedom increment within a time step, considering all degrees of freedom in an analysis (see DSPLIMIT label description (p. 446) above).

Physics Limit Set

The physics limit set comprises the following labels: ULIMIT, ROTLIMIT, TEMPLIMIT, PRESLIMIT, VOLTLIMIT, EMFLIMIT, MAGLIMIT, ALIMIT, CONCLIMIT. They can be used to specify distinct degree-of-freedom limits as cutback triggers for individual physics in a multiphysics analysis. Whenever one of these distinct limits is encountered, a cutback is triggered.

Degree-of-freedom limits as cutback trigger criteria are specified via **CUTCONTROL (p. 445)** with labels from either the DSPLIMIT set or the physics limit set. If multiple **CUTCONTROL (p. 445)** commands include labels from both of these sets, the last command issued determines whether the cutback trigger criteria is set by the DSPLIMIT or the physics limit set (see example command listing snippets (p. 450) below).

Command Default: If no **CUTCONTROL (p. 445)** commands are issued with labels from the DSPLIMIT set or the physics limit set, the default cutback trigger criterion is DSPLIMIT with *VALUE* = 1.0×10^{7}.

Creep and Viscoelastic Analyses

For creep and viscoelastic analyses, the cutback procedure is similar; the process continues until the minimum specified time step size is reached. However, if the criterion is exceeded, the program issues a warning but continues the substep until the analysis is complete. In this case, convergence is achieved but the criterion is not satisfied.

CUTCONTROL (p. 445) enables a step size reduction for analyses experiencing convergence difficulties; **OPNCONTROL (p. 1326)** is an analogous but opposite command that increases the step size to speed up converging analyses.

Example Usage

Friction Stir Welding Simulation (specify PLSLIMIT on CUTCONTROL)

Wire Crimping Simulation (specify PLSLIMIT on CUTCONTROL)

Control the maximum incremental pore pressure allowed in a time step via DPPLIMIT on CUTCONTROL

Regularized Microplane Damage Models (specify MDMG on CUTCONTROL)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Multiple CUTCONTROL (p. 445) Commands with labels from both the DSPLIMIT and the Physics Limit Sets

When multiple **CUTCONTROL (p. 445)** commands include labels from both the DSPLIMIT and the physics limit sets, DSPLIMIT is ignored unless *Lab* = DSPLIMIT on the last **CUTCONTROL (p. 445)** command issued as illustrated in the examples below.

- **Label on the last CUTCONTROL (p. 445) command issued is from the physics limit set**: The cutback trigger criteria are those specified by the physics limit set, and the earlier **CUTCONTROL (p. 445)**,DSPLIMIT command is ignored.

```
CUTCONTROL,TEMPLIMIT,10
CUTCONTROL,DSPLIMIT,0.7
CUTCONTROL,ULIMIT,0.2   !trigger criteria is specified by physics limit set (and DSPLIMIT is ignored)
!both ULIMIT and TEMPLIMIT contribute to the physics limit set of cutback trigger criteria
```

- ***Lab* = DSPLIMIT on the last CUTCONTROL (p. 445) command issued**: DSPLIMIT sets the cutback trigger criterion and earlier **CUTCONTROL (p. 445)** command(s) issued with *Lab* = labels from the physics limit set are ignored.

```
CUTCONTROL,TEMPLIMIT,10
CUTCONTROL,ULIMIT,0.2
CUTCONTROL,DSPLIMIT,0.7 !trigger criteria is specified by DSPLIMIT (and physics limit set labels are ignored)
```

Menu Paths

/CVAL, *WN*, *V1*, *V2*, *V3*, *V4*, *V5*, *V6*, *V7*, *V8*

Specifies nonuniform contour values on stress displays.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

V1, V2, V3, . . . , V8

Up to 8 contour values may be specified (in ascending order). The 0.0 value (if any) must not be the last value specified. If no values are specified, all contour specifications are erased and contours are automatically calculated.

Command Default

Nine contour values uniformly spaced between the extreme values.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command is similar to the **/CONTOUR (p. 415)** command. With **/CVAL (p. 450)**, however, you define the upper level of each contour band instead of having the contours uniformly distributed over the range. The minimum value (including a zero value for the first band) for a contour band cannot be specified. If you use both **/CONTOUR (p. 415)** and **/CVAL (p. 450)**, the last command issued takes precedence.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Contours>Non-uniform Contours

CVAR, *IR*, *IA*, *IB*, *ITYPE*, *DATUM*, *Name*

Computes covariance between two quantities.

POST26 (p. 58): Special Purpose (p. 60)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to *NV* (**NUMVAR (p. 1302)**)). If this number is the same as for a previous variable, the previous variable will be overwritten with this result.

IA*, *IB

Reference numbers of the two variables to be operated on. If only one, leave *IB* blank.

ITYPE

Defines the type of response PSD to be calculated:

0,1

Displacement (default).

2

Velocity.

3

Acceleration.

DATUM

Defines the reference with respect to which covariance is to be calculated:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Absolute value.

2

Relative to base (default).

Name

Thirty-two character name for identifying the variable on listings and displays. Embedded blanks are compressed upon output.

Notes

This command computes the covariance value for the variables referenced by the reference numbers *IA* and *IB*. If *DATUM* = 2, the variable referenced by *IR* will contain the individual modal contributions (that is, the dynamic or relative values). If *DATUM* = 1, the variable referenced by *IR* will contain the modal contributions followed by the contributions of pseudo-static and covariance between dynamic and pseudo-static responses. `File.psd` must be available for the calculations to occur.

Menu Paths

Main Menu>TimeHist Postpro>Calc Covariance

/CWD, *DIRPATH*

Changes the current working directory.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DIRPATH

The full path name of the new working directory.

Notes

After issuing the /CWD command, all new files opened with no default directory specified (via the **FILE (p. 752)**, **/COPY (p. 416)**, or **RESUME (p. 1601)** commands, for example) default to the new *DIRPATH* directory.

Menu Paths

Utility Menu>File>Change Directory

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CYCCALC,*FilePrefix*,*FileFormat*,*Separator*

Calculates results from a cyclic harmonic mode-superposition analysis using the specifications defined by CYCSPEC (p. 475).

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FilePrefix

Each result table (corresponding to each **CYCSPEC (p. 475)** specification) is written to a file beginning with *FilePrefix*. If blank (default), the result tables are written to the output file.

FileFormat

If *FilePrefix* is specified, then use *FileFormat* to specify the format of the file to be written:

FORM

Formatted file (default)

CSV

Comma-separated value file

Separator

If *FileFormat* is CSV, use *Separator* to specify the field separator:

COMMA

Use a comma (,) as the field separator (default)

COLON

Use a colon (:) as the field separator

DOT

Use a period (.) as the field separator

Command Default

Write the result tables to the output file.

Notes

CYCCALC (p. 453) loops through the specification given by **CYCSPEC (p. 475)** and computes the requested outputs. The outputs are given in a table format, with the rows corresponding to each frequency solution from the harmonic analysis, and the columns corresponding to each sector. The table entries are the maximum value of the specified quantity at the specified location in the sector. In addition, columns containing the maximum value at the frequency, the sector in which it occurs, and the node in the sector at which it occurs are output.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If *FilePrefix* is specified, a file is created for each output table with the name *FilePrefix_node_type.ext*, where *node* is the node number or component name, *type* is the item/component requested, and the file extension *.ext* is either .txt or .csv, depending on *FileFormat*.

A **SET (p. 1724)** command must precede the **CYCCALC (p. 453)** command.

The **CYCCALC (p. 453)** results are based on the currently active **RSYS (p. 1639)**, **SHELL (p. 1784)**, **LAYER (p. 1015)**, and **AVPRIN (p. 210)** settings.

The **CYCCALC (p. 453)** command only supports matched nodes. For more details on matching cyclic edge node pairs see Edge Component Pairs in the *Cyclic Symmetry Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

/CYCEXPAND, *WN*, *OPTION*, *Value1*, *Value2*

Graphically expands displacements, stresses and strains of a cyclically symmetric model.

PREP7 (p. 22): Special Purpose (p. 37)
POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

The window number to which the expansion applies. Valid values are 1 through 5. The default value is 1. The window number applies only to the AMOUNT argument.

OPTION

One of the following options:

ON

Activates cyclic expansion using the previous settings (if any). If no previous settings exist, this option activates the default settings. This option is default.

DEFAULT

Resets cyclic expansion to the default settings.

OFF

Deactivates cyclic expansion.

STATUS

Lists the current cyclic expansion settings.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AMOUNT

The number of repetitions *or* the total angle.

Value1

NREPEAT

Value2

The number of repetitions. The default is the total number of sectors in 360 degrees.

or

Value1

ANGLE

Value2

The total angle in degrees. The default is 360.

WHAT

A specified portion or subset of the model to expand:

Value1

The component name of the elements to expand. The default is all selected components.

EDGE

Sector edge display key. Possible *Value1* settings are:

-1

Suppresses display of edges between sectors even if the cyclic count varies between active windows. This setting is not valid for cyclic mode-superposition (MSUP) harmonic analyses.

Caution:

Plots with fewer than the maximum number of repetitions may have missing element faces at the sector boundaries.

0 or OFF

Averages stresses or strains across sector boundaries. This value is the default (although the default reverts to 1 or ON if the cyclic count varies between active windows).

1 or ON

No averaging of stresses or strains occurs, and sector boundaries are shown on the plot. This setting is not valid for cyclic MSUP harmonic analyses.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PHASEANG

Possible *Value1* settings are:

n

The phase angle shift in degrees. The valid range for *n* is 0 through 360. The default is 0. For a modal solution, this value is typically the phase angle obtained via the **CYCPHASE (p. 472)** command. The expanded modal results are printed or displayed for the specified phase angle shift.

AMPLITUDE (or *n* $\geq$ 360)

The amplitude is reported, except for the following circumstances where the amplitude solution is not valid:

- non-component results (such as equivalent stress)
- modal analyses (no amplitude is calculated, and the expanded modal results are printed or displayed at a phase angle of 360°).

SWEEP

For a mode-superposition harmonic solution, the maximum values across a phase angle sweep are reported.

Notes

In preprocessing, the **/CYCEXPAND (p. 454)** command verifies a cyclically symmetric model by graphically expanding it partially or through the full 360 degrees.

For the postprocessing plot nodal solution (**PLNSOL (p. 1425)**) operation, the command graphically expands displacements, stresses and strains of a cyclically symmetric model partially or though the full 360 degrees by combining the *real* (original nodes and elements) and *imaginary* (duplicate nodes and elements) parts of the solution.

For the print nodal solution (**PRNSOL (p. 1505)**) operation, the command expands the printed output of displacements or stresses on a sector-by-sector basis. To learn more about specific **PRNSOL (p. 1505)** behaviors in cyclic analyses, see Using the /CYCEXPAND Command in the *Cyclic Symmetry Analysis Guide*.

Use of the **/CYCEXPAND (p. 454)** command does *not* change the database. The command does not modify the geometry, nodal displacements or element stresses.

The command affects element and result plots only. It has no effect on operations other than plot element solution (**PLESOL (p. 1401)**), plot nodal solution (**PLNSOL (p. 1425)**), print nodal solution (**PRNSOL (p. 1505)**), and calculate harmonic solution (**CYCCALC (p. 453)**). Operations other than **PLESOL (p. 1401)**, **PLNSOL (p. 1425)**, **PRNSOL (p. 1505)**, or **CYCCALC (p. 453)** work on the *unprocessed* real and imaginary parts of a cyclic symmetry solution

If you issue a **/CYCEXPAND (p. 454)**,,0FF command, you cannot then expand the model by simply issuing another **/CYCEXPAND (p. 454)** command (for example, to specify an NREPEAT value for the number of repetitions). In such a case, you must specify **/CYCEXPAND (p. 454)**,,0N, which activates expansion using the previous settings (if any) or the default settings.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The command requires PowerGraphics and will turn PowerGraphics on (**/GRAPHICS (p. 866)**,POWER) if not already active. Any setting which bypasses PowerGraphics (for example, **/PBF (p. 1360)**) also bypasses cyclic expansion; in such cases, the **/CYCEXPAND (p. 454)** command displays unprocessed real and imaginary results.

The **CYCPHASE (p. 472)** command uses full model graphics (**/GRAPHICS (p. 866)**,FULL) to compute peak values. Because of this, there may be slight differences between max/min values obtained with **CYCPHASE (p. 472)**, and those obtained via **/CYCEXPAND (p. 454)**, which uses power graphics (**/GRAPHICS (p. 866)**,POWER).

For PHASEANG = AMPLITUDE (or 360) with a cyclic full harmonic solution, the only appropriate coordinate system is the solution coordinate system (**RSYS (p. 1639)**,SOLU).

Load case operations (**LCOPER (p. 1026)**) are not valid during a cyclic expansion using **/CYCEXPAND (p. 454)**.

To learn more about analyzing a cyclically symmetric structure, see the *Cyclic Symmetry Analysis Guide*.

Menu Paths

Main Menu>General Postproc>Cyclic Analysis>Cyc Expansion

Main Menu>Preprocessor>Modeling>Cyclic Sector>Cyc Expansion

CYCFILES,*FnameRst*,*ExtRst*,*FnameRfrq*,*ExtRfrq*

Specifies the data files where results are to be found for a cyclic symmetry mode-superposition harmonic analysis.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FnameRst

The file name and directory path of the results file from the cyclic modal solution. Defaults to Jobname.

ExtRst

File name extension for *FnameRst*. Defaults to rst.

FnameRfrq

The file name and directory path of the results file from the cyclic mode-superposition harmonic solution. Defaults to the value of the *FnameRst* argument.

ExtRfrq

File name extension for *FnameRfrq*. Defaults to rfrq.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

No defaults are available for the **CYCFILES (p. 457)** command. You must issue this command to properly postprocess the results of a cyclic symmetry mode-superposition harmonic analysis. If issued with no arguments, the postprocessing will be done using `Jobname.rst` and `Jobname.rfrq` from the current working directory.

Menu Paths

This command cannot be accessed from a menu.

CYCFREQ, *Option*, *Value1*, *Value2*, *Value3*, *Value4*, *Value5*

Specifies solution options for a cyclic symmetry mode-superposition harmonic analysis.

PREP7 (p. 22): Special Purpose (p. 37)
SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

One of the following options:

AERO

Specify the array containing the aerodynamic damping coefficients.

Value1

The name of the array containing the aerodynamic stiffness damping coefficients.

BLADE

Blade information required for a mistuning or aerodamping analysis.

Value1

The name of the nodal component containing the blade boundary nodes at the blade-to-disk interface. Also include boundary nodes at any shroud interfaces.

Value2

The name of the element component containing the blade elements.

Value3

The number of blade modes to include in the CMS reduction.

Value4

The lower bound of the frequency range of interest. This value is optional.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Value5

The upper bound of the frequency range of interest. This value is optional.

DEFAULT

Set the default cyclic harmonic solution settings.

EO

Excitation engine order.

Value1

An integer value indicating the the excitation order. The loadings on the other sectors will be related to the loading on the base sector based on the engine order phase shift.

Value2

The name of the Mechanical APDL array containing the modal forces corresponding to the modes kept in the mode-superpostion analysis.

MIST

Mistuning parameters.

Value1

The type of mistuning:

K

Stiffness (frequency) mistuning

Value2

The name of the array containing the stiffness mistuning parameters.

MODAL

Specifies if a damped modal analysis should be performed on the reduced system.

Value1

On/Off key.

0 (OFF or NO)

No modal solution. Perform the harmonic solution.

1 (ON or YES)

Perform a damped modal analysis of the reduced system in order to obtain the complex frequencies. The harmonic solution is not performed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Value2

Number of modes for the damped modal analysis.

Value3

The beginning, or lower end, of the frequency range of interest (in Hz).

Value4

The ending, or upper end, of the frequency range of interest (in Hz).

RESTART

Defines the point at which to restart the harmonic analysis.

Value1

The restart point:

OFF

No restart (default)

SWEEP

Restart for a new frequency sweep range (**HARFRQ (p. 885)**)

MIST

Restart for new mistuning parameters (new mistuning arrays)

USER

Causes the program to call for a user-defined solution.

Value1-5

Values passed down to the user-defined solution.

STATUS

List the harmonic solution option settings active for the cyclic model.

Command Default

No defaults are available for the **CYCFREQ (p. 458)** command. You must specify an *Option* label when issuing this command. Other values which may be necessary depend upon which *Option* label you specify.

Notes

The program solves a cyclically symmetric model (set up via the **CYCLIC (p. 462)** command during pre-processing) at the harmonic indices specified via the **CYCOPT (p. 466)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When *Option* = AERO, the aerodynamic coefficients are specified in a 5×(N×r) array (***DIM (p. 530)**), where N is the number of blades and r can be any positive integer. Each column has the structure:

$$i,m,n,V_{\text{real}},V_{\text{imag}}$$

where:

i = the i[th] interblade phase angle (IBPA)

m = the m[th] vibrating blade mode

n = the n[th] blade mode generating the pressure oscillations

V_{real} and V_{imag} = the real and imaginary coefficients.

One aerodynamic damping coefficient must be specified for each IBPA (equal to the number of blades) while keeping m and n constant.

The following table shows how the IBPA index (i) relates to other quantities for a system with 22 blades:

IBPA Index (i)	Nodal Diameter	IBPA (degrees)
0	0	0
1	1	16.36
⋮	⋮	⋮
20	-2	-32.73
21	-1	-16.36

The **CYCFREQ (p. 458)**,AERO command is only valid if **CYCFREQ (p. 458)**,BLADE is also specified. The blade mode numbers, m and n, are relative to the values kept in the **CYCFREQ (p. 458)**,BLADE command.

For constant (frequency-independent) mistuning, the stiffness parameters are specified in an N×1 array (***DIM (p. 530)**) where N is the number of blades.

For stiffness mistuning, each row entry represents the deviation of Young's modulus from nominal, $E_n=\left(1+\delta_n\right)E_0$ (or equivalently, the ratio of the frequency deviation squared). Each frequency can also be independently mistuned, in which case the array is N×M, where M is the number of blade frequencies (*Value3* of **CYCFREQ (p. 458)**,BLADE). The entries in each row therefore correspond to the ratio of the mistuned frequency to the tuned frequency squared minus one:

$$\delta f_i^n=\left(\frac{\bar{\omega}_i^n}{\omega_i^n}\right)^2-1$$

The USER option activates the solution macro CYCMSUPUSERSOLVE.MAC. The normal solution is skipped. You may implement your own mistuning solution using APDL and APDL Math operations, or call your own program for the solution.

The **CYCFREQ (p. 458)** command is valid in the preprocessing and solution stages of an analysis.

The **CYCFREQ (p. 458)**,MODAL,ON command writes modal frequencies to the output file. No other postprocessing is available for this modal solve.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When using **CYCFREQ (p. 458)**,RESTART, only mistuning parameters or frequency range may be changed. All other changes in parameters are ignored. This type of restart can only be performed by exiting the current mistuning solution using **FINISH (p. 758)** and re-entering the solution phase using **/SOLU (p. 1821)** and then calling the desired **CYCFREQ (p. 458)**,RESTART command.

To learn more about analyzing a cyclically symmetric structure, see the *Cyclic Symmetry Analysis Guide*.

Example Usage

Analysis and Solution Controls section of the Technology Showcase Example Problem: Forced-response analysis of a mistuned bladed disk with aerodamping.

For an example demonstrating how to apply modal loads directly in the cyclic harmonic analysis step of a mode-superposition harmonic cyclic symmetry analysis, see Apply Modal Loads Directly Using an Ordered Array in the *Cyclic Symmetry Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

---

*CYCLE

Bypasses commands within a do-loop.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Bypasses all commands between this command and the ***ENDDO (p. 636)** command within a do-loop. The next loop (if applicable) is initiated. The cycle option may also be conditionally executed [Use the ***IF (p. 927)**]. The ***CYCLE (p. 462)** command must appear on the same file as the ***DO (p. 567)** command.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

CYCLIC, *NSECTOR,ANGLE,KCN ,Name,USRCOMP, UsrNMap*

Specifies a cyclic symmetry analysis.

PREP7 (p. 22): Special Purpose (p. 37)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSECTOR

The number of sectors in the full 360 degrees, *or* one of the following options:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

STATUS

Indicates the current cyclic status.

OFF

Resets model to normal (non-cyclic) status and removes the duplicate sector if it exists. This option also deletes automatically detected edge components (generated when *USRCOMP* = 0).

UNDOUBLE

Removes the duplicate sector if it exists. The duplicate sector is created during the solution (**SOLVE (p. 1822)**) stage of a modal cyclic symmetry analysis.

Note:

The duplicate sector is necessary for displaying cyclic symmetry analysis results during postprocessing (**/POST1 (p. 1461)**).

If you specify a value of STATUS, OFF or UNDOUBLE, the command ignores all remaining arguments.

ANGLE

The sector angle in degrees.

KCN

An arbitrary reference number assigned to the cyclic coordinate system. The default value of 0 specifies automatic detection.

Name

The root name of sector low- and high-edge components (line, area, or node components). The default root name (when *USRCOMP* = 0) is "CYCLIC". A root name that you specify can contain up to 11 characters.

The naming convention for each low- and high-edge component pair is either of the following:

*Name*_m*xx*l, *Name*_m*xx*h (potentially matched node patterns)

*Name*_u*xx*l, *Name*_u*xx*h (potentially unmatched node patterns)

The *Name* value is the default ("CYCLIC ") or specified root name and *xx* is the component pair ID number (sequential, starting at 01).

USRCOMP

The number of pairs of user-defined low- and high-edge components on the cyclic sector (if any). The default value of 0 specifies automatic detection of sector edges; however, the automatic setting is not valid in all cases. (For more information, see the Notes section below.) If the value is greater than 0, no verification of user-defined components occurs.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UsrNMap

The name of a user-defined array specifying the matching node pairs between the sector low and high edges. Valid only when *USRCOMP* = 0. Skips the automatic detection of sector edges. Node pairs may be input in any order, but the low edge node must be the first entry in each pair.

```
*DIM,MYMAP,ARRAY,2,14 ! specifying 14 low-high edge node pairs
*set,mymap(1, 1), 107, 108 ! low node 107 <> high node 108
*set,mymap(1, 2), 147, 211 ! low node 147 <> high node 211
*set,mymap(1, 3), 110, 109 ! low node 110 <> high node 109
        ! etc for node pairs 4 through 14
cyclic,12,,1,,,MYMAP  ! use array MYMAP to generate cyclic CEs
```

Command Default

The default **CYCLIC (p. 462)** command (issuing the command with no arguments) detects the number of sectors (*NSECTOR*), the sector angle (*ANGLE*), and the coordinate system (*KCN*) based upon the existing solid or finite-element model. The command also detects sector low- and high-edge components in most cases and assigns the default root name " CYCLIC" to the components.

Notes

You can input your own value for *NSECTOR*, *ANGLE* or *KCN*; if you do so, the command verifies argument values before executing.

When *USRCOMP* = 0 and *UsrNMap* = blank (default), the **CYCLIC (p. 462)** command automatically detects low- and high-edge components for models that consist of any combination of line, area, or volume elements. If a solid model exists, however, the command uses only the lines, areas, and/or volumes to determine the low- and high-edge components; the elements, if any, are ignored.

Nodes will be automatically rotated unless **CYCOPT (p. 466)**,USRROT,YES has been specified.

If you issue a **CYCOPT (p. 466)**,TOLER command to set a tolerance for edge-component pairing *before* issuing the **CYCLIC (p. 462)** command, the **CYCLIC (p. 462)** command uses the specified tolerance when performing automatic edge-component detection.

For 2D models, autodetection does not consider the **CSYS (p. 441)**,5 or **CSYS (p. 441)**,6 coordinate system specification. Autodetection for 180 degree (two-sector) models is not possible unless a central hole exists.

The **CYCLIC (p. 462)** command sets values and keys so that, if possible, the area-mesh (**AMESH (p. 121)**) or volume-mesh (**VMESH (p. 2140)**) command meshes the sector with matching node and element face patterns on the low and high edges. (The command has no effect on any other element-creation command.)

Issue the **CYCLIC (p. 462)** command *prior* to the meshing command to, if possible, produce a mesh with identical node and element patterns on the low and high sector edges. Only the **AMESH (p. 121)** or **VMESH (p. 2140)** commands can perform automated matching. (Other meshing operation commands such as **VSWEEP (p. 2168)** cannot.) If you employ a meshing operation other than **AMESH (p. 121)** or **VMESH (p. 2140)**, you should ensure that node and element face patterns match, if desired. The **CYCLIC (p. 462)** command output indicates whether each edge-component pair has or can produce a matching node pair.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A cyclic solution (via the **SOLVE (p. 1822)** command) allows dissimilar mesh patterns on the extreme boundaries of a cyclically symmetric model. The allowance for dissimilar patterns is useful when you have only finite-element meshes for your model but not the geometry data necessary to remesh it to obtain identical node patterns. In such cases, it is possible to obtain solution results, although perhaps at the expense of accuracy. A warning message appears because results may be degraded near the sector edges.

The constraint equations (CEs) that tie together the low and high edges of your model are generated at the solution stage of the analysis from the low- and high-edge components (and nowhere else). You should verify that automatically detected components are in the correct locations and that you can account for all components; to do so, you can list (**CMLIST (p. 366)**) or plot (**CMPLOT (p. 371)**) the components.

If you issue the **CYCLIC (p. 462)** command after meshing and have defined element types with rotational degrees of freedom (DOFs), Mechanical APDL generates cyclic CEs for rotational DOFs that may not exist on the sector boundaries. Issue **CYCOPT (p. 466)**,DOF to prevent unused rotational terms from being generated.

Modal cyclic symmetry analysis is supported by the following eigensolvers:

- Block Lanczos (**MODOPT (p. 1140)**,LANB)
- PCG Lanczos (**MODOPT (p. 1140)**,LANPCG)
- Super Node (**MODOPT (p. 1140)**,SNODE)
- Subspace (**MODOPT (p. 1140)**,SUBSP)

To learn more about analyzing a cyclically symmetric structure, see the *Cyclic Symmetry Analysis Guide*.

When using the **CYCLIC (p. 462)** command to automatically detect the sector, if an area is defined with the **AL (p. 112)** command, the lines need to be oriented to form the closed curve.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CYCOPT, *OPTION*, *Value1*, *Value2*, *Value3*, *Value4*, *Value5*, *Value6*, *Value7*

Specifies solution options for a cyclic symmetry analysis.

PREP7 (p. 22): Special Purpose (p. 37)
SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

OPTION

Cyclic symmetry analysis option. There is no default. You must choose one of the following options:

BCMULT

Controls whether cyclic sector array parameter names are reused or created new for multiple entities.

Value1

The flag value.

0 (OFF or NO)

Create new array parameter names (default)

1(ON or YES)

Reuse array parameter names

COMBINE

For linear static cyclic symmetry analysis with non-cyclically symmetric loading only, expands and combines all harmonic index solutions and writes them to the results file during the solution phase of the analysis.

Value1

The flag value.

0 (OFF or NO)

Disable combining of harmonic index solutions (default)

1 (ON or YES)

Enable combining of harmonic index solutions

DEFAULT

Set the default cyclic solution settings.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DOF

The degrees of freedom to couple from the nodes on the low sector boundary to nodes on the high boundary:

Value1

The component pair ID number.

Value2, Value3, Value4, ..., Value7

The constraint-equation/-coupling degree of freedom (DOF) for this pair. Repeat the command to add other DOFs. The default is constraint-equation/-coupling *all* applicable DOFs.

FACETOL

Tolerance for inclusion of surface nodes into your base sector. Autodetect defaults to 15°, accommodating most sections. Specify a new *Value1* only when extreme cut angles or complex model geometry cause surface nodes to be excluded. See Notes (below) for more information.

Ansys, Inc. recommends that successful auto-detection depends more on the value of ANGTOL than the value of FACETOL. Please refer to **CYCOPT** Auto Detection Tolerance Adjustments for Difficult Cases for more information about auto-detection and the **CYCOPT (p. 466)** command.

Value1

The face tolerance applies only to auto detection from node/element models (already meshed and no solid model), and it defaults to 15°.

HINDEX

The harmonic index ranges to be solved. Applies to static and harmonic analyses only if *Value5* = STATIC (p. 468).

By default, the **SOLVE (p. 1822)** command loops through *all* available harmonic indices. Static and harmonic analyses only solve harmonic indices required for the applied loads. All other analyses solve them all.

EVEN / ODD

For low-frequency electromagnetic analysis only, EVEN specifies a symmetric solution and ODD specifies an antisymmetric solution.

The value you specify is based on the harmonic index: EVEN (default) indicates harmonic index = 0, and ODD indicates harmonic index = *N* / 2 (where *N* is an integer representing the number of sectors in 360°). A value of ODD applies only when *N* is an even number.

The **CYCOPT (p. 466)** command with this HINDEX option is cumulative. To remove an option (for example, EVEN), issue this command: **CYCOPT (p. 466)**,HINDEX,EVEN,,,-1

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Solve all applicable harmonic indices.

Note:

Value2 must be blank.

Value1*, *Value2*, *Value3

Solve harmonic indices in range *Value1* through *Value2* in steps of *Value3*. Repeat the command to add other ranges. The default solves *all* applicable harmonic indices.

Value4

The only valid value is -1. If specified, it removes *Value1* through *Value2* in steps of *Value3* from the set to solve. By default, if *Value4* = -1 then *Value1* = 0, *Value2* = 0, and *Value3* = 1.

Value5

For static and harmonic analyses, enter either a number or STATIC:

If *Value5* = <*number*>

the number entered sets the tolerance for determining if the Fourier contribution of a load is significant (default = 1.0E-5). In this case, the harmonic index selection is disabled.

If *Value5* = STATIC

the harmonic index selection is enabled, and no verification is done on the significance of unselected harmonic indicies.

Note:

Improper selection of the harmonic index range may produce incomplete (incorrect) results.

LDSECT

Restricts subsequently defined force loads and surface loads to a specified sector. The restriction remains in effect until you change or reset it. This option is not available for harmonic analyses based on mode-superposition (**CYCOPT (p. 466)**,MSUP,1)

Value1

The sector number. A value other than 0 (default) is valid for a cyclic symmetry analysis with non-cyclically symmetric loading only. A value of 0 (or ALL) resets the default behavior for cyclically symmetric loading (where the loads are identical on all sectors).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MOVE

Specifies if the program should move high- or low-edge component nodes paired within the specified tolerance (TOLER) to create *precisely matching* pairs.

Value1

The flag value.

0

Do not move edge component nodes (default)

1 or HIGH

Move the high-edge component nodes to precisely match the low-edge component nodes

-1 or LOW

Move the low-edge component nodes to precisely match the high-edge component nodes

MSUP

This flag is used to limit the results written to the `Jobname.mode` and `Jobname.rst` files in a modal cyclic symmetry analysis. In a linear perturbation analysis, the modal analysis and the first load step of the preceding base analysis must be set to the same value.

Value1

The flag value.

0 (OFF or NO)

Write results for the base and duplicate sectors to the `Jobname.mode` and `Jobname.rst` files.

1 (ON or YES)

Write only the base sector results to the `Jobname.mode` and `Jobname.rst` files for use in a subsequent mode-superposition-based analysis. Default, except for cyclic unsymmetric modal, LANPCG, and SNODE solutions, which use *Value1* = 0 as the default. This option is not valid for cyclic unsymmetric modal, LANPCG, and SNODE solutions.

STATUS

List the solution option settings active for the cyclic model.

TOLER

The tolerance used to determine whether a node on the low edge is paired with a node on the high edge.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Value1

The tolerance value.

Greater than 0

The absolute distance tolerance for automatic sector-boundary detection and low-/high-edge component node pairing

Less than 0

The relative tolerance for automatic sector-boundary detection and low-/high-edge component node pairing. In this case, the tolerance is *Value1* * *Length*, where *Length* is the length of the diagonal of an imaginary box enclosing the model

0

Tolerance is set to -1.0 x 10^{-4} (default)

Value2

ANGTOL = Maximum allowable angle tolerance. (default = 0.01°)

The valid range for *ANGTOL* is model dependent.

If you input both the number of sectors and a sector angle, the angle must match 360/(number of sectors) within *ANGTOL*.

If you input only a sector angle, it must divide evenly into 360° within *ANGTOL*.

If you input a sector angle, the final cyclic sector must span that angle within *ANGTOL*.

For auto detected sector angle, the final cyclic sector must span 360/(number of sectors) within *ANGTOL*, everywhere along the LOW/HIGH boundaries.

If *ANGTOL* is too small, your CAD or FEA model may not be accurate enough to allow auto detection or verification.

If *ANGTOL* is too large, you may get an unexpected or incorrect boundary definition, or in other cases fail to detect the boundaries.

For some difficult cases from FEA models (not solid models), you may need to change the value of *FACETOL* to achieve auto detection. Please refer to **CYCOPT** Auto Detection Tolerance Adjustments for Difficult Cases for more information about auto-detection and the **CYCOPT (p. 466)** command.

USRROT

Flag specifying whether the program should override automatic nodal rotations to edge components and allow you to apply nodal rotations manually.

Value1

The flag value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0 (OFF or NO)

Allow automatic node rotation (default)

1 (ON or YES)

Suppress automatic node rotation. If you select this option, you *must* apply appropriate nodal rotations to all edge component nodes; otherwise, your analysis will yield incorrect solution results.

LOW

Suppresses automatic rotation of low-edge component nodes only, allowing you to apply them manually. Automatic rotation of high-edge component nodes occurs to produce the matching edge nodes required for a valid cyclic solution.

HIGH

Suppresses automatic rotation of high-edge component nodes only, allowing you to apply them manually. Automatic rotation of low-edge component nodes occurs to produce the matching edge nodes required for a valid cyclic solution.

Notes

The program solves a cyclically symmetric model (set up via the **CYCLIC (p. 462)** command during preprocessing) at the harmonic indices specified via the **CYCOPT (p. 466)** command.

The **CYCOPT (p. 466)**,COMBINE option is an alternative to the **/CYCEXPAND (p. 454)** command and is especially useful for testing purposes. However, Ansys, Inc. recommends specifying COMBINE only when the number of sectors is relatively small. (The option expands nodes and elements into the full 360° and can slow postprocessing significantly.

If you issue a **CYCOPT (p. 466)**,TOLER command to set a tolerance for edge-component pairing *before* issuing the **CYCLIC (p. 462)** command, the **CYCLIC (p. 462)** command uses the specified tolerance when performing automatic edge-component detection.

In cases involving non-cyclically symmetric loading (that is, when LDSECT > 0), the underlying command operations create or modify the required SECTOR tabular boundary condition (BC) data to apply on the appropriate sector. Therefore, it is not necessary to manipulate tables for situations where the applied BC is not a function of other tabular BC variables such as TIME, X, Y, Z, and so on.

To delete a previously applied load on a specified sector, issue an **FDELE (p. 742)** command.

Because edge nodes are rotated into the cyclic coordinate system during solution, any applied displacements or forces on sector edges will be in the cyclic coordinate system.

The **CYCOPT (p. 466)** command is valid in the preprocessing and solution stages of an analysis.

To learn more about analyzing a cyclically symmetric structure, see the *Cyclic Symmetry Analysis Guide*.

Distributed-Memory Parallel (DMP) Restriction

The COMBINE option is not supported in a DMP solution.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Cyclic Sector>Cyclic Options

Main Menu>Solution>Solve>Cyclic Options

CYCPHASE, *TYPE*, *OPTION*

Provides tools for determining minimum and maximum possible result values from frequency couplets produced in a modal cyclic symmetry analysis.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TYPE

The type of operation requested:

DISP

Calculate the maximum and minimum possible displacement at each node in the original sector model. Store the values and the phase angle at which they occurred.

STRESS

Calculate the maximum and minimum possible stresses at each node in the original sector model. Store the values and the phase angle at which they occurred.

STRAIN

Calculate the maximum and minimum possible strains at each node in the original sector model. Store the values and the phase angle at which they occurred.

ALL

Calculate the maximum and minimum possible displacement, stress and strain at each node in the original sector model. Store the values and the phase angle at which they occurred.

GET

Places the value of a MAX or MIN item into the _CYCVALUE parameter, the node for that value in the _CYCNODE parameter, and the phase angle for the value in the _CYCPHASE parameter.

PUT

Put resulting sweep values for printing (via the **PRNSOL (p. 1505)** command) or plotting (via the **PLNSOL (p. 1425)** command).

LIST

List the current minimum/maximum displacement, stress and strain nodal values.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

STAT

Summarize the results of the last phase sweep.

CLEAR

Clear phase-sweep information from the database.

OPTION

If *TYPE* = DISP, STRAIN, STRESS or ALL, controls the sweep angle increment to use in the search:

Angle

The sweep angle increment in degrees, greater than 0.1 and less than 10. The default is 1.

If *TYPE* = PUT, controls which values are placed onto the model:

MAX

Put all existing nodal maximum values onto the model. This option is the default.

MIN

Put all existing nodal minimum values onto the model.

If *TYPE* = GET, controls the values placed into cyclic parameters:

Item

Specifies the type of values on which to operate:

U -- Displacement
S -- Stress
EPEL -- Strain

Comp

Specifies the specific component of displacement, stress or strain for which to get information:

X,Y,Z -- Basic components
XY,YZ,XZ -- Shear components
1,2,3 -- Principal values
EQV -- Equivalent value
SUM -- USUM

MxMn

Specifies whether the requested value information is for the maximum or minimum value:

MAX -- Maximum value.
MIN -- Minimum value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

No defaults are available for the **CYCPHASE (p. 472)** command. You must specify an argument (*TYPE*) when issuing the command. Other values which may be necessary (*OPTION*) depend upon which *TYPE* argument you specify.

Notes

When you expand the results of a modal cyclic symmetry analysis (via the **/CYCEXPAND (p. 454)** or **EXPAND (p. 711)** command), the program combines the real and imaginary results for a given nodal diameter, assuming no phase shift between them; however, the modal response can occur at *any* phase shift.

CYCPHASE (p. 472) response results are valid only for the first cyclic sector. To obtain the response at *any* part of the expanded model, Ansys, Inc. recommends using cyclic symmetry results expansion at the phase angle obtained via **CYCPHASE (p. 472)**.

The phase angles returned by **CYCPHASE (p. 472)** contain the minimum and maximum values for USUM, SEQV and other scalar principal stress and strain quantities; however, they do not always return the true minimum and maximum values for directional quantities like UX or SX unless the values fall in the first sector.

CYCPHASE (p. 472) does not consider midside node values when evaluating maximum and minimum values, which may affect display quantities but no others. (Typically, the program ignores midside node stresses and strains during postprocessing.)

Issuing **CYCPHASE (p. 472)**,PUT clears the result values for midside nodes on high order elements; therefore, this option sets element faceting (**/EFACET (p. 602)**) to 1. The command reports that midside nodal values are set to zero and indicates that element faceting is set to 1.

If the sweep values are available after issuing a **CYCPHASE (p. 472)**,PUT command, the **PRNSOL (p. 1505)** or **PLNSOL (p. 1425)** command will print or plot (respectively) the sweep values of structure displacement Ux, Uy, Uz, component stress/strain X, Y, Z, XY, YZ, ZX, principal stress/strain 1, 2, 3 and equivalent stress/strain EQV. The vector sum of displacement (USUM) and stress/strain intensity (SINT) are not valid phase-sweep results.

You can specify any coordinate system via the **RSYS (p. 1639)** command for displaying or printing **CYCPHASE (p. 472)** results. However, after **CYCPHASE (p. 472)** results have been extracted, you cannot then transform them via the **RSYS (p. 1639)** command. If you try to do so, the program issues a warning message.

The **CYCPHASE (p. 472)** command is valid in **/POST1 (p. 1461)** and for cyclically symmetric models only.

To learn more about analyzing a cyclically symmetric structure, see the *Cyclic Symmetry Analysis Guide*.

Main Menu>General Postproc>Cyclic Analysis>Cyclic Phase>Status

CYCSPEC, *LABEL*, *Node*, *Item*, *Comp*

Defines the set of result items for a subsequent CYCCALC (p. 453) command in postprocessing a cyclic harmonic mode-superposition analysis.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LABEL

One of the following labels:

ADD

Adds a new specification to the set (default). The maximum number of specifications that can be defined is 50.

LIST

Lists the current set of specifications. *Node*, *Item*, *Comp* are ignored.

ERASE

Erases the current set of specifications. *Node*, *Item*, *Comp* are ignored.

DELETE

Deletes an existing specification. *Item*, *Comp* are ignored.

Node

The node at which to evaluate the results. If *Node* is a nodal component, then all nodes in the component are included. All sectors containing this node (or set of nodes) are evaluated.

For *LABEL* = DELETE, use *Node* to indicate which specification in the set to delete.

Item

Specifies the type of values to evaluate:

U

Displacement

S

Stress

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EPEL

Elastic strain

Comp

Specifies the specific component of displacement, stress, or strain to evaluate:

X,Y,Z

Direct components

XY,YZ,XZ

Shear components (stress and strain only)

1,2,3

Principal values (stress and strain only)

EQV

Equivalent value (stress and strain only)

SUM

Vector sum (displacement only)

NORM

L2 norm for the set of nodes (displacement only)

Command Default

No defaults are available for the **CYCSPEC (p. 475)** command. You must issue this command to define the set of result items for evaluation in a subsequent **CYCCALC (p. 453)** command used in computing results of a cyclic harmonic mode-superposition analysis.

Notes

Up to 50 specifications can be defined for use in a subsequent **CYCCALC (p. 453)** command. If more than 50 specifications are desired, erase the table after the **CYCCALC (p. 453)** operation and add new specifications and repeat the **CYCCALC (p. 453)** command. All the specified nodes, items, and components are evaluated for all sectors and the maximum amplitude value output. For combined stresses and strains (*Comp* = 1,2,3 or EQV) or displacement vector sum (*Comp* = SUM), a 360 degree phase sweep is performed at each location to determine the maximum.

Additional POST1 controls are used to refine the specification. For component values, components are in the **RSYS (p. 1639)** direction. For shell elements, the results are at the **SHELL (p. 1784)** location. For EPEL,EQV, the results are based on the *EFFNU* value on the **AVPRIN (p. 210)** command. The controls active when the **CYCCALC (p. 453)** command is issued determine the result values. If results at another **SHELL (p. 1784)** location are desired, issue the new **SHELL (p. 1784)** command and then re-issue the **CYCCALC (p. 453)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If a single node is input, the *Item*/*Comp* value at that location in each sector is output. If a node component is given, then the maximum *Item*/*Comp* value within the set of nodes of each sector is output, one value for each sector (the node of the maximum may vary from sector to sector). For stress and strain items, only corner nodes are valid.

For the displacement norm option (*Item* = U, *Comp* = NORM), the L2 norm computed from all the nodes in the component is output, one per sector.

Menu Paths

This command cannot be accessed from a menu.

CYL4, *XCENTER*, *YCENTER*, *RAD1*, *THETA1*, *RAD2*, *THETA2*, *DEPTH*

Creates a circular area or cylindrical volume anywhere on the working plane.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XCENTER, YCENTER

Working plane X and Y coordinates of the center of the circle or cylinder.

RAD1, RAD2

Inner and outer radii (either order) of the circle or cylinder. A value of zero or blank for either *RAD1* or *RAD2*, or the same value for both *RAD1* and *RAD2*, defines a solid circle or cylinder.

THETA1, THETA2

Starting and ending angles (either order) of the circle or faces of the cylinder. Used for creating a partial annulus or partial cylinder. The sector begins at the algebraically smaller angle, extends in a positive angular direction, and ends at the larger angle. The starting angle defaults to 0° and the ending angle defaults to 360°. See the *Modeling and Meshing Guide* for an illustration.

DEPTH

The perpendicular distance (either positive or negative based on the working plane Z direction) from the working plane representing the depth of the cylinder. If *DEPTH* = 0 (default), a circular area is created on the working plane.

Notes

Defines a circular area anywhere on the working plane or a cylindrical volume with one face anywhere on the working plane. For a solid cylinder of 360°, the top and bottom faces will be circular (each area defined with four lines) and they will be connected with two surface areas (each spanning 180°). See the **CYL5 (p. 478)**, **PCIRC (p. 1369)**, and **CYLIND (p. 479)** commands for alternate ways to create circles and cylinders.

When working with a model imported from an IGES file (DEFAULT import option), you must provide a value for *DEPTH* or the command will be ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

---

CYL5, *XEDGE1*, *YEDGE1*, *XEDGE2*, *YEDGE2*, *DEPTH*

Creates a circular area or cylindrical volume by end points.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XEDGE1, YEDGE1

Working plane X and Y coordinates of one end of the circle or cylinder face.

XEDGE2, YEDGE2

Working plane X and Y coordinates of the other end of the circle or cylinder face.

DEPTH

The perpendicular distance (either positive or negative based on the working plane Z direction) from the working plane representing the depth of the cylinder. If *DEPTH* = 0 (default), a circular area is created on the working plane.

Notes

Defines a circular area anywhere on the working plane or a cylindrical volume with one face anywhere on the working plane by specifying diameter end points. For a solid cylinder of 360°, the top and bottom faces will be circular (each area defined with four lines) and they will be connected with two surface areas (each spanning 180°). See the **CYL4 (p. 477)**, **PCIRC (p. 1369)**, and **CYLIND (p. 479)** commands for alternate ways to create circles and cylinders.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Areas>Circle>By End Points

Main Menu>Preprocessor>Modeling>Create>Volumes>Cylinder>By End Pts & Z

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CYLIND, *RAD1*, *RAD2*, *Z1*, *Z2*, *THETA1*, *THETA2*

Creates a cylindrical volume centered about the working plane origin.

PREP7 (p. 22): Primitives (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RAD1, RAD2

Inner and outer radii (either order) of the cylinder. A value of zero or blank for either *RAD1* or *RAD2*, or the same value for both *RAD1* and *RAD2*, defines a solid cylinder.

Z1, Z2

Working plane Z coordinates of the cylinder. If either *Z1* or *Z2* is zero, one of the faces of the cylinder will be coplanar with the working plane.

THETA1, THETA2

Starting and ending angles (either order) of the cylinder. Used for creating a cylindrical sector. The sector begins at the algebraically smaller angle, extends in a positive angular direction, and ends at the larger angle. The starting angle defaults to 0.0° and the ending angle defaults to 360.0°. See the *Modeling and Meshing Guide* for an illustration.

Notes

Defines a cylindrical volume centered about the working plane origin. The top and bottom faces are parallel to the working plane but neither face need be coplanar with (that is, "on") the working plane. The cylinder must have a spatial volume greater than zero. (that is, this volume primitive command cannot be used to create a degenerate volume as a means of creating an area.) For a solid cylinder of 360°, the top and bottom faces will be circular (each area defined with four lines), and they will be connected with two areas (each spanning 180°.) See the **CYL4 (p. 477)** and **CYL5 (p. 478)** commands for alternate ways to create cylinders.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Volumes>Cylinder>By Dimensions

CZDEL, *grp1*, *grp2*, *grp3*

Edits or clears cohesive zone sections.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

grp1

Initial group of cohesive zone elements to be deleted.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

grp2

Final group of cohesive zone elements to be deleted.

grp3

Increment for selected groups.

Notes

The **CZDEL (p. 479)** command edits or deletes the interface elements and nodes, along with the associated changes made to the underlying plane or solid elements created during a previous **CZMESH (p. 480)** operation.

Each **CZMESH (p. 480)** operation will create groups of elements and nodes with component names in the format CZME_EL01 (elements) and CZME_ND01 (nodes). The final number of this format will be the number used for *grp1* and *grp2*. If *grp1* = ALL, all nodes and elements created by the **CZMESH (p. 480)** command will be deleted. After using **CZDEL (p. 479)**, all the user-defined components will be unselected.

The **CZDEL (p. 479)** command is valid for structural analyses only.

Menu Paths

This command cannot be accessed from a menu.

CZMESH,*ecomps1*,*ecomps2*,*KCN*,*KDIR*,*VALUE*,*CZTOL*

Create and mesh an interface area composed of cohesive zone elements.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ecomps1

Component name or number for the group of plane or solid structural elements adjacent to the interface being meshed.

ecomps2

Component name or number for the opposing (from *ecomps1*) group of plane or solid structural elements adjacent to the interface being meshed.

KCN

Coordinate system number for the separation surface and normal direction. (if *ecomps1* and *ecomps2* not specified)

KDIR

Direction (x, y, or z) normal to separation surface in the *KCN* coordinate system (if *ecomps1* and *ecomps2* not specified).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VALUE

Coordinate value along the *KDIR* axis at which to locate the interface (if *ecomps1* and *ecomps2* not specified).

CZTOL

Optional absolute tolerance about *VALUE* (if *ecomps1* and *ecomps2* not specified). Allows nodes occurring slightly above or below the separation to be grouped properly. The following expression represents the default value:

$$\frac{\sqrt{\Delta X^2+\Delta Y^2+\Delta Z^2}}{1000}$$

Where ΔX, ΔY, and ΔZ are the dimensions of the model based on nodal locations (that is, ΔX = X*max* - X*min*).

Notes

CZMESH (p. 480) is used on a mesh with shared nodes at the interface.

If *ecomps1* and *ecomps2* are specified, the **CZMESH (p. 480)** command creates/meshes interface elements (INTER202, INTER203, INTER204, INTER205) along the boundary between the two components or groups of elements.

The elements in each of the components or groups of elements share nodes with each other and also with the interface elements. This one-element thick boundary of interface elements splits the body between the two components or groups of elements.

Subsequent separation (delamination and failure) of the interface zone results in an increasing displacement between the nodes (within the interface element) along the cohesive zone elements. Unless otherwise specified, the **CZMESH (p. 480)** command analyzes the configuration and geometry of the adjacent structural elements and provides the appropriate interface element.

The **CZMESH (p. 480)** operation copies any nodal temperatures that you have defined on the split surface of the original mesh from the original nodes to the newly created coincident duplicate nodes. Displacements, forces, and other boundary conditions, however, are not copied; therefore, apply boundary conditions and loadings after issuing **CZMESH (p. 480)**.

If using **CZMESH (p. 480)** to generate interface elements (INTER202 and INTER205) in a VCCT-based crack-growth simulation, be aware that those elements do not support degenerate shapes. Examine the resulting mesh, therefore, to verify correct element connectivity around the crack tip.

This command does not support mesh regions with non-solid elements (such as surface-effect and shell elements).

This command is valid for structural analyses only.

Menu Paths

This command cannot be accessed from a menu.

D Commands

D, *Node*, *Lab*, *VALUE*, *VALUE2*, *NEND*, *NINC*, *Lab2*, *Lab3*, *Lab4*, *Lab5*, *Lab6*, *MESHFLAG*

Defines degree-of-freedom constraints at nodes.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Node

Node at which constraint is to be specified. If ALL, *NEND* and *NINC* are ignored and constraints are applied to all selected nodes (**NSEL (p. 1266)**). If *Node* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *Node*.

Lab

Valid degree-of-freedom label. If ALL, use all appropriate labels.

Structural labels: UX, UY, or UZ (displacements); ROTX, ROTY, or ROTZ (rotations); WARP (warping).

Thermal labels: TEMP, TBOT, TE2, TE3, . . ., TTOP (temperature).

Electric labels: VOLT (voltage); EMF (electromotive force).

Magnetic labels: MAG (scalar magnetic potential); AZ (vector magnetic potential).

Acoustic labels: PRES (pressure); UX, UY, or UZ (displacements for FSI coupled elements); ENKE (acoustic energy density); VX, VY or VZ (velocity); TEMP (temperature).

Pore fluid labels: PRES (pore pressure); UX, UY, or UZ (displacements); TEMP (temperature).

Diffusion labels: CONC (concentration).

For structural static and transient analyses, translational and rotational velocities are also valid loads. Use these labels: VELX, VELY, VELZ (translational velocities); OMGX, OMGY, OMGZ (rotational velocities).

For structural analyses, HDSP (hydrostatic pressure) is also valid. However, HDSP is *not* included when *Lab* = ALL.

For structural transient analyses, the following acceleration loads are also valid: ACCX, ACCY, ACCZ (translational accelerations); DMGX, DMGY, DMGZ (rotational accelerations). The velocity and acceleration loads are *not* included when *Lab* = ALL.

If the node is connected to an ELBOW290 element, the following pipe cross-section degree-of-freedom labels are also valid: SE, SO, SW, SRA, and SRT. (For details, see the ELBOW290 documenta-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

tion.) The degrees of freedom are *not* included when *Lab* = ALL. To constrain *all* cross-section degrees of freedom, specify *Lab* = SECT.

The PRES degree of freedom is also available for porous media problems.

Value

Degree-of-freedom value or table name reference for tabular boundary conditions. To specify a table, enclose the table name in percent (%) signs (for example, **D (p. 483)**,*Node*,TEMP,%*tabname*%). To define a table, issue ***DIM (p. 530)**.

If *Value* = SUPPORT, you can specify pseudo-constraints when using residual vectors in a modal analysis (**RESVEC (p. 1603)**,ON) or CMS analysis (**CMSOPT (p. 378)**,RFFB).

If the enforced motion is active in the modal analysis (**MODCONT (p. 1132)**,,on), *Value* is the base identification number. It should be an integer greater than or equal to 1 and less than 10000.

VALUE2

Second degree-of-freedom value (if any). If the analysis type and the degree of freedom allow a complex input, *Value* (above) is the real component and *VALUE2* is the imaginary component.

NEND, NINC

Specifies the same values of constraint at the range of nodes from *Node* to *NEND* (defaults to *Node*), in steps of *NINC* (defaults to 1).

Lab2, Lab3, Lab4, Lab5, Lab6

Additional degree-of-freedom labels. The same values are applied to the nodes for these labels.

MESHFLAG

Specifies how to apply constraint on the mesh. Valid in a nonlinear adaptivity analysis when *Lab* = UX / UY / UZ and *Node* is not a component name.

0 – Constraint applied on the current mesh (default).

1 – Constraint applied on the initial mesh for nonlinear adaptivity. (*NEND* and *NINC* are not valid.)

Notes

The available degrees of freedom per node are listed under **Degrees of Freedom** in the input table for each element type in the *Element Reference*. Degrees of freedom are defined in the nodal coordinate system. The positive directions of structural translations and rotations are along and about the positive nodal axes directions. Structural rotations should be input in radians. The node and the degree-of-freedom label must be selected (**NSEL (p. 1266)**, **DOFSEL (p. 569)**).

In a structural analysis, you can apply only one displacement, velocity, or acceleration load at any degree of freedom. If multiple loads are specified, the last applied load overrides the previous ones. For example, the following commands apply loads to node 100:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

D,100,UX,*Value*

D,100,VELX,*Value*

In this case, the velocity load (VELX) applied in the last command will override the displacement load (UX).

For elements used in static and low frequency electromagnetic analysis (SOLID236 and SOLID237), the AZ degree of freedom is not a z-component of a vector potential, but rather the flux contribution on the element edge. To specify a flux-parallel condition, set AZ = 0. For more information, see 3D Magnetostatics and Fundamentals of Edge-based Analysis in the *Low-Frequency Electromagnetic Analysis Guide*.

For ELBOW290 cross-section degrees of freedom (*Lab* = SE, SO, SW, SRA, SRT, or SECT), the **D (p. 483)** command can only specify fixed constraints. The degree-of-freedom value must be zero; no other values are valid.

For hydrostatic fluid elements (HSFLD241 and HSFLD242), the HDSP degree-of-freedom constraint at the pressure node prescribes the pressure value for all the fluid elements sharing the pressure node.

Tabular boundary conditions (*VALUE* = %*tabname*%) are available only for the following degree-of-freedom labels: Electric (VOLT), structural (UX, UY, UZ, ROTX, ROTY, ROTZ, and velocity and acceleration loads VELX, VELY, VELZ, OMGX, OMGY, OMGZ, ACCX, ACCY, ACCZ, DMGX, DMGY, DMGZ), acoustic (PRES, UX, UY, UZ, ENKE), temperature (TEMP, TBOT, TE2, TE3, . . ., TTOP), diffusion (CONC). All labels are valid only in static (**ANTYPE (p. 162)**,STATIC) and full transient (**ANTYPE (p. 162)**,TRANS) analyses.

In a mode-superposition harmonic or transient analysis, you must apply the constraints in the modal portion of the analysis for residual vector (Using the Residual Vector or the Residual Response Method to Improve Accuracy) and enforced motion (Enforced Motion Method for Mode-Superposition Transient and Harmonic Analyses) definitions.

%_FIX% is a Mechanical APDL reserved table name. When *VALUE* is set to %_FIX%, the program prescribes the degree of freedom to the current relative displacement value. This option is valid for the following labels: UX, UY, UZ, ROTX, ROTY, ROTZ. Alternatively, functions UX(), UY(), etc. can be used. (See ***GET (p. 797)** for a list of available functions.) In most cases, %_FIX% usage is efficient and recommended for all structural degrees of freedom.

When *Value* = SUPPORT, specify only the minimum number of displacement constraints necessary to prevent rigid body motion: three constraints (or fewer, depending on the element type) for 2D models and six (or fewer) for 3D models.

If constraints and initial conditions (**IC (p. 921)**) are applied at the same node, the constraint specification overrides. This combination is useful when a constraint degree-of-freedom value needs to start with a nonzero value at time = 0.0. For example, if the constraint degree-of-freedom value is prescribed to be a cosine function, then specifying an initial condition for the same node and degree of freedom ensures that the initial value for the constraint degree of freedom at time = 0.0 is same as the cosine function evaluated at time = 0.0. If initial conditions are not specified, the constraint degree-of-freedom value ramps from zero in the first substep of the first load step.

If more than one rotational degrees of freedom are constrained with non-zero rotations (ROTX, ROTY, ROTZ), rotational velocities (OMGX, OMGY, OMGZ), or rotational accelerations (DMGX, DMGY, DMGZ), then the rotation of the constrained node from its initial configuration to its final configuration depends

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

on the combination and the sequence in which the constraints are applied. See Rotations in a Large-Deflection Analysis in *Structural Analysis Guide*.

This command is also valid in PREP7.

---

DA,*AREA*,*Lab*,*Value1*,*Value2*

Defines degree-of-freedom constraints on areas.

SOLUTION (p. 38): Solid Constraints (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AREA

Area on which constraints are to be specified. If ALL, apply to all selected areas (**ASEL (p. 192)**). If *AREA* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *AREA*.

Lab

Symmetry label (see 1 below):

SYMM

Generate symmetry constraints. Requires no *Value1* or *Value2*.

ASYM

Generate antisymmetry constraints. Requires no *Value1* or *Value2*.

Mechanical APDL degree-of-freedom labels:

UX

Displacement in X direction.

UY

Displacement in Y direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UZ

Displacement in Z direction.

ROTX

Rotation about X axis.

ROTY

Rotation about Y axis.

ROTZ

Rotation about Z axis.

HDSP

Hydrostatic pressure.

PRES

Pressure.

TEMP, TBOT, TE2, TE3, . . ., TTOP

Temperature.

MAG

Magnetic scalar potential (see 2 below).

VOLT

Electric scalar potential (see 3 below).

AZ

Magnetic vector potential in Z direction (see 4 below).

CONC

Concentration.

ALL

Applies all appropriate degree-of-freedom labels *except* HDSP.

Footnotes for *Lab*:

1. Symmetry and antisymmetry constraints are generated as described for the **DSYM (p. 580)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. If *Lab* = MAG and *Value1* = 0, this sets the flux-normal condition for the magnetic scalar potential formulations (MSP) (A flux-parallel condition is the natural boundary condition for MSP.)
3. If *Lab* = VOLT and *Value1* = 0, the J-normal condition is set (current density (J) flow normal to the area). (A J-parallel condition is the natural boundary condition.)
4. For elements SOLID236 and SOLID237, if *Lab* = AZ and *Value1* = 0, this sets the flux-parallel condition for the edge formulation. (A flux-normal condition is the natural boundary condition.) Do *not* use the **DA (p. 487)** command to set the edge-flux degree of freedom, AZ to a nonzero value.

Value1

Value of degree of freedom or table name reference on the area. Valid for all degree-of-freedom labels. To specify a table, enclose the table name in % signs (for example, **DA (p. 487)**,*AREA*,TEMP,%*tabname*%). Use the ***DIM (p. 530)** command to define a table.

Value2

For MAG and VOLT degrees of freedom:

Value of the imaginary component of the degree of freedom.

Notes

You can transfer constraints from areas to nodes via **DTRAN (p. 583)** or **SBCTRAN (p. 1647)**. See **DK (p. 541)** for information about generating other constraints on areas.

Tabular boundary conditions (*VALUE* = %*tabname*%) are available only for the following degree-of-freedom labels: Electric (VOLT), Structural (UX, UY, UZ, ROTX, ROTY, ROTZ), Acoustic (PRES, UX, UY, UZ), and temperature (TEMP, TBOT, TE2, TE3, . . ., TTOP).

Constraints specified by the **DA (p. 487)** command can conflict with other specified constraints. See Resolution of Conflicting Constraint Specifications\ in the *Basic Analysis Guide* for details.

This command is also valid in PREP7.

DADELE, *AREA*, *Lab*

Deletes degree-of-freedom constraints on an area.

SOLUTION (p. 38): Solid Constraints (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AREA

Area for which constraints are to be deleted. If ALL, delete for all selected areas (**ASEL (p. 192)**). If *AREA* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). You can substitute a component name for *AREA*.

Lab

Valid constraint labels are:

ALL

All constraints.

SYMM

Symmetry constraints.

ASYM

Antisymmetry constraints.

UX

Displacement in X direction.

UY

Displacement in Y direction.

UZ

Displacement in Z direction.

ROTX

Rotation about X axis.

ROTY

Rotation about Y axis.

ROTZ

Rotation about Z axis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PRES

Pressure.

TEMP, TBOT, TE2, TE3, . . ., TTOP

Temperature.

MAG

Magnetic scalar potential.

VOLT

Electric scalar potential.

AZ

Magnetic vector potential in Z direction (see notes).

CONC

Concentration.

Notes

Deletes the degree of freedom constraints at an area (and all corresponding finite element constraints) previously specified with the **DA (p. 487)** command. See the **DDELE (p. 505)** command for delete details.

If the multiple species labels have been changed to user-defined labels via the MSSPEC command, use the user-defined labels.

See the **DA (p. 487)** or the **DA (p. 487)** commands for details on element applicability.

> **Warning:**
>
> *On previously meshed areas*, **all** constraints on affected nodes will be deleted, whether or not they were specified by the **DA (p. 487)** command.

This command is also valid in PREP7.

---

DALIST,*AREA*

Lists the DOF constraints on an area.

SOLUTION (p. 38): Solid Constraints (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AREA

List constraints for this area. If ALL (default), list for all selected areas (**ASEL (p. 192)**). If *P1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *AREA*.

Notes

Lists the degree of freedom constraints on an area previously specified with the **DA (p. 487)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>DOF Constraints>On All Areas

Utility Menu>List>Loads>DOF Constraints>On Picked Areas

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DAMORPH,*AREA*,*XLINE*,*RMSHKY*

Move nodes in selected areas to conform to structural displacements.

PREP7 (p. 22): Morphing (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

AREA

Non-structural area to which mesh movement (morph) applies. If ALL, apply morphing to all selected areas [ASEL]. If *AREA* = P, graphical picking is enabled. A component may be substituted for *AREA*.

XLINE

Lines to be excluded from morphing. If ALL, exclude all selected lines [LSEL] from morphing. If *XLINE* = P, graphical picking is enabled. A component may be substituted for *XLINE*. If *XLINE* is blank (default), allow morphing of nodes attached to lines of the selected areas (*AREA*) which are not shared by unselected areas. See Notes for clarification.

RMSHKY

Remesh flag option:

0

Remesh the selected non-structural areas only if mesh morphing fails.

1

Remesh the selected non-structural areas and bypass mesh morphing.

2

Perform mesh morphing only and do not remesh.

Notes

The selected areas should include only non-structural regions adjacent to structural regions. **DAMORPH (p. 494)** will morph the non-structural areas to coincide with the deflections of the structural regions.

Nodes in the structural regions move in accordance with computed displacements. Displacements from a structural analysis must be in the database prior to issuing **DAMORPH (p. 494)**.

By default, nodes attached to lines can move along the lines, or off the lines (if a line is interior to the selected areas). You can use *XLINE* to restrain nodes on certain lines.

By default (*RMSHKEY* = 0), **DAMORPH (p. 494)** will remesh the selected non-structural areas entirely if a satisfactory morphed mesh cannot be provided.

If boundary conditions and loads are applied directly to nodes and elements, the **DAMORPH (p. 494)** command requires that these be removed before remeshing can take place.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Exercise care with initial conditions defined by the **IC (p. 921)** command. Before a structural analysis is performed for a sequentially coupled analysis, the **DAMORPH (p. 494)** command requires that initial conditions be removed from all null element type nodes in the non-structural regions. Use **ICDELE (p. 923)** to delete the initial conditions.

Menu Paths

Main Menu>Preprocessor>Meshing>Modify Mesh>Phys Morphing>Areas

---

DAMPOPT, *Option*, *Value*

Sets damped eigensolver options.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Damped eigensolver option:

SHIFT

Activate or deactivate the shift strategy of the damped eigensolver to move to a frequency range of interest. The *FREQB* value of the **MODOPT (p. 1140)** command is used to choose the first frequency shift (see notes for details).

Valid input for *Value* when *Option* = SHIFT:

OFF

Do not activate the shift strategy.

ON

Activate the shift strategy (default).

MEMORY

Controls the memory allocation strategy for the Damped eigensolver.

Valid input for *Value* when *Option* = MEMORY:

DEFAULT

Default memory configuration (default). Everything is determined dynamically with respect to current machine resources.

INCORE

Fully in-core memory configuration.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

MIX1

First level of mixed in-core / out-of-core configuration.

MIX2

Second level of mixed in-core / out-of-core configuration.

OUTOFCORE

Fully out-of-core memory configuration.

Value

Assigned value for the specified *Option* (as described above).

Command Default

By default, the shift strategy is not activated for the damped eigensolver. This ensures a faster solve process but limits the number of eigenvalues that can be found.

The default memory allocation strategy is used. Mechanical APDL evaluates the resources of the machine to choose the in-core or out-of-core mode.

Notes

DAMPOPT (p. 495) specifies options to be used with the damped eigensolver (**MODOPT (p. 1140)**,DAMP) during a modal analysis (**ANTYPE (p. 162)**,MODAL).

Activating the shift strategy (*Option* = SHIFT and *Value* = ON) enables the eigensolver to find higher frequency eigenvalues that might otherwise be missed. The SHIFT option has two objectives:

- Extract high frequency eigenvalues according to the *FREQB* argument specified with **MODOPT (p. 1140)**.
- Unlock an auto-shift feature, so the algorithm will chain several analyses automatically then aggregate the solutions in one single results set.

If *FREQE* is specified on **MODOPT (p. 1140)**, the specified value is used to filter the complex eigenfrequencies based on magnitude.

When the shift strategy is activated (**DAMPOPT (p. 495)**,SHIFT,ON)

- and *FREQB* on **MODOPT (p. 1140)** is specified, the damped eigensolver only produces eigenfrequencies with a real part greater than *FREQB*
- and *FREQB* on **MODOPT (p. 1140)** is not specified, the damped eigensolver finds eigenvalues closest to the 0 Hz point.

Memory Allocation Option (*Option* = MEMORY)

The damped eigensolver algorithm allocates two main pools of memory:

1. Memory for the internal damped eigensolver iterations.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Memory for the specific damped eigensolver working arrays.

The following table shows how memory is allocated for each option.

Value **(*Option* = MEMORY)**	**Damped Eigensolver**	**Working Arrays**
INCORE	In-Core	In-Core
MIX1	In-Core	Out-of-Core
MIX2	Out-of-Core	In-Core
OUTOFCORE	Out-of-Core	Out-of-Core

The MIX1 configuration typically uses more memory than the MIX2 configuration, except when a large number of modes are requested for a small model.

Example Usage

Example: Shift Option Usage on **DAMPOPT** in the *Structural Analysis Guide*

Menu Paths

This command cannot be accessed from a menu.

DATA, *IR*, *LSTRT*, *LSTOP*, *LINC*, *Name*, *KCPLX*

Reads data records from a file into a variable.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

LSTRT

Start at location *LSTRT* (defaults to 1).

LSTOP

Stop at location *LSTOP* (defaults to *LSTRT*). Maximum location available is determined from data previously stored.

LINC

Fill every *LINC* location between *LSTRT* and *LSTOP* (defaults to 1).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name

Eight character name for identifying the variable on the printout and displays. Embedded blanks are compressed upon output.

KCPLX

Complex number key:

0

Data stored as the real part of the complex number.

1

Data stored as the imaginary part of the complex number.

Notes

This command must be followed by a format statement (on the next line) and the subsequent data records, and all must be on the same file (that may then be read with the **/INPUT (p. 948)** command). The format specifies the number of fields to be read per record, the field width, and the placement of the decimal point (if one is not included in the data value). The read operation follows the available FORTRAN FORMAT conventions of the system. See the system FORTRAN manual for details. Any standard FORTRAN real format (such as (4F6.0), (F2.0,2X,F12.0), etc.) may be used. Integer (I), character (A), and list-directed (*) descriptors may *not* be used. *The parentheses must be included in the format*. Up to 80 columns per record may be read. Locations may be filled within a range. Previous data in the range will be overwritten.

Menu Paths

This command cannot be accessed from a menu.

DATADEF

Specifies "Directly defined data status" as the subsequent status topic.

POST1 (p. 51): Status (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/DBDECRYPT, *KeyA*, *KeyB*, *DataType*, *NUM1*, *NUM2*, *INC*

Controls decryption of material data in the database file.

APDL (p. 19): Encryption/Decryption (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KeyA

Decryption key A (32-character maximum). This key is used to decrypt the data in a one-level encryption or to control access to the data in a two-level encryption. Leave this field blank if you do not have key A.

KeyB

Decryption key B (32-character maximum). This key is used to decrypt the data in a two-level encryption. Leave this field blank if the database file is encrypted with one-level encryption.

DataType

Type of data to decrypt. Must be set to MAT for material data.

NUM1*, *NUM2*, *INC

Decrypt materials from material number *NUM1* to *NUM2* (defaults to *NUM1*) in steps of *INC* (defaults to 1). If *NUM1* = ALL (default), *NUM2* and *INC* are ignored.

Notes

This command decrypts data in the database file. It must be issued before resuming the database file (**RESUME (p. 1601)** command). Only *KeyA* is required for a one-level encryption. For a two-level encryption, inputting *KeyB* gives you partial access to the data. Inputting both *KeyA* and *KeyB* gives you full access.

For more information about using **/DBDECRYPT (p. 499)** in the encryption/decryption procedure, see Encrypting Material Data in the *Ansys Parametric Design Language Guide*. See also the **/DBENCRYPT (p. 500)** command.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/DBENCRYPT, *KeyA*, *KeyB*, *DataType*, *NUM1*, *NUM2*, *INC*

Controls encryption of material data in the database file.

APDL (p. 19): Encryption/Decryption (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KeyA

Encryption key A (32-character maximum). This key is used to encrypt the data in a one-level encryption or to control access to the data in a two-level encryption.

KeyB

Encryption key B (32-character maximum). This key is used to encrypt the data in a two-level encryption . If *KeyB* is not specified, a one-level encryption is used to encrypt the data.

DataType

Type of data to encrypt. Must be set to MAT for material data.

NUM1*, *NUM2*, *INC

Encrypt materials from material number *NUM1* to *NUM2* (defaults to *NUM1*) in steps of *INC* (defaults to 1). If *NUM1* = ALL (default), *NUM2* and *INC* are ignored.

Notes

This command encrypts data in the database file. It must be issued before saving the database file (**SAVE (p. 1645)** command).

For a one-level encryption, specify only *KeyA* and set *NUM1* to ALL. (*NUM2* and *INC* are not used.)

For a two-level encryption, specify both *KeyA* and *KeyB*. Also specify *NUM1*, *NUM2*, and *INC* as needed.

For more information about using **/DBENCRYPT (p. 500)** in the encryption/decryption procedure, see Encrypting Material Data in the *Ansys Parametric Design Language Guide*. See also the **/DBDECRYPT (p. 499)** command.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DCGOMG, *DCGOX*, *DCGOY*, *DCGOZ*

Specifies the rotational acceleration of the global origin.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DCGOX, DCGOY, DCGOZ

Rotational acceleration of the global origin about the acceleration system X, Y, and Z axes.

Notes

Specifies the rotational acceleration of the global origin about each of the acceleration coordinate system axes (**CGLOC (p. 319)**). Rotational accelerations may be defined in these analysis types:

- Static (**ANTYPE (p. 162)**,STATIC)
- Harmonic (**ANTYPE (p. 162)**,HARMIC) -- full, VT [1], Krylov [1], or mode-superposition [2]
- Transient (**ANTYPE (p. 162)**,TRANS) -- full or mode-superposition [2]
- Substructuring (**ANTYPE (p. 162)**,SUBSTR)
- Modal (**ANTYPE (p. 162)**,MODAL)

1. Loads for VT and Krylov methods are supported as long as they are not:
   - complex tabulated loads (constant or trapezoidal loads in tabulated form are supported)
   - used in conjunction with Rotordynamics (**CORIOLIS (p. 417)**,on).
2. In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

See Acceleration Effect in the *Mechanical APDL Theory Reference* for details. Units are radians/time^2.

The **DCGOMG (p. 501)** command supports tabular boundary conditions (%*TABNAME_X*%, %*TABNAME_Y*%, and %*TABNAME_Z*%) for *DCGOMG_X*, *DCGOMG_Y*, and *DCGOMG_Z* input values (***DIM (p. 530)**) for full transient and harmonic analyses.

Related commands are **ACEL (p. 92)**, **CGLOC (p. 319)**, **CGOMGA (p. 320)**, **DOMEGA (p. 571)**, and **OMEGA (p. 1324)**.

See Analysis Tools in the *Theory Reference* for more information.

This command is also valid in PREP7.

---

DCUM, *Oper*, *RFACT*, *IFACT*, *TBASE*

Specifies that DOF constraint values are to be accumulated.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Oper

Accumulation key:

REPL

Subsequent values replace the previous values (default).

ADD

Subsequent values are added to the previous values.

IGNO

Subsequent values are ignored.

RFACT

Scale factor for the real component. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor.

IFACT

Scale factor for the imaginary component. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor.

TBASE

Base temperature for temperature difference. Used only with temperature degree of freedom. Scale factor is applied to the temperature difference (*T*-*TBASE*) and then added to *TBASE*. *T* is the current temperature.

Command Default

Replace previous values.

Notes

Allows repeated degree of freedom constraint values (displacement, temperature, etc.) to be replaced, added, or ignored. Operations apply to the selected nodes (**NSEL (p. 1266)**) and the selected degree of

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

freedom labels (**DOFSEL (p. 569)**). This command also operates on velocity and acceleration loads applied in a structural analysis.

The operations occur when the next degree of freedom constraints are defined. For example, issuing the command **D (p. 483)**,1,UX,.025 after a previous **D (p. 483)**,1,UX,.020 causes the new value of the displacement on node 1 in the x-direction to be 0.045 with the add operation, 0.025 with the replace operation, or 0.020 with the ignore operation. Scale factors are also available to multiply the next value before the add or replace operation. A scale factor of 2.0 with the previous "add" example results in a displacement of 0.070. Scale factors are applied even if no previous values exist. Issue **DCUM (p. 502)**,STAT to show the current label, operation, and scale factors. Solid model boundary conditions are not affected by this command, but boundary conditions on the FE model are affected.

Note:

FE boundary conditions may still be overwritten by existing solid model boundary conditions if a subsequent boundary condition transfer occurs.

DCUM (p. 502) does not work for tabular boundary conditions.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Settings>Replace vs Add>Constraints

Main Menu>Solution>Define Loads>Settings>Replace vs Add>Constraints

---

DDASPEC,*KeyRef*,*Shptyp*,*MountLoc*,*Deftyp*,*Amin*

Specifies the shock spectrum computation constants for DDAM analysis.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KeyRef

Key for reference catalog:

1

The spectrum computation constants are based on NRL-1396 (default). For more information, see Dynamic Design Analysis Method in the *Mechanical APDL Theory Reference*

Shptyp

Select the ship type:

SUBM

Submarine

SURF

Surface ship

MountLoc

Select the mounting location:

HULL

Hull mounting location. These structures are mounted directly to basic hull structures like frames, structural bulkheads below the water line, and shell plating above the water line.

DECK

Deck mounting location. These structures are mounted directly to decks, non-structural bulkheads, or to structural bulkheads above the water line.

SHEL

Shell plating mounting location. These structures are mounted directly to shell plating below the water line without intervening foundations.

Deftyp

Select the deformation type:

ELAS

Elastic deformation (default)

PLAS

Elastic-plastic deformation

Amin

Minimum acceleration value. It defaults to 6g, where g is the acceleration due to gravity.

Notes

The excitation along one of the fore and aft, vertical or athwartship directions is required to calculate the spectrum coefficients. Issue the **SED (p. 1704)** command before issuing **DDASPEC (p. 503)**. For example, if you want to apply the excitation along the fore and aft direction, you should specify *SEDX* = 1.0 on **SED (p. 1704)**. Similarly, for excitation along vertical or athwartship direction, specify *SEDY* = 1.0 or *SEDZ* = 1.0, respectively, on **SED (p. 1704)**.

ADDAM (p. 96) and **VDDAM (p. 2081)** may alternatively be used to calculate spectrum coefficients.

In order to perform a DDAM spectrum analysis using a units system other than BIN (default), you must specify the units system complying with the mass and length units of the model using the **/UNITS (p. 2054)** command. Issue the **/UNITS (p. 2054)** command before defining the shock spectrum computation constants (**DDASPEC (p. 503)**). The DDASPEC command is not supported with the user-defined units system (`Label` = USER on **/UNITS (p. 2054)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is also valid in PREP7.

Menu Paths

This command cannot be accessed from a menu.

DDELE, *NODE*, *Lab*, *NEND*, *NINC*, *Rkey*, *IRSTRTFLAG*

Deletes degree-of-freedom constraints.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Node for which constraint is to be deleted. If ALL, *NEND* and *NINC* are ignored and constraints for all selected nodes (**NSEL (p. 1266)**) are deleted. If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE*.

Lab

Valid degree of freedom label. If ALL, use all selected labels (**DOFSEL (p. 569)**). Structural labels: UX, UY, or UZ (displacements); ROTX, ROTY, or ROTZ (rotations); WARP (warping). Thermal labels: TEMP, TBOT, TE2, TE3, . . ., TTOP (temperature). Acoustic labels: PRES (pressure); UX, UY, or UZ (displacements for FSI coupled elements). Electric label: VOLT (voltage). Magnetic labels: MAG (scalar magnetic potential); AZ (vector magnetic potential). Diffusion label: CONC (concentration).

In structural analyses, the following velocity and acceleration load labels are also valid: VELX, VELY, VELZ (translational velocities); OMGX, OMGY, OMGZ (rotational velocities); ACCX, ACCY, ACCZ (translational accelerations); DMGX, DMGY, DMGZ (rotational accelerations).

In structural analyses, HDSP (hydrostatic pressure) is also valid.

If the node is connected to an ELBOW290 element, the following pipe cross-section degree of freedom labels are also valid: SE, SO, SW, SRA, and SRT. (For details, see the ELBOW290 documentation.) The degrees of freedom are *not* included when *Lab* = ALL. To constrain *all* cross-section degrees of freedom, specify *Lab* = SECT.

NEND*, *NINC

Delete constraints from *NODE* to *NEND* (defaults to *NODE*) in steps of *NINC* (defaults to 1).

Rkey

Ramping option:

OFF

Loads are step-removed (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON or FORCE

Forces on the specified degrees of freedom (*Lab*) are ramped during the next load step. The forces are ramped from the reaction forces of the previous load step, regardless of whether or not a constraint was present. If the specified node(s) and degree(s) of freedom has a force value currently defined, the force is ramped from the reaction-force value to the currently applied force value. If no force is currently applied, the force is ramped from the reaction-force value to zero. The ramping behavior is not in effect if the subsequent force is applied in tabular format.

For degrees of freedom other than structural and TEMP,[1] when performing a restart at an intermediate point during a load step,[2] the reaction-force data is not available. Therefore, the force is ramped from zero to the currently applied force value (if it exists) for the specified node(s) and degree(s) of freedom.

For structural and TEMP degrees of freedom, [1] during a restart from an intermediate point during a load step,[2] the reaction-force data is available. Therefore, it is ramped down during this restart step if no other loads are applied. See "Notes" (p. 506) for more information about the behavior of this option.

IRSTRTFLAG

Controls how the **DDELE (p. 505)** information is used during a restart analysis.

0

Retain the **DDELE (p. 505)** information for subsequent restart analysis (default).

1

Ignore the **DDELE (p. 505)** information for subsequent restart analysis.

See "Notes" (p. 506) for more information about this argument.

Notes

Deleting a constraint is not the same as setting it to zero (which fixes the degree of freedom to a zero value). Deleting a constraint has the same effect as deactivating, releasing, or setting the constraint free. The node and the degree-of-freedom label must be selected (**NSEL (p. 1266)**, **DOFSEL (p. 569)**).

For structural degrees of freedom,[1] the following limitation exists when the analysis is restarted:

- If a new force is applied (**F (p. 729)**) upon restart of the load step during which **DDELE (p. 505)**,*NODE*,*DofLabel*,,,RFORCE (or ON) was issued (and *IRSTRTFLAG* = 0), the force shows a jump to the current value at the time of restart before being ramped to its final value.

Upon restart, it is good practice to allow the reaction force to ramp down to zero in a load step, then to apply new loads in the next load step.

[1] UX, UY, YZ, ROTX, ROTY, and ROTZ

[2] Not at the beginning or end of a load step.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If you determine that a restart analysis is unnecessary, you can set *IRSTRTFLAG* = 1 to avoid the storage overhead associated with **DDELE (p. 505)** information. This flag is especially useful in an analysis involving a large model where **DDELE (p. 505)** may be specified on many nodes and degrees of freedom, but where a restart analysis will not occur.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DDOPTION, *Decomp*, *NPROCPERSOL*, *NUMSOLFORLP*

Sets domain decomposer option for a distributed-memory parallel (DMP) solution.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Decomp

Controls which domain decomposition algorithm to use.

AUTO

Automatically selects the optimal domain decomposition method (default).

MESH

Decompose the FEA mesh.

FREQ

Decompose the frequency domain for harmonic analyses.

CYCHI

Decompose the harmonic indices for cyclic symmetry modal analyses.

NPROCPERSOL

Number of processes to be used for mesh-based decomposition in conjunction with each frequency solution (*Decomp* = FREQ) or harmonic index solution (*Decomp* = CYCHI). Defaults to 1. This field is ignored when *Decomp* = MESH.

NUMSOLFORLP

Number of frequency or harmonic index solutions in a subsequent linear perturbation harmonic or linear perturbation cyclic modal analysis. This field is ignored when *Decomp* = MESH.

Command Default

The optimal algorithm for domain decomposition is automatically chosen.

Notes

This command controls options related to the domain decomposition algorithm used in a distributed-memory parallel (DMP) solution to split the analysis calculations into domains, with each domain being solved on a different process.

By default, the optimal domain decomposition algorithm (MESH, FREQ, or CYCHI) is automatically chosen. When FREQ (for a harmonic analysis) or CYCHI (for a cyclic symmetry modal analysis) is automatically chosen, the *NPROCPERSOL* argument is also automatically set to a value ≥ 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The "mesh" algorithm (*Decomp* = MESH) divides the finite element mesh into domains. In this case, domains are effectively groups of elements, with one domain being solved on each process. This algorithm seeks to create evenly sized domains (that is, domains with equal numbers of elements) as well as to minimize the size of interfaces between the newly created domains. This algorithm can be used for all analysis types.

The "frequency" algorithm (*Decomp* = FREQ) divides the specified frequency range for a harmonic analysis into domains. In this case, domains are effectively groups of frequency solutions, with one domain being solved on *NPROCPERSOL* processes. If there are more processes than frequency points, some processes will remain idle during the harmonic analysis solution. This algorithm seeks to create evenly sized domains. However, if the number of processes does not divide evenly into the number of frequency solutions, the efficiency of the parallel solution will be reduced. This algorithm can only be used for harmonic analyses using the auto (**HROPT (p. 912)**,AUTO), full (**HROPT (p. 912)**,FULL), frequency-sweep (**HROPT (p. 912)**,VT), or Krylov (**HROPT (p. 912)**,KRYLOV) method.

The "cyclic" algorithm (*Decomp* = CYCHI) divides the specified list of harmonic indices for a cyclic symmetry modal analysis into domains. In this case, domains are effectively groups of cyclic harmonic indices, with one domain being solved on *NPROCPERSOL* processes. If there are more processes than harmonic indices, some processes will remain idle during the cyclic model solution. This algorithm seeks to create evenly sized domains. However, if the number of processes does not divide evenly into the number of harmonic indices, the efficiency of the parallel solution will be reduced.

For the mesh algorithm (MESH), all available processes are used. This is not necessarily the case for the frequency and cyclic algorithms (FREQ and CYCHI).

NPROCPERSOL is only used when *Decomp* = FREQ or CYCHI. It defaults to 1, which essentially means that no mesh-based domain decomposition occurs. When *NPROCPERSOL* is defined to be greater than 1, a combination of FREQ or CYCHI decomposition and MESH decomposition is employed. As an example, consider a harmonic analysis with 50 requested frequency points (**NSUBST (p. 1287)**,50) that uses distributed processing with 100 CPU cores (`-dis -np` 100). Specifying **DDOPTION (p. 508)**,FREQ,2 would lead to 50 parallel sets of calculations, each working on a different frequency point and using 2 cores for mesh-based domain decomposition (that is, 2 groups of elements per frequency).

DDOPTION (p. 508) must be issued prior to solving the first load step. Once the first load step is completed, this command cannot be used to change the domain decomposition method. The only exception is for analyses which use the linear perturbation procedure.

In a linear perturbation analysis, **DDOPTION (p. 508)** must be entered prior to the **SOLVE (p. 1822)**,ELFORM command. In addition, the number of frequency solutions (in a subsequent harmonic analysis) or harmonic index solutions (in a subsequent cyclic modal analysis) must be input via the *NUMSOLFORLP* argument to enable proper domain decomposition to occur at the **SOLVE (p. 1822)**,ELFORM stage of the linear perturbation analysis. For more information, see Linear Perturbation Analysis in the *Structural Analysis Guide*

For more information and recommendations on how to choose the domain decomposition method, see Differences in Solution Processing in the *Parallel Processing Guide*.

For the frequency and the cyclic algorithms, solution information for the harmonic frequencies (*Decomp* = FREQ) or cyclic harmonic indices (*Decomp* = CYCHI) solved by the worker processes is only written to the output files for those processes (`Jobname`*n*`.OUT`). See Differences in General Behavior in the *Parallel Processing Guide* for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

DEACT

Specifies "Element birth and death" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Elem Birth/Death

/DECRYPT,*Key1*,*Key2*

Controls decryption of command input.

APDL (p. 19): Encryption/Decryption (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key1

Key to decrypt the encrypted input created by **/ENCRYPT (p. 634)**. The only valid label is PASSWORD.

Key2

Key to decrypt the encrypted input or to set the global encryption key. The following are valid inputs:

- If *Key2* = OPENSSL or is blank, then decryption commences and the previously set global encryption key is used for decryption.
- If *Key2* has a value, then that value is set as the global encryption key.
- If *Key2* = OFF, then the global encryption password previously set by the command **/DECRYPT (p. 510)**,PASSWORD,*Key2* is reset.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

When decrypting an encrypted input, /DECRYPT,PASSWORD,OPENSSL must appear as the first line of the encrypted file. The line is inserted automatically when you issue **/ENCRYPT (p. 634)** to create the encrypted file.

To read an encrypted file, enter **/DECRYPT (p. 510)**,PASSWORD,*Key2* anywhere in the standard input file to set the global encryption key. The encryption key must be set before reading in the encrypted input.

/DECRYPT (p. 510) is also valid when entered in the Command Input Window of the Mechanical APDL user interface.

See Encrypting Command Input and Other Data in the *Ansys Parametric Design Language Guide* for more information about using **/DECRYPT (p. 510)** and performing encryption and decryption.

Menu Paths

This command cannot be accessed from a menu.

DEFINE

Specifies "Data definition settings" as the subsequent status topic.

POST1 (p. 51): Status (p. 58)
POST26 (p. 58): Status (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (Jobname.log) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>General Postproc>Read Options

Utility Menu>List>Status>TimeHist Postproc>Variables

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*DEL, *Val1*, *Val2*

Deletes a parameter or parameters (GUI).

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Val1

Command behavior key:

ALL --

Delete all user-defined parameters, or all user-defined parameters *and* all system parameters, as specified by *Val2*.

(blank) --

Delete the parameter(s) specified by *Val2*.

***ParmName* --**

Delete a single named parameter, specified here. (*Val2* is not used in this case.)

Val2

The parameter or parameters to delete (used only when *Val1* = ALL or (blank)):

***LOC* --**

When *Val1* is (blank), specifies the location of the parameter within the Array Parameters dialog box. The location number is based on an alphabetically ordered list of all parameters in the database.

_PRM --

When *Val1* is ALL, deletes all parameters, including those named with a leading underscore (_) (except _STATUS and _RETURN). When *Val1* is (blank), deletes only those parameters named with a leading underscore (_) (except _STATUS and _RETURN).

PRM_ --

When *Val1* is (blank), deletes only those parameters named with a trailing underscore (_).

(blank) --

When *Val1* is ALL, a (blank) value for *Val2* causes *all* user-defined parameters to be deleted.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This is a command generally created by the graphical user interface (GUI). It appears in the log file (`Jobname.log`) if an array parameter is deleted from within the Array Parameters dialog.

Usage examples:

- Delete all user-defined parameters: ***DEL (p. 512)**,ALL
- Delete only those user-defined parameters named with a trailing underscore: ***DEL (p. 512)**,,PRM_
- Delete all user-defined *and* all system parameters (except for _STATUS and _RETURN): ***DEL (p. 512)**,ALL,_PRM
- Delete a parameter by specifying its location within the Array Parameters dialog: ***DEL (p. 512)**,,*LOC*
- Delete a single specified parameter by name: ***DEL (p. 512)**,*ParmName* (You cannot specify more than one named parameter at a time.)

The ***DEL (p. 512)** command does not free up memory but only deletes the specified reference. For example, memory usage increases from the continued issuance of ***DEL (p. 512)** and ***DIM (p. 530)** within ***DOWHILE (p. 573)** loops, as arrays are stored in the database (memory) and ***DEL (p. 512)** removes only the *reference* to the array. To release the memory in use, issue the **SAVE (p. 1645)** command after ***DEL (p. 512)**.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

DELETE,*SET*,*Nstart*,*Nend*

Specifies sets in the results file to be deleted before postprocessing.

AUX3 (p. 61): Results Files (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SET

Specifies that sets in the results file are to be deleted.

Nstart

The first set in a results file to be deleted.

Nend

The final set in a results file to be deleted. This field is used only if deleting more than one sequential sets.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

DELETE (p. 513) is a specification command that flags sets in the results file for deletion. It should be followed by a **COMPRESS (p. 408)** command, the corresponding action command that *deletes* the specified sets.

The **DELETE (p. 513)** command is valid only in the results file editing processor (auxiliary processor AUX3).

Menu Paths

This command cannot be accessed from a menu.

/DELETE,*Fname*,*Ext*,--,*DistKey*

Deletes a file.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to the current Jobname.

Ext

Filename extension (eight-character maximum).

--

Unused field.

DistKey

Key that specifies which file deletion action is performed on all processes in distributed-memory parallel mode:

0 (OFF or NO)

The program performs the file deletion only on the master process (default).

1 (ON or YES)

The program performs the file deletion locally on each process.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2 or BOTH

The program performs file deletion for *Fname*.*Ext* on the master process and for *FnameN*.*Ext* on all processes.

Notes

In distributed-memory parallel (DMP) mode, only the master process will delete *Fname*.*Ext* by default. However, when *DistKey* is set to 1 (or ON, or YES) or 2 (or BOTH), the command is executed by all processes. In this case, *Fname* will automatically have the process rank appended to it. This means *FnameN*.*Ext* will be deleted by all processes, where *N* is the DMP process rank. For more information see Differences in General Behavior in the *Parallel Processing Guide*.

Menu Paths

Utility Menu>File>File Operations>Delete

DELTIM, *DTIME*, *DTMIN*, *DTMAX*, *Carry*

Specifies the time step sizes to be used for the current load step.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DTIME

Time step size for this step. If automatic time stepping is used (**AUTOTS (p. 207)**), *DTIME* is the starting time substep.

If contact elements (TARGE169, TARGE170, CONTA172, CONTA174, CONTA175, or CONTA177) are used, defaults to *TIME* or *TIME*/20 (where *TIME* is the time at the end of the load step as set on the **TIME (p. 2000)** command), depending on the physics of the model. If none of these contact elements are used, defaults to *TIME*.

DTMIN

Minimum time step (if automatic time stepping is used). The program automatically determines the default based on the physics of the model.

DTMAX

Maximum time step (if automatic time stepping is used). The program automatically determines the default based on the physics of the model.

Carry

Time step carry over key:

OFF

Use *DTIME* as time step at start of each load step.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON

Use final time step from previous load step as the starting time step (if automatic time stepping is used).

The program automatically determines the default based on the physics of the model.

Notes

See **NSUBST (p. 1287)** for an alternative input.

Use consistent values for *DTIME* and *TIME* (**TIME (p. 2000)**). For example, using 0.9 for *DTIME* and 1.0 for *TIME* results in one time step because 1.0 (*TIME*) is divisible by .9 (*DTIME*) at most once. If you intend to load in 10 increments over a time span of 1.0, use 0.1 for *DTIME* and 1.0 for *TIME*.

The program calculates the initial incremental time so that (*EndingTime* - *StartingTime*)/*DTIME* is an integer, which may affect the initial incremental time that you specify. For example, if the starting time is 0, the ending time is 1, and the initial incremental time is 0.4, the program rounds to the nearest integer and adjusts the time to 0.33333.

For solution efficiency, specify values for all fields of this command.

Changing the time step size upon restarting an analysis during a load step is not recommended. You should only change the time step size between load steps.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Sol'n Controls>Basic

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>Time - Time Step

Main Menu>Solution>Analysis Type>Sol'n Controls>Basic

Main Menu>Solution>Load Step Opts>Time/Frequenc>Time - Time Step

---

DEMORPH, *ELEM*, *DIMN*, *RMSHKY*

Move nodes in selected elements to conform to structural displacements.

PREP7 (p. 22): Morphing (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Non-structural elements to which mesh movement (morph) applies. If ALL, apply morphing to all selected elements (**ESEL (p. 661)**). If ELEM = P, graphical picking is enabled. A component may be substituted for ELEM.

DIMN

Problem dimensionality. Use "2" for a 2D problem and "3" for a 3D problem (no default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RMSHKY

Remesh flag option:

0

Remesh the selected non-structural regions only if mesh morphing fails.

1

Remesh the selected non-structural regions and bypass mesh morphing.

2

Perform mesh morphing only and do not remesh.

Notes

The selected elements should include only non-structural regions adjacent to structural regions. The exterior nodes of the selected elements will usually be on the boundary of the region which will have node positions displaced. For *DIMN* = 2, elements must lie on a flat plane. The **DEMORPH (p. 516)** command requires a single domain grouping of elements be provided (multiple domains of elements are not permitted). Exterior nodes will be assumed fixed (no nodes will be morphed) unless they coincide with structural nodes having nonzero displacements.

Nodes in the structural regions move in accordance with computed displacements. Displacements from a structural analysis must be in the database prior to issuing **DEMORPH (p. 516)**.

By default (*RMSHKY* = 0), **DEMORPH (p. 516)** will remesh the selected non-structural regions entirely if a satisfactory morphed mesh cannot be provided.

If boundary conditions and loads are applied directly to nodes and elements, the **DEMORPH (p. 516)** command requires that these be removed before remeshing can take place.

Exercise care with initial conditions defined by the **IC (p. 921)** command. Before a structural analysis is performed for a sequentially coupled analysis, the **DEMORPH (p. 516)** command requires that initial conditions be removed from all null element type nodes in the non-structural regions. Use **ICDELE (p. 923)** to delete the initial conditions.

Menu Paths

Main Menu>Preprocessor>Meshing>Modify Mesh>Phys Morphing>Elements

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DERIV,*IR*,*IY*,*IX*,--,*Name*,--,--,*FACTA*

Differentiates a variable.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IY,IX

Reference numbers of variables to be operated on. *IY* is differentiated with respect to *IX*.

--

Unused field.

Name

Thirty-two character name for identifying the variable on printouts and displays. Embedded blanks are compressed for output.

--,--

Unused fields.

FACTA

Scaling factor (positive or negative) applied as shown below (defaults to 1.0).

Notes

Differentiates variables according to the operation:

IR = *FACTA* x d(*IY*)/d(*IX*)

Variable *IX* must be in ascending order.

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Derivative

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DESIZE, *MINL*, *MINH*, *MXEL*, *ANGL*, *ANGH*, *EDGMN*, *EDGMX*, *ADJF*, *ADJM*

Controls default element sizes.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MINL

Minimum number of elements that will be attached to a line when using lower-order elements (defaults to 3 elements per line). If *MINL* = DEFA, all arguments will be set back to default values. If *MINL* = STAT, list status of command (Including on/off status). If *MINL* = OFF, deactivate default element sizing. If *MINL* = ON, reactivate default element sizing.

MINH

Minimum number of elements that will be attached to a line when using higher-order elements. Defaults to 2 elements per line.

MXEL

Maximum number of elements that will be attached to a single line (lower or higher-order elements). Defaults to 15 elements per line for h-elements. To deactivate this limit, specify a large number (such as 9999).

ANGL

Maximum spanned angle per lower-order element for curved lines. Defaults to 15 degrees per element.

ANGH

Maximum spanned angle per higher-order element for curved lines. Defaults to 28 degrees per element.

EDGMN

Minimum element edge length. Defaults to no minimum edge length. The *MINL* or *MINH* argument can override this value.

EDGMX

Maximum element edge length. Defaults to no maximum edge length. The *MXEL* argument can override this value.

ADJF

Target aspect ratio for adjacent line. Used only when free meshing. Defaults to 1.0, which attempts to create equal-sided h-elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ADJM

Target aspect ratio for adjacent line. Used only when map meshing. Defaults to 4.0, which attempts to create rectangular h-elements.

Command Default

Default settings as described for each argument are used.

Notes

DESIZE (p. 519) settings are usually used for mapped meshing. They are also used for free meshing if SmartSizing is turned off (**SMRTSIZE (p. 1811)**,OFF), which is the default. Even when SmartSizing is on, some **DESIZE (p. 519)** settings (such as maximum and minimum element edge length) can affect free mesh density. The default settings of the **DESIZE (p. 519)** command are used only when no other element size specifications (**KESIZE (p. 978)**, **LESIZE (p. 1041)**, **ESIZE (p. 668)**) exist for a certain line.

This command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Size Cntrls>ManualSize>Global>Other

Main Menu>Solution>Manual Rezoning>Create Remesh Zone(s)>Mesh Controls>Default Element Sizing Options

---

DESOL, *ELEM*, *NODE*, *Item*, *Comp*, *V1*, *V2*, *V3*, *V4*, *V5*, *V6*

Defines or modifies solution results at a node of an element.

POST1 (p. 51): Set Up (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element number for which results are defined or modified. If ALL, apply to all selected elements (**ESEL (p. 661)**).

NODE

Node of element (actual node number, not the position) to which results are specified. If ALL, specify results for all selected nodes (**NSEL (p. 1266)**) of element. If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE*.

Item

Label identifying results. Valid item labels are shown in Table 105: DESOL - Valid Item and Component Labels (p. 521) below. Some items also require a component label (*Comp*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Comp

Component of the item (if required); see Table 105: DESOL - Valid Item and Component Labels (p. 521).

V1

Value (in the element coordinate system) assigned to the database item (and component, if any). If zero, a zero value will be assigned. If blank, value remains unchanged.

V2, V3, V4, . . . , V6

Additional values (if any) assigned to the remaining components (in the order corresponding to the *Comp* list shown below) for the specified *Item* (starting from the specified *Comp* label and proceeding to the right).

Notes

The **DESOL (p. 520)** command defines or modifies solution results in the database at a node of an area or volume element. For example, **DESOL (p. 520)**,35,50,S,X,1000,2000,1000 assigns values 1000, 2000, and 1000 to SX, SY, and SZ (respectively) of node 50 of element 35.

The settings of the POST1 **FORCE (p. 772)**, **SHELL (p. 1784)**, and **LAYER (p. 1015)** commands, if applicable, further specify which database items are affected.

For layered composite shells, specify the current element layer (**LAYER (p. 1015)**) *before* issuing the **DESOL (p. 520)** command.

All data is stored in the solution coordinate system but is displayed in the results coordinate system (**RSYS (p. 1639)**). To list the current results, use the **PRESOL (p. 1481)** command.

Modified solution results are not saved automatically. To save separate records of modified results, use either the **RAPPND (p. 1570)** or **LCWRITE (p. 1031)** command.

Result items are available depending on element type; check the individual element for availability. Valid item and component labels for element results are:

Table 105: DESOL - Valid Item and Component Labels

Item	Comp	Description
ELEM		Element number.
S	X, Y, Z, XY, YZ, XZ	Component stress.
EPEL	X, Y, Z, XY, YZ, XZ	Component elastic strain.
EPTH	X, Y, Z, XY, YZ, XZ	Component thermal strain.
EPPL	X, Y, Z, XY, YZ, XZ	Component plastic strain.
EPCR	X, Y, Z, XY, YZ, XZ	Component creep strain.
EPSW		Swelling strain.
NL	SEPL	Equivalent stress (from stress-strain curve).
"	SRAT	Stress state ratio.
"	HPRES	Hydrostatic pressure.
"	EPEQ	Accumulated equivalent plastic strain.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item	Comp	Description
"	CREQ	Accumulated equivalent creep strain.
"	PSV	Plastic state variable.
"	PLWK	Plastic work/volume.
SEND	ELASTIC	Elastic strain energy density.
"	PLASTIC	Plastic strain energy density.
"	CREEP	Creep strain energy density.
TG	X, Y, Z	Component thermal gradient.
TF	X, Y, Z	Component thermal flux.
PG	X, Y, Z	Component pressure gradient.
EF	X, Y, Z	Component electric field.
D	X, Y, Z	Component electric flux density.
H	X, Y, Z	Component magnetic field intensity.
B	X, Y, Z	Component magnetic flux density.
CG	X, Y, Z	Concentration gradient
DF	X, Y, Z	Diffusion flux density
FMAG	X, Y, Z	Component electromagnetic force.
F	X, Y, Z	X, Y, or Z structural force.
M	X, Y, Z	X, Y, or Z structural moment.
HEAT		Heat flow.
FLOW		Fluid flow.
AMPS		Current flow.
FLUX		Magnetic flux.
CSG	X, Y, Z	X, Y, or Z magnetic current segment component.
RATE		Diffusion flow rate

Menu Paths

Main Menu>General Postproc>Define/Modify>Elem Results

DETAB, *ELEM*, *Lab*, *V1*, *V2*, *V3*, *V4*, *V5*, *V6*

Modifies element table results in the database.

POST1 (p. 51): Set Up (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element for which results are to be modified. If ALL, modify all selected elements (**ESEL (p. 661)**) results. If *ELEM* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *ELEM*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Lab

Label identifying results. Valid labels are as defined with the **ETABLE (p. 687)** command. Issue **ETABLE (p. 687)**,STAT to display labels and values.

V1

Value assigned to this element table result in the database. If zero, a zero value will be assigned. If blank, value remains unchanged.

V2, V3, V4, . . . , V6

Additional values (if any) assigned to consecutive element table columns.

Notes

Modifies element table (**ETABLE (p. 687)**) results in the database. For example, **DETAB (p. 522)**,35,ABC,1000,2000,1000 assigns 1000, 2000, and 1000 to the first three table columns starting with label ABC for element 35. Use the **PRETAB (p. 1490)** command to list the current results. After deleting a column of data using **ETABLE (p. 687)**,*Lab*,ERASE, the remaining columns of data are not shifted to compress the empty slot. Therefore, the user must allocate null (blank) values for *V1*, *V2*...*V6* for any ETABLE entries which have been deleted by issuing **ETABLE (p. 687)**,*Lab*,ERASE. All data are stored in the solution coordinate system but will be displayed in the results coordinate system (**RSYS (p. 1639)**).

Menu Paths

Main Menu>General Postproc>Define/Modify>ElemTabl Data

/DEVICE, *Label*, *KEY*

Controls graphics device options.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Device function label:

BBOX

Bounding box mode. For PowerGraphics plots involving elements with **/SHOW (p. 1785)**,x11 and **/SHOW (p. 1785)**,win32, Mechanical APDL generally displays dynamic rotations faster. If KEY = 1 (ON), then a bounding box (not the elements) encompassing the model is displayed and rotated, rather than the element outlines (ON is default in preprocessing). When KEY = 0 (OFF), then dynamic rotations may be slower (Mechanical APDL redraws the element outlines) for plots involving elements with **/SHOW (p. 1785)**,x11 and **/SHOW (p. 1785)**,win32. OFF is default in postprocessing. This command is ignored if **/EDGE (p. 594)**,WN,1 is set for any WN. This is ignored in POST1 and SOLUTION plots.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For any PowerGraphics plots involving elements, regardless of **/SHOW (p. 1785)** settings, plots will generally be displayed faster.

VECTOR

Vector mode. In vector mode, areas, volumes, elements, and postprocessing display geometries are shown as outlines (wireframes). When vector mode is off (default), these entities are shown filled with color.

DITHER

When dithering is turned on (default), color intensity transitions are smoothed. This selection a

applies only to smooth-shaded images, that is, Z-buffered (**/TYPE (p. 2034)**), or raster plots with Gouraud or Phong shading (**/SHADE (p. 1783)**).

ANIM

Select the animation type used on 2D devices on the PC platform. A *KEY* value of BMP (or 0) sets animation mode to the Mechanical APDL animation controller (default). A *KEY* value of AVI (or 2) sets animation mode to AVI movie player file.

FONT

Font selection for the Mechanical APDL graphics window. When *Label* = FONT, the command format is: **/DEVICE (p. 523)**,FONT,*KEY*,*Val1*,*Val2*,*Val3*,*Val4*,*Val5*,*Val6* where *KEY* determines the type of font being controlled, and values 1 through 6 control various font parameters. *These values are device specific; using the same command input file* (**/INPUT (p. 948)**) *on different machines may yield different results.*. The following *KEY* values determine the font information that will be supplied to the appropriate driver (for example, Postscript, X11, Win32, JPEG, ...):

***KEY* = 1**

The command controls the LEGEND (documentation column) font.

***KEY* = 2**

The command controls the ENTITY (node and keypoint number) font.

***KEY* = 3**

The command controls the ANNOTATION/GRAPH font.

Linux:

Values 1 through 4 are used to find a match in the X11 database of font strings. Values 1, 2, and 3 are character strings; value 4 is a nonzero integer:

Val1

Family name (for example, Courier). If *Val1* = MENU, all other values are ignored and a font selection menu appears (GUI must be active).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Val2

Weight (for example, medium)

Val3

Slant (for example, r)

Val4

Pixel size (for example, 14). Note that this value does no affect the annotation fonts (*KEY* = 3). Use the **/TSPEC (p. 2024)** command for annotation font size.

Val5

unused

Val6

unused

PC:

The values are encoded in a PC logical font structure. Value 1 is a character string, and the remaining values are integers:

Val1

Family name (for example, Courier*New) Substitute an asterisk (*) for any blank character that appears in a family name. If *Val1* = MENU, all other values are ignored and a font selection menu appears (GUI must be active). When this value is blank, Mechanical APDL uses the first available resource it finds.

Val2

Weight (0 - 1000)

Val3

Orientation (in tenths of a degree)

Val4

Height (in logical units)

Val5

Width (in logical units)

Val6

Italics (0 = OFF, 1 = ON)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TEXT

Text size specification for the Mechanical APDL graphics window. Using this label with the **/DEVICE (p. 523)** command requires the following form: **/DEVICE (p. 523)**,TEXT,*KEY*,*PERCENT*. *KEY* = 1 for LEGEND fonts; *KEY* = 2 for ENTITY fonts. *PERCENT* specifies the new text size as a percent of the default text size. If *PERCENT* = 100, the new text size is precisely the default size. If *PERCENT* = 200, the new text size is twice the default text size.

KEY

Control key:

OFF or 0

Turns specified function off.

ON or 1

Turns specified function on or designates the LEGEND font.

2

Designates the ENTITY font.

3

Designates the ANNOTATION/GRAPH font.

Command Default

Vector mode off (that is, raster mode); dithering on.

Notes

This command is valid in any processor.

The **/DEVICE (p. 523)**,BBOX command is ignored in POST1 and SOLUTION plots. Also, the elements are displayed and rotated if you use **/DEVICE (p. 523)**,BBOX,ON and **/EDGE (p. 594)**,WN,1,ANGLE (effectively ignoring the BBOX option).

Menu Paths

Utility Menu>PlotCtrls>Font Controls>Legend Font

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/DFLAB,*DOF*,*DispLab*,*ForceLab*

Changes degree-of-freedom labels for user custom elements.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

DOF

Number between 1 and 32 indicating which degree of freedom is to have its labels changed. For a list of these quantities, see the degree-of-freedom table in the `echprm.inc` file. The first few quantities follow:

1 = UX,FX

2 = UY,FY

3 = UZ,FZ

4 = ROTX,MX

DispLab

New label (four-character maximum) for the displacement label. The prior label is no longer valid.

ForceLab

New label (four-character maximum) for the force label for this degree of freedom. The prior label is no longer valid.

Notes

The **/DFLAB (p. 527)** command is rarely used. Use it if you are writing a custom element and want to use degrees of freedom that are not part of the standard element set.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DFLX, *NODE*, *BX*, *BY*, *BZ*, *BX2*, *BY2*, *BZ2*

Imposes a uniform magnetic flux B on an edge-element electromagnetic model.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Nodes at which the edge-flux (AZ) constraints corresponding to the uniform magnetic flux are to be specified. Valid options are ALL (default) or Component Name. If ALL, constraints are applied to all selected nodes (**NSEL (p. 1266)**).

BX, BY, BZ

Real components of magnetic flux B.

BX2, BY2, BZ2

Imaginary components of magnetic flux B.

Notes

The **DFLX (p. 528)** command sets the constraints on the edge-flux (AZ) degrees of freedom to produce a uniform magnetic flux B in an edge-based electromagnetic analysis using one of these element types: SOLID226, SOLID227, SOLID236, or SOLID237. The command ignores the corner nodes of the elements (even if they were selected) and imposes the AZ-constraints on the mid-side nodes only. The AZ-constraints are imposed in the active Cartesian coordinate system. A non-Cartesian coordinate system will be ignored by the **DFLX (p. 528)** command.

The edge-flux constraints at the mid-side nodes are derived from the magnetic vector potential **A**, which is related to the imposed magnetic flux **B** as follows:

$$A=\frac{1}{2}\left[B\times r\right]$$

where **r** is the position of the mid-side node.

The **DFLX (p. 528)** command creates a component named _DFLX for the constrained midside nodes. You can use this component to delete the constraints imposed by the **DFLX (p. 528)** command.

This command is also valid in PREP7.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DFSWAVE, *KCN*, *RADIUS*, *PSDREF*, *DENS*, *SONIC*, *INCANG*, *NPARA*, *SampOpt*

Specifies the incident planar waves with random phases for a diffuse sound field.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Local coordinate system:

N

Coordinate system number. Default = 0.

DELETE

Delete defined incident diffused planar waves.

RADIUS

Radius of the reference sphere on which the incident planar waves are distributed with equal energy. Defaults to 50 x the half-maximum dimension of the structural panel.

PSDREF

Reference power spectral density. Default = 1.

DENS

Mass density of incident planar wave media. Default = 1.2041 kg/m^3.

SONIC

Sound speed in incident planar wave media. Default = 343.24 m/s)

INCANG

Maximum incident angle (0^o <= *degree* <= 180^o) against the positive z axis in the local coordinate system *KCN*. Default = 89^o.

NPARA

Number of divisions on the reference sphere with cutting planes parallel to the x-y coordinate plane of the local coordinate system. Default = 20.

SampOpt

Random sampling option:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Initializes the random generator of incident planar wave phases and samples the phases at each solving frequency.

MULT

Initializes the random generator of incident planar wave phases at the first frequency and samples the phases at each solving frequency.

MONO

Initializes the random generator of incident planar wave phases and samples the phases only once at first solving frequency so that the same phases are used over the whole frequency range for each incident planar wave.

Notes

Issue the **DFSWAVE (p. 529)** command to activate a diffuse sound field. (The **AWAVE (p. 213)** command does not activate a diffuse sound field.)

The SURF154 surface element must be defined on the surface of the structural solid element for the excitation.

The acoustic elements and the absorbing boundary condition must be defined in the open acoustic domain. Do not define the acoustic domain on the excitation side.

The **PRAS (p. 1464)** and **PLAS (p. 1387)** commands calculate the average transmission loss for multiple sampling phases at each frequency over the frequency range.

The symmetry of a panel structure cannot be used to reduce the simulation size, as the incident plane waves have varying random phase angles. The z axis of the Cartesian coordinate system (*KCN*) must be consistent with the panel's outward normal unit vector at the center of the panel's sending side.

Menu Paths

This command cannot be accessed from a menu.

***DIM**,*Par*,*Type*,*IMAX*,*JMAX*,*KMAX*,*Var1*,*Var2*,*Var3*,*CSYSID*

Defines an array parameter and its dimensions.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Par

Name of parameter to be dimensioned. See ***SET (p. 1720)** for name restrictions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Type

Array type:

ARRAY --

Arrays are similar to standard FORTRAN arrays (indices are integers) (default). Index numbers for the rows, columns, and planes are sequential values beginning with one. Used for 1-, 2-, or 3D arrays.

ARR4 --

Same as ARRAY, but used to specify 4-D arrays.

ARR5 --

Same as ARRAY, but used to specify 5-D arrays.

CHAR --

Array entries are character strings (up to 8 characters each). Index numbers for rows, columns, and planes are sequential values beginning with one.

TABLE --

Array indices are real (non-integer) numbers which must be defined when filling the table. Index numbers for the rows and columns are stored in the zero column and row "array elements" and are initially assigned a near-zero value. Index numbers must be in ascending order and are used only for retrieving an array element. When retrieving an array element with a real index that does not match a specified index, linear interpolation is done among the nearest indices and the corresponding array element values (***SET (p. 1720)**). Used for 1-, 2-, or 3D tables.

TAB4 --

Same as TABLE, but used to specify 4-D tables.

TAB5 --

Same as TABLE, but used to specify 5-D tables.

STRING --

Array entries are character strings (up to IMAX each). Index numbers for columns and planes are sequential values beginning with 1. Row index is character position in string.

IMAX

Extent of first dimension (row). (For *Type* = STRING, *IMAX* is rounded up to the next multiple of eight and has a limit of 248). Default = 1.

JMAX

Extent of second dimension (column). Default = 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KMAX

Extent of third dimension (plane). Default = 1.

Var1

Variable name corresponding to the first dimension (row) for *Type* = TABLE, TAB4, or TAB5. Default = Row.

Var2

Variable name corresponding to the second dimension (column) for *Type* = TABLE, TAB4, or TAB5. Default = Column.

Var3

Variable name corresponding to the third dimension (plane) for *Type* = TABLE, TAB4, TAB5. Default = Plane.

CSYSID

An integer corresponding to the coordinate system ID number. Default = 0 (global Cartesian).

Notes

Up to three dimensions (row, column, and plane) may be defined using ARRAY and TABLE. Use ARR4, ARR5, TAB4, and TAB5 to define up to five dimensions (row, column, plane, book, and shelf). An index number is associated with each row, column, and plane. For array and table type parameters, element values are initialized to zero. For character and string parameters, element values are initialized to (blank). A defined parameter must be deleted (***SET (p. 1720)**) before its dimensions can be changed. Scalar (single valued) parameters should not be dimensioned. ***DIM (p. 530)**,A,,3 defines a vector array with elements A(1), A(2), and A(3). ***DIM (p. 530)**,B,,2,3 defines a 2x3 array with elements B(1,1), B(2,1), B(1,2), B(2,2), B(1,3), and B(2,3). Use ***STATUS (p. 1863)**,*Par* to display elements of array *Par*. You can write formatted data files (tabular formatting) from data held in arrays through the ***VWRITE (p. 2174)** command.

If you use table parameters to define boundary conditions, then *Var1*, *Var2*, and/or *Var3* can either specify a primary variable (listed in Table 106: *DIM - Primary Variables (p. 533)) or can be an independent parameter. If specifying an independent parameter, then you must define an additional table for the independent parameter. The additional table must have the same name as the independent parameter and may be a function of one or more primary variables or another independent parameter. All independent parameters must relate to a primary variable.

Tabular load arrays can be defined in both global Cartesian (default), cylindrical, spherical, or local (see below) coordinate systems by specifying *CSYSID*, as defined in **LOCAL (p. 1059)**. Coordinate system *CSYSID* must exist prior to issuing the ***DIM (p. 530)** command.

The following constraints apply when specifying a local coordinate system for your tabular loads:

- Only Cartesian, cylindrical and spherical coordinate systems are supported
- Angle values for Y in cylindrical or spherical coordinate systems must be input in degrees and must be positive values between 0 and 360 degrees ($0 \le Y \le 360$)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Angle values for Z in spherical coordinate system must be input in degrees and must be positive values between -90 and +90 (-90 ≤ Z ≤ 90)

If specifying a 4- or 5-D array or table, four additional fields (*LMAX*, *MMAX*, *Var4*, and *Var5*) are available. Thus, for a 4-D table, the command syntax would be:

```
*DIM,Par,Type,IMAX,JMAX,KMAX,LMAX,Var1,Var2,Var3,Var4,CSYSID
```

For a 5-D table, the command syntax is:

```
*DIM,Par,Type,IMAX,JMAX,KMAX,LMAX,MMAX,Var1,Var2,Var3,Var4,Var5,CSYSID
```

You cannot create or edit 4- or 5-D arrays or tables via the GUI.

For more information, see Array Parameters.

Table 106: *DIM - Primary Variables

Primary Variable	Label for *Var1, Var2, Var3, Var4, Var5*
Time	TIME
Frequency	FREQ
X-coordinate location	X
Y-coordinate location	Y
Z-coordinate location	Z
Temperature	TEMP
Velocity	VELOCITY
Pressure	PRESSURE [1]
Geometric gap/penetration	GAP
Cyclic sector number	SECTOR
Multistage Harmonic Index	MSHI
Harmonic-based load[a]	NHINDEX
Amplitude of the rotational velocity vector	OMEGS
Eccentricity	ECCENT
Phase shift	THETA
Element number	ELEM
Node number	NODE
Concentration	CONC

[a] Used in a Harmonic Balance Method (HBM) analysis (see Applying Loads and Constraints in an HBM Analysis in the *Harmonic Balance Method Analysis Guide*).

1. Specify PRESSURE as the independent variable (not PRES).

The X, Y, and Z coordinate locations listed above are valid in global Cartesian, or local (Cartesian, cylindrical and spherical) coordinate systems. The VELOCITY label is applicable only to the calculated fluid velocity in element FLUID116.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When using PRESSURE as a primary variable, the underlying element must have the pressure DOF associated with it, or it must be a supported contact element.

The gap/penetration label (GAP) is only used for defining certain contact element real constants.

The frequency label (FREQ) is valid for harmonic analyses only.

The node and element labels (NODE and ELEM) allow you to use node and element numbers as primary variables, and their axis values should be integers.

The OMEGS, ECCENT, and THETA primary variables only apply to the COMBI214 element. The amplitude of the rotational velocity (OMEGS) is an absolute value, so only positive values of OMEGS are valid. The eccentricity (ECCENT) and phase shift (THETA) labels are only valid for nonlinear analyses.

If you use table parameters to define boundary conditions, the table names (*Par*) must not exceed 32 characters.

In thermal analyses, if you apply tabular loads as a function of temperature but the rest of the model is linear (for example, includes no temperature-dependent material properties or radiation), you should turn on Newton-Raphson iterations (**NROPT (p. 1261)**,FULL) to evaluate the temperature-dependent tabular boundary conditions correctly.

When tabular input is used to define a load via the **F (p. 729)** or **D (p. 483)** commands, the applied load may be incorrect in the following situation. This occurs when multiple solutions are performed such that the solution processor is entered multiple times (that is, the command sequence **/SOLU (p. 1821)**, **SOLVE (p. 1822)**, **FINISH (p. 758)** is repeated) and the **SET (p. 1724)** command is used in the general postprocessor (**/POST1 (p. 1461)**) to read the results file (`.rst`) between solutions. This is because the applied load becomes a fixed value in the `.rst` file and cannot be changed to the values defined by the tabular input. The workarounds are to avoid reading the `.rst` file between solutions or reissue the **F (p. 729)** or **D (p. 483)** command that uses tabular input in each solution step.

This command is valid in any processor.

Menu Paths

Utility Menu>Parameters>Array Parameters>Define/Edit

/DIRECTORY,*StrArray*,*FileName*,*Ext*,*Dir*

Put the file names in the current directory into a string parameter array.

APDL (p. 19): Array Parameters (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

StrArray

Name of the "string array" parameter which will hold the returned values. String array parameters are similar to character arrays, but each array element can be as long as 128 characters. If the string

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

parameter does not exist, it will be created. The array will be created as: *DIM,StrArray,STRING,64,2,numFileName

FileName

File name (64 characters maximum). Only files matching this name will be returned. The *FileName* ALL may match any file name.

Ext

File name extension (8 characters maximum). Only files with an extension matching this name will be returned. A blank or ALL will match any extension.

Directory

The directory in which the files reside. The default is the current working directory.

Notes

The **/DIRECTORY (p. 534)** command gets the file names in the current directory and puts them into a string parameter array. Each file will be included in the array as a name-extension pair.

Menu Paths

This command cannot be accessed from a menu.

DISPLAY

Specifies "Display settings" as the subsequent status topic.

POST1 (p. 51): Status (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>General Postproc>Plot Results

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/DIST, *WN*, *DVAL*, *KFACT*

Specifies the viewing distance for magnifications and perspective.

GRAPHICS (p. 16): Views (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

DVAL

Distance along the view line from the observer to the focus point (defaults to value producing full-window display). Distances "too close" to the object will produce excessive magnifications. If *DVAL* = AUTO, zero, or blank, the program will calculate the distance automatically. If *DVAL* = USER, the distance of last display will be used (useful when last display automatically calculated distance).

KFACT

DVAL interpretation key:

0

Interpret numerical *DVAL* values as described above.

1

Interpret *DVAL* as a multiplier on the current distance (*DVAL* of 2 gives twice the current distance; 0.5 gives half the current distance, etc.).

Command Default

Distance is automatically calculated to produce full window magnification.

Notes

The scale factor is relative to the window shape. For example, for objects centered in a square window and with parallel projection (no perspective), a distance of $\ell/2$ (+10%) produces a full window magnification, where ℓ is the largest in-plane vertical or horizontal dimension. See also **/AUTO (p. 207)** and **/USER (p. 2061)** commands.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Pan, Zoom, Rotate

Utility Menu>PlotCtrls>View Settings>Magnification

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DJ, *ELEM*, *LABEL*, *VALUE*

Specifies boundary conditions on the components of relative motion of a joint element.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element number or ALL to be specified.

LABEL

Valid labels are:

UX

Displacement in local x direction.

UY

Displacement in local y direction.

UZ

Displacement in local z direction.

ROTX

Rotation about local x axis.

ROTY

Rotation about local y axis.

ROTZ

Rotation about local y axis.

VELX

Linear velocity in local x direction.

VELY

Linear velocity in local y direction.

VELZ

Linear velocity in local z direction.

OMGX

Angular velocity in local x direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OMGY

Angular velocity in local y direction.

OMGZ

Angular velocity in local z direction.

ACCX

Linear acceleration in local x direction.

ACCY

Linear acceleration in local y direction.

ACCZ

Linear acceleration in local z direction.

DMGX

Angular acceleration in local x direction.

DMGY

Angular acceleration in local y direction.

DMGZ

Angular acceleration in local z direction.

VALUE

Value of the label.

Notes

This command is valid for MPC184 joint elements. See **DJDELE (p. 539)** for information about deleting boundary conditions applied via this command.

You can apply only one displacement, velocity, or acceleration load at any relative degree of freedom. If multiple loads are specified, the last applied load overrides the previous ones. For example, the following commands apply loads to element 100:

D,100,UX,*Value*
D,100,VELX,*Value*

In this case, the velocity load (VELX) applied in the last command will override the displacement load (UX).

Tabular boundary conditions (*VALUE* = %*tabname*%) can be used.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

%_FIX% is a Mechanical APDL reserved table name. When *VALUE* is set to %_FIX%, the program sprescribe the degree of freedom to the current relative displacement value. This option is only valid for the following labels: UX, UY, UZ, ROTX, ROTY, ROTZ. In most cases, %_FIX% usage is efficient and recommended for all structural degrees of freedom.

In a modal analysis, the values of the eigenvectors at the degree of freedom connected via **DJ (p. 537)** may be insufficiently accurate to satisfy the **DJ (p. 537)** constraint conditions.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Structural>Displacement>On Joint Elems

Main Menu>Solution>Define Loads>Apply>Structural>Displacement>On Joint Elems

---

DJDELE, *ELEM*, *LAB*

Deletes boundary conditions on the components of relative motion of a joint element.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element number or ALL. ALL (or leaving this field blank) will delete all joint element boundary conditions specified by *LAB*.

LAB

Valid labels are:

UX

Displacement in local x direction.

UY

Displacement in local y direction.

UZ

Displacement in local z direction.

ROTX

Rotation about local x axis.

ROTY

Rotation about local y axis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ROTZ

Rotation about local z axis.

VELX

Linear velocity in local x direction.

VELY

Linear velocity in local y direction.

VELZ

Linear velocity in local z direction.

OMGX

Angular velocity in local x direction.

OMGY

Angular velocity in local y direction.

OMGZ

Angular velocity in local z direction.

ACCX

Linear acceleration in local x direction.

ACCY

Linear acceleration in local y direction.

ACCZ

Linear acceleration in local z direction.

DMGX

Angular acceleration in local x direction.

DMGY

Angular acceleration in local y direction.

DMGZ

Angular acceleration in local z direction.

ALL, or (blank)

Delete all applied boundary conditions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command is valid for MPC184 joint elements. See **DJ (p. 537)** for information on specifying boundary conditions on the components of relative motion of a joint element.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Delete>All Load Data>All Constraint>On Joint Elems

Main Menu>Preprocessor>Loads>Define Loads>Delete>Structural>Displacement>On Joint Elems

DJLIST, *Elem*

Lists boundary conditions applied to joint elements.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Elem

Element number or ALL (or blank). Lists joint element boundary conditions on the specified element(s).

Notes

This command is valid for MPC184 joint elements. See **DJ (p. 537)** for information on specifying boundary conditions on joint elements.

Menu Paths

Utility Menu>List>Loads>Joint Element DOF Constraints>On Picked Element

---

DK, *KPOI*, *Lab*, *VALUE*, *VALUE2*, *KEXPND*, *Lab2*, *Lab3*, *Lab4*, *Lab5*, *Lab6*

Defines DOF constraints at keypoints.

SOLUTION (p. 38): Solid Constraints (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KPOI

Keypoint at which constraint is to be specified. If ALL, apply to all selected keypoints (**KSEL (p. 995)**). If *KPOI* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *KPOI*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Lab

Valid degree of freedom label. If ALL, use all appropriate labels *except* HDSP. Structural labels: UX, UY, or UZ (displacements); ROTX, ROTY, or ROTZ (rotations); WARP (warping); HDSP (hydrostatic pressure). Thermal labels: TEMP, TBOT, TE2, TE3, . . ., TTOP (temperature). Acoustic labels: PRES (pressure); UX, UY, or UZ (displacements for FSI coupled elements). Electric labels: VOLT (voltage). Magnetic labels: MAG (scalar magnetic potential); AZ (vector magnetic potential). Diffusion labels: CONC (concentration).

VALUE

Degree of freedom value or table name reference for tabular boundary conditions. To specify a table, enclose the table name in percent signs (%) (for example, **DK (p. 541)**,NODE,TEMP,%*tabname*%). Use the ***DIM (p. 530)** command to define a table.

VALUE2

Second degree of freedom value (if any). If the analysis type and the degree of freedom allow a complex input, *VALUE* (above) is the real component and *VALUE2* is the imaginary component.

KEXPND

Expansion key:

0

Constraint applies only to the node at this keypoint.

1

Flags this keypoint for constraint expansion.

Lab2, Lab3, Lab4, . . . , Lab6

Additional degree of freedom labels. The same values are applied to the keypoints for these labels.

Notes

A keypoint may be flagged using *KEXPND* to allow its constraints to be expanded to nodes on the attached solid model entities having similarly flagged keypoint constraints. Constraints are transferred from keypoints to nodes with the **DTRAN (p. 583)** or **SBCTRAN (p. 1647)** commands. The expansion uses interpolation to apply constraints to the nodes on the lines between flagged keypoints. If all keypoints of an area or volume region are flagged *and the constraints (label and values) are equal*, the constraints are applied to the interior nodes of the region. See the **D (p. 483)** command for a description of nodal constraints.

Tabular boundary conditions (*VALUE* = %*tabname*%) are available only for the following degree of freedom labels: Electric (VOLT), structural (UX, UY, UZ, ROTX, ROTY, ROTZ), Acoustic (PRES, UX, UY, UZ), and temperature (TEMP, TBOT, TE2, TE3, . . ., TTOP).

Constraints specified by the **DK (p. 541)** command can conflict with other specified constraints. See Resolution of Conflicting Constraint Specifications in the *Basic Analysis Guide* for details.

This command is also valid in PREP7.

Utility Menu>List>Loads>DOF Constraints>On All Keypoints

Utility Menu>List>Loads>DOF Constraints>On Picked KPs

DL, *LINE*, *AREA*, *Lab*, *Value1*, *Value2*

Defines DOF constraints on lines.

SOLUTION (p. 38): Solid Constraints (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LINE

Line at which constraints are to be specified. If ALL, apply to all selected lines (**LSEL (p. 1074)**). If *LINE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *LINE*.

AREA

Area containing line. The normal to the symmetry or antisymmetry surface is assumed to lie on this area. Defaults to the lowest numbered selected area containing the line number.

Lab

Symmetry label (see 1 below):

SYMM

Generate symmetry constraints.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ASYM

Generate antisymmetry constraints.

Mechanical APDL degree-of-freedom labels:

UX

Displacement in X direction.

UY

Displacement in Y direction.

UZ

Displacement in Z direction.

ROTX

Rotation about X axis.

ROTY

Rotation about Y axis.

ROTZ

Rotation about Z axis.

HDSP

Hydrostatic pressure.

WARP

Warping magnitude.

TEMP, TBOT, TE2, TE3, . . ., TTOP

Temperature

VOLT

Electric scalar potential (see 2).

AZ

Magnetic vector potential in Z direction.

CONC

Concentration.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Applies all appropriate DOF labels *except* HDSP.

Footnotes for *Lab*:

1. Symmetry and antisymmetry constraints are generated as described on the **DSYM (p. 580)** command.
2. Setting *Lab* = VOLT and *Value1* = 0 applies the J-normal boundary condition (current density vector (J) flows normal to the line). No input is required for the J-parallel condition because it is the natural boundary condition.

Value1

Value of DOF (real part) or table name reference on the line. Valid for all DOF labels. To specify a table, enclose the table name in % signs (for example, **DL (p. 545)**,*LINE*,*AREA*,TEMP,%*tabname*%). Use the ***DIM (p. 530)** command to define a table.

Value2

For VOLT DOFs:

Actual value of the imaginary component of the degree of freedom.

Notes

You can transfer constraints from lines to nodes with the **DTRAN (p. 583)** or **SBCTRAN (p. 1647)** commands. See the **DK (p. 541)** command for information about generating other constraints at lines.

Tabular boundary conditions (*Value1* = %*tabname*%) are available only for the following degree of freedom labels: Electric (VOLT), Structural (UX, UY, UZ, ROTX, ROTY, ROTZ), Acoustic (PRES, UX, UY, UZ), and temperature (TEMP, TBOT, TE2, TE3, . . ., TTOP).

Constraints specified with this command can conflict with other specified constraints. For more information, see Resolution of Conflicting Constraint Specifications.

This command is also valid in PREP7.

---

DLDELE, *LINE*, *Lab*

Deletes DOF constraints on a line.

SOLUTION (p. 38): Solid Constraints (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LINE

Line for which constraints are to be deleted. If ALL, delete for all selected lines (**LSEL (p. 1074)**). If *LINE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *LINE*

Lab

Constraint label:

ALL

All constraints.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SYMM

Symmetry constraints.

ASYM

Antisymmetry constraints.

UX

Displacement in X direction.

DLIST,*NODE1*,*NODE2*,*NINC*

Lists DOF constraints.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE1*, *NODE2*, *NINC

List constraints for nodes *NODE1* to *NODE2* (defaults to *NODE1*) in steps of *NINC* (defaults to 1). If ALL (default), *NODE2* and *NINC* are ignored and constraints for all selected nodes (**NSEL (p. 1266)**) are listed. If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE1*(*NODE2* and *NINC* are ignored).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Listing applies to the selected nodes (**NSEL (p. 1266)**) and the selected degree of freedom labels (**DOFSEL (p. 569)**).

This command is valid in any processor.

Menu Paths

*DMAT, *Matrix*, *Type*, *Method*, *Val1*, *Val2*, *Val3*, *Val4*, *Val5*

Creates a dense matrix.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Matrix

Name used to identify the matrix. Must be specified.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Type

Matrix type:

D --

Double precision real values (default).

Z --

Complex double precision values.

I --

Integer values.

Method

Method used to create the matrix:

ALLOC --

Allocate space for a matrix (default).

RESIZE --

Resize an existing matrix to new row and column dimensions. Values are kept from the original matrix. If the dimensions specified by *Val1* (rows) and *Val2* (columns) are greater than the original matrix size, the additional entries are assigned a value of zero.

COPY --

Copy an existing matrix.

LINK --

Link to an existing matrix. The memory will be shared between the original matrix and the new matrix. This is useful for manipulating a submatrix of a larger matrix. The *Val1* through *Val5* arguments will be used to specify the lower and upper bounds of row and column numbers from the original matrix.

IMPORT --

Import the matrix from a file.

Val1, *Val2*, *Val3*, *Val4*, *Val5*

Additional input. The meaning of *Val1* through *Val5* will vary depending on the specified *Method*. See details below.

The following *Valx* fields are used with *Method* = ALLOC or *Method* = RESIZE:

Val1

Number of rows in the matrix.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Val2

Number of columns in the matrix.

Val3

Memory allocation type (used only with *Method* = ALLOC):

INCORE --

In-core memory allocation (default).

OUTOFCORE --

Out-of-core memory allocation.

The following *Valx* fields are used with *Method* = COPY:

Val1

Name of the matrix to copy.

Val2

Method used for copying the matrix:

TRANS --

Transpose the original matrix. *Val3* and *Val4* are ignored.

REAL --

Copy the real part to the output matrix. This option only applies when copying a complex value matrix to a real value matrix. *Val3* and *Val4* are ignored.

IMAG --

Copy the imaginary part to the output matrix. This option only applies when copying a complex value matrix to a real value matrix. *Val3* and *Val4* are ignored.

EXTRACT --

Extract a submatrix based on row and column numbers specified by *Val3* and *Val4*.

Val3

Name of integer vector (***VEC (p. 2085)**) containing row numbers. If no vector is specified, defaults to all rows.

Val4

Name of integer vector (***VEC (p. 2085)**) containing column numbers. If no vector is specified, defaults to all columns.

The following *Valx* fields are used with *Method* = LINK:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Val1

Name of the original matrix.

Val2

First column number (defaults to 1).

Val3

Last column number (defaults to the maximum column number of the original matrix).

Val4

First row number (defaults to 1).

Val5

Last row number (defaults to the maximum row number of the original matrix).

The following table describes the *Valx* fields used with *Method* = IMPORT:

***Method* = IMPORT**					
Val1	***Val2***	***Val3***	***Val4***	***Val5***	**Description**
FULL	File name [a]	Matrix type: STIFF - Stiffness matrix MASS - Mass matrix DAMP - Damping matrix RHS - Load vector K_RE - Real part of the stiffness matrix K_IM - Imaginary part of the stiffness matrix	(not used)	(not used)	Import a matrix or load vector from an existing FULL file. For a complex stiffness matrix, you can use the K_RE or K_IM label to import only the real part or only the imaginary part. The K_RE and K_IM options both create real matrices.
MODE	File name [a]	First mode number	Last mode number	(not used)	Import a set of modes from an existing MODE file.
CMS	File name [a]	Mode type: NOR - Normal modes IRF - Inertial relief modes CST - Constraint modes	(not used)	(not used)	Import a modal basis from an existing CMS file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Method = IMPORT					
Val1	***Val2***	***Val3***	***Val4***	***Val5***	**Description**
		RSD - Residual modes			
TCMS	File name [a]	Mode type: NOR - Normal modes IRF - Inertial relief modes CST - Constraint modes	(not used)	(not used)	Import a modal basis from an existing TCMS file.
RST	File name [a]	First data set number	Last data set number	Result Type: NSL - Nodal Solution VSL - Transient velocity solution ASL - Transient acceleration solution RF - Reaction Forces	Import degree of freedom results from an existing RST file.
SUB	File name [a]	Matrix type: STIFF - Stiffness (or conductivity) matrix MASS - Mass (or specific heat) matrix DAMP - Damping matrix RHS - Load vector	(not used)	(not used)	Import a matrix or load vector from an existing SUB file.
HBMAT	File name [a]	File format: ASCII	(not used)	(not used)	Import a matrix from an existing Harwell-Boeing format file.

Method = IMPORT					
Val1	***Val2***	***Val3***	***Val4***	***Val5***	**Description**
		BINARY			
EMAT	File name [a]	Matrix type: STIFF - Stiffness matrix MASS - Mass matrix DAMP - Damping matrix STRESS - Stress-stiffness matrix RHS - Load vector	Element number	(not used)	Import an element matrix or load vector from an existing EMAT file.
MAT	File name [a]	(not used)	(not used)	(not used)	Restore from a previous ***EXPORT (p. 716)** (*FORMAT* = MAT) command.
APDL	Array parameter name	(not used)	(not used)	(not used)	Import an existing array parameter.
MMF	File name [a]	(not used)	(not used)	(not used)	Import a dense matrix from an existing Matrix Market file.
DMIG	File name [a]	File Format: FREE - Free field format LARGE - Large field format (default) (see "Notes" (p. 556) for examples)	Delimiter character (only for FREE field format): ',' - comma character (default) 'S' - space character	Matrix name (default is the first matrix of the DMIG file)	Import a matrix from an existing Nastran DMIG file.

[a] File name is case-sensitive with a 32-character maximum.

Notes

This command allows you to create a dense matrix. To create a sparse matrix, use the ***SMAT (p. 1801)** command. ***SMAT (p. 1801)** is recommended for large matrices obtained from the .FULL or .HBMAT file. Refer to the **HBMAT (p. 888)** command documentation for more information about .FULL file contents.

Use the ***VEC (p. 2085)** command to create a vector.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For very large matrices, use the OUTOFCORE option (*Method* = ALLOC or COPY) to keep some of the matrix on disk if there is insufficient memory.

When importing a dense matrix from a **DMIG** file, you can define the formatting of the file using the *Val3* and *Val4* fields. Here are a few different example of formats:

- A LARGE field format file (using *Val3* = 'LARGE'):

```
...
DMIG*   KAAX                           21               2
*                     21               1-2.261491337E+08
...
```

- A FREE field format file with blank separators (using *Val4* = 'S'):

```
...
DMIG stiff 1 2 1 2 29988.
1 6 149940. 2 2 -29988.
2 6 149940.
...
```

- A FREE field format file with a comma separator (using *Val4* = ','):

```
...
DMIG,KF,22321,3,,22321,2,-5.00E+6
DMIG,KF,22320,3,,22320,2,-5.00E+6
...
```

Requirement when importing matrices from a Nastran DMIG file: To ensure that the .sub file is properly generated from matrices imported from Nastran **DMIG** file, the generalized coordinates for a CMS superelement (SPOINTS in Nastran) must appear last (have highest ID number).

Example Usage

APDL Math Examples in the *Ansys Parametric Design Language Guide*

Menu Paths

This command cannot be accessed from a menu.

DMPEXT, *SMODE*, *TMODE*, *Dmpname*, *Freqb*, *Freqe*, *NSTEPS*

Extracts modal damping coefficients in a specified frequency range.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SMODE

Source mode number. There is no default for this field; you must enter an integer greater than zero.

TMODE

Target mode. Defaults to *SMODE*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Dmpname

Array parameter name containing the damping results. Defaults to d_damp.

Freqb

Beginning frequency range (real number greater than zero) or 'EIG' at eigenfrequency of source mode. 'EIG' is valid only if *SMODE* = *TMODE*. Note that EIG must be enclosed in single quotes when this command is used on the command line or in an input file. There is no default for this field; you must enter a value.

Freqe

End of frequency range. Must be blank for *Freqb* = EIG. Default is *Freqb*.

NSTEPS

Number of substeps. Defaults to 1.

Notes

DMPEXT invokes a Mechanical APDL macro that uses modal projection techniques to compute the damping force by the modal velocity of the source mode onto the target mode. From the damping force, damping parameters are extracted. DMPEXT creates an array parameter *Dmpname*, with the following entries in each row:

- response frequency
- modal damping coefficient
- modal squeeze stiffness coefficient
- damping ratio
- squeeze-to-structural stiffness ratio

The macro requires the modal displacements from the file Jobname.EFL obtained from the **RMFLVEC (p. 1612)** command. In addition, a node component FLUN must exist from all FLUID136 nodes. The computed damping ratio may be used to specify constant or modal damping by means of the **DMPRAT (p. 562)** or **MDAMP (p. 1117)** commands. For Rayleigh damping, use the **ABEXTRACT (p. 88)** command to compute ALPHAD and BETAD damping parameters. See Thin Film Analysis for more information on thin film analyses.

The macro uses the **LSSOLVE (p. 1085)** command to perform two load steps for each frequency. The first load case contains the solution of the source mode excitation and can be used for further postprocessing. Solid model boundary conditions are deleted from the model. In addition, prescribed nodal boundary conditions are applied to the model. You should carefully check the boundary conditions of your model prior to executing a subsequent analysis.

This command is also valid in PREP7.

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Solution>ThinFilm>DampExtract>Eigenfrequency

Main Menu>Solution>ThinFilm>DampExtract>Frequency Range

DMPOPTION, *FileType*, *Combine*, *ResCombFreq*, *DeleOpt*

Specifies distributed-memory parallel (DMP) file combination options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FileType

Type of solution file to combine after a distributed memory parallel solution. There is no default; if (blank), the command is ignored.

RST

Results files (`.rst`, `.rth`, `.rmg`, `.rstp`)

EMAT

Element matrix files (`.emat`).

ESAV

Element saved data files (`.esav`)

MODE

Modal results files (`.mode`)

MLV

Modal load vector file (`.mlv`)

IST

Initial state file (`.ist`)

FULL

Full matrix file (`.full`)

Reduced complex displacement file (`.`)

RDSP

Reduced displacement file (`.rdsp`)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RNNN

Multiframe restart files (.r*nnn*)

Combine

Option to combine solution files.

Yes

Combine solution files (default for all files except the .r*nnn* files).

No

Do not combine solution files (default for the .r*nnn* files only).

ResCombFreq

Frequency used to combine the local results files during a distributed memory parallel solution. This option applies only when *FileType* = RST and *Combine* = YES.

NONE

Do not combine the local results files during solution. The local results files is combined only upon leaving the solution processor (default).

ALL

Combines the local results files at every time point.

LAST

Combines the local results files at the last time point of every load step.

DeleOpt

Option to delete local solution files of the type specified by *FileType* option after they are combined. This option applies only when *Combine* = Yes.

Yes

Delete the local solution files after they are combined.

No

Do not delete the local solution files after they are combined (default).

Command Default

Local solution files are automatically combined into a single global file upon leaving the solution processor (for example, Jobname*n*.rst files are combined into one Jobname.rst file). This is true for all files except the .R*nnn* files. Because they may be required in a subsequent analysis, local files are not automatically deleted after combination.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **DMPOPTION (p. 559)** command controls how solution files are written during a distributed-memory parallel (DMP) solution. This command is most useful for controlling how results files (`.rst`, `.rth`, etc.) are written.

In a distributed memory parallel solution, a local results file is written by each process (`Jobname`*n*`.ext`, where *N* is the process number). By default, the program automatically combines the local results files (for example, `Jobname`*n*`.rst`) upon leaving the solution processor (for example, upon the **FINISH (p. 758)** command) into a single global results file (`Jobname.rst`) which can be used in postprocessing.

Alternatively, the *ResCombFreq* argument can be used to combine the local results files at certain time points during the distributed solution to create a single combined results file that can be used to postprocess the model while the solution progresses. Doing so increases data communication and I/O between processes, leading to slower performance.

The *ResCombFreq* option only applies when solving static analyses, and harmonic or transient analyses that use the full method. It does not apply to mode superposition harmonic and mode superposition transient analyses. It does not apply when using the frequency domain decomposition option (**DDOPTION (p. 508)**,FREQ) in a harmonic analysis.

To reduce communication and I/O, issue **DMPOPTION (p. 559)**,RST,NO to bypass this step of combining the local results files; the local files remain on the local disks in the current working directory. You can then use **RESCOMBINE (p. 1589)** in the POST1 general postprocessor (**/POST1 (p. 1461)**) to read all results into the database for postprocessing.

The **RESCOMBINE (p. 1589)** command macro is intended for use with POST1. If you want to postprocess distributed parallel solution results using the POST26 time-history postprocessor (**/POST26 (p. 1462)**), it is recommended that you combine your local results files into one global results file (**DMPOPTION (p. 559)**,RST,YES or **COMBINE (p. 406)**).

Local `.emat`, `.esav`, `.mode`, `.mlv`, `.ist`, `.rfrq`, `.rdsp`, and `.full` files are also written (when applicable) by each process in a distributed memory parallel solution. If these files are not needed for a downstream solution or operation, you can issue the command **DMPOPTION (p. 559)**,*FileType*,NO for each file type to bypass the file combination step and thereby improve performance.

If **DMPOPTION (p. 559)**,MODE,NO or **DMPOPTION (p. 559)**,RST,NO is specified in a modal analysis, element results cannot be written to the combined mode file (`Jobname.mode`). In this case, if distributed-memory parallel processing is used in a downstream harmonic or transient analysis that uses the mode-superposition method, the *MSUPkey* on the **MXPAND (p. 1203)** command can retain its value. However, if shared-memory parallel processing is used in the downstream harmonic or transient analysis, the *MSUPkey* is effectively set to NO.

If **DMPOPTION (p. 559)**,RNNN,YES is specified, all multiframe restart files named `Jobname.r001` to `Jobname.r999` are automatically combined upon leaving the solution processor (which can be slow and inefficient). To manually combine a single set of `.r`*nnn* restart files, use the **COMBINE (p. 406)** command.

Since local solution files may be required in a downstream analysis, the option to delete them after combination is disabled (*DeleOpt* = No) by default. However, you can enable this option to reduce disk space usage by removing certain files if you know that they are not needed in any subsequent analysis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DMPOPTION (p. 559) can be changed between load steps; however, doing so does not affect which set of solution files are combined. The values of *Combine* and *DeleOpt* are overwritten if **DMPOPTION (p. 559)** is issued multiple times for the same *FileType*. As a result, only the last values of *Combine* and *DeleOpt* for each *FileType* upon leaving the solution processor determine whether the local solution files are combined with or without deletion. For example, in a two-load-step solution, if **DMPOPTION (p. 559)**, RST, NO is issued in the first load step and **DMPOPTION (p. 559)**, RST, YES, ,YES is issued in the second load step, all sets on the local results files will be combined, and then the local results files will be deleted. If the opposite is true (**DMPOPTION (p. 559)**, RST, YES, ,YES is issued in the first load step, and **DMPOPTION (p. 559)**, RST, NO is issued in the second load step), no results files are combined, and thus no local results files are deleted.

After using **DMPOPTION (p. 559)** to suppress file combination, you may find it necessary to combine the local files for a specific *FileType* for use in a subsequent analysis. In this case, use the **COMBINE (p. 406)** command to combine local solution files into a single, global file.

Menu Paths

This command cannot be accessed from a menu.

DMPRAT, *RATIO*

Sets a modal damping ratio.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RATIO

Modal damping ratio (for example, 2% is input as 0.02).

Command Default

Use damping as defined by Damping in the *Structural Analysis Guide*.

Notes

Sets a damping ratio for use in a mode-superposition transient analysis (**ANTYPE (p. 162)**,TRANS with **TRNOPT (p. 2017)**,MSUP), a mode-superposition harmonic analysis (**ANTYPE (p. 162)**,HARMIC with **HROPT (p. 912)**,MSUP) analysis, or a spectrum (**ANTYPE (p. 162)**,SPECTR) analysis.

DMPRAT (p. 562) can also be defined in a substructure analysis that uses component mode synthesis. The damping ratio is added on the diagonal of the reduced damping matrix, as explained in Component Mode Synthesis (CMS).

This command is also valid in PREP7.

Additional Information

Damping Matrices in the *Mechanical APDL Theory Reference*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>Damping

Main Menu>Solution>Load Step Opts>Time/Frequenc>Damping

DMPSTR, *COEFF*, *DMPSFreqTab*

Sets constant structural damping data.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

COEFF

Constant structural damping coefficient.

DMPSFreqTab

Average excitation frequency table (Hz) for the calculation of equivalent viscous damping from structural damping input (**DMPSTR (p. 563)** and **MP (p. 1160)**,DMPS) in a full transient analysis. Enclose the table name in percent signs (%) and use the ***DIM (p. 530)** command to define the table with primary variable TIME. To define a constant frequency instead of a table, see **TRNOPT (p. 2017)**.

Command Default

Use damping as defined by Damping in the *Structural Analysis Guide*.

Notes

Sets a constant structural (or hysteretic) damping coefficient for use in these analysis types:

- Harmonic (**ANTYPE (p. 162)**,HARMIC) -- full, Krylov, or mode-superposition [1]
- Modal (**ANTYPE (p. 162)**,MODAL) with **MODOPT (p. 1140)**,UNSYM, DAMP, or QRDAMP.

1. In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

DMPSTR (p. 563) is also supported in transient (**ANTYPE (p. 162)**,TRANS) analyses (full or QRDAMP mode-superposition) as an equivalent viscous damping when an average excitation frequency is specified. For a full or mode-superposition transient, specify a constant excitation frequency as *DMPSFreq* on the **TRNOPT (p. 2017)** command. For a full transient, you can alternatively specify a table of frequencies using *DMPSFreqTab* on this command. *DMPSFreqTab* overwrites *DMPSFreq* on **TRNOPT (p. 2017)**.

Note that for structures with multiple materials, **MP (p. 1160)**,DMPS can also be used to specify constant structural material damping on a per material basis. If both **DMPSTR (p. 563)** and **MP (p. 1160)**,DMPS are specified, the damping effects are additive.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>Damping

Main Menu>Solution>Load Step Opts>Time/Frequenc>Damping

DNSOL, *NODE*, *Item*, *Comp*, *V1*, *V2*, *V3*, *V4*, *V5*, *V6*, *DataKey*

Defines or modifies solution results at a node.

POST1 (p. 51): Set Up (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Node for which results are specified. If ALL, apply to all selected nodes (**NSEL (p. 1266)**). If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE*.

Item

Label identifying results, see Table 107: DNSOL - Valid Item and Component Labels (p. 565). Some items also require a component label.

Comp

Component of the item. Valid component labels are shown Table 107: DNSOL - Valid Item and Component Labels (p. 565) below.

V1, V2, V3, . . . , V6

Value assigned to result. If zero, a zero value will be assigned. If blank, the value remains unchanged. Additional values (if any) assigned to the remaining components (in the order corresponding to the *Comp* list shown below for the specified *Item* (starting from the specified *Comp* label and proceeding to the right).

DataKey

Key to specify which data is modified:

AUTO

Nodal-averaged results are used if available. Otherwise, the element-based data is used if available. (Default)

ESOL

Only element-based results are used. If they are not available, the command is ignored.

NAR

Only nodal-averaged results are used. If they are not available, the command is ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

DNSOL (p. 564) can be used only with FULL graphics activated (**/GRAPHICS (p. 866)**,FULL); it will not work correctly with PowerGraphics activated.

DNSOL (p. 564) defines or modifies solution results in the database at a node. For example, **DNSOL (p. 564)**,35,U,X,.001,.002,.001 assigns values 0.001, 0.002, and 0.001 to UX, UY, and UZ (respectively) for node 35. All results that are changed in the database, including the nodal degree of freedom results, are available for all subsequent operations. All data is stored in the solution coordinate system but is displayed in the results coordinate system (**RSYS (p. 1639)**). Use **PRNSOL (p. 1505)** to list the current results.

Data input by **DNSOL (p. 564)** is stored in temporary space and does not replace information in the database. Therefore, data input by this command may be overwritten if a change is made to the selected set of nodes or if an output operation acts on a new *Item*.

Issuing **DNSOL (p. 564)** requires you to place the data type (stress/strain) in the element nodal records. To work around this requirement, use the **DESOL (p. 520)** command or equivalent path to add a dummy element stress/strain record.

Result items are available depending on element type; check the individual element for availability. Valid item and component labels for element results are shown in Table 107: DNSOL - Valid Item and Component Labels (p. 565).

Using DNSOL (p. 564) with Nodal-Averaged Results

If nodal-averaged results (**OUTRES (p. 1336)**,NAR or another nodal-averaged label) are in the database, then **DNSOL (p. 564)** acts on the nodal-averaged data for the applicable items (S, EPEL, EPPL, EPCR, EPTH, EPSW) by default. You can change this behavior via the *DataKey* argument.

DNSOL (p. 564) behavior differs when the command acts on nodal-averaged results. The nodal-averaged results that are defined or modified will be apparent in subsequent command operations (for example **PRNSOL (p. 1505)**, **PLNSOL (p. 1425)**) in both full model graphics mode (**/GRAPHICS (p. 866)**,FULL) and PowerGraphics mode (**/GRAPHICS (p. 866)**,POWER). The resultant data is stored in the global Cartesian coordinate system but is displayed in the results coordinate system (**RSYS (p. 1639)**). **DNSOL (p. 564)** can only be applied to nodal-averaged results if they are already in the database; otherwise, the modifications are applied to the element-based solution in temporary memory. The modified nodal-averaged results are not saved to the results file automatically. To save separate records of modified nodal-averaged results, use **LCWRITE (p. 1031)**, **RAPPND (p. 1570)**, or **RESWRITE (p. 1604)**.

DNSOL (p. 564) can only modify component values (*Comp* = X, Y, Z, XY, YZ, or XZ) for nodal-averaged results. If you attempt to modify principal values using **DNSOL (p. 564)** with *DataKey* = AUTO, then the modification is applied to element-based results if they are available.

Table 107: DNSOL - Valid Item and Component Labels

Valid Item and Component Labels for Nodal DOF Results		
Item	**Comp**	**Description**
U	X, Y, Z	X, Y, or Z structural displacement.
ROT	X, Y, Z	X, Y, or Z structural rotation.
TEMP[1]		Temperature.
PRES		Pressure.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Valid Item and Component Labels for Nodal DOF Results

Item	Comp	Description
VOLT		Electric potential.
MAG		Magnetic scalar potential.
V	X, Y, Z	X, Y, or Z fluid velocity.
A	X, Y, Z	X, Y, or Z magnetic vector potential.
CONC		Concentration.

Valid Item and Component Labels for Area and Volume Element Results

Item	Comp	Description
S	X, Y, Z, XY, YZ, XZ	Component stress. [2]
"	1, 2, 3	Principal stress. [3]
"	INT	Stress intensity. [3]
"	EQV	Equivalent stress. [3]
EPEL	X, Y, Z, XY, YZ, XZ	Component elastic strain. [2]
"	1, 2, 3	Principal elastic strain. [3]
"	INT	Elastic strain intensity. [3]
"	EQV	Elastic equivalent strain. [3]
EPTH	X, Y, Z, XY, YZ, XZ	Component thermal strain. [2]
"	1, 2, 3	Principal thermal strain. [3]
"	INT	Thermal strain intensity. [3]
"	EQV	Thermal equivalent strain. [3]
EPPL	X, Y, Z, XY, YZ, XZ	Component plastic strain. [2]
"	1, 2, 3	Principal plastic strain. [3]
"	INT	Plastic strain intensity. [3]
"	EQV	Plastic equivalent strain. [3]
EPCR	X, Y, Z, XY, YZ, XZ	Component creep strain. [2]
"	1, 2, 3	Principal creep strain. [3]
"	INT	Creep strain intensity. [3]
"	EQV	Creep equivalent strain. [3]
EPSW		Swelling strain. [2]
NL	SEPL	Equivalent stress (from stress-strain curve).
"	SRAT	Stress state ratio.
"	HPRES	Hydrostatic pressure.
"	EPEQ	Accumulated equivalent plastic strain.
"	CREQ	Accumulated equivalent creep strain.
"	PSV	Plastic state variable.
"	PLWK	Plastic work/volume.
SEND	ELASTIC	Elastic strain energy density. (For viscoelastic materials, the stored energy.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Valid Item and Component Labels for Area and Volume Element Results

Item	Comp	Description
"	PLASTIC	Plastic strain energy density.
"	CREEP	Creep strain energy density.
TG	X, Y, Z, SUM	Component thermal gradient or vector sum.
TF	X, Y, Z, SUM	Component thermal flux or vector sum.
PG	X, Y, Z, SUM	Component pressure gradient or vector sum.
EF	X, Y, Z, SUM	Component electric field or vector sum.
D	X, Y, Z, SUM	Component electric flux density or vector sum.
H	X, Y, Z, SUM	Component magnetic field intensity or vector sum.
B	X, Y, Z, SUM	Component magnetic flux density or vector sum.
FMAG	X, Y, Z, SUM	Component electromagnetic force or vector sum.

1. For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use the labels TBOT, TE2, TE3, ..., TTOP instead of TEMP.

2. For these component values, nodal-averaged results are modified if they are available in the results file and *DataKey* = AUTO or NAR.

3. Modifying principal values of nodal-averaged results is not supported.

Menu Paths

Main Menu>General Postproc>Define/Modify>Nodal Results

***DO**,*Par*,*IVAL*,*FVAL*,*INC*

Defines the beginning of a do-loop.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Par

The name of the scalar parameter to be used as the loop index. See ***SET (p. 1720)** for name restrictions. Any existing parameter of the same name will be redefined. There is no character parameter substitution for the *Par* field.

IVAL*, *FVAL*, *INC

Initially assign *IVAL* to *Par*. Increment *IVAL* by *INC* for each successive loop. If *IVAL* exceeds *FVAL* and *INC* is positive, the loop is not executed. *INC* defaults to 1. Negative increments and non-integer numbers are allowed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The block of commands following the ***DO (p. 567)** command (up to the ***ENDDO (p. 636)** command) is executed repeatedly until some loop control is satisfied. Printout is automatically suppressed on all loops after the first (include a **/GOPR (p. 865)** command to restore the printout). The command line loop control (*Par*,*IVAL*,*FVAL*,*INC*) must be input; however, a Use the ***IF (p. 927)** within the block can also be used to control looping (***EXIT (p. 707)**, ***CYCLE (p. 462)**). One level of internal file switching is used for each nested ***DO (p. 567)**. Twenty levels of nested do-loops are allowed.

Note:

Do-loops that include **/INPUT (p. 948)**, ***USE (p. 2059)**, or an "Unknown Command" macro, have less nesting available because each of these operations also uses a level of file switching. The ***DO (p. 567)**, ***ENDDO (p. 636)**, and any ***CYCLE (p. 462)** and ***EXIT (p. 707)** commands for a do-loop must all be read from the same file (or keyboard). You cannot use the MULTIPRO or ***CREATE (p. 434)** commands within a ***DO (p. 567)**-loop. Picking operations should also not be used within a ***DO (p. 567)**-loop.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

DOF, *Lab1*, *Lab2*, *Lab3*, *Lab4*, *Lab5*, *Lab6*, *Lab7*, *Lab8*, *Lab9*, *Lab10*

Adds degrees of freedom to the current DOF set.

PREP7 (p. 22): Element Type (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
Product Restrictions (p. 569)

Lab1*, *Lab2*, *Lab3*, . . . , *Lab10

Valid labels are: UX, UY, UZ (structural displacements); ROTX, ROTY, ROTZ (structural rotations); TEMP, TBOT, TE2, TE3, . . ., TTOP (temperatures); PRES (pressure); VOLT (voltage); MAG (magnetic scalar potential); AZ (magnetic vector potential); CURR (current); EMF (electromotive force drop); CONC (concentration); DELETE.

Command Default

Use degree of freedom set determined from element types.

Notes

The degree of freedom (DOF) set for the model is determined from all element types defined. This command may be used to add to the current set. The ALL label may be used on some commands to represent all labels of the current degree of freedom set for the model. Issue the **DOF (p. 568)** command

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

with no arguments to list the current set. Use the DELETE label to delete any previously added DOFs and return to the default DOF set.

Product Restrictions

Command Option Lab	Available Products
UX, UY, UZ, ROTX, ROTY, ROTZ	**Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
MAG, VOLT	**Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
AZ	Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on
PRES	Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on
TEMP, TBOT, TE2, TE3	**Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
CURR, EMF	**Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
CONC	**Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on
DELETE	**Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Menu Paths

Main Menu>Preprocessor>Element Type>Add DOF

Main Menu>Preprocessor>Element Type>Remove DOFs

DOFSEL, *Type*, *Dof1*, *Dof2*, *Dof3*, *Dof4*, *Dof5*, *Dof6*

Selects a DOF label set for reference by other commands.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Select a new set of labels.

A

Add labels to the current set.

U

Unselect (remove) labels from the current set.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Restore the full set of labels.

STAT

Display the current select status.

Dof1*,*Dof2*,*Dof3*,...,*Dof6

Used only with *Type* = S, A, or U. Valid lables are:

Structural labels: UX, UY, or UZ (displacements); U (UX, UY, and UZ) ; ROTX, ROTY, or ROTZ (rotations); ROT (ROTX, ROTY, and ROTZ); DISP (U and ROT); HDSP (Hydrostatic pressure).

Thermal labels: TEMP, TBOT, TE2, TE3, . . ., TTOP (temperature).

Acoustic labels: PRES (pressure); UX, UY, or UZ (displacements for FSI coupled elements).

Electric labels: VOLT (voltage); EMF (electromotive force drop); CURR (current).

Magnetic labels: MAG (scalar magnetic potential); AZ (vector magnetic potential); A (AZ); CURR (current).

Structural force labels: FX, FY, or FZ (forces); F (FX, FY, and FZ); MX, MY, or MZ (moments); M (MX, MY, and MZ); FORC (F and M); DVOL (fluid mass flow rate).

Thermal force labels: HEAT, HBOT, HE2, HE3, . . ., HTOP (heat flow).

Fluid flow force label: FLOW (fluid flow).

Electric force labels: AMPS (current flow); CHRG (electric charge).

Magnetic force labels: FLUX (scalar magnetic flux); CSGZ (magnetic current segment).

Diffusion labels: CONC (concentration); RATE (diffusion flow rate).

Command Default

Degree of freedom (and the corresponding force) labels are determined from the model.

Notes

Selects a degree of freedom label set for reference by other commands. The label set is used on certain commands where ALL is either input in the degree of freedom label field or implied. The active label set has no effect on the solution degrees of freedom. Specified labels which are not active in the model (from the **ET (p. 686)** or **DOF (p. 568)** command) are ignored. As a convenience, a set of force labels corresponding to the degree of freedom labels is also selected. For example, selecting UX also causes FX to be selected (and vice versa). The force label set is used on certain commands where ALL is input in the force label field.

This command is valid in any processor.

---

DOMEGA, *DOMGX*, *DOMGY*, *DOMGZ*

Specifies the rotational acceleration of the structure.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

DOMGX*, *DOMGY*, *DOMGZ

Rotational acceleration of the structure about the global Cartesian X, Y, and Z axes.

Notes

Specifies the rotational acceleration of the structure about each of the global Cartesian axes. Rotational accelerations may be defined in these analysis types:

- Static (**ANTYPE (p. 162)**,STATIC)
- Harmonic (**ANTYPE (p. 162)**,HARMIC) -- full, VT [1], Krylov [1], or mode-superposition [2]
- Transient (**ANTYPE (p. 162)**,TRANS) -- full or mode-superposition [2]
- Substructuring (**ANTYPE (p. 162)**,SUBSTR)
- Modal (**ANTYPE (p. 162)**,MODAL)

1. Loads for VT and Krylov methods are supported as long as they are not:
   - complex tabulated loads (constant or trapezoidal loads in tabulated form are supported)
   - used in conjunction with Rotordynamics (**CORIOLIS (p. 417)**,on).
2. In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

See Acceleration Effect in the *Mechanical APDL Theory Reference* for details. Units are radians/time^2.

The **DOMEGA (p. 571)** command supports tabular boundary conditions (%*TABNAME_X*%, %*TABNAME_Y*%, and %*TABNAME_Z*%) for *DOMEGA_X*, *DOMEGA_Y*, and *DOMEGA_Z* input values (***DIM (p. 530)**) for full transient and harmonic analyses.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Related commands are **ACEL (p. 92)**, **CGLOC (p. 319)**, **CGOMGA (p. 320)**, **DCGOMG (p. 501)**, and **OMEGA (p. 1324)**.

See Analysis Tools in the *Theory Reference* for more information.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Structural>Inertia>Angular Accel>Global
Main Menu>Preprocessor>Loads>Define Loads>Delete>Structural>Inertia>Angular Accel>Global
Main Menu>Solution>Define Loads>Apply>Structural>Inertia>Angular Accel>Global
Main Menu>Solution>Define Loads>Delete>Structural>Inertia>Angular Accel>Global

---

***DOT**,*Vector1*,*Vector2*,*Par_Real*,*Par_Imag*,*Conj*

Computes the dot (or inner) product of two vectors.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Vector1

Name of first vector; must have been previously specified by a ***VEC (p. 2085)** command.

Vector2

Name of second vector; must have been previously specified by a ***VEC (p. 2085)** command.

Par_Real

Parameter name that contains the result.

Par_Imag

Parameter name that contains the imaginary part of the result (used only for complex vectors).

Conj

Key to specify use of the conjugate of *Vector1* when the vectors are complex:

TRUE

Use the conjugate of *Vector1* (default).

FALSE

Do not use the conjugate of *Vector1*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

If *Vector1* and *Vector2* are complex, the complex conjugate of *Vector1* is used to compute the result (*Par_Real*, *Par_Imag*). Therefore, ***DOT** applied to complex vectors performs the operation:

$$res = V1^{*} \cdot V2$$

Set *Conj* = FALSE if you do not want to use the conjugate of *Vector1*. In this case, the operation is:

$$res = V1 \cdot V2$$

Menu Paths

This command cannot be accessed from a menu.

***DOWHILE**, *Par*

Loops repeatedly through the next *ENDDO (p. 636) command.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Par

The name of the scalar parameter to be used as the loop index. There is no character parameter substitution for the *Par* field.

Notes

DOWHILE (p. 573)** loops repeatedly through the next ***ENDDO (p. 636)** command as long as *Par* is greater than zero. The block of commands following the ***DOWHILE (p. 573)** command (up to the ***ENDDO (p. 636)** command) is executed repeatedly until some loop control is satisfied. Printout is automatically suppressed on all loops after the first (include a **/GOPR (p. 865)** command to restore the printout). The command line loop control (*Par*) must be input; however, ***IF (p. 927)** within the block can also be used to control looping (EXIT (p. 707)**, ***CYCLE (p. 462)**). One level of internal file switching is used for each nested ***DOWHILE (p. 573)**. Twenty levels of nested do-loops are allowed.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DSCALE, *RFACT*, *IFACT*, *TBASE*

Scales DOF constraint values.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RFACT

Scale factor for the real component. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor.

IFACT

Scale factor for the imaginary component. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor.

TBASE

Base temperature for temperature difference. For temperatures, the scale factor is applied to the temperature difference (*T*-*TBASE*) and then added to *TBASE*. *T* is the current temperature.

Notes

Scales degree of freedom constraint values (displacement, temperature, etc.) in the database. If velocity and acceleration boundary conditions are applied in a structural analysis, they are also scaled by this command. Solid model boundary conditions are not scaled by this command, but boundary conditions on the FE model are scaled.

Note:

Such scaled FE boundary conditions may still be overwritten by unscaled solid model boundary conditions if a subsequent boundary condition transfer occurs.

Scaling applies to the previously defined values for the selected nodes (**NSEL (p. 1266)**) and the selected degree of freedom labels (**DOFSEL (p. 569)**). Issue **DLIST (p. 550)** command to review results.

DSCALE (p. 574) does not work for tabular boundary conditions.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Operate>Scale FE Loads>Constraints

Main Menu>Solution>Define Loads>Operate>Scale FE Loads>Constraints

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/DSCALE, *WN*, *DMULT*

Sets the displacement multiplier for displacement displays.

GRAPHICS (p. 16): Scaling (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

DMULT

AUTO or 0

Scale displacements automatically so that maximum displacement (vector amplitude) displays as 5 percent of the maximum model length, as measured in the global Cartesian X, Y, or Z directions.

1

Do not scale displacements (that is, scale displacements by 1.0, true to geometry). Often used with large deflection results.

FACTOR

Scale displacements by numerical value input for FACTOR.

OFF

Remove displacement scaling (that is, scale displacements by 0.0, no distortion).

USER

Set *DMULT* to that used for last display (useful when last *DMULT* value was automatically calculated).

Command Default

The default value is AUTO or 0 except when:

Large deflection effects are included (**NLGEOM (p. 1231)**,ON) and it is not a modal analysis; then the default is 1.

It is a spectrum analysis (**ANTYPE (p. 162)**,SPECTR); then the default is OFF.

The amplitude of a time-harmonic solution is computed using the **HRCPLX (p. 910)** command (OMEGAT $\geq$ 360°); then the default is OFF.

The amplitude of a complex modal or harmonic solution is stored into the database using the **SET (p. 1724)** command (*KIMG* = AMPL); then the default is OFF.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

If Multi-Plots are not being displayed, and the current device is a 3D device (**/SHOW (p. 1785)**,3D), then the displacement scale in all active windows will be the same, even if separate **/DSCALE (p. 575)** commands are issued for each active window. For efficiency, the program maintains a single data structure (segment) containing only one displacement scale. The program displays the same segment (displacement scale) in all windows. Only the view settings will be different in each of the active windows.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Displacement Scaling

DSPOPTION,*Reord_Option*,*Memory_Option*,*Memory_Size*,--,--,*Solve_Info*

Sets memory option for the sparse solver.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Reord_Option

Reordering option:

DEFAULT

Use the default reordering scheme.

SEQORDER

Use a sequential equation reordering scheme. Relative to PARORDER, this option typically results in longer equation ordering times and therefore longer overall solver times. Occasionally, however, this option will produce better quality orderings which decrease the matrix factorization times and improve overall solver performance.

PARORDER

Use a parallel equation reordering scheme. Relative to SEQORDER, this option typically results in shorter equation ordering times and therefore shorter overall solver times. Occasionally, however, this option will produce lower quality orderings which increase the matrix factorization times and degrade overall solver performance.

Memory_Option

Memory allocation option:

DEFAULT

Use the default memory allocation strategy for the sparse solver. The default strategy attempts to run in the INCORE memory mode. If there is not enough physical memory available

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

when the solver starts to run in the INCORE memory mode, the solver will then attempt to run in the OUTOFCORE memory mode.

INCORE

Use a memory allocation strategy in the sparse solver that will attempt to obtain enough memory to run with the entire factorized matrix in memory. This option uses the most amount of memory and should avoid doing any I/O. By avoiding I/O, this option achieves optimal solver performance. However, a significant amount of memory is required to run in this mode, and it is only recommended on machines with a large amount of memory. If the allocation for in-core memory fails, the solver will automatically revert to out-of-core memory mode.

OUTOFCORE

Use a memory allocation strategy in the sparse solver that will attempt to allocate only enough work space to factor each individual frontal matrix in memory, but will share the entire factorized matrix on disk. Typically, this memory mode results in poor performance due to the potential bottleneck caused by the I/O to the various files written by the solver.

FORCE

This option, when used in conjunction with the *Memory_Size* option, allows you to force the sparse solver to run with a specific amount of memory. This option is only recommended for the advanced user who understands sparse solver memory requirements for the problem being solved, understands the physical memory on the system, and wants to control the sparse solver memory usage.

Memory_Size

Initial memory size allocation for the sparse solver for each process (*Memory_Size*/process in GB). The *Memory_Size* setting should always be well within the physical memory available, but not so small as to cause the sparse solver to run out of memory. Warnings and/or errors from the sparse solver will appear if this value is set too low. If the FORCE memory option is used, this value is the amount of memory allocated for the entire duration of the sparse solver solution.

--,--

Unused fields

Solve_Info

Solver output option:

OFF

Turns off additional output printing from the sparse solver (default).

PERFORMANCE

Turns on additional output printing from the sparse solver, including a performance summary and a summary of file I/O for the sparse solver. Information on memory usage during assembly of the global matrix (that is, creation of the `Jobname.full` file) is also printed with this option.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Automatic memory allocation is used.

Notes

This command controls options related to the sparse solver in all analysis types where this solver can be used.

The amount of memory required for the sparse solver is unknown until the matrix structure is preprocessed, including equation reordering. The amount of memory allocated for the sparse solver is then dynamically adjusted to supply the solver what it needs to compute the solution.

If you have a large memory system, you may want to try selecting the INCORE memory mode for larger jobs to improve performance. Also, when running the sparse solver with many processors on the same machine or on a machine with very slow I/O performance (for example, slow hard drive speed), you may want to try using the INCORE memory mode to achieve better performance. However, doing so may require much more memory compared to running in the OUTOFCORE memory mode.

Running with the INCORE memory mode is best for jobs which comfortably fit within the limits of the physical memory on a given system. If the sparse solver workspace exceeds physical memory size, the system will be forced to use virtual memory (or the system page/swap file). In this case, it is typically more efficient to run with the OUTOFCORE memory mode.

Menu Paths

This command cannot be accessed from a menu.

DSUM,*SIGNIF*,*Label*,*TD*,*ForceType*

Specifies the double sum mode combination method.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SIGNIF

Combine only those modes whose significance level exceeds the *SIGNIF* threshold. For single-point, multi-point, or DDAM response spectrum (*Spectype* = SPRS, MPRS, or DDAM on **SPOPT (p. 1837)**), the significance level of a mode is defined as the mode coefficient divided by the maximum mode coefficient of all modes. Any mode whose significance level is less than *SIGNIF* is considered insignificant and is not contributed to the mode combinations. The higher the *SIGNIF* threshold, the fewer the number of modes combined. *SIGNIF* defaults to 0.001. If *SIGNIF* is specified as 0.0, it is taken as 0.0. (This mode combination method is not valid for **SPOPT (p. 1837)**, PSD.)

Label

Label identifying the combined mode solution output.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DISP

Displacement solution (default). Displacements, stresses, forces, etc., are available.

VELO

Velocity solution. Velocities, "stress velocities," "force velocities," etc., are available.

ACEL

Acceleration solution. Accelerations, "stress accelerations," "force accelerations," etc., are available.

TD

Time duration for earthquake or shock spectrum. *TD* defaults to 10.

ForceType

Label identifying the forces to be combined:

STATIC

Combine the modal static forces (default).

TOTAL

Combine the modal static plus inertial forces.

Notes

Modes whose effective damping ratio defined in Equation 14.42 exceeds or equals 1.0 are not combined.

This command is also valid for PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>Mode Combine>DSUM Method

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>MultiPt>Mode Combine>DSUM Method

Main Menu>Preprocessor>Loads>Load Step Opts>Spectrum>SinglePt>Mode Combine>DSUM Method

Main Menu>Solution>Load Step Opts>Spectrum>Mode Combine>DSUM Method

Main Menu>Solution>Load Step Opts>Spectrum>MultiPt>Mode Combine>DSUM Method

Main Menu>Solution>Load Step Opts>Spectrum>SinglePt>Mode Combine>DSUM Method

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DSYM, *Lab*, *Normal*, *KCN*

Specifies symmetry or antisymmetry degree-of-freedom constraints on nodes.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Symmetry label:

SYMM

Generate symmetry constraints as described below (default).

ASYM

Generate antisymmetry constraints as described below.

Normal

Surface orientation label to determine the constraint set (surface is assumed to be perpendicular to this coordinate direction in coordinate system *KCN*):

X

Surface is normal to coordinate X direction (default). Interpreted as R direction for non-Cartesian coordinate systems.

Y

Surface is normal to coordinate Y direction. θ direction for non-Cartesian coordinate systems.

Z

Surface is normal to coordinate Z direction. Φ direction for spherical or toroidal coordinate systems.

KCN

Reference number of global or local coordinate system used to define surface orientation.

Notes

Specifies symmetry or antisymmetry degree-of-freedom constraints on the selected nodes. The nodes are first automatically rotated (any previously defined rotations on these nodes are redefined) into coordinate system *KCN*, then zero-valued constraints are generated, as described below, on the selected degree-of-freedom set (limited to displacement, velocity, and magnetic degrees of freedom) (**DOFSEL (p. 569)**). Constraints are defined in the (rotated) nodal coordinate system, as usual. See the **D (p. 483)** and **NROTAT (p. 1264)** commands for additional details about constraints and nodal rotations.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Symmetry and Antisymmetry Constraints:

Symmetry or antisymmetry constraint generations are based upon the valid degrees of freedom in the model, that is, the degrees of freedom associated with the elements attached to the nodes. The labels for degrees of freedom used in the generation depend on the *Normal* label.

For displacement degrees of freedom, the constraints generated are:

	SYMM		ASYM	
Normal	**2D**	**3D**	**2D**	**3D**
X	UX, ROTZ	UX, ROTZ, ROTY	UY	UY, UZ, ROTX
Y	UY, ROTZ	UY, ROTZ, ROTX	UX	UX, UZ, ROTY
Z	--	UZ, ROTX, ROTY	--	UX, UY, ROTZ

For velocity degrees of freedom, the constraints generated are:

	SYMM		ASYM	
Normal	**2D**	**3D**	**2D**	**3D**
X	VX	VX	VY	VY, VZ
Y	VY	VY	VX	VX, VZ
Z	--	VZ	--	VX, VY

For the 2D vector magnetic degree of freedom, AZ, symmetry is naturally satisfied and the SYMM label generates no constraints. The ASYM label generates flux parallel conditions (flux flows parallel to the surface).

	SYMM	ASYM
Normal	**2D**	**2D**
X	--	AZ
Y	--	AZ

---

DSYS, *KCN*

Activates a display coordinate system for geometry listings and plots.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Coordinate system reference number. *KCN* may be 0,1,2 or any previously defined local coordinate system number.

Note:

If a cylinder is displayed in its cylindrical coordinate system (with a 1,0,0 view), it will be unrolled (developed) into a flat plane (with theta along the Y direction).

Command Default

Global Cartesian (*KCN* = 0) display coordinate system.

Notes

Boundary condition symbols, vector arrows, and element coordinate system triads are not transformed to the display coordinate system. The display system orientation (for the default view) is X horizontal to the right, Y vertical upward, and Z out of the screen (normal).

Line directions and area directions (**/PSYMB (p. 1552)**,LDIR and **/PSYMB (p. 1552)**,ADIR) are not plotted for *KCN* >0.

When you create 3D annotation, the coordinates are stored to the database in the display coordinate system that was active at the time of creation. Changing the display coordinate system does not change the annotation coordinate data in the database.

This command is valid in any processor.

Menu Paths

---

DTRAN

Transfers solid model DOF constraints to the finite element model.

SOLUTION (p. 38): Solid Constraints (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Constraints are transferred only from selected solid model entities to selected nodes. The **DTRAN (p. 583)** operation is also done if the **SBCTRAN (p. 1647)** command is issued, and is automatically done upon initiation of the solution calculations (**SOLVE (p. 1822)**).

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Operate>Transfer to FE>Constraints

Main Menu>Solution>Define Loads>Operate>Transfer to FE>Constraints

---

DUMP, *NSTRT*, *NSTOP*

Dumps the contents of a binary file.

AUX2 (p. 61): Binary File Dump (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSTRT*, *NSTOP

Dump file from record *NSTRT* (defaults to 1) to *NSTOP* (defaults to *NSTRT*). If *NSTRT* = HEAD, dump only record 1 of the file (*NSTOP* and the format specification are ignored). If *NSTRT* = ALL, dump the entire file.

Notes

Dumps the file named on the AUX2 **FILEAUX2 (p. 753)** command according the format specified on the **FORM (p. 773)** command.

Menu Paths

Utility Menu>File>List>Binary Files

Utility Menu>List>Files>Binary Files

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/DV3D, *Lab*, *Key*

Sets 3D device option modes.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Mode label:

ACCU

Activating the accumulation buffer for OpenGL graphics, providing faster model rotation when shaded backgrounds are in use. This feature is off by default.

ACTR

Label term to designate the cursor position as the center for automatic dynamic rotational center capability. The subsequent *Key* value (see below) turns this capability on and off. This feature is on by default. (Available for OpenGL displays only.)

ANIM

Animation mode. The ANIM option allows you to create animation frames in pixmap mode instead of display list mode. This may improve large model performance, but it eliminates local manipulation while animation is in progress. This feature is on by default.

ANTI

Label term to control Anti-aliasing, a smoothing technique for your graph plots. (see below) The subsequent *Key* value turns this capability on and off. The default for this feature is off. (Available for OpenGL displays only).

CNTR

Switches banded contours on (1) or off (0) for your 3D contour display. The default is 1 (ON). Other contour parameters such as number of contours or the increment and range are defined using the **/CONTOUR (p. 415)** command. When either 9 or 128 contours are specified via **/CONTOUR (p. 415)**, this command is ignored and a smooth contour is always displayed.

DGEN

Local manipulation degenerate mode. You access the DGEN option to set wire-frame local manipulation mode for 3D devices (device dependent). This feature is off by default.

DLIST

With DLIST, you can specify whether screen updates and redraws will be performed using the Mechanical APDL display list (off), or the 3D device's display list (on). DLIST is on by default for Windows systems, but off for Linux.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DELS

You use DELS to suppress contour display screen overwrites when **/NOERASE (p. 1249)** is active. This prevents the bleed-through that occurs when you overlay contour plots.

TRIS

Triangle strip mode. Tri-stripping provides faster 3D display capabilities and is on by default. Some display enhancements, such as texturing, are adversely affected by tri-stripping. You can turn off tri-stripping in order to improve these display functions. Be sure to turn tri-stripping on after the desired output is obtained.

Key

The following key options apply to *Lab* = ACCU:

0

(OFF) The accumulation buffer is not accessed. (default)

1

(ON) Access to the buffer is enabled.

The following key options apply to *Lab* = ACTR:

0

(OFF) The cursor position has no effect on the existing rotational center for dynamic operations.

1

(ON) The rotational center for dynamic rotations in OpenGL is determined by the position of the mouse cursor on (or within 15 pixels of) the model. Any rotations that are initiated with the cursor more than 15 pixels from the model will occur about the midpoint of the Z-axis at that point in space. If the Z-buffer has not been refreshed the Z-axis will have an infinite value, and rotations will appear to occur about an extremely long Z-axis. This behavior stops when the graphics window is refreshed or replotted. (default)

Note that when using the GUI in 3D mode, when ACTR = 1, the **Rotational Center** option is grayed out under **Utility Menu> PlotCtrls> View Setting** because the rotational center is determined strictly by the position of the mouse cursor.

The following key options apply to *Lab* = ANIM:

0

Display list animation. The object can be dynamically manipulated while animating. No legend, countour or annotation items are displayed. (see Notes, below)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

On Linux, device-dependent pixmap animation is used. On the PC, bitmap animation is provided (default). When you animate in this mode, you cannot dynamically manipulate your model (see Notes, below).

2

On the PC only, this option provides AVI animation which uses the AVI movie player .

Although you can create animations of multiple Mechanical APDL window schemes, animations created with OpenGL display lists (**/DV3D (p. 584)**, ANIM, 0) do not retain the windowing scheme information. You CAN save multiple windows via the X11/WIN32 drivers, or via the OpenGL driver with **/DV3D (p. 584)**, ANIM, KEY in effect (where KEY is not zero).

The following key options apply to *Lab* = ANTI

0

(OFF) Anti-aliasing is not active (default).

1

(ON) The anti-aliasing technique will be applied to smooth the lines in your displays (valid for OpenGL only).

The following key options apply to *Lab* = DGEN:

0

Normal manipulation.

1

Wireframe Manipulation.

The following key options apply to *Lab* = DLIST:

0

(OFF) The Mechanical APDL display list is used for plotting and dynamic graphics manipulation (Linux default).

1

(ON) The local (3D device) display list is used for plotting and dynamic rotation (Windows default).

The following key options apply to *Lab* = TRIS:

0

(OFF) Tri-stripping is off.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

(ON) Tri-stripping is on (default).

This command is valid in any processor.

Notes

Mechanical APDL uses display list animation for its 3D models. This memory resident array method interfaces with the OpenGL model information to allow the program to efficiently pan, zoom, rotate and dynamically manipulate your model during animation. The logo, legend, contour and other annotation items are produced in 2D and will not appear when **/DV3D (p. 584)**, ANIM, 0 is in effect. To display these items, use **/DV3D (p. 584)**, ANIM, 1. All screen data will be displayed, but manipulation of the model will not be possible.

Menu Paths

Utility Menu>PlotCtrls>Device Options

DVAL, *BaseID*, *Lab*, *VALUE*, *VALUE2*, *KeyCal*

Defines values at enforced motion base.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

BaseID

The identification number of the enforced motion base (defined using the **D (p. 483)** command in the modal analysis).

Lab

U

Enforced displacement.

ACC

Enforced acceleration.

VALUE

The value or table name reference for tabular boundary conditions. To specify a table, enclose the table name in percent (%) signs (**DVAL (p. 587)**,*BaseID*,U,%*tablename*%). Use the ***DIM (p. 530)** command to define a table.

VALUE2

The value of the second degree of freedom (if present). If the analysis type and the degree of freedom allow a complex input, *VALUE* is the real component and *VALUE2* is the imaginary component.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KeyCal

Displacement result calculation key:

ON

Calculate absolute displacement and acceleration results (default).

OFF

Calculate relative displacement and acceleration results.

Notes

In a mode-superposition harmonic or transient analysis, you can apply enforced displacement or acceleration loads. If multiple loads are specified for the same base identification number (BaseID), the last load applied overrides the previous ones. For example, the following commands apply displacement to the base with identification number 1:

```
DVAL,1,U,VALUE
DVAL,1,ACC,VALUE
```

In this case, the acceleration (ACC) applied in the last command will override the displacement (U).

Issue **LSCLEAR (p. 1071)**,LSOPT to delete **DVAL (p. 587)** command options from the database.

For more information, see Enforced Motion Method for Mode-Superposition Transient and Harmonic Analyses in the *Structural Analysis Guide* and Enforced Motion Method for Transient and Harmonic Analyses in the *Mechanical APDL Theory Reference*.

Menu Paths

This command cannot be accessed from a menu.

DVMORPH, *VOLU*, *XAREA*, *RMSHKY*

Move nodes in selected volumes to conform to structural displacements.

PREP7 (p. 22): Morphing (p. 37)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VOLU

Non-structural volume to which mesh movement (morph) applies. If ALL, apply morphing to all selected volumes (**VSEL (p. 2163)**). If *VOLU* = P, graphical picking is enabled. A component may be substituted for *VOLU*.

XAREA

Areas to be excluded from morphing. If ALL, exclude all selected areas (**ASEL (p. 192)**). If *XAREA* = P, graphical picking is enabled. A component may be substituted for *XAREA*. If *XAREA* is blank

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(default), allow morphing of nodes attached to areas of the selected volumes (*VOLU*) which are not shared by unselected volumes. (See Notes for clarification).

RMSHKY

Remesh flag option:

0

Remesh the selected non-structural volumes only if mesh morphing fails.

1

Remesh the selected non-structural volumes and bypass mesh morphing.

2

Perform mesh morphing only and do not remesh.

Notes

The selected volumes should include only non-structural regions adjacent to structural regions. DVMORPH will morph the non-structural volumes to coincide with the deflections of the structural regions.

Nodes in the structural regions move in accordance with computed displacements. Displacements from a structural analysis must be in the database prior to issuing DVMORPH.

By default, nodes attached to areas can move along the areas. You can use *XAREA* to restrain nodes on certain areas.

By default (*RMSHKY* = 0), DVMORPH will remesh the selected non-structural volumes entirely if a satisfactory morphed mesh cannot be provided.

If boundary conditions and loads are applied directly to nodes and elements, the DVMORPH command requires that these be removed before remeshing can take place.

Exercise care with initial conditions defined by the **IC (p. 921)** command. Before a structural analysis is performed for a sequentially coupled analysis, the DVMORPH command requires that initial conditions be removed from all null element type nodes in the non-structural regions. Use **ICDELE (p. 923)** to delete the initial conditions.

Menu Paths

Main Menu>Preprocessor>Meshing>Modify Mesh>Phys Morphing>Volumes

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DYNOPT

Specifies "Dynamic analysis options" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Dynamics Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

E Commands

E, I, J, K, L, M, N, O, P

Defines an element by node connectivity.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

I

Number of node assigned to first nodal position (node I). If *I* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

J, K, L, M, N, O, P

Number assigned to second (node J) through eighth (node P) nodal position, if any.

Notes

Defines an element by its nodes and attribute values. You can specify up to eight nodes. You can add more nodes if needed (**EMORE (p. 627)**).

The number of nodes required and the order in which they are specified are described in Element Input in the *Element Reference*. Elements are assigned a number automatically (**NUMSTR (p. 1301)**) as generated. The current (or default) MAT, TYPE, REAL, SECNUM and ESYS attribute values are also assigned to the element.

When creating elements with more than eight nodes (**E (p. 591)** followed by **EMORE (p. 627)**), it may be necessary disable shape-checking (**SHPP (p. 1787)**) before issuing this command.

If a valid element type can be created without using additional nodes (**EMORE (p. 627)**), this command creates that element. **EMORE (p. 627)** then modifies the element to include the additional nodes. If shape-checking is active, it occurs before **EMORE (p. 627)** is issued. If the shape-checking limits are exceeded, therefore, element creation may fail before **EMORE (p. 627)** modifies the element into an acceptable shape.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>Auto Numbered>Thru Nodes

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EALIVE, *ELEM*

Reactivates an element (for the birth and death capability).

SOLUTION (p. 38): Birth and Death (p. 47)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element to be reactivated. If ALL, reactivate all selected elements (**ESEL (p. 661)**). If *ELEM* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *ELEM*. To specify a table, enclose the table name in percent signs (%), e.g. **EALIVE (p. 592)**,%*tabname*%.

Notes

Reactivates the specified element when the birth and death capability is being used. An element can be reactivated only *after* it has been deactivated (**EKILL (p. 616)**).

Reactivated elements have a zero strain (or thermal heat storage, etc.) state.

The usage of tabular input is described in Using TABLE Type Array Parameters to Control Birth and Death in the *Advanced Analysis Guide*.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Birth & Death>Activate Elem

Main Menu>Solution>Load Step Opts>Other>Birth & Death>Activate Elem

ECPCHG

Optimizes degree-of-freedom usage in a coupled acoustic model.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

The **ECPCHG (p. 592)** command converts uncoupled acoustic element types to coupled acoustic element types that are attached to the fluid-structure interaction interface. Or it converts coupled acoustic element types to uncoupled acoustic element types that are not attached to the fluid-structure interaction interface. Issuing **ECPCHG (p. 592)** can dramatically reduce the size of the `Jobname.emat` file, compared to the model fully meshed with the coupled acoustic elements.

Performing the **ECPCHG (p. 592)** conversion on meshed volumes can create circumstances in which more than one element type is defined for a single volume.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If the acoustic elements are coupled with shell elements (SHELL181 or SHELL281), you must set the fluid-structure interaction (FSI) flag by issuing the **SF (p. 1733)**,,FSI command before the **ECPCHG (p. 592)** command.

ECPCHG (p. 592) may add new element types to your model, or it may change the element type for existing acoustic elements. You should verify the defined element types with **ETLIST (p. 702)** and the element attributes with **ELIST (p. 619)** after using this command.

Menu Paths

This command cannot be accessed from a menu.

EDELE, *IEL1*, *IEL2*, *INC*

Deletes selected elements from the model.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IEL1*, *IEL2*, *INC

Delete elements from *IEL1* to *IEL2* (defaults to *IEL1*) in steps of *INC* (defaults to 1). If *IEL1* = ALL, *IEL2* and *INC* are ignored and all selected elements (**ESEL (p. 661)**) are deleted. If *IEL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *IEL1* (*IEL2* and *INC* are ignored).

Notes

Deleted elements are replaced by null or "blank" elements. Null elements are used only for retaining the element numbers so that the element numbering sequence for the rest of the model is not changed by deleting elements. Null elements may be removed (although this is not necessary) with the **NUMCMP (p. 1291)** command. If related element data (pressures, etc.) are also to be deleted, delete that data before deleting the elements. **EDELE (p. 593)** is for unattached elements only. You can use the **xCLEAR** family of commands to remove any attached elements from the database.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Circuit>Delete Elements

Main Menu>Preprocessor>Modeling>Delete>Elements

Main Menu>Preprocessor>Modeling>Delete>Pre-tens Elemnts

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/EDGE, *WN*, *KEY*, *ANGLE*

Displays only the common lines ("edges") of an object.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies. The default window is 1.

KEY

Edge key:

Elements Plots

0

Display common lines between all adjacent element faces.

1

Display only the common lines between non-coplanar faces (that is, show only the edges).

Contour Plots

0

Display only the common lines between non-coplanar faces.

1

Display common lines between all element faces.

ANGLE

Largest angle between two faces for which the faces are considered to be coplanar (0° to 180°). Defaults to 45°. A smaller angle produces more edges, a larger angle produces fewer edges.

Command Default

For element plots, display common lines between all adjacent element faces. For contour plots, display only the common lines between non-coplanar faces.

Notes

The *ANGLE* field is used in PowerGraphics to determine geometric discontinuities. It is a tolerance measure for the differences between the normals of the surfaces being considered. Values within the tolerance are accepted as coplanar (geometrically continuous). In postprocessing displays, results are not averaged across discontinuous surfaces.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A surface can be displayed as an edge outline without interior detail. This is useful for both geometry and postprocessing displays. Element outlines are normally shown as solid lines for geometry and displacement displays. Lines common to adjacent "coplanar" element faces are removed from the display. Midside nodes of elements are ignored.

The **/SHRINK (p. 1794)** option is ignored with the edge option.

/EDGE (p. 594) is not supported for **PLESOL (p. 1401)** and **/ESHAPE (p. 665)** displays when in PowerGraphics mode (**/GRAPHICS (p. 866)**,POWER).

The **/EDGE (p. 594)** command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Edge Options

EEMBED

Generates bonded connections between intersecting elements.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

From selected elements, **EEMBED (p. 595)** identifies embedded elements that are partially or completely enclosed within other (base) elements, determines the interior intersection surfaces between the embedded and base elements, and generates special-purpose REINF265 reinforcing elements representing the bonded connection stiffness of the interior intersection surfaces.

Supported base elements are 3D structural solids (SOLID185, SOLID186, SOLID187, and SOLID285) and thermal solids (SOLID278, SOLID279, and SOLID291). Supported embedded elements are 3D structural links and beams (LINK180, BEAM188, and BEAM189) and thermal link (LINK33).

Before issuing **EEMBED (p. 595)**, define the base and embedded elements, then select the elements to be included for embedded connections. Mesh conformity between the base and embedded elements is not required. A combination of supported base and embedded element types is allowed.

The command has no arguments. Simply issue the command to perform the embedding procedure.

You can inspect newly created reinforcing element types, sections, and elements (**ETLIST (p. 702)**, **SLIST (p. 1795)**, **ELIST (p. 619)**, or **EPLOT (p. 648)**).

Do not issue other preprocessing commands (such as **ET (p. 686)**, **E (p. 591)**, **EMODIF (p. 626)**, and **SECTYPE (p. 1697)**) to create or modify the special-purpose reinforcing elements, element types, and sections.

Elements generated by **EEMBED (p. 595)** are not associated with the solid model.

Reinforcing elements do not account for subsequent modifications made to the base and embedded elements. To avoid inconsistencies, issue **EEMBED (p. 595)** only after the base elements are finalized. If you delete or modify base or embedded elements (for example, via **EDELE (p. 593)**, **EMODIF (p. 626)**,

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ETCHG (p. 699), **EMID (p. 624)**, **EORIENT (p. 646)**, **NUMMRG (p. 1295)**, or **NUMCMP (p. 1291)**), remove all affected reinforcing elements and associated sections, and reissue **EEMBED (p. 595)**.

EEMBED (p. 595) creates new reinforcing sections (of *Subtype* = GCON (p. 1697)) containing details about the created REINF265 elements, then applies them to all newly generated special-purpose REINF265 elements. The number of new reinforcing sections depends on the number of new REINF265 elements. (You can examine the properties of new sections (**SLIST (p. 1795)**).) The program sets the ID number of the newest reinforcing section to the highest available section ID number in the model. After issuing **EEMBED (p. 595)**, the command shows the highest-numbered IDs (element type, element, and section). Do not overwrite a new reinforcing section when defining subsequent sections.

If performing a subsequent structural analysis after the thermal analysis, you can use **EEMBED (p. 595)** to convert the reinforcing elements for the structural analysis, as follows:

1. Convert the thermal base and embedded elements to the appropriate structural element (**ET (p. 686)** or **EMODIF (p. 626)**).
2. Select the reinforcing elements generated by **EEMBED (p. 595)** in the previous thermal analysis only.
3. Issue **EEMBED (p. 595)**.

   Result: The program modifies the attributes of the selected reinforcing elements so that they are compatible with the converted base and embedded elements.

Degree-of-freedom boundary conditions cannot be directly applied on embedded LINK/BEAM nodes.

For more information about using this command, see Direct-Embedding Workflow in the *Structural Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

EEXTRUDE, *Action*, *NELEM*, *SPACE*, *DIST*, *THETA*, *TFACT* , –, *BCKEY*

Extrudes 2D plane elements into 3D solids during a 2D to 3D analysis.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Specifies one of the following command behaviors:

AUTO

Extrudes plane elements (PLANE182 and PLANE183) based on the KEYOPT(3) setting (p. 598). Complementary elements are also extruded. (See Notes (p. 598) for more information.) This behavior is the default.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PLANE

Extrudes elements in the global Z direction. KEYOPT(3) of the parent plane elements is ignored.

AXIS

Extrudes elements about the global Y axis. KEYOPT(3) of the parent plane elements is ignored.

TANGENT

Extrudes plane and contact elements about the global Y axis. Target elements are extruded in the global Z direction.

TIRE

Extrudes plane and contact elements about the global Y axis in a 360-degree span. Target elements are extruded in the global Z direction *if outside the plane elements*. Mesh refinement is adapted specifically for tire analysis.

See Figure 2: Example Command Actions (p. 599).

NELEM

Number of elements to generate in the extruded direction. If you do not specify a number, the program calculates a number automatically based on the average element size and extrusion distance.

SPACE

Spacing ratio. If positive, this value is the nominal ratio of the last division size to the first division size (if > 1.0, sizes increase, if < 1.0, sizes decrease). If negative, |SPACE| is the nominal ratio of the center division size to the end division size. Default = 1.0 (uniform spacing).

DIST

Distance to extrude in the global Z direction for the plane strain case (*Action* = PLANE). The default is 1.

THETA

Angle (in degrees) depending on *Action*:

Action = AXIS – Ending angle to extrude about the global Y axis for the axisymmetric case. Default = 360. (The beginning angle is always 0 degrees.)

Action = TIRE – Span of the contact patch for mesh refinement. The program generates an abrupt mesh transition from fine to coarse. Default = 0.

TFACT

Factor for increasing the rigid target size. The size of the extruded rigid target elements is determined automatically based on the size of the contact elements. Default = 0.2.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

--

Reserved for future use.

BCKEY

Controls the nodal orientation in the third direction and boundary-condition mapping (*Action* = AXIS or TIRE only):

0 --

All nodes are rotated to a local Cartesian coordinate system where X is the radial, Y axial and Z circumferential direction. All loads and displacements are mapped from the 2D model to the 3D model in the local coordinate system.

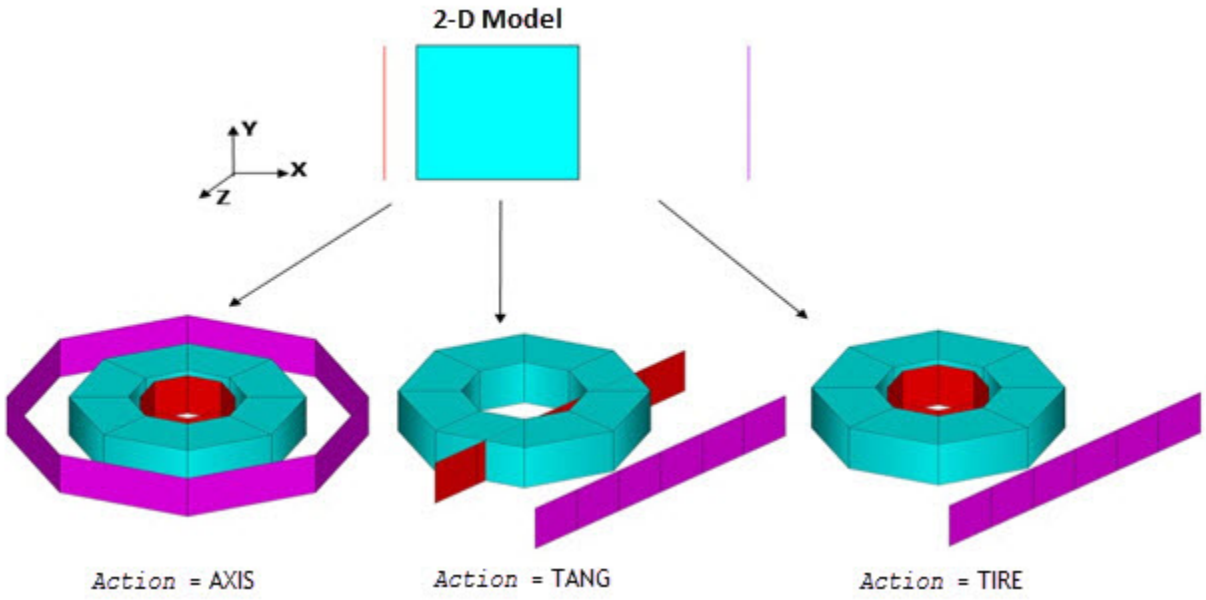
If applying rotation ROTY in axisymmetric cases with torsion on the 2D model, this value sets UZ = 0 at all corresponding 3D nodes.

This value is the default.

1 --

Only nodes with applied loads and/or displacements are rotated to a local Cartesian coordinate system where X is the radial, Y axial and Z circumferential direction. All loads are mapped to the 3D model and all applied displacements are reset to zero.

See Figure 3: Boundary Condition Key Behavior (p. 600).



Notes

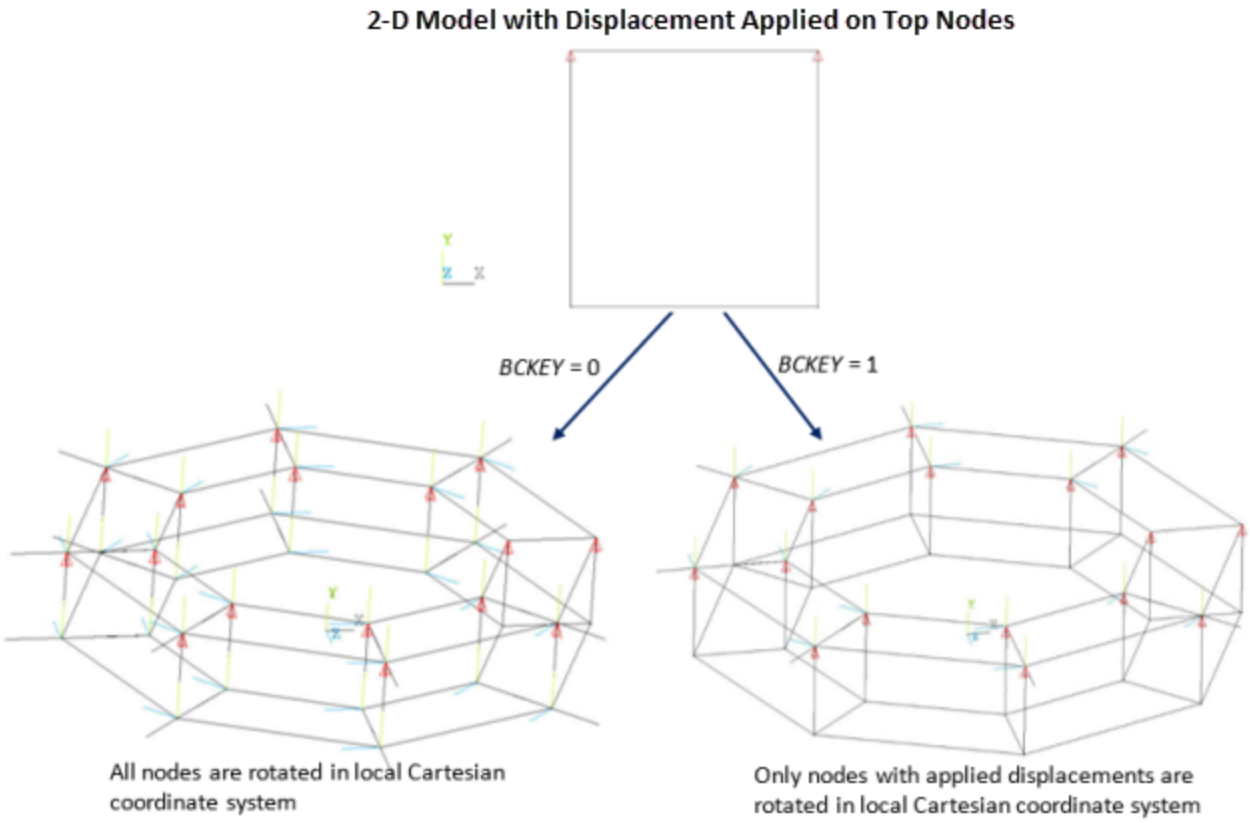
The **EEXTRUDE (p. 596)** command extrudes elements PLANE182 and PLANE183. Complementary elements TARGE169, CONTA172, and REINF263 also extrude. Extrusion operates automatically on elements in the selected element set.

Action = TIRE determines if target elements are in the middle (rim) part of the model or on the outside (road) part. The middle elements extrude axisymmetrically about the Y axis, and the outside elements extrude in the Z direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 2: Example Command Actions

If interference exists between road and tire, the command extrudes outside elements within the specified tolerance (**SELTOL (p. 1710)**) in the global Z direction. For more information, see 2D to 3D analysis.



The *BCKEY* value is valid only within the 2D to 3D analysis environment (that is, after issuing **MAP2DTO3D (p. 1107)**,START and before issuing **MAP2DTO3D (p. 1107)**,FINISH).

Use the default *BCKEY* = 0 setting if you intend to apply minimal new loads or constraints during the 3D analysis phase; otherwise, set *BCKEY* = 1.

For more information, including how boundary conditions and loads are mapped from the 2D model to the 3D model, see 2D-to-3D Analysis in the *Advanced Analysis Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 3: Boundary Condition Key Behavior

This command is valid in the PREP7 (**/PREP7 (p. 1479)**) and SOLUTION (**/SOLU (p. 1821)**) processors. Some options are valid within the 2D to 3D analysis environment only (between **MAP2DTO3D (p. 1107)**,START and **MAP2DTO3D (p. 1107)**,FINISH).

Element Behavior

For automatic PLANE182 and PLANE183 extrusion (*Action* = AUTO), based on the element behavior of the plane elements, the command performs as follows:

KEYOPT(3) = 0 --

Plane stress; the element is ignored.

KEYOPT(3) = 1 --

Axisymmetric; the element is extruded 360 degrees about the Y-axis. *THETA* is ignored.

KEYOPT(3) = 2 --

Plane strain (Z strain = 0.0); the element is extruded a unit distance in the global Z direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KEYOPT(3) = 3 --

Plane stress with thickness input; the element is extruded in the Z-direction as specified by the thickness input via a real constant.

KEYOPT(3) = 5 --

Generalized plane strain; the element is ignored.

KEYOPT(3) = 6 --

Axisymmetric with torsion; the element is extruded 360 degrees about the Y-axis. *THETA* is ignored.

For an axisymmetric extrusion (*Action* = AUTO with KEYOPT(3) = 1, *Action* = AXIS, or *Action* = TANGENT), the command merges any nodes within the specified tolerance (**SELTOL (p. 1710)**,*TOLER*) of the axis into a single node, then forms degenerate tetrahedrons, pyramids, or wedges. The default tolerance value is 1.0E-6.

For an axisymmetric extrusion, SHELL208 and SHELL209 will extrude.

You can control shape-checking options via the **SHPP (p. 1787)** command.

The extrusion behavior of accompanying contact (CONTA172) is determined by the plane element settings. Rigid target (TARGE169) elements are extruded in the global Z direction unless axisymmetric extrusion (*Action* = AXIS or *Action* = TIRE) is in effect.

Within the 2D to 3D analysis environment (between **MAP2DTO3D (p. 1107)**,START and **MAP2DTO3D (p. 1107)**,FINISH), PLANE182, PLANE183, and associated contact/target/reinforcing elements are supported for the axisymmetric (with or without torsion) and plane-strain options only. For REINF263 reinforcing elements, if the fibers have an orientation angle that causes torsion in an axisymmetric analysis, use the axsiymmetrixc-with-torsion option (KEYOPT(3) = 6) for the base elements. For more information, see 2D-to-3D Analysis Requirements and Limitations in the *Advanced Analysis Guide*.

2D to 3D Element Pairs

The following table shows each 2D element capable of extrusion and its corresponding post-extrusion 3D element:

Pre-extrusion 2D Element	Post-extrusion 3D Element
PLANE182	SOLID185
PLANE183	SOLID186
TARGE169	TARGE170
CONTA172	CONTA174
REINF263	REINF265
SHELL208	SHELL181
SHELL209	SHELL281

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

All element properties are also transferred consistently during extrusion. For example, a $\overline{B}$ 2D element is extruded to a $\overline{B}$ 3D element, and a mixed u-P 2D element is extruded to a mixed u-P 3D element. Element and node components are passed over the 3D elements and extruded nodes.

Menu Paths

This command cannot be accessed from a menu.

/EFACET, *NUM*

Specifies the number of facets per element edge for PowerGraphics displays.

POST1 (p. 51): Controls (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NUM

Number of facets per element edge for element plots.

1

Use 1 facet per edge (default for h-elements).

2

Use 2 facets per edge.

4

Use 4 facets per edge.

Command Default

As stated above.

Notes

/EFACET (p. 602) is valid only when PowerGraphics is enabled (**/GRAPHICS (p. 866)**,POWER), except that it can be used in FULL graphics mode for element CONTA174. (See the **/GRAPHICS (p. 866)** command and element CONTA174 in the *Element Reference* for more information.) The **/EFACET (p. 602)** command is only applicable to element type displays.

/EFACET (p. 602) controls the fineness of the subgrid that is used for element plots. The element is subdivided into smaller portions called *facets*. Facets are piecewise linear surface approximations of the actual element face. In their most general form, facets are warped planes in 3D space. A greater number of facets will result in a smoother representation of the element surface for element plots. **/EFACET (p. 602)** may affect results averaging. See Contour Displays in the *Basic Analysis Guide* for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For midside node elements, use *NUM* = 2; if *NUM* = 1, no midside node information is output. For non-midside node elements, *NUM* should be set to 1. See the **PLNSOL (p. 1425)** and **PRNSOL (p. 1505)** commands for more information.

With PowerGraphics active (**/GRAPHICS (p. 866)**,POWER), the averaging scheme for surface data with interior element data included (**AVRES (p. 212)**,,FULL) and multiple facets per edge (**/EFACET (p. 602)**,2 or **/EFACET (p. 602)**,4) will yield differing minimum and maximum contour values depending on the Z-Buffering options (**/TYPE (p. 2034)**,,6 or **/TYPE (p. 2034)**,,7). When the Section data is not included in the averaging schemes (**/TYPE (p. 2034)**,,7), the resulting absolute value for the midside node is significantly smaller.

For cyclic symmetry mode-superposition harmonic solutions, only *NUM* = 1 is supported in postprocessing.

Caution:

If you specify **/EFACET (p. 602)**,1, *PowerGraphics does not plot midside nodes. You must use* **/EFACET (p. 602)**,2 *to make the nodes visible.*

This command is valid in any processor.

EGEN, *ITIME*, *NINC*, *IEL1*, *IEL2*, *IEINC*, *MINC*, *TINC*, *RINC*, *CINC*, *SINC*, *DX*, *DY*, *DZ*

Generates elements from an existing pattern.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITIME*, *NINC

Do this generation operation a total of *ITIME*s, incrementing all nodes in the given pattern by *NINC* each time after the first. *ITIME* must be >1 if generation is to occur. *NINC* may be positive, zero, or negative. If *DX*, *DY*, and/or *DZ* is specified, *NINC* should be set so any existing nodes (as on **NGEN (p. 1218)**) are not overwritten.

IEL1*, *IEL2*, *IEINC

Generate elements from selected pattern beginning with *IEL1* to *IEL2* (defaults to *IEL1*) in steps of *IEINC* (defaults to 1). If *IEL1* is negative, *IEL2* and *IEINC* are ignored and the last |*IEL1*|

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

elements (in sequence backward from the maximum element number) are used as the pattern to be repeated. If *IEL1* = ALL, *IEL2* and *IEINC* are ignored and use all selected elements (**ESEL (p. 661)**) as pattern to be repeated. If *P1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *IEL1* (*IEL2* and *INC* are ignored).

MINC

Increment material number of all elements in the given pattern by *MINC* each time after the first.

TINC

Increment element type number by *TINC*. The element types with incremented numbers must be defined before issuing the **EGEN (p. 603)** command.

RINC

Increment real constant table number by *RINC*.

CINC

Increment element coordinate system number by *CINC*.

SINC

Increment section ID number by *SINC*.

DX*, *DY*, *DZ

Define nodes that do not already exist but are needed by generated elements (as though the **NGEN (p. 1218)**,*ITIME*, *INC*, *NODE1*, , , *DX*, *DY*, *DZ* were issued before **EGEN (p. 603)**). Zero is a valid value. If blank, *DX*, *DY*, and *DZ* are ignored.

Notes

A pattern may consist of any number of previously defined elements. The MAT, TYPE, REAL, ESYS, and SECNUM numbers of the new elements are based upon the elements in the pattern and not upon the current specification settings.

You can use the **EGEN (p. 603)** command to generate interface elements (INTER192, INTER193, INTER194, and INTER195) directly. However, because interface elements require that the element connectivity be started from the bottom surface, you must make sure that you use the correct element node connectivity. See the element descriptions for INTER192, INTER193, INTER194, and INTER195 for the correct element node definition.

Menu Paths

Main Menu>Preprocessor>Modeling>Copy>Elements>Auto Numbered

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EGID, *VAL*

Specifies a global identifier for a set of MESH200 elements.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

VAL

An integer for identifying a set of MESH200 elements used in a reinforcing analysis. Default = 1.

Notes

VAL is a global identifier that you assign to a set of MESH200 elements in a reinforcing analysis. The command is valid only when using the mesh-independent method for defining reinforcing.

The global identifier that you specify is transferred to the reinforcing members (individual reinforcings) when they are generated (**EREINF (p. 656)**).

Issue **EGID (p. 605)** *before* generating the MESH200 elements.

If necessary, you can change the global identifier for an existing set of MESH200 elements (**EMODIF (p. 626)**).

For more information about using this command in a mesh-independent reinforcing analysis, see Selecting and Displaying Groups of Reinforcing Members in the *Structural Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

***EIGEN**, *Kmatrix*, *Mmatrix*, *Cmatrix*, *Evals*, *Evects*

Performs a modal solution with unsymmetric or damping matrices.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Kmatrix

Name of the stiffness matrix. May be a real or complex-valued matrix.

Mmatrix

Name of the mass matrix.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cmatrix

Name of the damping matrix (used only for **MODOPT (p. 1140)**,DAMP).

Evals

Name of the output eigenvalues vector. It will be an *m*-long ***VEC (p. 2085)** vector of complex values, where *m* is the number of eigenvalues requested (**MODOPT (p. 1140)**).

Evects

Name of the output eigenvector matrix. It will be a *n* x *m* ***DMAT (p. 551)** (dense) matrix of complex values, where *n* is the size of the matrix and *m* is the number of eigenvalues requested (**MODOPT (p. 1140)**).

Notes

Use the command **ANTYPE (p. 162)**,MODAL and the **MODOPT (p. 1140)** command to specify the modal solution options. Only **MODOPT (p. 1140)**,DAMP, **MODOPT (p. 1140)**,UNSYM, **MODOPT (p. 1140)**,LANB, and **MODOPT (p. 1140)**,SUBSP are supported.

***EIGEN (p. 605)** with Block Lanczos (LANB) only supports sparse matrices.

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

Menu Paths

This command cannot be accessed from a menu.

EINFIN,*CompName*,*PNODE(NREF1)*,*NREF2*,*NREF3*,*MATID*

Generates structural infinite elements from selected nodes.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | PrepPost | **Solver** | AS add-on

CompName

Component name containing the reference nodes for calculating the position of *poles* for generating INFIN257 structural infinite elements.

The number of poles and their positions are based on the number of included nodes:

- If the component includes only one node, the node becomes the pole node. The pole node is typically located at or near the geometric center of the finite element domain if there is a single pole.
- If the component includes two (2D) or three nodes (3D), the program constructs an infinite line or area, then calculates the pole positions by drawing a perpendicular line from a selected node to the line or area.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- If the component includes more than two (2D) or three nodes (3D), the program uses the first two or three nodes calculate the position of poles.

PNODE* or *NREF1

Node number for the direct input of the pole node. (A parameter or parametric expression is also valid.) Specify this value when no *CompName* has been specified. (If *CompName* is specified, this value is ignored.)

If *NREF2*, or *NREF2* and *NREF3*, are defined, this value becomes the first reference node (*NREF1*) used to calculate pole positions.

NREF2

Node number of the second reference node used to calculate pole positions. (A parameter or parametric expression is also valid.) Specify this value when no *CompName* has been specified. (If *CompName* is specified, this value is ignored.) To input this value, first specify *NREF1* (replacing *PNODE*). Pole positions are calculated on an infinite line defined by *NREF1* and *NREF2*.

NREF3

Node number of the third reference node used to calculate pole positions. (A parameter or parametric expression is also valid.) Specify this value when no *CompName* has been specified. (If *CompName* is specified, this value is ignored.) To input this value, first specify *NREF1* (replacing *PNODE*) and *NREF2*. Pole positions are calculated on an infinite line defined by *NREF1*, *NREF2*, and *NREF3*.

MATID

Optional material ID of the structural infinite element. (A parameter or parametric expression is also valid.) If specified, this value defines the material properties of the structural infinite elements explicitly; otherwise, the material ID is copied from the base elements.

Notes

The **EINFIN (p. 606)** command generates structural infinite elements (INFIN257) directly from the selected face of valid base elements (existing standard elements in your model). The command scans all base elements for the selected nodes and generates a compatible infinite element type for each base element. A combination of different base element types is allowed if the types are all compatible with the infinite elements.

The infinite element type requires no predefinition (**ET (p. 686)**).

The faces of base elements are determined from the selected node set (**NSEL (p. 1266)**), and the geometry of the infinite element is determined based on the shape of the face. Element characteristics and options are determined according to the base element. For the face to be used, all nodes on the face of a base element must be selected

Use base elements to model the near-field domain that interacts with the solid structures or applied loads. To apply the truncated far-field effect, a single layer of infinite elements must be attached to the near-field domain. The outer surface of the near-field domain must be convex.

The material of the structural infinite elements can be defined in either of two ways. If *MATID* is specified, the command uses that value to define the material property of the structural infinite elements. If

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

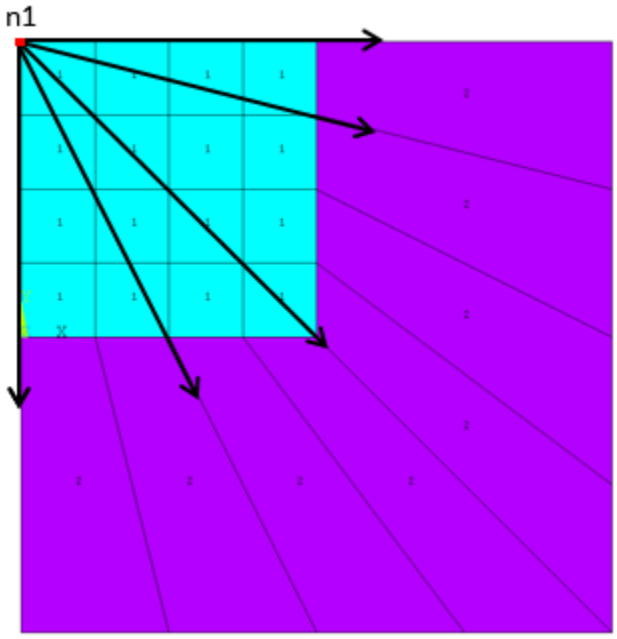
MATID is *not* specified, the material ID of the base element is copied to the attached infinite element. Although only isotropic material is allowed for the infinite elements, these options enable you to define anisotropic material for the base elements in a static analysis. (In a transient analysis, however, use the same isotropic material for both base elements and infinite elements.)

After the **EINFIN (p. 606)** command executes, you can verify the newly created infinite element types and elements (**ETLIST (p. 702)**, **ELIST (p. 619)**, **EPLOT (p. 648)**).

Infinite elements do not account for any subsequent modifications made to the base elements. It is good practice to issue the **EINFIN (p. 606)** command only *after* the base elements are finalized. If you delete or modify base elements (via **EDELE (p. 593)**, **EMODIF (p. 626)**, **ETCHG (p. 699)**, **EMID (p. 624)**, **EORIENT (p. 646)**, **NUMMRG (p. 1295)**, or **NUMCMP (p. 1291)** commands, for example) after generating the structural infinite elements, remove all affected infinite elements and reissue the **EINFIN (p. 606)** command; doing so prevents inconsistencies.

Command Usage Examples

Example 3: Single Reference Node (Pole)



2D Elements:

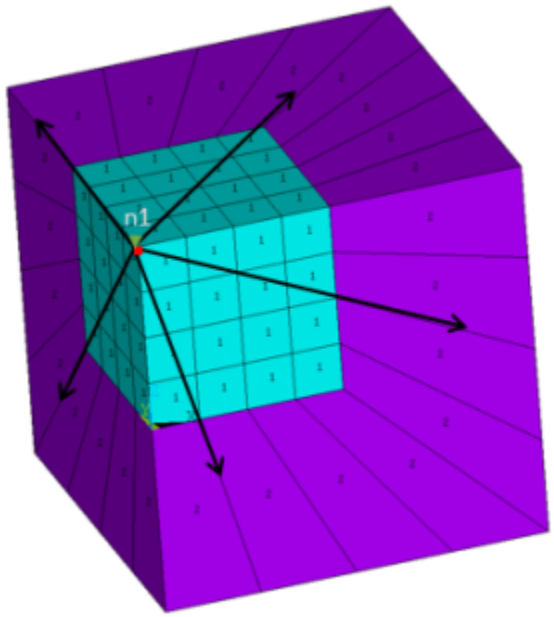
```
/prep7
et,1,182
mp,ex,1,1e9
mp,nuxy,1,0.3

type,1             ! Generate solid elements
mat,1
rect,0,4,0,4
elsize,1
allsel
mshkey,1
amesh,1

n1 = node(0,4,0)   ! Select reference node
nsel,s,loc,x,4     ! Select nodes on base element
nsel,a,loc,y,0
EINFIN, ,n1
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3D Elements:



```
/prep7
et,1,185          ! Generate solid elements
mp,ex,1,1e9
mp,nuxy,1,0.3

type,1
mat,1
block,0,4,0,4,0,4
elsize,1

mshkey,1
vmesh,1

n1 = node(0,0,4)  ! Select reference node
nsel,,loc,x,4     ! Select nodes on base elements
nsel,a,loc,y,4
nsel,a,loc,z,0
EINFIN, ,n1
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

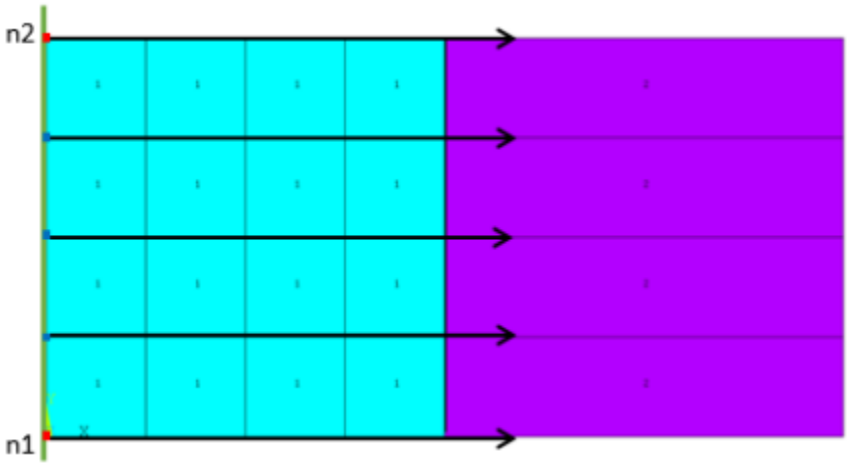
Example 4: Two Reference Nodes

2D Elements:

```
/prep7
et,1,182            ! Generate solid elements
mp,ex,1,1e9
mp,nuxy,1,0.3
type,1
mat,1
rect,0,4,0,4
elsize,1
allsel
mshkey,1
amesh,1

n1 = node(0,0,0)    ! Select reference nodes
n2 = node(0,4,0)

nsel,,loc,x,4       ! Select nodes on base elements
EINFIN, ,n1,n2
```



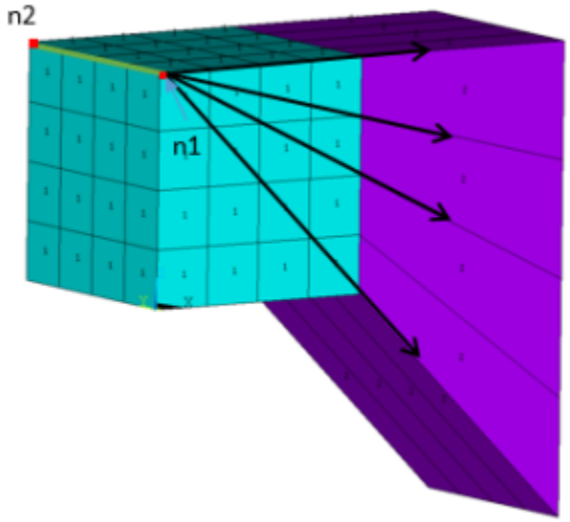
Following is the equivalent input with a component:

```
/prep7
et,1,182            ! Generate solid elements  mp,ex,1,1e9
mp,nuxy,1,0.3
type,1
mat,1
rect,0,4,0,4
elsize,1
allsel
mshkey,1
amesh,1

n1 = node(0,0,0)     ! Select  reference nodes
n2 = node(0,4,0)
nsel,,node,,n1
nsel,a,node,,n2
cm, nrefs, node      ! Define component
allsel
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
nsel,,loc,x,4        ! Select nodes on base elements
EINFIN, nrefs
```



3D Elements:

```
/prep7

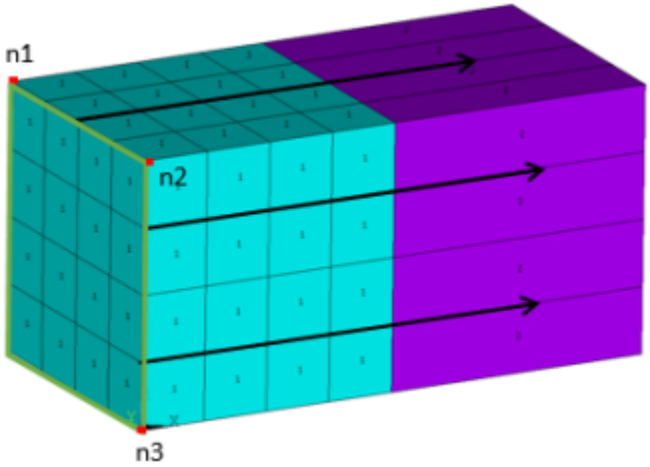
et,1,185             ! Generate solid elements
mp,ex,1,1e9
mp,nuxy,1,0.3

type,1
mat,1
block,0,4,0,4,0,4
elsize,1
mshkey,1
vmesh,1

n1 = node(0,0,4)    ! Select reference nodes
n2 = node(0,4,4)
nsel,,loc,x,4       ! Select nodes on base elements
EINFIN, ,n1, n2
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Example 5: Three Reference Nodes



3D Elements Only:

```
/prep7

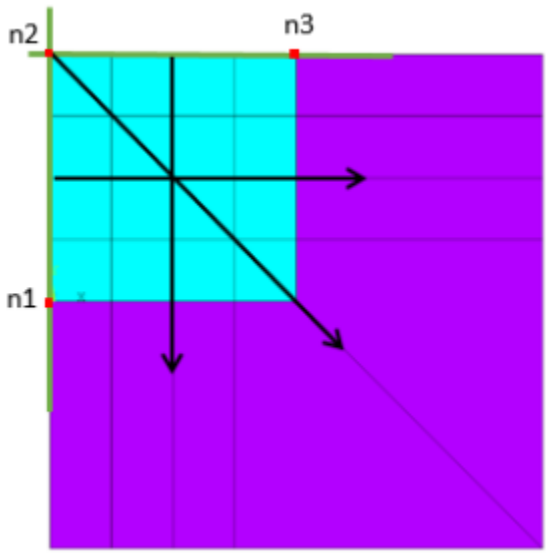
et,1,185            ! Generate solid elements
mp,ex,1,1e9
mp,nuxy,1,0.3

type,1
mat,1
block,0,4,0,4,0,4
elsize,1
mshkey,1
vmesh,1

n1 = node(0,4,4)    ! Select reference nodes
n2 = node(0,0,4)
n3 = node(0,0,0)
nsel,,loc,x,4       ! Select nodes on base elements
EINFIN, ,n1,n2,n3
```

Example 6: Multiple EINFIN Commands

2D Elements:



```
/prep7
et,1,182
mp,ex,1,1e9
mp,nuxy,1,0.3

type,1             ! Generate solid elements
mat,1
rect,0,4,0,4
elsize,1
allsel
mshkey,1
amesh,1

n1 = node(0,0,0)
n2 = node(0,4,0)
nsel,,loc,x,4,
nsel,r,loc,y,0.5,5
EINFIN,,n1,n2      ! upper right quad. elements
nsel,all
nsel,,loc,x,4
nsel,r,loc,y,0,1.5
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

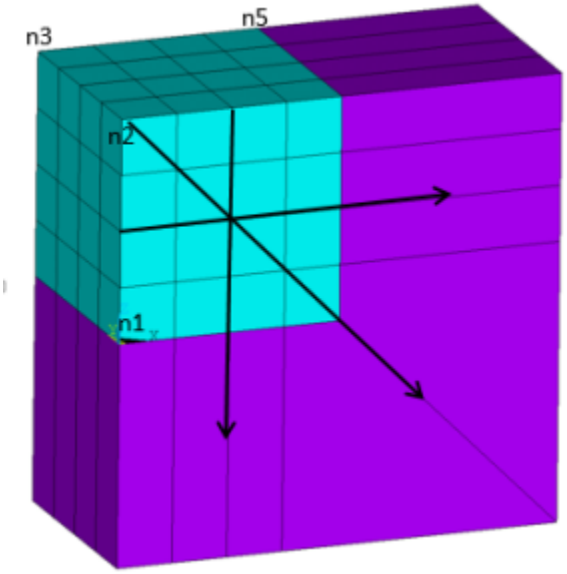
```
EINFIN,,n2          ! Lower corner element
nsel,all
n3 = node(4,4,0)
nsel,s,loc,y,0
EINFIN,,n2,n3       ! Lower elements (y<0)
```

3D Elements:

```
/prep7

et,1,185              ! Generate solid elements
mp,ex,1,1e9
mp,nuxy,1,0.3

type,1
mat,1



block,0,4,0,4,0,4
elsize,1

mshkey,1
vmesh,1

n1 = node(0,0,0)
n2 = node(0,0,4)
n3 = node(0,4,4)

nsel,s,loc,x,4,
nsel,u,loc,z,0
EINFIN, , n1, n2, n3  ! Upper right part
allsel
nsel,s,loc,x,4
nsel,r,loc,z,-0.1,1.2
EINFIN,,n2,n3         ! Corner element
allsel
n5 = node(4,4,4)
nsel,s,loc,z,0
EINFIN,,n2,n3,n5      ! Lower part (z<0)
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

EINTF, *TOLER*, *K*, *TLAB*, *KCN*, *DX*, *DY*, *DZ*, *KNONROT*

Defines two-node elements between coincident or offset nodes.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TOLER

Tolerance for coincidence (based on maximum Cartesian coordinate difference for node locations and on angle differences for node orientations). Defaults to 0.0001. Only nodes within the tolerance are considered to be coincident.

K

Only used when the type of the elements to be generated is PRETS179. *K* is the pretension node that is common to the pretension section that is being created. If *K* is not specified, it is created automatically and will have an Mechanical APDL-assigned node number. If *K* is specified but does not already exist, it will be created automatically but will have the user-specified node number. *K* cannot be connected to any existing element.

TLAB

Nodal number ordering. Allowable values are:

LOW

The 2-node elements are generated from the lowest numbered node to the highest numbered node.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HIGH

The 2-node elements are generated from the highest numbered node to the lowest numbered node.

REVE

Reverses the orientation of the selected 2-node element.

KCN

In coordinate system *KCN*, elements are created between node 1 and node 2 (= node 1 + dx dy dz).

DX, DY, DZ

Node location increments that define the node offset in the active coordinate system (DR, Dθ, DZ for cylindrical and DR, Dθ, DΦ for spherical or toroidal).

KNONROT

When *KNONROT* = 0, the nodes coordinate system is not rotated. When *KNONROT* = 1, the nodes belonging to the elements created are rotated into coordinate system *KCN* (see **NROTAT (p. 1264)** command description).

Notes

Defines 2-node elements (such as gap elements) between coincident or offset nodes (within a tolerance). May be used, for example, to "hook" together elements interfacing at a seam, where the seam consists of a series of node pairs. One element is generated for each set of two coincident nodes. For more than two coincident or offset nodes in a cluster, an element is generated from the lowest numbered node to each of the other nodes in the cluster. If fewer than all nodes are to be checked for coincidence, use the **NSEL (p. 1266)** command to select the nodes. Element numbers are incremented by one from the highest previous element number. The element type must be set (**ET (p. 686)**) to a 2-node element before issuing this command. Use the **CPINTF (p. 425)** command to connect nodes by coupling instead of by elements. Use the **CEINTF (p. 305)** command to connect the nodes by constraint equations instead of by elements.

For contact element CONTA178, the tolerance is based on the maximum Cartesian coordinate difference for node locations only. The angle differences for node orientations are not checked.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>Auto Numbered>At Coincid Nd

Main Menu>Preprocessor>Modeling>Create>Elements>Auto Numbered>Offset Nodes

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EKILL, *ELEM*

Deactivates an element (for the birth and death capability).

SOLUTION (p. 38): Birth and Death (p. 47)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element to be deactivated. If ALL, deactivate all selected elements (**ESEL (p. 661)**). If *ELEM* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *ELEM*. To specify a table, enclose the table name in percent signs (%), e.g. **EKILL (p. 616)**,%*tabname*%.

Notes

Deactivates the specified element when the birth and death capability is being used. A deactivated element remains in the model but contributes a near-zero stiffness (or conductivity, etc.) value (**ESTIF (p. 681)**) to the overall matrix. Any solution-dependent state variables (such as stress, plastic strain, creep strain, etc.) are set to zero. Deactivated elements contribute nothing to the overall mass (or capacitance, etc.) matrix, and do not generate a load vector (pressures, convections, gravity, etc.).

The usage of tabular input is described in Using TABLE Type Array Parameters to Control Birth and Death in the *Advanced Analysis Guide*.

The element can be reactivated with the **EALIVE (p. 592)** command.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Birth & Death>Kill Elements

Main Menu>Solution>Load Step Opts>Other>Birth & Death>Kill Elements

ELBOW, *Transkey*, *TOL*, *Dof*, *Cons1*, *Cons2*, *Cons3*, *Cons4*

Specifies degrees of freedom to be coupled for end release and applies section constraints to elbow elements.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Transkey

Pipe-to-elbow transition flag:

OFF

Do not automatically transition pipes to elbows. (This behavior is the default.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON

Automatically convert straight PIPE289 elements to ELBOW290 elements where it is beneficial. The program converts elements in transition regions where curved ELBOW290 elements are connected to straight PIPE289 elements.

TOL

Angle tolerance (in degrees) between adjacent ELBOW290 elements. The default value is 20. A value of -1 specifies *all* selected ELBOW290 elements.

Dof

Degrees of freedom to couple:

ALL

Couple all nodal degrees of freedom (UX, UY, UZ, ROTX, ROTY, and ROTZ). This behavior is the default.

BALL

Create ball joints (equivalent to releasing ROTX, ROTY, and ROTZ).

Cons1*, *Cons2*, *Cons3*, *Cons4

Section degrees of freedoms to constrain. If *Cons1* through *Cons4* are unspecified, no section constraints are applied:

SECT

All section deformation

SE

Section radial expansion

SO

Section ovalization

SW

Section warping

SRA

Local shell normal rotation about cylindrical axis t2

SRT

Local shell normal rotation about cylindrical axis t1

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **ELBOW (p. 616)** command specifies end releases and section constraints for ELBOW290 elements and converts straight PIPE289 elements to ELBOW290 elements.

Curved PIPE289 elements are *not* converted to ELBOW290 elements.

ELBOW290 elements are generated only if there are *existing* ELBOW290 elements in the curved areas.

The command works on currently selected nodes and elements. It creates end releases on any two connected elbow elements whose angle at connection exceeds the specified tolerance. From within the GUI, the **Picked** node option generates an end release and section constraints at the selected node regardless of the angle of connection (that is, the angle tolerance [*TOL*] is set to -1).

Elbow and pipe elements must share the same section ID in order for the pipe-to-elbow transition to occur.

To list the elements altered by the **ELBOW (p. 616)** command, issue an **ELIST (p. 619)** command.

To list the coupled sets generated by the **ELBOW (p. 616)** command, issue a **CPLIST (p. 427)** command.

To list the section constraints generated by the **ELBOW (p. 616)** command, issue a **DLIST (p. 550)** command.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>End Releases>Elbows>On Selected set

Main Menu>Solution>Load Step Opts>Other>End Releases>Elbows>On Selected set

---

ELEM

Specifies "Elements" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Elements

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ELIST, *IEL1*, *IEL2*, *INC*, *NNKEY*, *RKEY*

Lists the elements and their attributes.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IEL1*, *IEL2*, *INC

Lists elements from *IEL1* to *IEL2* (defaults to *IEL1*) in steps of *INC* (defaults to 1). If *IEL1* = ALL (default), *IEL2* and *INC* are ignored and all selected elements (**ESEL (p. 661)**) are listed. If *IEL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *IEL1* (*IEL2* and *INC* are ignored).

NNKEY

Node listing key:

0

List attribute references and nodes.

1

List attribute references but not nodes.

RKEY

Real constant listing key:

0

Do not show real constants for each element.

1

Show real constants for each element. This includes default values chosen for the element.

Notes

Lists the elements with their nodes and attributes (MAT, TYPE, REAL, ESYS, SECNUM, PART). See also the **LAYLIST (p. 1017)** command for listing layered elements.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Elements>Attributes + RealConst

Utility Menu>List>Elements>Attributes Only

Utility Menu>List>Elements>Nodes + Attributes

Utility Menu>List>Elements>Nodes + Attributes + RealConst

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*ELSE

Separates the final if-then-else block.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Optional final block separator within an if-then-else construct. See the ***IF (p. 927)** for details. If a batch input stream hits an end-of-file during a false ***IF (p. 927)** condition, the run will not terminate normally. You will need to terminate it externally (via either the Linux "kill" function or the Windows task manager). The ***ELSE (p. 620)** command must appear on the same file as the ***IF (p. 927)** command, and all five characters must be input.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

*ELSEIF, *VAL1*, *Oper1*, *VAL2*, *Conj*, *VAL3*, *Oper2*, *VAL4*

Separates an intermediate if-then-else block.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

VAL1

First numerical value (or parameter which evaluates to numerical value) in the conditional comparison operation. *VAL1*, *VAL2*, *VAL3*, and *VAL4* can also be character strings (enclosed in quotes) or parameters for *Oper* = EQ and NE only.

Oper1

Operation label. A tolerance of 1.0E-10 is used for comparisons between real numbers:

EQ --

Equal (for *VAL1* = *VAL2*).

NE --

Not equal (for *VAL1* ≠*VAL2*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LT --

Less than (for *VAL1*<*VAL2*).

GT --

Greater than (for *VAL1*>*VAL2*).

LE --

Less than or equal (for *VAL1* ≤ *VAL2*).

GE --

Greater than or equal (for *VAL1* ≥ *VAL2*).

ABLT --

Absolute values of *VAL1* and *VAL2* before < operation.

ABGT --

Absolute values of *VAL1* and *VAL2* before > operation.

VAL2

Second numerical value (or parameter which evaluates to numerical value) in the conditional comparison operation.

Conj

(Optional) Connection between two logical clauses.

AND -

True if both clauses (*Oper1* and *Oper2*) are true.

OR -

True if either clause is true.

XOR -

True if either (but not both) clause is true.

VAL3

(Optional) Third numerical value (or parameter which evaluates to numerical value).

Oper2

(Optional) Operation label. This will have the same labels as *Oper1*, except it uses *Val3* and *Val4*. A tolerance of 1.0E-10 is used for comparisons between real numbers.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL4

(Optional) Fourth numerical value (or parameter value which evaluates to a numerical value).

Notes

Optional intermediate block separator within an if-then-else construct. All seven characters of the command name (*ELSEIF) must be input. This command is similar to the ***IF (p. 927)** command except that the *Base* field is not used. The ***IF (p. 927)**, ***ELSEIF (p. 620)**, ***ELSE (p. 620)**, and ***ENDIF (p. 636)** commands for each if-then-else construct must all be read from the same file (or keyboard).

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

EMAGERR

Calculates the relative error in an electrostatic or electromagnetic field analysis.

POST1 (p. 51): Magnetics Calculations (p. 55)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

The relative error is an approximation of the mesh discretization error associated with a solution. It is based on the discrepancy between the unaveraged, element-nodal field values and the averaged, nodal field values. The calculation is valid within a material boundary and does not consider the error in continuity of fields across dissimilar materials.

For electrostatics, the field values evaluated are the electric field strength (EFSUM) and the electric flux density (DSUM). A relative error norm of each is calculated on a per-element basis and stored in the element table (**ETABLE (p. 687)**) with the labels EF_ERR and D_ERR. Normalized error values EFN_ERR and DN_ERR are also calculated and stored in the element table. Corresponding quantities for electromagnetics are H_ERR, B_ERR, HN_ERR, and BN_ERR, which are calculated from the magnetic field intensity (HSUM) and the magnetic flux density (BSUM). The normalized error value is the relative error norm value divided by the peak element-nodal field value for the currently selected elements.

Use the **PLETAB (p. 1411)** and **PRETAB (p. 1490)** commands to plot and list the error norms and normalized error values.

Menu Paths

Main Menu>General Postproc>Elec&Mag Calc>Element Based>Error Eval

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EMATWRITE, *Key*

Forces the writing of all the element matrices to `Jobname.emat`.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Write key:

YES

Forces the writing of the element matrices to `Jobname.emat` even if not normally done.

NO

Element matrices are written only if required. This value is the default.

Notes

The **EMATWRITE (p. 623)** command forces Mechanical APDL to write the `Jobname.emat` file.

If used in the solution processor (**/SOLU (p. 1821)**), this command is valid within the first load step only.

This command is also valid in PREP7.

Menu Paths

This command cannot be accessed from a menu.

EMF

Calculates the electromotive force (emf), or voltage drop along a predefined path.

POST1 (p. 51): Magnetics Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

EMF (p. 623) invokes a Mechanical APDL macro which calculates the electromotive force (emf), or voltage drop along a predefined path (specified with the **PATH (p. 1354)** command). It is valid for both 2D and 3D electric field analysis. The calculated emf value is stored in the parameter EMF.

You must define a line path (via the **PATH (p. 1354)** command) before issuing the **EMF (p. 623)** command macro. The macro uses calculated values of the electric field (EF), and uses path operations for the calculations. All path items are cleared when the macro finishes executing.

The **EMF (p. 623)** macro sets the "ACCURATE" mapping method and "MAT" discontinuity option on the **PMAP (p. 1449)** command. The program retains these settings after executing the macro.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>General Postproc>Elec&Mag Calc>Path Based>EMF

EMFT

Summarizes electromagnetic forces and torques.

POST1 (p. 51): Magnetics Calculations (p. 55)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Use this command to summarize electromagnetic force and torque in both static electric and magnetic problems. To use this command, select the nodes in the region of interest and make sure that all elements are selected. If **RSYS (p. 1639)** = 0, the force is reported in the global Cartesian coordinate system. If **RSYS (p. 1639)** ≠ 0, force is reported in the specified coordinate system. However, for torque, if **RSYS (p. 1639)** ≠ 0, this command will account for the shift and rotation as specified by **RSYS (p. 1639)**, but will report only the Cartesian components.

Forces are stored as items _FXSUM, _FYSUM, _FZSUM, and _FSSUM. Torque is stored as items _TXSUM, _TYSUM, _TZSUM, and _TSSUM.

This command is valid only with PLANE121, SOLID122, SOLID123, PLANE222, PLANE223, SOLID225, SOLID226, SOLID227, PLANE233, SOLID236 and SOLID237 elements.

Menu Paths

Main Menu> General Postprocessor> Elec&Mag Calc> Summarize Force/Torque

---

EMID, *Key*, *Edges*

Adds or removes midside nodes.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Add or remove key:

ADD

Add midside node to elements (default).

REMOVE

Remove midside nodes from elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Edges

ALL

Add (or remove) midside nodes to (from) all edges of all selected elements, independent of which nodes are selected (default).

EITHER

Add (or remove) midside nodes only to (from) element edges which have either corner node selected.

BOTH

Add (or remove) midside nodes only to (from) element edges which have both corner nodes selected.

Notes

This command adds midside nodes to (or removes midside nodes from) the selected elements. For this to occur, the selected elements must be midside node capable, the active element type (**TYPE (p. 2036)**) must allow midside node capability, and the relationship between the finite element model and the solid model (if any) must first be disassociated (**MODMSH (p. 1138)**).

By default, **EMID (p. 624)** generates a midside node wherever a zero (or missing) midside node occurs for that element. You can control this and add (or remove) midside nodes selectively by using the *Edges* argument. Nodes are located midway between the two appropriate corner nodes based on a linear Cartesian interpolation. Nodal coordinate system rotation angles are also linearly interpolated. Connected elements share the same midside node. Node numbers are generated sequentially from the maximum node number.

The **EMID (p. 624)** command is useful for transforming linear element types to quadratic element types having the same corner node connectivity.

EMID (p. 624) is also useful for transforming elements created outside of the program.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Elements>Add Mid Nodes

Main Menu>Preprocessor>Modeling>Move / Modify>Elements>Remove Mid Nd

---

EMIS,*MAT*,*EVALU*

Specifies emissivity as a material property for the Radiation Matrix method.

AUX12 (p. 62): Radiation Matrix Method (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT

Material number associated with this emissivity (500 maximum). Defaults to 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EVALU

Emissivity for this material (0.0 < *EVALU* ≤ 1.0). Enter a very small number for zero.

Command Default

Since there is no command default (p. 3) value for emissivity, you must issue **EMIS (p. 625)** to specify it. Otherwise, an error message appears. If you issue **EMIS (p. 625)** without defining a numerical value, emissivity defaults to 0.

Notes

Specifies emissivity as a material property for the Radiation Matrix method. This material property can then be associated with each element.

Menu Paths

Main Menu>Radiation Opt>Matrix Method>Emissivities

EMODIF, *IEL*, *STLOC*, *I1*, *I2*, *I3*, *I4*, *I5*, *I6*, *I7*, *I8*

Modifies a previously defined element.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IEL

Modify nodes and/or attributes for element number *IEL*. If ALL, modify all selected elements (**ESEL (p. 661)**). If *IEL* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *IEL*.

STLOC

Starting location (*n*) of first node to be modified or the attribute label.

If *n*, modify element node positions *n*, *n*+1, etc. (*n* = 1 to 20). For example, if *STLOC* = 1, *I1* refers to the first node, *I2*, the second, etc. If *STLOC* = 9, *I1* refers to the ninth node, *I2*, the tenth, etc. Attributes are also modified to the currently specified values.

Use -*n* to modify only nodes and not attributes.

If zero, modify only the attributes to the currently specified values.

If MAT, TYPE, REAL, ESYS, SECNUM, or EGID, modify only that attribute to the *I1* value.

I1, I2, I3, . . . , I8

Replace the previous node numbers assigned to this element with these corresponding values. A (blank) retains the previous value (except in the *I1* field, which resets the *STLOC* node number to zero).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For attributes (*STLOC* = MAT, TYPE, etc.), replace the existing value with the *I1* value (or the default if *I1* is zero or blank).

For attributes MAT and REAL, inputting the label GCN for *I1* replaces the existing attribute value with zero for the specified elements. This is a special case used only for converting contact elements (TARGE169 through CONTA177) from a pair-based definition to a general contact definition.

Notes

The nodes and/or attributes (MAT, TYPE, REAL, ESYS, SECNUM, or EGID values) of an existing element can be changed with this command.

The EGID attribute is valid only for MESH200 elements when they are used to generate reinforcing elements (REINF*nnn*) via the mesh-independent method for defining reinforcing.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Elements>Modify Attrib

Main Menu>Preprocessor>Modeling>Move / Modify>Elements>Modify Nodes

---

EMORE, *Q*, *R*, *S*, *T*, *U*, *V*, *W*, *X*

Adds more nodes to the just-defined element.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Q, R, S, T, U, V, W, X

Numbers of nodes typically assigned to ninth (node *Q*) through sixteenth (node *X*) nodal positions, if any. If *Q* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Notes

Repeat **EMORE (p. 627)** command for up to 4 additional nodes (20 maximum). Nodes are added after the last *nonzero* node of the element. Node numbers defined with this command may be zeroes.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EMSEL, *Type*, - -, - -, *VMIN*, *VMAX*, *VINC*

Selects a group of reinforcing members via a predefined global identifier.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Specifies the selection type for the reinforcing elements:

S – Select a new set (default).

A – Select an additional set and add it to the current set.

U – Unselect a set from the current set.

ALL – Restore the full set.

STAT – Display the current selection status.

The following arguments are valid only when *Type* = S, A, or U:

- -

Reserved for future use.

- -

Reserved for future use.

VMIN

Minimum value of a group-identifier range.

VMAX

Maximum value of global identifier range. Default = VMIN for input values.

VINC

Value increment within the specified range. Default = 1.

Command Default

All global identifiers are selected.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Understanding Reinforcing Member Groups

When using the mesh-independent method for defining reinforcing, the global identifier for a set of MESH200 elements (specified via **EGID (p. 605)**) is transferred from the MESH200 elements to the reinforcing members (individual reinforcings) when the reinforcing elements (REINF*nnn*) are generated (**EREINF (p. 656)**).

The **EMSEL (p. 628)** command selects groups of reinforcing members (individual reinforcings) via specified global identifiers.

Example 7: Selecting Reinforcing Member Groups

The following command selects a new group of reinforcing members based on global identifiers 1 through 7:

```
EMSEL,S,,,1,7
```

VMIN, *VMAX*, and *VINC* are positive integer values.

This command is valid in PREP7 and POST1.

For more information about using this command in a mesh-independent reinforcing analysis, see Selecting and Displaying Groups of Reinforcing Members in the *Structural Analysis Guide*.

The **EMSEL (p. 628)** command is valid only for the reinforcing elements generated via the mesh-independent method for defining reinforcing.

When using the standard method for defining reinforcing, you can use the **LAYER (p. 1015)** command to select reinforcing members in POST1. (The **LAYER (p. 1015)** command is not valid in PREP7.)

Menu Paths

This command cannot be accessed from a menu.

EMSYM, *NSECT*

Specifies circular symmetry for electromagnetic sources.

PREP7 (p. 22): Special Purpose (p. 37)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NSECT

The number of circular symmetry sections (defaults to 1).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Specifies the number of times to repeat electromagnetic sources for circular symmetry. Applies to SOURC36 elements and to coupled-field elements with electric current conduction results in the database. Sources are assumed to be equally spaced over 360° about the global Cartesian Z axis.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Magnetics>Options Only>Copy Sources

Main Menu>Solution>Load Step Opts>Magnetics>Options Only>Copy Sources

---

EMTGEN,*Ncomp*,*Ecomp*,*PNcomp*,*DOF*,*GAP*,*GAPMIN*,*FKN*,*EPZERO*,*--*,*Smethod*

Generates a set of TRANS126 elements.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ncomp

Component name of the surface nodes of a structure which attach to the TRANS126 elements. The component name must be 32 characters or less, and you must enclose the name in single quotes in the **EMTGEN (p. 630)** command line.

Ecomp

Component name of the TRANS126 elements generated. The component name must be 32 characters or less, and you must enclose the name in single quotes in the **EMTGEN (p. 630)** command line. Defaults to EMTELM.

PNcomp

Component name of the plane nodes generated by the command at an offset (*GAP*) from the surface nodes. The component name must be 32 characters or less, and you must enclose the name in single quotes in the **EMTGEN (p. 630)** command line. Defaults to EMTPNO.

DOF

Active structural degree of freedom (DOF) for TRANS126 elements in the Cartesian coordinate system. You must enclose the DOF label in single quotes:

UX

Displacement in X direction.

UY

Displacement in Y direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UZ

Displacement in Z direction.

GAP

Initial gap distance from the surface nodes to the plane. Be sure to use the correct sign with respect to Ncomp node location.

GAPMIN

Minimum gap distance allowed (GAPMIN real constant) for TRANS126 elements. Defaults to the absolute value of (*GAP*)*0.05.

FKN

Contact stiffness factor used as a multiplier for a contact stiffness appropriate for bulk deformation. Defaults to 0.1. A negative value is interpreted as the modulus of elasticity on which the contact stiffness will be based.

EPZERO

Free-space permittivity. Defaults to 8.854e-6 (μMKS units).

--

Unused field.

Smethod

Stiffness method for TRANS126 elements (KEYOPT(6) setting). You must enclose the following labels in single quotes:

AUGM

Augmented stiffness method (default).

FULL

Full stiffness method. This method must be used in a linear perturbation harmonic analysis.

Notes

The **EMTGEN (p. 630)** command generates a set of TRANS126 elements between the surface nodes of a moveable structure and a plane of nodes, typically representing a ground plane. The plane of nodes is created by the command at a specified offset (*GAP*). Each element attaches to a surface node and to a corresponding node representing the plane. The generated plane nodes should be constrained appropriately for the analysis.

By default, the created elements use the augmented stiffness method (KEYOPT(6) = 1), which can help convergence. You can change to the full stiffness method (KEYOPT(6) = 0) by setting *Smethod* = FULL. The full stiffness method is required for a linear perturbation harmonic analysis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can use TRANS126 elements for simulating fully coupled electrostatic structural coupling between a MEMS device and a plane, if the gap distance between the device and the plane is small compared to the overall surface area dimensions of the device. This assumption allows for a point-wise closed-form solution of capacitance between the surface nodes and the plane; i.e. CAP = EPZERO*AREA/GAP, where EPZERO if the free-space permittivity, AREA is the area associated with the node, and GAP is the gap between the node and the plane. The area for each node is computed using the ARNODE function. See the ***GET (p. 797)** command description for more information on the ARNODE function.

With a distributed set of TRANS126 elements attached directly to the structure and a plane (such as a ground plane), you can perform a full range of coupled electrostatic-structural simulations, including:

- Static analysis (due to a DC voltage or a mechanical load)
- Prestressed modal analysis (eigenfrequencies, including frequency-shift effects of a DC bias voltage)
- Prestressed harmonic analysis (system response to a small-signal AC excitation with a DC bias voltage or mechanical load)
- Large signal transient analysis (time-transient solution due to an arbitrary time-varying voltage or mechanical excitation)

The TRANS126 element also employs a node-to-node gap feature so you can perform contact-type simulations where the structure contacts a plane (such as a ground plane). The contact stiffness factor, FKN, is used to control contact penetration once contact is initiated. A smaller value provides for easier convergence, but with more penetration.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Transducers>Electromechanic>Node to Plane

---

EMUNIT, *Lab*, *VALUE*

Specifies the system of units for magnetic field problems.

PREP7 (p. 22): Materials (p. 24)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Label specifying the type of units:

MKS

Rationalized MKS system of units (meters, amperes, henries, webers, etc.). Free-space permeability is set to 4 πe-7 henries/meter. Free-space permittivity is set to 8.85 e-12 F/m.

MUZRO

User defined system of units. Free-space permeability is set to the value input for *VALUE*. Other units must correspond to the permeability units. Relative permeability may be altered to absolute values.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EPZRO

User defined system of units. Free-space permittivity is set to the value input for VALUE. Other units must correspond to the permittivity units.

VALUE

User value of free-space permeability (defaults to 1) if *Lab* = MUZRO, or free-space permittivity (defaults to 1) if *Lab* = EPZRO.

Command Default

Rationalized MKS system of units (meters, amperes, henries, webers, etc.). Free-space permeability is set to 4 πe-7 Henries/meter, free-space permittivity is set to 8.85e-12 Farads/meter.

Notes

Specifies the system of units to be used for electric and magnetic field problems. The free-space permeability and permittivity values may be set as desired. These values are used with the relative property values (**MP (p. 1160)**) to establish absolute property values.

Note:

If the magnetic source field strength (H_s) has already been calculated (**BIOT (p. 265)**), switching **EMUNIT (p. 632)** will not change the values.

For micro-electromechanical systems (MEMS), where dimensions are on the order of microns, see the conversion factors in System of Units in the *Coupled-Field Analysis Guide*.

This command is also valid in SOLUTION.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Change Mat Props>Electromag Units

Main Menu>Preprocessor>Material Props>Electromag Units

Main Menu>Solution>Load Step Opts>Other>Change Mat Props>Electromag Units

---

EN, *IEL*, *I*, *J*, *K*, *L*, *M*, *N*, *O*, *P*

Defines an element by its number and node connectivity.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IEL

Number assigned to element being defined. If *IEL* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

I

Number of node assigned to first nodal position (node I).

J, K, L, M, N, O, P

Number assigned to second (node J) through eighth (node P) nodal position, if any.

Notes

Defines an element by its nodes and attribute values. Similar to the **E (p. 591)** command except it allows the element number (*IEL*) to be defined explicitly. Element numbers need not be consecutive. Any existing element already having this number will be redefined.

Up to 8 nodes may be specified with the **EN (p. 633)** command. If more nodes are needed for the element, use the **EMORE (p. 627)** command. The number of nodes required and the order in which they should be specified are described in the *Element Reference* for each element type. The current (or default) MAT, TYPE, REAL, SECNUM, and ESYS attribute values are also assigned to the element.

When creating elements with more than 8 nodes using this command and the **EMORE (p. 627)** command, it may be necessary to turn off shape checking using the **SHPP (p. 1787)** command before issuing this command. If a valid element type can be created without using the additional nodes on the **EMORE (p. 627)** command, this command will create that element. The **EMORE (p. 627)** command will then modify the element to include the additional nodes. If shape checking is active, it will be performed before the **EMORE (p. 627)** command is issued. Therefore, if the shape checking limits are exceeded, element creation may fail before the **EMORE (p. 627)** command modifies the element into an acceptable shape.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>User Numbered>Thru Nodes

---

/**ENCRYPT**,*Key*,*Fname*,*Ext*

Controls encryption of command input.

APDL (p. 19): Encryption/Decryption (p. 20)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Encryption key used to encrypt the data (32-character maximum). A character parameter may be used. If the key is unspecified, encryption is turned off.

Fname

Name of file (including directory path) where the encrypted commands are written (248-character maximum for both file name and directory). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ext

File name extension (eight-character maximum).

Notes

This command opens the encrypted file specified by *Fname* and *Ext* for writing encrypted input commands.

Issuing this command results in a new file that overwrites any data in an existing file by the same name. When the encrypted file is written, the first line in the file is /DECRYPT,PASSWORD,OPENSSL and the last line is /DECRYPT.

See Encrypting Command Input and Other Data in the *Ansys Parametric Design Language Guide* for more information about using **/ENCRYPT (p. 634)** and performing encryption and decryption.

Menu Paths

This command cannot be accessed from a menu.

---

*END

Closes a macro file.

APDL (p. 19): Macro Files (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Closes a file opened with ***CREATE (p. 434)**. The ***END (p. 635)** command is an 8-character command (to differentiate it from ***ENDIF (p. 636)**). If you add commented text on that same line but do not allow enough spaces between ***END (p. 635)** and the "!" that indicates the comment text, the ***END (p. 635)** will attempt to interpret the "!" as the 8th character and will fail.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*ENDDO

Ends a do-loop and starts the looping action.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

One ***ENDDO (p. 636)** is required for each nested do-loop. The ***ENDDO (p. 636)** command must appear on the same file as the ***DO (p. 567)** command, and all six characters must be input.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

*ENDIF

Ends an if-then-else.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Required terminator for the if-then-else construct. See ***IF (p. 927)** for details.

If a batch input stream hits an end-of-file during a false ***IF (p. 927)** condition, the analysis will not terminate normally. You will need to terminate it externally (use either the Linux "kill" function or the Windows task manager). The ***ENDIF (p. 636)** command must appear on the same file as the ***IF (p. 927)** command, and all six characters must be input.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ENDRELEASE, - -, *TOLERANCE*, *Dof1*, *Dof2*, *Dof3*, *Dof4*, *KJCT*, *KCHECK*

Specifies degrees of freedom to be decoupled for end release.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

- -

Unused field.

TOLERANCE

Angle tolerance (in degrees) between adjacent elements (*KCHECK* = 0), *or* a percentage tolerance value for comparing cross-section properties between adjacent elements (*KCHECK* = 1). Default = 20.

To release *all* selected elements, set *TOLERANCE* = -1.

See "Notes" (p. 638) for information about using this argument with *KCHECK*.

Dof1*, *Dof2*, *Dof3*, *Dof4

Degrees of freedom to release. If *Dof1* is blank, WARP is assumed and *Dof2*, *Dof3*, and *Dof4* are ignored.

WARP

Release the warping degree of freedom (default).

ROTX

Release rotations in the X direction.

ROTY

Release rotations in the Y direction.

ROTZ

Release rotations in the Z direction.

UX

Release displacements in the X direction.

UY

Release displacements in the Y direction.

UZ

Release displacements in the Z direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BALL

Create ball joints (equivalent to releasing WARP, ROTX, ROTY, and ROTZ).

KJCT

Behavior at a junction node (a node shared by more than two elements):

0 (or blank) – Release all elements. *TOLERANCE* is ignored.

1 – Release noncontinuous elements (if only one pair of continuous elements exists).

This argument is ignored (due to ambiguity) if *KJCT* = 1 and multiple pairs of continuous elements exist.

This argument is ignored if *TOLERANCE* = -1.

KCHECK

Controls how connected elements are checked at selected nodes.

0 (or blank) – Check only the angle between connected elements at the selected nodes (default).

1 – Check the angle and other cross-section properties (including offsets and orientations) between connected elements at the selected nodes.

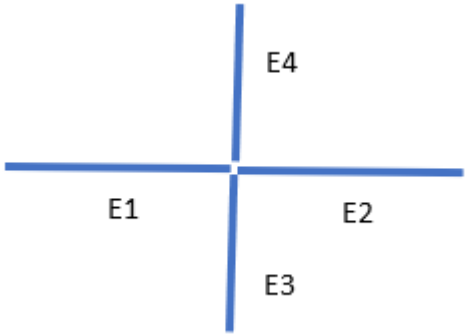
This argument is ignored if *TOLERANCE* = -1.

Notes

ENDRELEASE (p. 637) specifies end releases for the BEAM188, BEAM189, PIPE288, and PIPE289 elements. The command works on currently selected nodes and elements.

Depending on the specified *KCHECK*, the command generates end releases on any two connected elements whose angle at the connection is > *TOLERANCE*, or whose cross-section properties have a difference > *TOLERANCE* percent.

From within the GUI, the **Picked node** option (equivalent to *TOLERANCE* = -1) generates an end release at the selected node regardless of the angle of connection or cross-section properties.



When *KCHECK* = 1:

- The specified *TOLERANCE* serves as a *percentage* for comparing cross-section properties between adjacent elements. (For example, if using the default *TOLERANCE* = 20, the tolerance is considered to be 20 percent.)
- In addition to the angle between connected elements, the section integrated properties (such as area, Iyy, Iyz, Izz, warping constant, and torsion constant), offsets, and cross-section orientations are also compared at the selected nodes. If the difference in any of the properties (or angles) is > *TOLERANCE*, the requested degrees of freedom are released for those nodes.

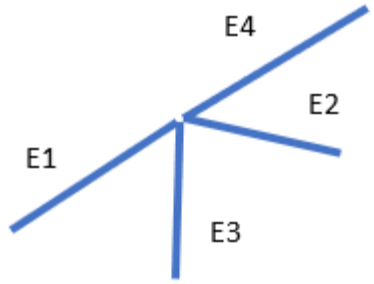
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

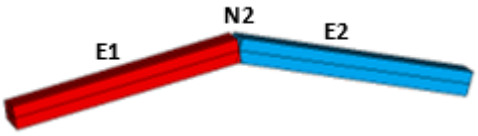
- For comparing cross-section orientations, the Y axes of cross-sections are compared after being projected onto the middle plane (the plane having a normal vector equal to the average of element X axes).
- For comparing offsets, the differences in the centers of cross-sections are compared against the approximate maximum section size of the connected elements.

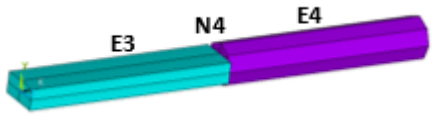
Table 108: Examples: End-Release Conditions at a Junction Node when *KJCT* = 1 and *KCHECK* = 0

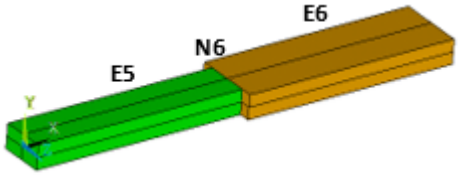
Example Junction Node (E – Element)	Behavior
	E2 is not released. E3 is released. A new node is generated for E3.
	E2 and E3 are released if the angles between E1-E2 and E1-E3 are within tolerance (two continuous pairs).
	E2, E3, and E4 are released regardless of *KJCT* (two continuous pairs).

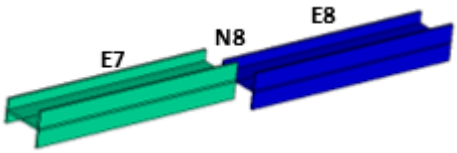
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

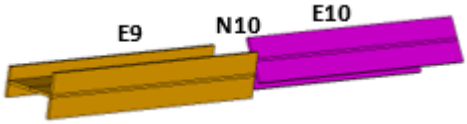












Example Junction Node (E – Element)	Behavior
	E4 is not released. E2 and E3 are released. New nodes are generated for E2 and E3.

Table 109: Examples: Using *KCHECK* with *TOLERANCE* = 20

Example (E – Element, N – Node)	Behavior when *KCHECK* = 0	Behavior when *KCHECK* = 1
	E1 and E2 are connected at an angle > 20°, so an end release is generated at N2.	E1 and E2 have the same section properties but are connected at an angle > 20°, so an end release is generated at N2.
	E3 and E4 are continuous (angle between them is < 20°), so an end release is not generated at N4.	E3 and E4 use different beam sections, so an end release is generated at N4.
	E5 and E6 are continuous (angle between them is less than 20°), so an end release is not generated at N6.	The difference between the section properties of E5 and E6 is > 20%, so an end release is generated at N6.
	E7 and E8 are continuous (angle between them are < 20°), so an end release is not generated at N8.	The difference between the section offsets of E7 and E8 is > 20%, so an end release is generated at N8.
	E9 and E10 are continuous (angle between them is < 20°), so an end release is not generated at N10.	The difference between the cross-section orientations of E9 and E10 is > 20°, so an end release is generated at N10.

To list the coupled sets generated by this command, issue **CPLIST (p. 427)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Exercise engineering judgement when using this command. Improper use may result in mechanics that render a solution impossible.

ENERSOL, *NVAR*, *Item*, *--*, *Name*

Specifies the total energies to be stored.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR

Arbitrary reference number assigned to this variable (2 to NV).

Item

SENE

Potential energy (stiffness energy)

KENE

Kinetic energy

DENE

Damping energy

WEXT

Work done by external load

AENE

Artificial energy due to hourglass control/drill stiffness or due to contact stabilization damping

STEN

Artificial energy due to nonlinear stabilization

--

Unused field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NAME

A 32-character name identifying the item on printouts and displays. Defaults to a 4-character label formed by the four characters of the *Item* value.

Notes

Damping energy (DENE) and work done by external loads (WEXT) are available only if the following were set prior to the analysis solution: *EngCalc* = YES on the **TRNOPT (p. 2017)**, **HROUT (p. 918)** or **MXPAND (p. 1203)** command; and *Item* = VENG, ESOL, or ALL on the **OUTRES (p. 1336)** command.

If *EngCalc* = YES on the **HROUT (p. 918)** or **MXPAND (p. 1203)** command, *Item* = SENE and KENE are the average potential and kinetic energies, respectively.

Menu Paths

This command cannot be accessed from a menu.

ENGEN, *IINC*, *ITIME*, *NINC*, *IEL1*, *IEL2*, *IEINC*, *MINC*, *TINC*, *RINC*, *CINC*, *SINC*, *DX*, *DY*, *DZ*

Generates elements from an existing pattern.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IINC

Increment to be added to element numbers in pattern.

ITIME*, *NINC

Do this generation operation a total of *ITIME*s, incrementing all nodes in the given pattern by *NINC* each time after the first. *ITIME* must be > 1 if generation is to occur. *NINC* may be positive, zero, or negative.

IEL1*, *IEL2*, *IEINC

Generate elements from the pattern that begins with *IEL1* to *IEL2* (defaults to *IEL1*) in steps of *IEINC* (defaults to 1). If *IEL1* is negative, *IEL2* and *IEINC* are ignored and use the last |*IEL1*| elements (in sequence backward from the maximum element number) as the pattern to be repeated. If *IEL1* = ALL, *IEL2* and *IEINC* are ignored and all selected elements (**ESEL (p. 661)**) are used as the pattern to be repeated. If *IEL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *IEL1* (*IEL2* and *IEINC* are ignored).

MINC

Increment material number of all elements in the given pattern by *MINC* each time after the first.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TINC

Increment type number by *TINC*.

RINC

Increment real constant table number by *RINC*.

CINC

Increment element coordinate system number by *CINC*.

SINC

Increment section ID number by *SINC*.

DX*, *DY*, *DZ

Define nodes that do not already exist but are needed by generated elements (**NGEN (p. 1218)**,*ITIME*, *INC*, *NODE1*, , , *DX*, *DY*, *DZ*). Zero is a valid value. If blank, *DX*, *DY*, and *DZ* are ignored.

Notes

Same as the **EGEN (p. 603)** command except it allows element numbers to be explicitly incremented (*IINC*) from the generated set. Any existing elements already having these numbers will be redefined.

Menu Paths

Main Menu>Preprocessor>Modeling>Copy>Elements>User Numbered

ENORM, *ENUM*

Reorients shell element normals or line element node connectivity.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ENUM

Element number having the normal direction that the reoriented elements are to match. If *ENUM* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Notes

Reorients shell elements so that their outward normals are consistent with that of a specified element. **ENORM (p. 643)** can also be used to reorder nodal connectivity of line elements so that their nodal ordering is consistent with that of a specified element.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For shell elements, the operation reorients the element by reversing and shifting the node connectivity pattern. For example, for a 4-node shell element, the nodes in positions I, J, K and L of the original element are placed in positions J, I, L and K of the reoriented element. All 3D shell elements in the selected set are considered for reorientation, and no element is reoriented more than once during the operation. Only shell elements adjacent to the lateral (side) faces are considered.

The command reorients the shell element normals on the same panel as the specified shell element. A *panel* is the geometry defined by a subset of shell elements bounded by free edges or T-junctions (anywhere three or more shell edges share common nodes).

Reorientation progresses within the selected set until either of the following conditions is true:

- The edge of the model is reached.
- More than two elements (whether selected or unselected) are adjacent to a lateral face.

In situations where unselected elements might undesirably cause case b to control, consider using **ENSYM (p. 644)**,0,,0,ALL instead of **ENORM (p. 643)**. It is recommended that reoriented elements be displayed and graphically reviewed.

You cannot use the **ENORM (p. 643)** command to change the normal direction of any element that has a body or surface load. We recommend that you apply all of your loads only *after* ensuring that the element normal directions are acceptable.

Real constant values are not reoriented and may be invalidated by an element reversal.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Elements>Shell Normals

---

ENSYM, *IINC*, --, *NINC*, *IEL1*, *IEL2*, *IEINC*

Generates elements by symmetry reflection.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IINC

Increment to be added to element numbers in existing set.

--

Unused field.

NINC

Increment nodes in the given pattern by *NINC*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IEL1*, *IEL2*, *IEINC

Reflect elements from pattern beginning with *IEL1* to *IEL2* (defaults to *IEL1*) in steps of *IEINC* (defaults to 1). If *IEL1* = ALL, *IEL2* and *IEINC* are ignored and pattern is all selected elements (**ESEL (p. 661)**). If *IEL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *IEL1* (*IEL2* and *IEINC* are ignored).

Notes

The **ENSYM (p. 644)** command is similar to the **ESYM (p. 684)** command except that it enables explicitly assigned element numbers to the generated set (in terms of an increment *IINC*). Any existing elements already having these numbers are redefined.

The operation generates a new element by incrementing the nodes on the original element, and reversing and shifting the node connectivity pattern. For example, for a 4-node 2D element, the nodes in positions I, J, K and L of the original element are placed in positions J, I, L and K of the reflected element.

Similar permutations occur for all other element types. For line elements, the nodes in positions I and J of the original element are placed in positions J and I of the reflected element.

See the **ESYM (p. 684)** command for additional information about symmetry elements.

This command also provides a convenient way to reverse shell element normals. If the *IINC* and *NINC* argument fields are left blank, the effect of the reflection is to reverse the direction of the outward normal of the specified elements. You cannot use this command to change the normal direction of any element that has a body or surface load. It is best to apply all loading only *after* ensuring that the element normal directions are acceptable.

Real constants (such as nonuniform shell thickness and tapered beam constants) may be invalidated by an element reversal.

For more information about controlling element normals, see Revising Your Model.

Main Menu>Preprocessor>Modeling>Reflect>Elements>User Numbered

---

/EOF

Exits the file being read.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This command causes an end-of-file exit when encountered on a switched file. (See **/INPUT (p. 948)**, ***USE (p. 2059)**, etc.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Commands are then read continuing from the file that contained the file switching command (or from the terminal if the switch was made from the terminal).

Use the **/EXIT (p. 708)** command to terminate a Mechanical APDL run.

This command cannot be used in a do-loop or if-then-else construct.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

EORIENT,*Etype*,*Dir*,*TOLER*

Reorients solid element normals.

PREP7 (p. 22): Meshing (p. 29)
PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Etype

Specifies which elements to orient.

LYSL

Specifies that layered solid elements will be oriented. This value is the default. Layered element types affected by this option include SOLID185 with KEYOPT(3) = 1, SOLID186 with KEYOPT(3) = 1, SOLSH190, SOLID278 with KEYOPT(3) = 1 or 2, and SOLID279 with KEYOPT(3) = 1 or 2.

Dir

The axis and direction for orientation, or an element number. If *Dir* is set to a positive number (*n*), then all eligible elements are oriented as similarly as possible to element *n*.

NEGX

The element face with the outward normal most nearly parallel to the element coordinate system's negative x-axis is designated (reoriented) as face 1.

POSX

The element face with the outward normal most nearly parallel to the element coordinate system's positive x-axis is designated (reoriented) as face 1.

NEGY

The element face with the outward normal most nearly parallel to the element coordinate system's negative y-axis is designated (reoriented) as face 1. .

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

POSY

The element face with the outward normal most nearly parallel to the element coordinate system's positive y-axis is designated (reoriented) as face 1.

NEGZ

(Default) The element face with the outward normal most nearly parallel to the element coordinate system's negative z-axis is designated (reoriented) as face 1.

POSZ

The element face with the outward normal most nearly parallel to the element coordinate system's positive z-axis is designated (reoriented) as face 1.

TOLER

The maximum angle (in degrees) between the outward normal face and the target axis. Default is 90.0. Lower *TOLER* values will reduce the number of faces that are considered as the basis of element reorientation.

Notes

EORIENT (p. 646) renumbers the element faces, designating the face most parallel to the XY plane of the element coordinate system (set with **ESYS (p. 685)**) as face 1 (nodes I-J-K-L, parallel to the layers in layered elements). It calculates the outward normal of each face and changes the node designation of the elements so the face with a normal most nearly parallel with and in the same general direction as the target axis becomes face 1.

The target axis, defined by *Dir*, is either the negative or positive indicated axis or the outward normal of face 1 of that element.

All layered solid elements in the selected set are considered for reorientation. The elements affected are layered structural solids (SOLID185, SOLID186), solid shell elements (SOLSH190), and layered thermal elements (SOLID278, SOLID279).

After reorienting elements, you should always display and graphically review results using the **/ESHAPE (p. 665)** command. When plotting models with many or symmetric layers, it may be useful to temporarily reduce the number of layers to two, with one layer being much thicker than the other.

You cannot use **EORIENT (p. 646)** to change the normal direction of any element that has a body or surface load. We recommend that you apply all of your loads only *after* ensuring that the element normal directions are acceptable.

Prisms and tetrahedrals are also supported for non-layered solid elements. Prisms are supported for layered solid elements, including layered SOLID185, layered SOLID186, layered SOLID278, layered SOLID279, and SOLSH190. However, layers parallel to the four-node face of the prism are not supported.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Elements>Orient Normal

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EPLOT

Produces an element display.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Produces an element display of the selected elements. In full graphics, only the element faces that have all of their corresponding nodes selected are plotted. In PowerGraphics, all element faces of the selected element set are plotted irrespective of the nodes selected. However, for both full graphics and PowerGraphics, adjacent or otherwise duplicated faces of 3D solid elements will not be displayed in an attempt to eliminate plotting of interior facets. See the **DSYS (p. 582)** command for display coordinate system issues.

This command will display curvature in midside node elements when PowerGraphics is activated (**/GRAPHICS (p. 866)**,POWER) and **/EFACET (p. 602)**,2 or **/EFACET (p. 602)**,4 are enabled. (To display curvature, two facets per edge is recommended (**/EFACET (p. 602)**,2)). When you specify **/EFACET (p. 602)**,1, PowerGraphics does not display midside nodes. **/EFACET (p. 602)** has no effect on **EPLOT (p. 648)** for non-midside node elements.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Modeling>CMS>CMS Superelements>By Picking

Utility Menu>Plot>Elements

EQSLV, *Lab*, *TOLER*, *MULT*, *--*, *KeepFile*

Specifies the type of equation solver.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Equation solver type:

SPARSE

Sparse direct equation solver. Applicable to real-value or complex-value symmetric and unsymmetric matrices. Available only for STATIC, HARMIC (full method only), TRANS (full method only), SUBSTR, and PSD spectrum analysis types (**ANTYPE (p. 162)**). Can be used for nonlinear and linear analyses, especially nonlinear analysis where indefinite matrices are frequently encountered. Well suited for contact analysis where contact status alters the mesh topology. Other typical well-suited applications are: (a) models consisting of shell/beam or shell/beam and solid elements (b) models with a multi-branch structure, such as an automobile exhaust or a turbine fan. This is an alternative to iterative solvers since it com-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

bines both speed and robustness. Generally, it requires considerably more memory (~10x) than the PCG solver to obtain optimal performance (running totally in-core). When memory is limited, the solver works partly in-core and out-of-core, which can noticeably slow down the performance of the solver. See the **BCSOPTION (p. 218)** command for more details on the various modes of operation for this solver.

This solver can be run using shared-memory parallel (SMP), distributed-memory parallel (DMP), or hybrid parallel processing. For DMP, this solver preserves all of the merits of the classic or shared memory sparse solver. The total sum of memory (summed for all processes) is usually higher than the shared memory sparse solver. System configuration also affects the performance of the distributed memory parallel solver. If enough physical memory is available, running this solver in the in-core memory mode achieves optimal performance. The ideal configuration when using the out-of-core memory mode is to use one processor per machine on multiple machines (a cluster), spreading the I/O across the hard drives of each machine, assuming that you are using a high-speed network such as Infiniband to efficiently support all communication across the multiple machines.

This solver supports use of the GPU accelerator capability.

JCG

Jacobi Conjugate Gradient iterative equation solver. Available only for STATIC, HARMIC (full method only), and TRANS (full method only) analysis types (**ANTYPE (p. 162)**). Can be used for structural, thermal, and multiphysics applications. Applicable for symmetric, unsymmetric, complex, definite, and indefinite matrices. Recommended for 3D harmonic analyses in structural and multiphysics applications. Efficient for heat transfer, electromagnetics, piezoelectrics, and acoustic field problems.

This solver can be run using shared-memory parallel (SMP), distributed-memory parallel (DMP), or hybrid parallel processing.For DMP, in addition to the limitations listed above, this solver only runs in a distributed parallel fashion for STATIC and TRANS (full method) analyses in which the stiffness is symmetric and only when not using the fast thermal option (**THOPT (p. 1997)**). Otherwise, this solver disables distributed-memory parallelism at the onset of the solution, and shared-memory parallelism is used instead.

This solver supports use of the GPU accelerator capability. When using the GPU accelerator capability, in addition to the limitations listed above, this solver is available only for STATIC and TRANS (full method) analyses where the stiffness is symmetric and does not support the fast thermal option (**THOPT (p. 1997)**).

ICCG

Incomplete Cholesky Conjugate Gradient iterative equation solver. Available for STATIC, HARMIC (full method only), and TRANS (full method only) analysis types (**ANTYPE (p. 162)**). Can be used for structural, thermal, and multiphysics applications, and for symmetric, unsymmetric, complex, definite, and indefinite matrices. The ICCG solver requires more memory than the JCG solver, but is more robust than the JCG solver for ill-conditioned matrices.

This solver can only be run in shared-memory parallel mode. If it is run in DMP mode, this solver disables distributed-memory parallelism at the onset of the solution, and shared-memory parallelism is used instead

This solver does not support use of the GPU accelerator capability.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

QMR

Quasi-Minimal Residual iterative equation solver. Available for the HARMIC (full method only) analysis type (**ANTYPE (p. 162)**). Can be used for symmetric, complex, definite, and indefinite matrices. The QMR solver is more stable than the ICCG solver.

This solver can only be run in shared memory parallel mode and only supports 1 core. If it is run in DMP mode, this solver disables distributed-memory parallelism at the onset of the solution, and shared-memory parallelism is used instead

This solver does not support use of the GPU accelerator capability.

PCG

Preconditioned Conjugate Gradient iterative equation solver (licensed from Computational Applications and Systems Integration, Inc.). Requires less disk file space than SPARSE and is faster for large models. Useful for plates, shells, 3D models, large 2D models, and other problems having symmetric or unsymmetric, sparse matrices. Such matrices are typically positive definite or indefinite for symmetric full harmonic analyses that solve a symmetric complex number matrix system. The PCG solver can be used for:

- single-field structural analyses involving symmetric or unsymmetric matrices
- single-field acoustic analyses with pressure as the degree of freedom
- single-field thermal analyses involving symmetric or unsymmetric matrices

Requires twice as much memory as JCG. Available only for analysis types (**ANTYPE (p. 162)**): STATIC, TRANS (full method only), HARMIC (full method only), or MODAL (with PCG Lanczos option only). Also available for the use pass of substructure analyses (MATRIX50). The PCG solver can robustly handle models that involve the use of constraint and/or coupling equations (**CE (p. 297)**, **CEINTF (p. 305)**, **CP (p. 421)**, **CPINTF (p. 425)**, and **CERIG (p. 310)**). With this solver, you can use the **MSAVE (p. 1183)** command to obtain a considerable memory savings.

The PCG solver can handle ill-conditioned problems by using a higher level of difficulty (see **PCGOPT (p. 1365)**). Ill-conditioning arises from elements with high aspect ratios, contact, and plasticity.

This solver can be run in shared-memory parallel or distributed-memory parallel mode. In DMP mode, this solver preserves all of the merits of the classic or shared-memory PCG solver. The total sum of memory (summed for all processes) is about 30% more than the shared-memory PCG solver.

This solver supports use of the GPU accelerator capability.

TOLER

Iterative solver tolerance value. Used only with the Jacobi Conjugate Gradient, Incomplete Cholesky Conjugate Gradient, Pre-conditioned Conjugate Gradient, and Quasi-Minimal Residual equation solvers. For the (symmetric or unsymmetric) PCG solver, the default is 1.0E-8. When using the PCG Lanczos mode extraction method, the default solver tolerance value is 1.0E-4. For the JCG and ICCG solvers with symmetric matrices, the default is 1.0E-8. For the PCG solver used in a full harmonic analysis, the default tolerance is 1.0E-6. For the JCG and ICCG solvers with unsymmetric matrices,

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

and for the QMR solver, the default is 1.0E-6. Iterations continue until the SRSS norm of the residual is less than *TOLER* times the norm of the applied load vector. For the PCG solver in the linear static analysis case, 3 error norms are used. If one of the error norms is smaller than *TOLER*, and the SRSS norm of the residual is smaller than 1.0E-2, convergence is assumed to have been reached. See Iterative Solver in the *Mechanical APDL Theory Reference* for details.

Note:

When used with the Pre-conditioned Conjugate Gradient equation solver, *TOLER* can be modified between load steps (this is typically useful for nonlinear analysis).

If a *Lev_Diff* value of 5 is specified on the **PCGOPT (p. 1365)** command (either program- or user-specified), *TOLER* has no effect on the accuracy of the obtained solution from the PCG solver; a direct solver is used when *Lev_Diff* = 5.

MULT

Multiplier (defaults to 2.5 for nonlinear analyses; 1.0 for linear analyses) used to control the maximum number of iterations performed during convergence calculations. Used only with the Pre-conditioned Conjugate Gradient equation solver (PCG). The maximum number of iterations is equal to the multiplier (*MULT*) times the number of degrees of freedom (DOF). If *MULT* is input as a negative value, then the maximum number of iterations is equal to abs(*MULT*). Iterations continue until either the maximum number of iterations or solution convergence has been reached. In general, the default value for *MULT* is adequate for reaching convergence. However, for ill-conditioned matrices (that is, models containing elements with high aspect ratios or material type discontinuities) the multiplier may be used to increase the maximum number of iterations used to achieve convergence. The recommended range for the multiplier is 1.0 ≤ *MULT* ≤3.0. Normally, a value greater than 3.0 adds no further benefit toward convergence, and merely increases time requirements. If the solution does not converge with 1.0 ≤ *MULT* ≤3.0, or in less than 10,000 iterations, then convergence is highly unlikely and further examination of the model is recommended. Rather than increasing the default value of *MULT*, consider increasing the level of difficulty (*Lev_Diff*) on the **PCGOPT (p. 1365)** command.

--

Unused field.

KeepFile

Determines whether files from a SPARSE solver run should be deleted or retained. Applies only to *Lab* = SPARSE for static and full transient analyses.

DELE

Deletes all files from the SPARSE solver run, including the factorized file, `.DSPsymb`, upon **FINISH (p. 758)** or **/EXIT (p. 708)** (default).

KEEP

Retains all necessary files from the SPARSE solver run, including the `.DSPsymb` file, in the working directory.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

The sparse direct solver is the default solver for all analyses, with the exception of modal/buckling analyses.

For modal/buckling analyses, there is no default solver. You must specify a solver with the **MODOPT (p. 1140)** or **BUCOPT (p. 280)** command. The specified solver automatically chooses the required internal equation solver (for example, **MODOPT (p. 1140)**,LANPCG automatically uses **EQSLV (p. 648)**,PCG internally, and **BUCOPT (p. 280)**,LANB automatically uses **EQSLV (p. 648)**,SPARSE internally).

Notes

The selection of a solver can affect the speed and accuracy of a solution. For a more detailed discussion of the merits of each solver, see Solution in the *Basic Analysis Guide* .

This command is also valid in PREP7.

Distributed-Memory Parallel (DMP) Restriction

All equation solvers are supported in a DMP analysis. However, the SPARSE and PCG solvers are the only distributed solvers that always run a fully distributed solution. The JCG solver runs in a fully distributed mode in some cases; in other cases, it does not. The ICCG and QMR solvers are not distributed solvers; therefore, you will not see the full performance improvements with these solvers that you would with a fully distributed solution.

ERASE

Explicitly erases the current display.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Similar to a hardware screen erase key. Useful during an "immediate" display to erase the screen without a replot so that the display continues on a clean screen. This action is automatically included in commands such as **NPLOT (p. 1254)** and **EPLOT (p. 648)**.

If the **/NOERASE (p. 1249)** command is active, issuing the erase command will simply clear the display area. Subsequent replots will provide the display previously generated by the **/NOERASE (p. 1249)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Erase Options>Erase Screen

/ERASE

Specifies that the screen is to be erased before each display.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Command Default

Previous **/ERASE (p. 653)** or **/NOERASE (p. 1249)** setting will be used. Initially defaults to **/ERASE (p. 653)** setting.

Notes

Erase occurs with the next display request, but before the display is actually started. **/NOERASE (p. 1249)** can be used to suppress the automatic screen erase.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Erase Options>Erase Between Plots

EREAD,*Fname*,*Ext*,--

Reads elements from a file.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to ELEM if *Fname* is blank.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- -

Unused field.

Notes

This read operation is not necessary in a standard anlaysis run but is provided as a convenience for those wanting to read a coded element file, such as from another mesh generator or from a CAD/CAM program.

Data should be formatted as generated via **EWRITE (p. 703)**.

If issuing **EREAD (p. 653)** to acquire element information generated from **EWRITE (p. 703)**, you must also issue **NREAD (p. 1256)** before the **EREAD (p. 653)** command. The element types (**ET (p. 686)**) must be defined before the file is read so that the file may be read properly. Only elements that are specified via **ERRANG (p. 660)** are read from the file. Also, only elements that are fully attached to the nodes specified via **NRRANG (p. 1265)** are read from the file.

Elements are assigned numbers consecutively as read from the file, beginning with the current highest database element number plus one. The file is rewound before and after reading. Reading continues until the end of the file.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>Read Elem File

---

EREFINE, *NE1*, *NE2*, *NINC*, *LEVEL*, *DEPTH*, *POST*, *RETAIN*

Refines the mesh around specified elements.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NE1*, *NE2*, *NINC

Elements (*NE1* to *NE2* in increments of *NINC*) around which the mesh is to be refined. *NE2* defaults to *NE1*, and *NINC* defaults to 1. If *NE1* = ALL, *NE2* and *NINC* are ignored and all selected elements are used for refinement. If *NE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NE1* (*NE2* and *NINC* are ignored).

LEVEL

Amount of refinement to be done. Specify the value of *LEVEL* as an integer from 1 to 5, where a value of 1 provides minimal refinement, and a value of 5 provides maximum refinement (defaults to 1).

DEPTH

Depth of mesh refinement in terms of number of elements outward from the indicated elements, *NE1* to *NE2* (defaults to 0).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

POST

Type of postprocessing to be done after element splitting, in order to improve element quality:

OFF

No postprocessing will be done.

SMOOTH

Smoothing will be done. Node locations may change.

CLEAN

Smoothing and cleanup will be done. Existing elements may be deleted, and node locations may change (default).

RETAIN

Flag indicating whether quadrilateral elements must be retained in the refinement of an all-quadrilateral mesh. (The program ignores the *RETAIN* argument when you are refining anything other than a quadrilateral mesh.)

ON

The final mesh will be composed entirely of quadrilateral elements, regardless of the element quality (default).

OFF

The final mesh may include some triangular elements in order to maintain element quality and provide transitioning.

Notes

EREFINE (p. 654) refines all area elements and tetrahedral volume elements adjacent to the specified elements.

Mesh refinement is not available on a solid model containing initial conditions at nodes (**IC (p. 921)**), coupled nodes (**CP (p. 421)** family of commands), constraint equations (**CE (p. 297)** family of commands), or boundary conditions or loads applied directly to any of its nodes or elements. This restriction applies to nodes and elements anywhere in the model, not just in the region where you want to request mesh refinement. If you have detached the mesh from the solid model, disable postprocessing cleanup or smoothing (*POST* = OFF) after refinement to preserve the element attributes.

For more information about mesh refinement, see Revising Your Model.

This command is also valid for rezoning.

Main Menu>Preprocessor>Meshing>Modify Mesh>Refine At>All

Main Menu>Preprocessor>Meshing>Modify Mesh>Refine At>Elements

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EREINF,*KOffALim*,*KTri*

Generates reinforcing elements from selected existing (base) elements.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KOffALim

Enable or disable the limit of the angle between a MESH200 element and a base element. Valid for the mesh-independent method only.

0 – Enable the angle limit (default).

1 – Disable the angle limit.

KTri

Specify the shape of 3D smeared reinforcing members. Valid for the mesh-independent method only.

0 – Generate quad-dominant (mixed quadrilateral and triangular) reinforcing members (default).

1 – Generate triangular reinforcing members only.

Notes

EREINF (p. 656) generates reinforcing elements (REINF263, REINF264 and REINF265) directly from selected base elements (that is, existing standard structural elements in your model). The command scans all selected base elements and generates (if necessary) a compatible reinforcing element type for each base element. (You can select a combination of different base element types.)

Before issuing **EREINF (p. 656)**, first define the reinforcing geometry, material, and orientation via one of two methods:

Mesh-Independent Method:

Use MESH200 elements to temporarily represent the geometry of the reinforcing fibers or smeared reinforcing surfaces. Define additional data including material, fiber cross-section area, fiber spacing, and fiber orientation via reinforcing sections with the mesh pattern (**SECDATA (p. 1655)**) and assign the sections to corresponding MESH200 elements. (Predefining the reinforcing element type (**ET (p. 686)**) is not required.)

Standard Method:

Define reinforcing section types (**SECTYPE (p. 1697)**) with standard reinforcing location patterns (**SECDATA (p. 1655)**). The standard reinforcing location input are given with respect to the selected base elements; therefore, a change in the base mesh may require redefining the (mesh-dependent) reinforcing section types.

Standard element-definition commands (such as **ET (p. 686)** and **E (p. 591)**) are not used for defining reinforcing elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EREINF (p. 656) creates no new nodes. The reinforcing elements and the base elements share the common nodes.

Elements generated by **EREINF (p. 656)** are not associated with the solid model.

After **EREINF (p. 656)** executes, you can issue **ETLIST (p. 702)**, **ELIST (p. 619)**, or **EPLOT (p. 648)** to verify the newly created reinforcing element types and elements.

Reinforcing elements do not account for any subsequent modifications made to the base elements. Ansys, Inc. recommends issuing **EREINF (p. 656)** only *after* the base elements are finalized. If you delete or modify base elements (via **EDELE (p. 593)**, **EMODIF (p. 626)**, **ETCHG (p. 699)**, **EMID (p. 624)**, **EORIENT (p. 646)**, **NUMMRG (p. 1295)**, or **NUMCMP (p. 1291)**, for example), remove all affected reinforcing elements and reissue **EREINF (p. 656)** to avoid inconsistencies.

If you define reinforcing via the mesh-independent method, **EREINF (p. 656)** creates new reinforcing sections containing details of the created reinforcing elements, then applies them to all newly generated reinforcing elements. The number of new reinforcing sections depends on the number of new reinforcing elements. (You can examine the properties of new sections (**SLIST (p. 1795)**).) The program sets the ID number of the newest reinforcing section to the highest section ID number in the model. After issuing **EREINF (p. 656)**, the command shows the highest-numbered IDs (element type, element, and section). Do not overwrite a new reinforcing section when defining subsequent sections.

For the 3D smeared-reinforcing element (REINF265) with the mesh-independent method, you can select the shape of the reinforcing members via *KTri*. The default behavior (*KTri* = 0) generates quad-dominant members (primarily quadrilaterals but with some triangles).

EREINF (p. 656) can generate the reinforcing elements with thermal properties if the base elements are thermal solid elements (SOLID278 or SOLID279):

- If using the mesh-independent method for defining reinforcing, apply element body-force loading (**BFE (p. 237)**,,HGEN) or nodal body-force loading (**BF (p. 221)**,,HGEN) on the MESH200 elements.
- If using the standard method for defining reinforcing, apply element body-force loading (**BFE (p. 237)**,,HGEN) on the reinforcing members directly. (Do not apply *nodal* body-force loading (**BF (p. 221)**,,HGEN).)

If performing a subsequent structural analysis after the thermal analysis, **EREINF (p. 656)** can convert the reinforcing elements for the structural analysis:

1. Convert the thermal base elements to the appropriate structural element (**ET (p. 686)** or **EMODIF (p. 626)**).
2. Select the reinforcing elements only.
3. Issue **EREINF (p. 656)**.

   Result: The selected reinforcing elements are converted to elements compatible with the converted base elements.

Solution accuracy can be affected if the volume ratio between reinforcing elements and base elements is high, particularly when body loading (such as heat generation) is applied via the reinforcing elements. If the program detects a high volume ratio of reinforcing elements generated via the mesh-independent method, it issues a warning message and saves affected base and MESH200 elements (used to generate

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the reinforcing elements) into a component for close model inspection. Only the volume of reinforcing elements created by the *current* **EREINF (p. 656)** command is considered in the volume-ratio calculation (that is, no volume accumulation occurs over multiple **EREINF (p. 656)** commands).

For more information, see Reinforcing and Direct Element Embedding in the *Structural Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

ERESX, *Key*

Specifies extrapolation of integration-point results.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Extrapolation key:

DEFA

If element is fully elastic (no active plasticity, creep, or swelling nonlinearities), extrapolate the integration-point results to the nodes. If any portion of the element is plastic (or other active material nonlinearity), copy the integration-point results to the nodes (default).

YES

Extrapolate the linear portion of the integration-point results to the nodes and copy the nonlinear portion (for example, plastic strains).

NO

Copy the integration-point results to the nodes.

Command Default

Extrapolate integration-point results to the nodes for all elements except those with active plasticity, creep, or swelling nonlinearities (default).

For coupled pore-pressure-thermal elements (CPT212, CPT213, CPT215, CPT216, CPT217), the default behavior is to copy integration-point results to the nodes.

Notes

Specifies whether the solution results at the element-integration points are extrapolated or copied to the nodes for element and nodal postprocessing. Structural stresses, elastic and thermal strains, field gradients, and fluxes are affected. Nonlinear data (such as plastic, creep, and swelling strains) are always copied to the nodes, never extrapolated. For shell elements, **ERESX (p. 658)** applies only to integration-point results in the in-plane directions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Extrapolation occurs in the element-solution coordinate system. For elements allowing different solution systems at integration points (such as SHELL281 and SOLID186), extrapolation can produce unreliable results when the solution coordinate systems in each element differ significantly. (Varying element-solution coordinate systems can be created via the **ESYS (p. 685)** command or from large deformation.) Examine results carefully in such cases, and disable extrapolation if necessary.

This command is also valid in PREP7.

Main Menu>Solution>Load Step Opts>Output Ctrls>Integration Pt

---

ERNORM, *Key*

Controls error estimation calculations.

POST1 (p. 51): Controls (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Control key:

ON

Perform error estimation (default). This option is not valid for PowerGraphics.

OFF

Do not perform error estimation.

Command Default

Error estimation calculations are performed by default unless PowerGraphics is enabled (**/GRAPHICS (p. 866)**,POWER).

Notes

Especially for thermal analyses, program speed increases if error estimation is suppressed. Therefore, it might be desirable to use error estimation only when needed. The value of the **ERNORM (p. 659)** key is not saved on `file.db`. Consequently, you need to reissue the **ERNORM (p. 659)** key after a **RESUME (p. 1601)** if you wish to deactivate error estimation again.

Menu Paths

Main Menu>General Postproc>Options for Outp

Utility Menu>List>Results>Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ERRANG, *EMIN*, *EMAX*, *EINC*

Specifies the element range to be read from a file.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

EMIN*, *EMAX*, *EINC

Elements with numbers from *EMIN* (defaults to 1) to *EMAX* (defaults to 999999999) in steps of *EINC* (defaults to 1) will be read.

Notes

Defines the element number range to be read (**EREAD (p. 653)**) from the element file. If a range is also implied from the **NRRANG (p. 1265)** command, only those elements satisfying both ranges will be read.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>Read Elem File

ESCHECK, *Sele*, *Levl*, *Defkey*

Perform element shape checking for a selected element set.

PREP7 (p. 22): Database (p. 22)
SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Sele

Specifies whether to select elements for checking:

(blank)

List all warnings/errors from element shape checking.

ESEL

Select the elements based on the *.Levl* criteria specified below.

Levl

WARN

Select elements producing warning and error messages.

ERR

Select only elements producing error messages (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Defkey

Specifies whether check should be performed on deformed element shapes.

0

Do not update node coordinates before performing shape checks (default).

1

Update node coordinates using the current set of deformations in the database.

Notes

Shape checking will occur according to the current **SHPP (p. 1787)** settings. Although **ESCHECK (p. 660)** is valid in all processors, *Defkey* uses the current results in the database. If no results are available a warning will be issued.

This command is also valid in PREP7, SOLUTION and POST1.

Menu Paths

Main Menu>General Postproc>Check Elem Shape>Sel Warning/Error Elements

---

ESEL, *Type*, *Item*, *Comp*, *VMIN*, *VMAX*, *VINC*, *KABS*

Selects a subset of elements.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Restore the full set.

NONE

Unselect the full set.

INVE

Invert the current set (selected becomes unselected and vice versa).

STAT

Display the current select status.

The following fields are used only with *Type* = S, R, A, or U:

Item

Label identifying data, see Table 110: ESEL - Valid Item and Component Labels (p. 663). Some items also require a component label. If *Item* = PICK (or simply "P"), graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). Defaults to ELEM. If *Item* = STRA (straightened), elements are selected whose midside nodes do not conform to the curved line or non-flat area on which they should lie. (Such elements are sometimes formed during volume meshing (**VMESH (p. 2140)**) in an attempt to avoid excessive element distortion.) You should graphically examine any such elements to evaluate their possible effect on solution accuracy.

Comp

Component of the item (if required). Valid component labels are shown in Table 110: ESEL - Valid Item and Component Labels (p. 663) below.

VMIN

Minimum value of item range. Ranges are element numbers, attribute numbers, load values, or result values as appropriate for the item. A component name (as specified via the **CM (p. 356)** command) can also be substituted for *VMIN* (in which case *VMAX* and *VINC* are ignored).

VMAX

Maximum value of item range. *VMAX* defaults to *VMIN* for input values.

For result values, *VMAX* defaults to infinity if *VMIN* is positive, or to zero if *VMIN* is negative.

VINC

Value increment within range. Used only with integer ranges (such as for element and attribute numbers). Defaults to 1. *VINC* cannot be negative.

KABS

Absolute value key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Check sign of value during selection.

1

Use absolute value during selection (sign ignored).

Command Default

All elements are selected.

Notes

Selects elements based on values of a labeled item and component. For example, to select a new set of elements based on element numbers 1 through 7, use **ESEL (p. 661)**,S,ELEM,,1,7. The subset is used when the ALL label is entered (or implied) on other commands, such as **ELIST (p. 619)**,ALL. Only data identified by element number are selected. Selected data are internally flagged; no actual removal of data from the database occurs. Different element subsets cannot be used for different load steps (**SOLVE (p. 1822)**) in a **/SOLU (p. 1821)** sequence. The subset used in the first load step is used for all subsequent load steps regardless of subsequent **ESEL (p. 661)** specifications.

This command is valid in any processor.

Elements crossing the named path (**PATH (p. 1354)**) are selected. This option is available only in PREP7 and POST1. If no geometry data has been mapped to the path (via **PMAP (p. 1449)** and **PDEF (p. 1372)**, for example), the path assumes the default mapping option (**PMAP (p. 1449)**,UNIFORM) to map the geometry prior to selecting the elements. If an invalid path name is given, the **ESEL (p. 661)** command is ignored (and the status of selected elements is unchanged). If no elements are crossing the path, the **ESEL (p. 661)** command returns zero elements selected.

For selections based on non-integer numbers (coordinates, results, etc.), items that are within the range *VMIN* -*Toler* and *VMAX* + *Toler* are selected. The default tolerance *Toler* is based on the relative values of *VMIN* and *VMAX* as follows:

- If *VMIN* = *VMAX*, *Toler* = 0.005 x *VMIN*.
- If *VMIN* = *VMAX* = 0.0, *Toler* = 1.0E-6.
- If *VMAX* ≠ *VMIN*, *Toler* = 1.0E-8 x (*VMAX* - *VMIN*).

To override this default and specify *Toler* explicitly, issue the **SELTOL (p. 1710)** (p. 1710) command.

Table 110: ESEL (p. 661) - Valid Item and Component Labels

Valid Item and Component Labels ESEL (p. 661), *Type*, *Item*, *Comp*, *VMIN*, *VMAX*, *VINC*, *KABS*

Item	Comp	Description
ELEM		Element number.
ADJ		Elements adjacent to element *VMIN* (*VMAX* and *VINC* fields are ignored). Only elements (of the same dimensionality) adjacent to

Valid Item and Component Labels ESEL (p. 661), *Type*, *Item*, *Comp*, *VMIN*, *VMAX*, *VINC*, *KABS*

Item	Comp	Description
		lateral faces are considered. Progression continues until edge of model or until more than two elements are adjacent at a face.
CENT	X, Y, Z	X, Y, or Z location in the active coordinate system.
TYPE		Element type number.
ENAME		Element name (or identifying number).
MAT		Material ID number.
REAL	(blank)	Real constant number.
	GCN	General contact/target elements (select all elements identified by real constant set number = 0). Remaining fields (*VMIN*, *VMAX*, etc.) are ignored.
	BASE	All split contact pairs (**CNCHECK (p. 382)**,SPLIT/DMP) that are associated with the current real constant set number.
ESYS		Element coordinate system number.
OVER		Overlapping contact elements created during contact pair splitting (**CNCHECK (p. 382)**,SPLIT/DMP)
LIVE		Active elements (**EALIVE (p. 592)**). *VMIN* and *VMAX* fields are ignored.
LAYER		Layer number (where only composite elements with a nonzero thickness for the requested layer number are included) (**LAYER (p. 1015)**).
SEC	(blank)	Cross section ID number (**SECNUM (p. 1685)**)
	MAT	Selects the elements with the requested MAT ID specified via *VMIN* and *VMAX* as attached to the section.
STRA		Straightened. See the description of the *Item* argument above.
SFE	PRES	Element pressure.
	CONV	Element convection bulk temperature.
	HFLUX	Element heat flux.
	FSI	Element (acoustic) fluid-structure interaction flag.
	IMPD	Element (acoustic) impedance.
	SHLD	Surface normal velocity or acceleration (acoustic analysis).
	MXWF	Element Maxwell force flag.
	CHRGS	Electric surface charge density.
	INF	Element infinite surface flag.
	DFLUX	Element diffusion flux.
BFE	TEMP	Element temperature.
	FLUE	Element fluence.
	HGEN	Element heat generation rate.
	JS	Element current density, magnitude only.
	MVDI	Element magnetic virtual displacements flag.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Valid Item and Component Labels ESEL (p. 661), *Type, Item, Comp, VMIN, VMAX, VINC, KABS*

Item	Comp	Description
	DGEN	Element diffusing substance generation rate.
	CHRGD	Electric charge density.
PATH	*Lab*	Selects all elements being crossed by the path with name *Lab* (**PATH (p. 1354)**). If *Lab* = ALL, all elements related to all defined paths are selected.
	Valid item and component labels for element result values are:	
ETAB	*Lab*	Any user-defined element table label (**ETABLE (p. 687)**).

/ESHAPE, *SCALE*, *KEY*

Displays elements with shapes determined from the real constants, section definition, or other inputs.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SCALE

Scaling factor:

0

Use simple display of line and area elements. This value is the default.

1

Use real constants, section definition, or other information to form a solid shape display of the applicable elements.

FAC

Multiply certain real constants, such as thickness, by *FAC* (where *FAC* > 0.01) and use them to form a solid shape display of elements.

KEY

Current shell thickness key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Use current thickness in the displaced solid shape display of shell elements (valid for SHELL181, SHELL208, SHELL209, and SHELL281). This value is the default.

1

Use initial thickness in the displaced solid shape display of shell elements.

Command Default

Use simple display of line and area elements (*SCALE* = 0).

Notes

The **/ESHAPE (p. 665)** command allows beams, shells, current sources, and certain special-purpose elements or elements with special options to be displayed as solids with the shape determined from the real constants, section types, or other information. Elements are displayed via the **EPLOT (p. 648)** command. No checks for valid or complete input are made for the display.

Following are details about using this command with various element types:

- COMBIN14, COMBIN39, and MASS21 are displayed with a graphics icon, with the offset determined by the real constants and KEYOPT settings.
- BEAM188, BEAM189, PIPE288, PIPE289 and ELBOW290 are displayed as solids with the shape determined via the section-definition commands (**SECTYPE (p. 1697)** and **SECDATA (p. 1655)**). The arbitrary section option (*Subtype* = ASEC) has no definite shape and appears as a thin rectangle to indicate the orientation; the thin side represents the beam Y axis and the thick (longer) side represents the Z axis. The length of thick side is determined by *TKZ*. If *TKZ* = 0, the area is used to determine the length of thick side. The thin side is scaled by the fraction of the thick side, regardless of *TKY*. If the offsets are defined via *CGY*/*CGZ* (**SECDATA (p. 1655)** or **SECOFFSET (p. 1685)**,USER,*OFFSETY*,*OFFSETZ*), they are applied to the plot without scaling. The elements are displayed with internal lines representing the cross-section mesh.
- Reduced-integration and lower-order shells (SHELL181 and SHELL208 with KEYOPT(3)=0) are displayed with uniform thickness, evaluated at the centroid, to reflect the element behavior.
- SOLID272 and SOLID273 are displayed as solids with the shape determined via the section-definition commands (**SECTYPE (p. 1697)** and **SECDATA (p. 1655)**). The 2D master plane is revolved around the prescribed axis of symmetry.
- PLANE182, PLANE183, PLANE222, and PLANE223 with KEYOPT(3) = 6 are displayed as 3D solids with the shape determined by nodal locations and displacements at the nodes.
- Contour plots are available for these elements in postprocessing for PowerGraphics only (**/GRAPHICS (p. 866)**,POWER). To view 3D deformed shapes for the elements, issue **OUTRES (p. 1336)**,MISC or **OUTRES (p. 1336)**,ALL for static or transient analyses. To view 3D mode shapes for a modal or eigenvalue buckling analysis, expand the modes with element results calculation ON (*Elcalc* = YES for **MXPAND (p. 1203)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- SOURC36, CIRCU124, and TRANS126 elements always plot using **/ESHAPE (p. 665)** when PowerGraphics is activated (**/GRAPHICS (p. 866)**,POWER).

In most cases, **/ESHAPE (p. 665)** renders a thickness representation of your shell, plane and layered elements more readily in PowerGraphics (**/GRAPHICS (p. 866)**,POWER). This type of representation employs PowerGraphics to generate the enhanced representation, and will often provide no enhancement in Full Graphics (**/GRAPHICS (p. 866)**,FULL). This is especially true for POST1 results displays, where **/ESHAPE (p. 665)** is not supported for most element types with FULL graphics.

When PowerGraphics is active, **/ESHAPE (p. 665)** may degrade the image if adjacent elements have overlapping material, such as shell elements which are not co-planar. Additionally, if adjacent elements have different thicknesses, the polygons depicting the connectivity between the "thicker" and "thinner" elements along the shared element edges may not always be displayed.

For POST1 results displays (such as **PLNSOL (p. 1425)**), the following limitations apply:

- If you issue **RSYS (p. 1639)**,SOLU before reviewing results for beam or pipe elements, contour plots for displacement (for example, **PLNSOL (p. 1425)**,U,*X* and **PLDISP (p. 1400)**) do not appear in the solution coordinate system when **/ESHAPE (p. 665)** is active. Instead, the contours appear in the global Cartesian coordinate system.

- When shell elements are not co-planar, the resulting **PLNSOL (p. 1425)** display with **/ESHAPE (p. 665)** will actually be a **PLESOL (p. 1401)** display as the non-coincident pseudo-nodes are not averaged. Additionally, **/ESHAPE (p. 665)** should not be used with coincident elements because the plot may incorrectly average the displacements of the coincident elements.

- When nodes are initially coincident and PowerGraphics is active, duplicate polygons are eliminated to conserve display time and disk space. The command may degrade the image if initially coincident nodes have different displacements. The tolerance for determining coincidence is 1E-9 times the model's bounding box diagonal.

- If you want to view solution results (**PLNSOL (p. 1425)**, etc.) on layered elements (such as SHELL181, SOLSH190, SOLID185 Layered Solid, SOLID186 Layered Solid, SHELL208, SHELL209, SHELL281, and ELBOW290), set KEYOPT(8) = 1 for the layer elements so that the data for all layers is stored in the results file.

- You can plot the through-thickness temperatures of elements SHELL131 and SHELL132 regardless of the thermal DOFs in use by issuing the **PLNSOL (p. 1425)**,TEMP command (with PowerGraphics and **/ESHAPE (p. 665)** active).

- The **/ESHAPE (p. 665)**,1 and **/ESHAPE (p. 665)**,*FAC* commands are incompatible with the **/CYCEXPAND (p. 454)** command used in cyclic symmetry analyses.

- The **/ESHAPE (p. 665)**,1 command does not support velocity and acceleration results for elements PLANE182, PLANE183, PLANE222, or PLANE223 with KEYOPT(3) = 6.

- For coupled-field elements PLANE222 and PLANE223 with KEYOPT(3) = 6, the **/ESHAPE (p. 665)** command can be used to visualize structural results. Non-structural results visualization is limited to gradient and flux displays supported with PowerGraphics.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>PlotCtrls>Style>Size and Shape

ESIZE, *SIZE*, *NDIV*

Specifies the default number of line divisions.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SIZE

Default element edge length on surface boundaries (that is, lines). Divisions are automatically calculated (rounded upward to next integer) from line lengths. If *SIZE* is zero (or blank), use *NDIV*.

NDIV

Default number of element divisions along region boundary lines. Not used if *SIZE* is input.

Notes

Specifies the default number of line divisions (elements) to be generated along the region boundary lines. The number of divisions may be defined directly or automatically calculated. Divisions defined directly for any line (**LESIZE (p. 1041)**, **KESIZE (p. 978)**, etc.) are retained. For adjacent regions, the divisions assigned to the common line for one region are also used for the adjacent region. See the **MOPT (p. 1151)** command for additional meshing options.

For free meshing operations, if smart element sizing is being used (**SMRTSIZE (p. 1811)**) and **ESIZE (p. 668)**,*SIZE* has been specified, *SIZE* will be used as a starting element size, but will be overridden (that is, a smaller size may be used) to accommodate curvature and small features.

This command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Size Cntrls>ManualSize>Global>Size

Main Menu>Preprocessor>Meshing>Size Cntrls>SmartSize>Adv Opts

---

ESLA, *Type*

Selects those elements associated with the selected areas.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of element select:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Notes

Selects area elements belonging to meshed (**AMESH (p. 121)**), selected (**ASEL (p. 192)**) areas.

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

ESLL, *Type*

Selects those elements associated with the selected lines.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of element select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Selects line elements belonging to meshed (**LMESH (p. 1057)**), selected (**LSEL (p. 1074)**) lines.

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

ESLN, *Type*, *EKEY*, *NodeType*

Selects those elements attached to the selected nodes.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of element selected:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

EKEY

Node set key:

0

Select element if *any* of its nodes are in the selected nodal set (default).

1

Select element only if *all* of its nodes are in the selected nodal set.

NodeType

Label identifying type of nodes to consider when selecting:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ALL

Select elements considering all of their nodes (default).

ACTIVE

Select elements considering only their active nodes. An active node is a node that contributes DOFs to the model.

INACTIVE

Select elements considering only their inactive nodes (such as orientation or radiation nodes).

CORNER

Select elements considering only their corner nodes.

MID

Select elements considering only their midside nodes.

Notes

ESLN (p. 670) selects elements which have any (or all *EKEY*) *NodeType* nodes in the currently-selected set of nodes. Only elements having nodes in the currently-selected set can be selected.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Circuit>Delete Elements

Main Menu>Preprocessor>Modeling>Delete>Pre-tens Elemnts

Utility Menu>Select>Entities

ESLV, *Type*

Selects elements associated with the selected volumes.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of element selected:

S

Select a new set (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Notes

Selects volume elements belonging to meshed (**VMESH (p. 2140)**), selected (**VSEL (p. 2163)**) volumes.

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

ESOL, *NVAR*, *ELEM*, *NODE*, *Item*, *Comp*, *Name*

Specifies element data to be stored from the results file.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR

Arbitrary reference number assigned to this variable (2 to *NV* (**NUMVAR (p. 1302)**)). Overwrites any existing results for this variable.

ELEM

Element for which data are to be stored. If *ELEM* = P, graphical picking is enabled (valid only in the GUI).

NODE

Node number on this element for which data are to be stored. If blank, store the average element value (except for *FMAG* values, which are summed instead of averaged). If *NODE* = P, graphical picking is enabled (valid only in the GUI).

Item

Label identifying the item. General item labels are shown in Table 111: ESOL - General Result Item and Component Labels (p. 673). Some items also require a component label. For selected result output, specify SRES and see Table 112: ESOL - Selected Result (SRES) Component Labels (p. 679).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Comp

Component of the item (if required). General component labels are shown in Table 111: ESOL - General Result Item and Component Labels (p. 673) below. If *Comp* is a sequence number (*n*), the *NODE* field is ignored.

Name

32-character name for identifying the item on the printout and displays. Defaults to a label formed by concatenating the first four characters of the *Item* and *Comp* labels.

Notes

See Table 111: ESOL - General Result Item and Component Labels (p. 673) for a list of item and component labels for element (excluding line element) results. See Table 112: ESOL - Selected Result (SRES) Component Labels (p. 679) for a list of valid selected result (*Item* = SRES) components.

ESOL (p. 672) defines element results data to be stored from a results file (**FILE (p. 752)**). Not all items are valid for all elements. To see the available items for a given element, refer to the input and output summary tables in the documentation for that element.

Two methods of data access are available via the **ESOL (p. 672)** command. You can access some data by using a generic label (*component name method*), while others require a label and number (*sequence number method*).

Use the component name method to access general element data (that is, element data generally available to most element types or groups of element types). Element results are in the element coordinate system, except for layered elements where results are in the layer coordinate system. Element forces and moments are in the nodal coordinate system. Results are obtainable for an element at a specified node. Further location specifications can be made for some elements via **SHELL (p. 1784)**, **LAYERP26 (p. 1016)**, and **FORCE (p. 772)**.

The sequence number method is required for data that is not averaged (such as pressures at nodes and temperatures at integration points), or data that is not easily described generically (such as all derived data for structural line elements and contact elements, all derived data for thermal line elements, and layer data for layered elements).

In a 2D to 3D analysis, this command not supported in the POST26 postprocessor and is ignored.

Table 111: ESOL (p. 672) - General Result Item and Component Labels

Component Name Method		
Item	**Comp**	**Description**
S	X, Y, Z, XY, YZ, XZ	Component stress.
	1, 2, 3	Principal stress.
	INT	Stress intensity.
	EQV	Equivalent stress.
EPEL	X, Y, Z, XY, YZ, XZ	Component elastic strain.
	1, 2, 3	Principal elastic strain.
	INT	Elastic strain intensity.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Component Name Method		
Item	**Comp**	**Description**
	EQV	Elastic equivalent strain.
EPTH	X, Y, Z, XY, YZ, XZ	Component thermal strain.
	1, 2, 3	Principal thermal strain.
	INT	Thermal strain intensity.
	EQV	Thermal equivalent strain.
EPPL	X, Y, Z, XY, YZ, XZ	Component plastic strain.
	1, 2, 3	Principal plastic strain.
	INT	Plastic strain intensity.
	EQV	Plastic equivalent strain.
EPCR	X, Y, Z, XY, YZ, XZ	Component creep strain.
	1,2,3	Principal creep strain.
	INT	Creep strain intensity.
	EQV	Creep equivalent strain.
EPDI	X, Y, Z, XY, YZ, XZ	Component diffusion strain.
	1, 2, 3	Principal diffusion strain.
	INT	Diffusion strain intensity.
	EQV	Diffusion equivalent strain.
NL	SEPL	Equivalent stress (from stress-strain curve).
	SRAT	Stress state ratio.
	HPRES	Hydrostatic pressure.
	EPEQ	Accumulated equivalent plastic strain.
	CREQ	Accumulated equivalent creep strain.
	PSV	Plastic state variable.
	PLWK	Plastic work/volume.
SEND	ELASTIC[a]	Elastic strain energy density. (For viscoelastic and sintering materials, the stored energy.)
	PLASTIC	Plastic strain energy density.
	CREEP	Creep strain energy density.
	DAMAGE	Damage strain energy density.
	VDAM[a]	Viscoelastic dissipation energy density.
	VREG	Visco-regularization strain energy density.
	DISS	Structural-thermal dissipation.
	ENTO	Total strain energy density (sum of ELASTIC, PLASTIC, and CREEP strain energy densities).
CDM	DMG	Damage variable.
	LM	Maximum previous strain energy for virgin material.
GKS	X	Gasket component stress (also gasket pressure).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Component Name Method		
Item	**Comp**	**Description**
GKD	X	Gasket component total closure.
GKDI	X	Gasket component total inelastic closure.
GKTH	X	Gasket component thermal closure.
SS	X, XY, XZ	Interface traction (stress).
SD	X,XY,XZ	Interface separation.
CONT	STAT[b]	Contact status.
	PENE	Contact penetration.
	PRES	Contact pressure.
	SFRIC	Contact friction stress.
	STOT	Contact total stress (pressure plus friction).
	SLIDE	Contact sliding distance.
	GAP	Contact gap distance.
	FLUX	Total heat flux at contact surface.
	CNOS	Total number of contact status changes during substep.
	FPRS	Fluid penetration pressure.
TG[c]	X, Y, Z, SUM	Component thermal gradient or vector sum.
TF[c]	X, Y, Z, SUM	Component thermal flux or vector sum.
PG	X, Y, Z, SUM	Component pressure gradient or vector sum.
EF	X, Y, Z, SUM	Component electric field or vector sum.
D	X, Y, Z, SUM	Component electric flux density or vector sum.
H	X, Y, Z, SUM	Component magnetic field intensity or vector sum.
B	X, Y, Z, SUM	Component magnetic flux density or vector sum.
CG	X, Y, Z, SUM	Component concentration gradient or vector sum.
DF	X, Y, Z, SUM	Component diffusion flux density or vector sum.
FMAG	X, Y, Z, SUM	Component electromagnetic forces or vector sum.
P	X, Y, Z, SUM	Poynting vector components or vector sum
F	X, Y, Z	Component structural force.
M	X, Y, Z	Component structural moment.
HEAT[c]		Heat flow.
FLOW		Fluid flow.
AMPS		Current flow.
FLUX		Magnetic flux.
CSG	X, Y, Z	Component magnetic current segment.
RATE		Diffusion flow rate.
SENE		"Stiffness" energy.
STEN		Elemental energy dissipation due to stabilization.
KENE		Kinetic energy.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Component Name Method		
Item	**Comp**	**Description**
ASENE		Amplitude stiffness energy.
PSENE		Peak stiffness energy.
AKENE		Amplitude kinetic energy.
PKENE		Peak kinetic energy.
DENE		Damping energy.
WEXT[d]		Work due to external load.
AENE		Artificial energy due to hourglass control/drill stiffness or due to contact stabilization.
JHEAT		Element Joule heat generation.
JC	X, Y, Z, SUM	Conduction current density for elements that support conduction current calculation. Components (X, Y, Z) and vector sum (SUM).
JS	X, Y, Z	Source current density for low-frequency magnetic analyses. Total current density (sum of conduction and displacement current densities) in low-frequency electric analyses. Components (X, Y, Z).
JT	X, Y, Z, SUM	Total measurable current density in low-frequency electromagnetic analyses. (Conduction current density in a low-frequency electric analysis.) Components (X, Y, Z) and vector sum (SUM).
MRE		Magnetics Reynolds number.
VOLU		Volume of volume element.
BFE	TEMP	Body temperatures (calculated from applied temperatures) as used in solution (area and volume elements only).
FICT	TEMP	Fictive temperature.
CAP	C0,X0,K0,ZONE, DPLS,VPLS	Material cap plasticity model only: Cohesion; hydrostatic compaction yielding stress; I1 at the transition point at which the shear and compaction envelopes intersect; zone = 0: elastic state, zone = 1: compaction zone, zone = 2: shear zone, zone = 3: expansion zone; effective deviatoric plastic strain; volume plastic strain.
EDPC	CSIG,CSTR	Material EDP creep model only (not including the cap model): Equivalent creep stress; equivalent creep strain.
FFLX	X, Y, Z	Fluid flux flow in poromechanics.
FGRA	X, Y, Z	Fluid pore pressure gradient in poromechanics.
PMSV	VRAT, PPRE, DSAT, RPER	Void volume ratio, pore pressure, degree of saturation, and relative permeability for coupled pore-pressure-thermal elements.
YSIDX	TENS,SHEA	Yield surface activity status for Mohr-Coulomb, soil, concrete, and joint rock material models: 1 = yielded, 0 = not yielded.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Component Name Method		
Item	**Comp**	**Description**
FPIDX	TF01,SF01, TF02,SF02, TF03,SF03, TF04,SF04	Failure plane surface activity status for concrete and joint rock material models: 1 = yielded, 0 = not yielded. Tension and shear failure status are available for all four sets of failure planes.
NS	X, Y, Z, XY, YZ, XZ	Nominal strain for hyperelastic material, reported in the current configuration (unaffected by **RSYS (p. 1639)**).
MPLA	DMAC, DMAX	Microplane damage, macroscopic and maximum values.
MPDP	TOTA, TENS, COMP, RW	Microplane homogenized total, tension, and compression damages (TOTA, TENS, COMP), and split weight factor (RW).
DAMAGE	1,2,3,MAX	Damage in directions 1, 2, 3 (1, 2, 3) and the maximum damage (MAX).
GDMG		Damage
IDIS		Structural-thermal dissipation rate
BKS	X, Y, Z, XY, YZ, XZ	Total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements.
BKS1, . . . ,BKS5	X, Y, Z, XY, YZ, XZ	Superimposed components of the total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements when more than one superimposed back-stress component is defined.
EPFR		Free strain in porous media
FC1S	1,2,3,4,5,6	First set of six components of FCC crystal slip. Available for 3D elements only.
FC2S	1,2,3,4,5,6	Second set of six components of FCC crystal slip. Available for 3D elements only.
HC1S	1,2,3,4,5,6	Six components of HCP crystal slip on basal and prismatic systems. Available for 3D elements only.
HC2S	1,2,3,4,5,6	Six components of HCP crystal slip on pyramidal system. Available for 3D elements only.
HC3S	1,2,3,4,5,6	First set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC4S	1,2,3,4,5,6	Second set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC5S	1,2,3,4,5,6	Six components of HCP crystal slip on the second-order pyramidal system. Available for 3D elements only.
BC1S	1,2,3,4,5,6	First set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC2S	1,2,3,4,5,6	Second set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC3S	1,2,3,4,5,6	First set of six components of BCC slip on 112 plane. Available for 3D elements only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Component Name Method		
Item	**Comp**	**Description**
BC4S	1,2,3,4,5,6	Second set of six components of BCC slip on 112 plane. Available for 3D elements only.
BC5S	1,2,3,4,5,6	First set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC6S	1,2,3,4,5,6	Second set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC7S	1,2,3,4,5,6	Third set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC8S	1,2,3,4,5,6	Fourth set of six components of BCC slip on 123 plane. Available for 3D elements only.
FC1H	1,2,3,4,5,6	First set of six components of FCC crystal hardness. Available for 3D elements only.
FC2H	1,2,3,4,5,6	Second set of six components of FCC crystal hardness. Available for 3D elements only.
HC1H	1,2,3,4,5,6	Sixcomponents of HCP crystal hardness on basal and prismatic systems. Available for 3D elements.
HC2H	1,2,3,4,5,6	Six components of HCP crystal hardness on pyramidal system. Available for 3D elements only.
HC3H	1,2,3,4,5,6	First set of six components of HCP crystal hardness on the first-order pyramidal system. Available for 3D elements only.
HC4H	1,2,3,4,5,6	Second set of six components of HCP crystal hardness on the first-order pyramidal system. Available for 3D elements only.
HC5H	1,2,3,4,5,6	Six components of HCP crystal hardness on the second-order pyramidal system. Available for 3D elements only.
BC1H	1,2,3,4,5,6	First set of six components of BCC hardness on 111 plane. Available for 3D elements only.
BC2H	1,2,3,4,5,6	Second set of six components of BCC hardness on 111 plane. Available for 3D elements only.
BC3H	1,2,3,4,5,6	First set of six components of BCC hardness on 112 plane. Available for 3D elements only.
BC4H	1,2,3,4,5,6	Second set of six components of BCC hardness on 112 plane. Available for 3D elements only.
BC5H	1,2,3,4,5,6	First set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC6H	1,2,3,4,5,6	Second set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC7H	1,2,3,4,5,6	Third set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC8H	1,2,3,4,5,6	Fourth set of six components of BCC hardness on 123 plane. Available for 3D elements only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Component Name Method		
Item	**Comp**	**Description**
XELG	1,2,3,45,6,EQV	Crystal Lagrangian strain in 11, 22, 33, 12, 23,13 directions and its equivalent. Available for 3D elements only.
SINT	RHO, ETA, SSTR, GRAIN	Sintering relative density, viscosity, sintering stress, and average grain size values.
Sequence Number Method		
Item	**Comp**	**Description**
SMISC	*snum*	Summable items.
NMISC	*snum*	Nonsummable items.
LS	*snum*	Line element elastic stresses.
LEPEL	*snum*	Line element strains.
LEPTH	*snum*	Line element thermal strains.
LEPPL	*snum*	Line element plastic strains.
LEPCR	*snum*	Line element creep strains.
LBFE	*snum*	Line element temperatures.

[a] The results for this postprocessing SEND component are invalid for ELBOW290 if that element is used with viscoelastic or viscohyperelastic materials.

[b] For more information about the meaning of contact status and its possible values, see Reviewing Results in POST1 in the *Contact Technology Guide*.

[c] For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use the labels HBOT, HE2, HE3, . . ., HTOP instead of HEAT.

[d] WEXT is calculated for element-based loading only (and not for nodal-force loading). WEXT is stored on elements to which loading has been applied; if surface elements are added on top of other elements, for example, and pressure loading is applied to the surface elements, WEXT is available for the surface elements only.

Table 112: ESOL - Selected Result (SRES) Component Labels

ESOL (p. 672),*NVAR*,*ELEM*,*NODE*,SRES,*Comp*	
Comp	**Description**
SVAR*n*	The *n*th state variable.
FLDUF0*n*	The *n*th user-defined field variable.
ItemComp (concatenated *Item* + *Comp* label) from Table 208: OSRESULT - Item and Component Labels (p. 1328)[a]	See the table (p. 1328) for the combined item and component description.

[a] See Example 10: Specifying and Retrieving Selected Result Output (p. 1329).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ESORT, *Item*, *Lab*, *ORDER*, *KABS*, *NUMB*

Sorts the element table.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item

Label identifying the item:

ETAB

(currently the only *Item* available)

Lab

element table label:

Lab

Any user-defined label from the **ETABLE (p. 687)** command (input in the *Lab* field of the **ETABLE (p. 687)** command).

ORDER

Order of sort operation:

0

Sort into descending order.

1

Sort into ascending order.

KABS

Absolute value key:

0

Sort according to real value.

1

Sort according to absolute value.

NUMB

Number of elements (element table rows) to be sorted in ascending or descending order (*ORDER*) before sort is stopped (remainder will be in unsorted sequence) (defaults to all elements).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Use ascending element number order.

Notes

The element table rows are sorted based on the column containing the *Lab* values. Use **EUSORT (p. 703)** to restore the original order. If **ESORT (p. 680)** is specified with PowerGraphics on (**/GRAPHICS (p. 866)**,POWER), then the nodal solution results listing (**PRNSOL (p. 1505)**) will be the same as with the full graphics mode (**/GRAPHICS (p. 866)**,FULL).

Menu Paths

Main Menu>General Postproc>List Results>Sorted Listing>Sort Elems

---

ESTIF, *KMULT*

Specifies the matrix multiplier for deactivated elements.

SOLUTION (p. 38): Birth and Death (p. 47)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KMULT

Stiffness matrix multiplier for deactivated elements (defaults to 1.0E-6).

Command Default

Use 1.0E-6 as the multiplier.

Notes

Specifies the stiffness matrix multiplier for elements deactivated with the **EKILL (p. 616)** command (birth and death).

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Birth & Death>StiffnessMult

Main Menu>Solution>Load Step Opts>Other>Birth & Death>StiffnessMult

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ESURF, *XNODE*, *Tlab*, *Shape*

Generates elements overlaid on the free faces of selected nodes.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XNODE

Node number that is used only in the following two cases:

XNODE is a single extra node number (ID) used for generating SURF151 or SURF152 elements when KEYOPT(5)=1.

XNODE is a single pressure node number (ID) used for generating HSFLD241 or HSFLD242 elements.

There is no default. *XNODE* must be specified for the above cases. If *XNODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A parameter or parametric expression can be substituted for *XNODE*.

Tlab

Generates target, contact, and hydrostatic fluid elements with correct direction of normals.

This option is valid only with TARGE169, TARGE170, CONTA172, CONTA174, CONTA177, HSFLD241, and HSFLD242 elements.

TOP

Generates target and contact elements over beam and shell elements, or hydrostatic fluid elements over shell elements, with the normals the same as the underlying beam and shell elements (default).

BOTTOM

Generates target and contact elements over beam and shell elements, or hydrostatic fluid elements over shell elements, with the normals opposite to the underlying beam and shell elements.

If target or contact elements *and* hydrostatic fluid elements are defined on the same underlying shell elements, you only need to use this option once to orient the normals opposite to the underlying shell elements.

REVERSE

Reverses the direction of the normals on existing selected target elements, contact elements, and hydrostatic fluid elements.

If target or contact elements *and* hydrostatic fluid elements are defined on the same underlying shell elements, you only need to use this option once to reverse the normals for all selected elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Shape

Used to specify the element shape for target element TARGE170 (*Shape* = LINE or POINT) or TARGE169 elements (*Shape* = POINT).

(blank)

The target element takes the same shape as the external surface of the underlying element (default).

LINE

Generates LINE or PARA (parabolic) segments on exterior of selected 3D elements.

POINT

Generates POINT segments on selected nodes.

Notes

The **ESURF (p. 682)** command generates elements of the currently active element type overlaid on the free faces of existing elements. For example, surface elements (such as SURF151, SURF152, SURF153, SURF154, or SURF159) can be generated over solid elements (such as PLANE55, SOLID70, PLANE182, SOLID185, or SOLID272, respectively).

Element faces are determined from the selected node set (**NSEL (p. 1266)**) and the load faces for that element type. The operation is similar to that used for generating element loads from selected nodes via the **SF (p. 1733)**,ALL command, except that elements (instead of loads) are generated. All nodes on the face must be selected for the face to be used. For shell elements, only face one of the element is available. If nodes are shared by adjacent selected element faces, the faces are not free and no element is generated.

Elements created by **ESURF (p. 682)** are oriented such that their surface load directions are consistent with those of the underlying elements. Carefully check generated elements and their orientations.

Generated elements use the existing nodes and the active **MAT (p. 1111)**, **TYPE (p. 2036)**, **REAL (p. 1579)**, and **ESYS (p. 685)** attributes. The exception is when *Tlab* = REVERSE. The reversed target and contact elements have the same attributes as the original elements. If the underlying elements are solid elements, *Tlab* = TOP or BOTTOM has no effect.

When the command generates a target element, the shape is by default the same as that of the underlying element. Issue **ESURF (p. 682)**,,,LINE or **ESURF (p. 682)**,,,POINT to generate LINE, PARA, and POINT segments.

The **ESURF (p. 682)** command can also generate the 2D or 3D node-to-surface element CONTA175, based on the selected node components of the underlying solid elements. When used to generate CONTA175 elements, all **ESURF (p. 682)** arguments are ignored. (If CONTA175 is the active element type, the path **Main Menu> Preprocessor> Modeling> Create> Elements> Node-to-Surf** uses **ESURF (p. 682)** to generate elements.)

To generate SURF151 or SURF152 elements that have two extra nodes from FLUID116 elements, KEYOPT(5) for SURF151 or SURF152 is first set to 0 and **ESURF (p. 682)** is issued. Then KEYOPT(5) for SURF151

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

or SURF152 is set to 2 and **MSTOLE (p. 1200)** is issued. For more information, see Using the Surface Effect Elements in the *Thermal Analysis Guide*.

For hydrostatic fluid elements HSFLD241 and HSFLD242, the **ESURF (p. 682)** command generates triangular (2D) or pyramid-shaped (3D) elements with bases that are overlaid on the faces of selected 2D or 3D solid or shell elements. The single vertex for all generated elements is at the pressure node specified as *XNODE*. The generated elements fill the volume enclosed by the solid or shell elements. The nodes on the overlaid faces have translational degrees of freedom, while the pressure node shared by all generated elements has a single hydrostatic pressure degree of freedom, HDSP (see HSFLD241 and HSFLD242 for more information about the pressure node).

---

ESYM, - -, *NINC*, *IEL1*, *IEL2*, *IEINC*

Generates elements from a pattern by a symmetry reflection.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

--

Unused field.

NINC

Increment nodes in the given pattern by *NINC*.

IEL1*, *IEL2*, *IEINC

Reflect elements from pattern beginning with *IEL1* to *IEL2* (defaults to *IEL1*) in steps of *IEINC* (defaults to 1). If *IEL1* = ALL, *IEL2* and *IEINC* are ignored and pattern is all selected elements (**ESEL (p. 661)**). If *IEL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *IEL1* (*IEL2* and *IEINC* are ignored).

Notes

Generates additional elements from a given pattern (similar to **EGEN (p. 603)**) except with a symmetry reflection. The operation generates a new element by incrementing the nodes on the original element, and reversing and shifting the node connectivity pattern. For example, for a 4-node 2D element, the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

nodes in positions I, J, K, and L of the original element are placed in positions J, I, L, and K of the reflected element.

Similar permutations occur for all other element types. For line elements, the nodes in positions I and J of the original element are placed in positions J and I of the reflected element.

It is recommended that symmetry elements be displayed and graphically reviewed.

If the nodes are also reflected (as with the **NSYM (p. 1289)** command), this pattern is such that the orientation of the symmetry element remains similar to the original element (that is, clockwise elements are generated from clockwise elements).

For a non-reflected node pattern, the reversed orientation has the effect of reversing the outward normal direction (clockwise elements are generated from counterclockwise elements).

Because nodes may be defined anywhere in the model independently of this command, any orientation of the symmetry elements is possible. See also the **ENSYM (p. 644)** command for modifying existing elements.

ESYS, *KCN*

Sets the element coordinate system attribute pointer.

PREP7 (p. 22): Meshing (p. 29)
PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Coordinate system number:

0

Use element coordinate system orientation as defined (either by default or by KEYOPT setting) for the element (default).

N

Use element coordinate system orientation based on local coordinate system *N* (where *N* must be greater than 10). For global system 0, 1, or 2, define a local system *N* parallel to appropriate system with the **LOCAL (p. 1059)** or **CS (p. 435)** command (for example, **LOCAL (p. 1059)**,11,1).

Command Default

Use element coordinate system orientation as defined (either by default or by KEYOPT setting) for the element (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

ESYS (p. 685) identifies the local coordinate system to be used to define the element coordinate system of subsequently defined elements.

The command is valid for area and volume elements only.

For non-layered volume elements, the local coordinate system *N* is assigned as the element coordinate system. *N* refers to the coordinate system reference number (*KCN*) defined via **LOCAL (p. 1059)** (or a similar command).

For shell and layered volume elements, the x and y axes of the local coordinate system *N* are projected onto the shell or layer plane to determine the element coordinate system.

For more information, see Understanding the Element Coordinate System.

Element coordinate system numbers can be displayed (**/PNUM (p. 1457)**).

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh Attributes>Default Attribs

---

ET, *ITYPE*, *Ename*, *KOP1*, *KOP2*, *KOP3*, *KOP4*, *KOP5*, *KOP6*, *INOPR*

Defines a local element type from the element library.

PREP7 (p. 22): Element Type (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITYPE

An arbitrary local element-type number. Defaults to 1 + current maximum.

Ename

A full element name (such as **pipe288**) *or* element number only (such as **288**), as given in the element library.

KOP1, KOP2, KOP3, . . . , KOP6

KEYOPT values (1 through 6) as desired for the specified element.

INOPR

Specify 1 to suppress all element-solution printout for this element type.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **ET (p. 686)** command selects an element type from the element library and establishes it as a local element type for the current model. Information derived from the element type is used for subsequent commands, so the **ET (p. 686)** command(s) should be issued early.

Although specifying a full element name (category prefix and number such as **pipe288**) for *Ename* is optional, it is still displayed in the output.

Ename = 0 is a special option to ignore the specified element type during solution without removing it from the model. The option is valid only for the previously defined element type. (The preferred method for ignoring elements is to issue **ESEL (p. 661)** or another selection command (p. 14).)

KOPn are element key options (KEYOPT(*n*)), used to enable or disable options available for the given element. Available KEYOPT values are shown each element documented in the element library. If KEYOPT(7) and higher are needed, input those KEYOPT values values via **KEYOPT (p. 979)**.

Although **ET (p. 686)** defines an element type local to your model, you must point to the desired local element type before meshing. To do so, issue **TYPE (p. 2036)** (or a similar command such as **KATT (p. 969)**, **LATT (p. 1014)**, **AATT (p. 85)**, or **VATT (p. 2075)**).

Menu Paths

Main Menu>Preprocessor>Element Type>Add/Edit/Delete

ETABLE, *Lab*, *Item*, *Comp*, *Option*

Fills a table of element values for further processing.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Any unique user-defined label for use in subsequent commands and output headings. A valid label has a maximum of eight characters and is not a general predefined *Item* label. Default: An eight-character label formed by concatenating the first four characters of the *Item* and *Comp* labels.

If the same as a previous user label, the result item is included under the same label. Up to 200 different labels can be defined.

The following predefined labels are reserved:

REFL

Refills all tables previously defined with the **ETABLE (p. 687)** commands (not the **CALC (p. 283)** module commands) according to the latest **ETABLE (p. 687)** specifications. It is convenient for refilling tables after the load step (**SET (p. 1724)**) has changed. Remaining fields are ignored.

STAT

Displays stored table values.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ERAS

Erases the entire table.

Item

Label identifying the item. General item labels are shown in the tables below. Some items also require a component label. Character parameters are valid. *Item* = ERAS erases a *Lab* column. For selected result output, specify SRES and see Table 114: ETABLE - Selected Result (SRES) Component Labels (p. 698).

Comp

Component of the item (if required). General component labels are shown in the tables below. Character parameters can be used.

Option

Option for storing element table data:

MIN

Store minimum element nodal value of the specified item component.

MAX

Store maximum element nodal value of the specified item component.

AVG

Store averaged element centroid value of the specified item component (default).

Notes

ETABLE (p. 687) defines a table of values per element (the element table) for use in further processing. The element table is organized similar to a spreadsheet, with rows representing all selected elements and columns consisting of result items which have been moved into the table (*Item*,*Comp*) via **ETABLE (p. 687)**. Each column of data is identified by a user-defined label (*Lab*) for listings and displays.

After entering the data into the element table, you are not limited to listing or displaying your data (**PLESOL (p. 1401)**, **PRESOL (p. 1481)**, etc.). You can also perform many types of operations on your data, such as adding or multiplying columns (**SADD (p. 1643)**, **SMULT (p. 1814)**), defining allowable stresses for safety calculations (**SALLOW (p. 1644)**), or multiplying one column by another (**SMULT (p. 1814)**). For more information, see Getting Started in the *Basic Analysis Guide*.

For reinforcing elements, this command displays the results of reinforcing member (individual reinforcing) selected via the **LAYER (p. 1015)**,*N* command (where *N* is a given reinforcing member). **LAYER (p. 1015)**,0 (default) or **LAYER (p. 1015)**,1 selects the first reinforcing member.

Various results data can be stored in the element table. For example, many items for an element are inherently single-valued (one value per element). The single-valued items include: SERR, SDSG, TERR, TDSG, SENE, TENE, KENE, ASENE, PSENE, AKENE, PKENE, DENE, WEXT, AENE, JHEAT, JS, VOLU, and CENT. All other items are multivalued (varying over the element, such that there is a different value at each node). Because only one value is stored in the element table per element, an average value (based on

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the number of contributing nodes) is calculated for multivalued items. Exceptions to this averaging procedure are FMAG and all element force items, which represent the sum only of the contributing nodal values.

Two methods of data access can be used with the **ETABLE (p. 687)** command. The method you select depends upon the type of data that you want to store. Some results can be accessed via a generic label (Component Name method), while others require a label and number (Sequence Number method).

The component name method is used to access the general element data (that is, element data which is generally available to most element types or groups of element types). All of the single-valued items and some of the more general multivalued items are accessible with the Component Name method. Various element results depend on the calculation method and the selected results location (**AVPRIN (p. 210)**, **RSYS (p. 1639)**, **LAYER (p. 1015)**, **SHELL (p. 1784)**, and **ESEL (p. 661)**).

Although nodal data is readily available for listing and display (**PRNSOL (p. 1505)**, **PLNSOL (p. 1425)**) without using the element table, you can also use the Component Name method to enter these results into the element table for further "worksheet" manipulation. (See Getting Started in the *Basic Analysis Guide* for more information.) A listing of the general *Item* and *Comp* labels for the component name method is shown in Table 113: ETABLE - General Result Item and Component Labels (p. 690). See Table 114: ETABLE - Selected Result (SRES) Component Labels (p. 698) for a list of selected result (*Item* = SRES) *Comp* labels.

The sequence number method enables you to view results for data that is not averaged (such as pressures at nodes, temperatures at integration points, etc.), or data that is not easily described in a generic fashion (such as all derived data for structural line elements and contact elements, all derived data for thermal line elements, layer data for layered elements, etc.). A table illustrating the *Items* (such as LS, LEPEL, LEPTH, SMISC, NMISC, SURF, etc.) and corresponding sequence numbers for each element is shown in the Output Data section of each element description.

Some element table data are reported in the results coordinate system. These include all component results (for example, UX, UY, etc.; SX, SY, etc.). Line element solution quantities (LS, LEPEL, LEPTH, LEPPL, LEPCR, LEPTO, and LEPTT) for ELBOW290 are also reported in the results coordinate system if euler angles are saved. The solution writes component results in the database and on the results file in the solution coordinate system. When you issue the **ETABLE (p. 687)** command, these results are then transformed into the results coordinate system (**RSYS (p. 1639)**) before being stored in the element table. The default results coordinate system is global Cartesian (**RSYS (p. 1639)**,0). All other data are retrieved from the database and stored in the element table with no coordinate transformation.

To display the stored table values, issue the **PRETAB (p. 1490)**, **PLETAB (p. 1411)**, or **ETABLE (p. 687)**,STAT command. To erase the entire table, issue **ETABLE (p. 687)**,ERAS. To erase a *Lab* column, issue **ETABLE (p. 687)**,*Lab*,ERAS.

When the GUI is enabled, if a **Delete** operation in a Define Element Table Data dialog box writes this command to a log file (`Jobname.log` or `Jobname.lgw`), the program sets *Lab* = blank, *Item* = ERASE, and *Comp* = an integer number. In this case, the program has assigned a value of *Comp* that corresponds to the location of a chosen variable name in the dialog list. It is *not* intended that you type in such a location value for *Comp* in a session; however, a file that contains a GUI-generated **ETABLE (p. 687)** command of this form can be used for batch input or the **/INPUT (p. 948)** command.

The MIN and MAX options are not available for thermal elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The element table data option (*Option*) is not available for all output items. See the table below for supported items.

Table 113: ETABLE (p. 687) - General Result Item and Component Labels

General Item and Component Labels ETABLE (p. 687), *Lab, Item, Comp*		
Item	**Comp**	**Description**
Valid Item Labels for Degree of Freedom Results		
U	X, Y, Z	X, Y, or Z structural displacement.
ROT	X, Y, Z	X, Y, or Z structural rotation.
TEMP[a]		Temperature.
PRES		Pressure.
VOLT		Electric potential.
GFV1, GFV2, GFV3		Nonlocal field values 1, 2, and 3.
MAG		Magnetic scalar potential.
V	X, Y, Z	X, Y, or Z fluid velocity.
A	X, Y, Z	X, Y, or Z magnetic vector potential.
CONC		Concentration.
CURR		Current.
EMF		Electromotive force drop.
Valid Item and Component Labels for Element Results		
S[b]	X, Y, Z, XY, YZ, XZ	Component stress.
	1, 2, 3	Principal stress.
	INT	Stress intensity.
	EQV	Equivalent stress.
EPEL[b]	X, Y, Z, XY, YZ, XZ	Component elastic strain.
	1, 2, 3	Principal elastic strain.
	INT	Elastic strain intensity.
	EQV	Elastic equivalent strain.
EPTH[b]	X, Y, Z, XY, YZ, XZ	Component thermal strain.
	1, 2, 3	Principal thermal strain.
	INT	Thermal strain intensity.
	EQV	Thermal equivalent strain.
EPDI[b]	X, Y, Z, XY, YZ, XZ	Component diffusion strain.
	1, 2, 3	Principal diffusion strain.
	EQV	Diffusion equivalent strain.
	INT	Diffusion strain intensity.
EPPL[b]	X, Y, Z, XY, YZ, XZ	Component plastic strain.
	1, 2, 3	Principal plastic strain.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels ETABLE (p. 687), *Lab, Item, Comp*		
Item	**Comp**	**Description**
	INT	Plastic strain intensity.
	EQV	Plastic equivalent strain.
EPCR[b]	X, Y, Z, XY, YZ, XZ	Component creep strain.
	1, 2, 3	Principal creep strain.
	INT	Creep strain intensity.
	EQV	Creep equivalent strain.
EPSW[b]		Swelling strain.
EPTO[b]	X, Y, Z, XY, YZ, XZ	Component total mechanical strain (*excluding* thermal) (EPEL + EPPL + EPCR).
	1, 2, 3	Principal total mechanical strain.
	INT	Total mechanical strain intensity.
	EQV	Total equivalent mechanical strain.
EPTT[b]	X, Y, Z, XY, YZ, XZ	Component total strain *including* thermal, diffusion, and swelling (EPEL + EPTH + EPPL + EPDI + EPCR + EPSW).
	1, 2, 3	Principal total strain.
	INT	Total strain intensity.
	EQV	Total equivalent strain.
NL[b]	SEPL	Equivalent stress (from stress-strain curve).
	SRAT	Stress state ratio.
	HPRES	Hydrostatic pressure.
	EPEQ	Accumulated equivalent plastic strain.
	CREQ	Accumulated equivalent creep strain.
	PSV	Plastic state variable.
	PLWK	Plastic work/volume.
SEND[b]	ELASTIC[c]	Elastic strain energy density. (For viscoelastic and sintering materials, the stored energy.)
	PLASTIC	Plastic strain energy density.
	CREEP	Creep strain energy density.
	DAMAGE	Damage strain energy density.
	VDAM[c]	Viscoelastic dissipation energy density.
	VREG	Visco-regularization strain energy density.
	DISS	Structural-thermal dissipation.
	ENTO	Total strain energy density (sum of ELASTIC, PLASTIC, and CREEP strain energy densities).
SVAR	1 to MAX	State variable.
CDM	DMG	Damage variable.
	LM	Maximum previous strain energy for virgin material.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels ETABLE (p. 687), *Lab, Item, Comp*		
Item	**Comp**	**Description**
FAIL	MAX[a][d]	Maximum of all active failure criteria defined at the current location (**FCTYP (p. 740)**) .
	EMAX[a][d]	Maximum Strain Failure Criterion.
	SMAX[a][d]	Maximum Stress Failure Criterion.
	TWSI[a][d]	Tsai-Wu Strength Index Failure Criterion.
	TWSR[a][d]	Inverse of Tsai-Wu Strength Ratio Index Failure Criterion.
	HFIB[a][d][e]	Hashin Fiber Failure Criterion.
	HMAT[a][d][e]	Hashin Matrix Failure Criterion.
	PFIB[a][d][e]	Puck Fiber Failure Criterion.
	PMAT[a][d][e]	Puck Matrix Failure Criterion.
	L3FB[a][d][e]	LaRc03 Fiber Failure Criterion.
	L3MT[a][d][e]	LaRc03 Matrix Failure Criterion.
	L4FB[a][d][e]	LaRc04 Fiber Failure Criterion.
	L4MT[a][d][e]	LaRc04 Matrix Failure Criterion.
	USR1, USR2, ..., USR9[a][d][e][f]	User-defined failure criteria.
PFC	MAX[g]	Maximum of all failure criteria defined at current location.
	FT[g]	Fiber tensile failure criteria.
	FC[g]	Fiber compressive failure criteria.
	MT[g]	Matrix tensile failure criteria.
	MC[g]	Matrix compressive failure criteria.
PDMG	STAT	Damage status (0 = undamaged, 1 = damaged, 2 = completely damaged).
	FT	Fiber tensile damage variable.
	FC	Fiber compressive damage variable .
	MT	Matrix tensile damage variable .
	MC	Matrix compressive damage variable .
	S	Shear damage variable (S).
	SED	Energy dissipated per unit volume .
	SEDV	Energy per unit volume due to viscous damping.
FCMX[a][d]	LAY	Layer number where the maximum of all active failure criteria over the entire element occurs.
	FC	Number of the maximum-failure criterion over the entire element: 1 - EMAX 2 - SMAX 3 - TWSI

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels ETABLE (p. 687), *Lab, Item, Comp*		
Item	**Comp**	**Description**
		4 - TWSR 5 - PFIB 6 - PMAT 7 - HFIB 8 - HMAT 9 - L3FB 10 - L3MT 11 - L4FB 12 - L4MT 13~21 - USR1~USR9
	VAL	Value of the maximum failure criterion over the entire element.
TG[h]	X, Y, Z, SUM	Component thermal gradient or vector sum.
TF[h]	X, Y, Z, SUM	Component thermal flux or vector sum.
PG	X, Y, Z, SUM	Component pressure gradient or vector sum.
EF	X, Y, Z, SUM	Component electric field or vector sum.
D	X, Y, Z, SUM	Component electric flux density or vector sum.
H	X, Y, Z, SUM	Component magnetic field intensity or vector sum.
B	X, Y, Z, SUM	Component magnetic flux density or vector sum.
CG	X, Y, Z, SUM	Component concentration gradient or vector sum.
DF	X, Y, Z, SUM	Component diffusion flux density or vector sum.
FMAG[f]	X, Y, Z, SUM	Component electromagnetic forces or vector sum.
SERR[e]		Structural error energy.
SDSG[e]		Absolute value of maximum variation of any nodal stress component.
TERR[e]		Thermal error energy.
TDSG[e]		Absolute value of the maximum variation of any nodal thermal gradient component.
F	X, Y, Z	Component structural force. Sum of element nodal values.
M	X, Y, Z	Component structural moment. Sum of element nodal values.
HEAT		Heat flow. Sum of element nodal values.
FLOW		Fluid flow. Sum of element nodal values.
AMPS		Current flow. Sum of element nodal values.
FLUX		Magnetic flux. Sum of element nodal values.
CSG	X, Y, Z	Component magnetic current segment.
RATE		Diffusion flow rate. Sum of element nodal values.
SENE		"Stiffness" energy or thermal heat dissipation (applies to all elements where meaningful). Same as TENE.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels ETABLE (p. 687), *Lab, Item, Comp*		
Item	**Comp**	**Description**
AENE		Artificial energy of the element. This includes the sum of hourglass control energy and energy generated by in-plane drilling stiffness from shell elements (applies to all elements where meaningful). It also includes artificial energy due to contact stabilization. The energy is used for comparisons to SENE energy to predict the solution error due to artificial stiffness.
TENE		Thermal heat dissipation or "stiffness" energy (applies to all elements where meaningful). Same as SENE.
KENE		Kinetic energy (applies to all elements where meaningful).
ASENE		Amplitude "stiffness" energy.
PSENE		Peak "stiffness" energy.
AKENE		Amplitude kinetic energy.
PKENE		Peak kinetic energy.
DENE		Damping energy.
WEXT[i]		Work due to external load.
STEN		Elemental energy dissipation due to stabilization.
JHEAT		Element Joule heat generation.
JS	X, Y, Z, SUM	Source current density for low-frequency magnetic analyses. Total current density (sum of conduction and displacement current densities) in low frequency electric analyses. Components (X, Y, Z) and vector sum (SUM).
JT	X, Y, Z, SUM	Total measureable current density in low-frequency electromagnetic analyses. (Conduction current density in a low-frequency electric analysis.) Components (X, Y, Z) and vector sum (SUM).
JC	X, Y, Z, SUM	Conduction current density for elements that support conduction current calculation. Components (X, Y, Z) and vector sum (SUM).
MRE		Magnetics Reynolds number.
VOLU		Element volume. Based on unit thickness for 2D plane elements (unless the thickness option is used) and on the full 360 degrees for 2D axisymmetric elements.
CENT	X, Y, Z	Undeformed X, Y, or Z location (based on shape function) of the element centroid in the active coordinate system.
BFE[b]	TEMP	Body temperatures (calculated from applied temperatures) as used in solution (area and volume elements only).
SMISC	*snum*	Element summable miscellaneous data value at sequence number *snum* (shown in the Output Data section of each applicable element description).
NMISC	*snum*	Element non-summable miscellaneous data value at sequence number *snum* (shown in the Output Data section of each applicable element description).
SURF	*snum*	Element surface data value at sequence number *snum*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels ETABLE (p. 687), *Lab, Item, Comp*		
Item	**Comp**	**Description**
CONT	STAT[d]	Contact status: 3 = closed and sticking 2 = closed and sliding 1 = open but near contact 0 = open and not near contact
	PENE	Contact penetration (zero or positive).
	PRES	Contact pressure.
	SFRIC	Contact friction stress.
	STOT	Contact total stress (pressure plus friction).
	SLIDE	Contact sliding distance.
	GAP	Contact gap distance (0 or negative).
	FLUX	Total heat flux at contact surface.
	CNOS	Total number of contact status changes during substep.
	FPRS	Fluid penetration pressure.
TOPO		Densities used for topological optimization.
CAP	C0,X0,K0,ZONE, DPLS,VPLS	Material cap plasticity model only: Cohesion; hydrostatic compaction yielding stress; I1 at the transition point at which the shear and compaction envelopes intersect; zone = 0: elastic state, zone = 1: compaction zone, zone = 2: shear zone, zone = 3: expansion zone; effective deviatoric plastic strain; volume plastic strain.
EDPC	CSIG,CSTR	Material EDP creep model only (not including the cap model): Equivalent creep stress; equivalent creep strain.
ESIG[b]	X,Y,Z,XY,YZ,ZX	Components of Biot's effective stress.
	1, 2, 3	Principal stresses of Biot's effective stress.
	INT	Stress intensity of Biot's effective stress.
	EQV	Equivalent stress of Biot's effective stress.
DPAR	TPOR	Total porosity (Gurson material model).
	GPOR	Porosity due to void growth.
	NPOR	Porosity due to void nucleation.
FFLX	X,Y,Z	Fluid flow flux in poromechanics.
FGRA	X,Y,Z	Fluid pore pressure gradient in poromechanics.
FICT[b]	TEMP	Fictive temperature.
PMSV	VRAT, PPRE, DSAT, RPER	Void volume ratio, pore pressure, degree of saturation, and relative permeability for coupled pore-pressure-thermal elements.
YSIDX	TENS,SHEA	Yield surface activity status for Mohr-Coulomb, soil, concrete, and joint rock material models: 1 = yielded, 0 = not yielded.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels ETABLE (p. 687), *Lab, Item, Comp*		
Item	**Comp**	**Description**
FPIDX	TF01,SF01, TF02,SF02, TF03,SF03, TF04,SF04	Failure plane surface activity status for concrete and joint rock material models: 1 = yielded, 0 = not yielded. Tension and shear failure status are available for all four sets of failure planes.
NS	X, Y, Z, XY, YZ, XZ	Nominal strain for hyperelastic material, reported in the current configuration (unaffected by **RSYS (p. 1639)**).
MPLA	DMAC, DMAX	Microplane damage, macroscopic and maximum values.
MPDP	TOTA, TENS, COMP, RW	Microplane homogenized total, tension, and compression damages (TOTA, TENS, COMP), and split weight factor (RW).
DAMAGE	1,2,3,MAX	Damage in directions 1, 2, 3 (1, 2, 3) and the maximum damage (MAX).
GDMG		Damage
IDIS		Structural-thermal dissipation rate
BKS	X, Y, Z, XY, YZ, XZ	Total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements.
BKS1, . . . , BKS5	X, Y, Z, XY, YZ, XZ	Superimposed components of the total nonlinear kinematic backstress reported in the current configuration (unaffected by **RSYS (p. 1639)**). Available for 3D, plane strain, and axisymmetric elements when more than one superimposed back-stress component is defined.
EPFR		Free strain in porous media
FC1S	1,2,3,4,5,6	First set of six components of FCC crystal slip. Available for 3D elements only.
FC2S	1,2,3,4,5,6	Second set of six components of FCC crystal slip. Available for 3D elements only.
HC1S	1,2,3,4,5,6	Six components of HCP crystal slip on basal and prismatic systems. Available for 3D elements only.
HC2S	1,2,3,4,5,6	Six components of HCP crystal slip on pyramidal system. Available for 3D elements only.
HC3S	1,2,3,4,5,6	First set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC4S	1,2,3,4,5,6	Second set of six components of HCP crystal slip on the first-order pyramidal system. Available for 3D elements only.
HC5S	1,2,3,4,5,6	Six components of HCP crystal slip on the second-order pyramidal system. Available for 3D elements only.
BC1S	1,2,3,4,5,6	First set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC2S	1,2,3,4,5,6	Second set of six components of BCC slip on 111 plane. Available for 3D elements only.
BC3S	1,2,3,4,5,6	First set of six components of BCC slip on 112 plane. Available for 3D elements only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels ETABLE (p. 687), *Lab, Item, Comp*		
Item	**Comp**	**Description**
BC4S	1,2,3,4,5,6	Second set of six components of BCC slip on 112 plane. Available for 3D elements only.
BC5S	1,2,3,4,5,6	First set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC6S	1,2,3,4,5,6	Second set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC7S	1,2,3,4,5,6	Third set of six components of BCC slip on 123 plane. Available for 3D elements only.
BC8S	1,2,3,4,5,6	Fourth set of six components of BCC slip on 123 plane. Available for 3D elements only.
FC1H	1,2,3,4,5,6	First set of six components of FCC crystal hardness. Available for 3D elements only.
FC2H	1,2,3,4,5,6	Second set of six components of FCC crystal hardness. Available for 3D elements only.
HC1H	1,2,3,4,5,6	Sixcomponents of HCP crystal hardness on basal and prismatic systems. Available for 3D elements.
HC2H	1,2,3,4,5,6	Six components of HCP crystal hardness on pyramidal system. Available for 3D elements only.
HC3H	1,2,3,4,5,6	First set of six components of HCP crystal hardness on the first-order pyramidal system. Available for 3D elements only.
HC4H	1,2,3,4,5,6	Second set of six components of HCP crystal hardness on the first-order pyramidal system. Available for 3D elements only.
HC5H	1,2,3,4,5,6	Six components of HCP crystal hardness on the second-order pyramidal system. Available for 3D elements only.
BC1H	1,2,3,4,5,6	First set of six components of BCC hardness on 111 plane. Available for 3D elements only.
BC2H	1,2,3,4,5,6	Second set of six components of BCC hardness on 111 plane. Available for 3D elements only.
BC3H	1,2,3,4,5,6	First set of six components of BCC hardness on 112 plane. Available for 3D elements only.
BC4H	1,2,3,4,5,6	Second set of six components of BCC hardness on 112 plane. Available for 3D elements only.
BC5H	1,2,3,4,5,6	First set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC6H	1,2,3,4,5,6	Second set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC7H	1,2,3,4,5,6	Third set of six components of BCC hardness on 123 plane. Available for 3D elements only.
BC8H	1,2,3,4,5,6	Fourth set of six components of BCC hardness on 123 plane. Available for 3D elements only.
XELG	1,2,3,45,6,EQV	Crystal Lagrangian strain in 11, 22, 33, 12, 23,13 directions and its equivalent. Available for 3D elements only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Item and Component Labels ETABLE (p. 687), *Lab, Item, Comp*		
Item	**Comp**	**Description**
SINT	RHO, ETA, SSTR, GRAIN	Sintering relative density, viscosity, sintering stress, and average grain size values.

[a] For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use labels TBOT, TE2, TE3, . . ., TTOP instead of TEMP.

[b] Element table option (*Option*) is available for this element output data item.

[c] The results for this postprocessing SEND component are invalid for ELBOW290 when that element is used with viscoelastic or viscohyperelastic materials.

[d] For MPC-based contact definitions, the value of STAT can be negative. This indicates that one or more contact constraints were intentionally removed to prevent overconstraint. STAT = -3 is used for MPC bonded contact; STAT = -2 is used for MPC no-separation contact.

[e] Some element- and material-type limitations apply. For more information, see **PRERR (p. 1480)**.

[f] When using the **EMFT (p. 624)** procedure to calculate electromagnetic force (PLANE121, SOLID122, SOLID123, PLANE233, SOLID236 or SOLID237 elements only), the FMAG sum will be zero or near zero.

[g] Failure criteria are based on the effective stresses in the damaged material.

[h] *Comp* = SUM is not supported for coupled pore-pressure-thermal (CPT*nnn*) elements.

[i] WEXT is calculated for element-based loading only (and not for nodal-force loading). WEXT is stored on elements to which loading has been applied; if surface elements are added on top of other elements, for example, and pressure loading is applied to the surface elements, WEXT is available for the surface elements only.

Table 114: ETABLE - Selected Result (SRES) Component Labels

ETABLE (p. 687),*Lab*,SRES,*Comp*	
Comp	**Description**
SVAR*n*	The *n*th state variable.
FLDUF0*n*	The *n*th user-defined field variable.
ItemComp (concatenated *Item* + *Comp* label) from Table 208: OSRESULT - Item and Component Labels (p. 1328)[a]	See the table (p. 1328) for the combined item and component description.

[a] See Example 10: Specifying and Retrieving Selected Result Output (p. 1329).

Main Menu>General Postproc>Element Table>Erase Table

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ETCHG, *Cnv*

Changes element types to their corresponding types.

PREP7 (p. 22): Element Type (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Cnv

Converts the element types to the corresponding type. Valid labels are:

TTS

Thermal to Structural

STT

Structural to Thermal

MTT

Magnetic to Thermal

FTS

Fluid to Structural

ETS

Electrostatic to Structural

ETT

Electrical to Thermal

Notes

Changes the currently defined element types to their corresponding types. Elements without a companion element (listed above) are not switched and should be switched with the **ET (p. 686)** command to an appropriate element type or to a null element. The KEYOPT values for the switched element types are reset to zero or to their default values. You must check these values to see if they are still meaningful. Additionally, if *Cnv* = ETI, ITE, or TTE, all real constants are set to zero.

If *Cnv* = ITE, you will need to choose a material model that corresponds to your previously-defined material properties. If working interactively, the application prompts you to do so.

Element Pairs

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ETCONTROL, *Eltech*, *Eldegene*

Control the element technologies used in element formulation (for applicable elements).

PREP7 (p. 22): Element Type (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Eltech

Element technology control:

SUGGESTION

The program offers a suggestion for the best element technology before solving. If necessary, mixed u-P (KEYOPT(6)) is also included and reset. This behavior is the default.

SET

The program informs you of the best settings and resets any applicable KEYOPT settings automatically. This action overrides any previous manual settings.

OFF

Deactivates automatic selection of element technology. No suggestions are issued, and no automatic resetting occurs.

Eldegene

Element degenerated shape control:

ON

If element shapes are degenerated, the degenerated shape function is employed and enhanced strain, simplified enhanced strain, and B-bar formulations are turned off (default).

OFF

If element shapes are degenerated, regular shape functions are still used, and the specified element technologies (for example, enhanced strain, B-bar, uniform reduced integration) are still used.

Command Default

The program makes suggestions for the best element technology by default (**ETCONTROL (p. 701)**,SUGGESTION,ON).

Notes

This command is valid for elements SHELL181, PLANE182, PLANE183, SOLID185, SOLID186, SOLID187, BEAM188, BEAM189, SHELL208, SHELL209, PLANE222, PLANE223, SOLID225, SOLID226, SOLID227, REINF264, SOLID272, SOLID273, SHELL281, SOLID285, PIPE288, PIPE289, ELBOW290.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For more information, see Automatic Selection of Element Technologies and Formulations in the *Element Reference*.

Menu Paths

Main Menu>Preprocessor>Element Type>Elem Tech Control

ETDELE, *ITYP1*, *ITYP2*, *INC*

Deletes element types.

PREP7 (p. 22): Element Type (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITYP1*, *ITYP2*, *INC

Deletes element types from *ITYP1* to *ITYP2* (defaults to *ITYP1*) in steps of *INC* (defaults to 1). If *ITYP1* = ALL, *ITYP2* and *INC* are ignored and all element types are deleted. Element types are defined with the **ET (p. 686)** command.

Menu Paths

Main Menu>Preprocessor>Element Type>Add/Edit/Delete

ETLIST, *ITYP1*, *ITYP2*, *INC*

Lists currently defined element types.

PREP7 (p. 22): Element Type (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITYP1*, *ITYP2*, *INC

Lists element types from *ITYP1* to *ITYP2* (defaults to *ITYP1*) in steps of *INC* (defaults to 1). If *ITYP1* = ALL (default), *ITYP2* and *INC* are ignored and all element types are listed.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>List>Properties>Element Types

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ETYPE

Specifies "Element types" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Element Types

EUSORT

Restores original order of the element table.

POST1 (p. 51): Element Table (p. 52)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Changing the selected element set (**ESEL (p. 661)**) also restores the original element order.

Menu Paths

Main Menu>General Postproc>List Results>Sorted Listing>Unsort Elems

EWRITE, *Fname*, *Ext*, --, *KAPPND*, *Format*

Writes elements to a file.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (up to 248 characters, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to ELEM if *Fname* is blank.

--

Unused field.

KAPPND

Append key:

0

Rewind file before the write operation.

1

Append data to the end of the existing file.

Format

Format key:

SHORT

I6 format (default).

LONG

I8 format. Switches automatically to I10 if entity IDs are large.

Notes

Writes the selected elements to a file. The write operation is unnecessary in a standard Mechanical APDL run but is provided as convenience to users wanting a coded element file.

If issuing **EWRITE (p. 703)** from Mechanical APDL to be used in Mechanical APDL, issue **NWRITE (p. 1305)** to store nodal information for later use.

Only elements having all of their nodes defined (and selected) are written. Data are written in a coded format. The data description of each record is: I, J, K, L, M, N, O, P, MAT, TYPE, REAL, SECNUM, ESYS, IEL, where MAT, TYPE, REAL, and ESYS are attribute numbers, SECNUM is the beam section number, and IEL is the element number.

The format is (14I6) if *Format* = SHORT, and (14I8 or 14I10) if *Format* = LONG.

One element description per record is written for elements having <= 8 nodes. For elements having > 8 nodes, nodes 9 and above are written on a second record using the same format.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Elements>Write Elem File

---

EXBOPT,*OUTINV2*,*OUTTCMS*,*OUTSUB*,*OUTCMS*,*OUTCOMP*,*OUTRM*,*NOINV*,*OUTELE*

Specifies *.exb* file output options in a CMS generation pass.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

OUTINV2

Output control for 2nd order invariant:

0

Do not output (default).

1

Output the second order invariant.

OUTTCMS

Output control for `.tcms` file:

0

Do not output (default).

1

Output the `.tcms` file.

OUTSUB

Output control for `.sub` file:

0

Do not output (default).

1

Output the `.sub` file.

OUTCMS

Output control for `.cms` file:

0

Do not output (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Output the `.cms` file.

OUTCOMP

Output control for node and element component information:

0

Do not output any component information.

1

Output node component information only.

2

Output element component information only.

3

Output both node and element component information (default).

OUTRM

Output control for the recovery matrix:

0

Do not output (default).

1

Output the recovery matrix to `file.exb`.

2

Output the recovery matrix to a separate file, `file_RECOVER.exb`.

NOINV

Invariant calculation:

0

Calculate all invariants (default).

1

Suppress calculation of the 1st and 2nd order invariants. NOINV = 1 suppresses OUTINV2 = 1.

OUTELE

Output control for the element data:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Do not output (default).

1

Output the element data.

Command Default

Default settings as described for each argument are used.

Notes

When the body property file (`file.exb`) is requested in a CMS generation pass (**CMSOPT (p. 378)**,,,,,,EXB command), the `.tcms`, `.sub`, and `.cms` files are not output by default. Use the **EXBOPT (p. 705)** command to request these files, as needed.

EXBOPT (p. 705) can also be used to manage some content in the `.exb` file for improving performance and storage (see the *OUTINV2*, *OUTCOMP*, *OUTRM*, *NOINV*, and *OUTELE* arguments described above).

If both recovery matrix output (*OUTRM* = 1 or 2) and the `.tcms` file (*OUTTCMS* = 1) are requested, the `.tcms` file writing is turned off due to potentially large in-core memory use.

For more information on how to generate `file.exb`, see Ansys Interface to AVL EXCITE in the *Substructuring Analysis Guide*

Menu Paths

This command cannot be accessed from a menu.

---

*EXIT

Exits a do-loop.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

The command following the ***ENDDO (p. 636)** is executed next. The exit option may also be conditional [Use the ***IF (p. 927)**]. The ***EXIT (p. 707)** command must appear on the same file as the ***DO (p. 567)** command.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/EXIT,*Slab*,*Fname*,*Ext*,--

Stops the run and returns control to the system.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Slab

Mode for saving the database:

MODEL

Save the model data (solid model, finite element model, loadings, etc.) only (default).

SOLU

Save the model data and the solution data (nodal and element results).

ALL

Save the model data, solution data and post data (element tables, path results, etc.)

NOSAVE

Do not save any data on File.db (an existing DB file will not be overwritten).

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name, defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to DB if *Fname* is blank.

--

Unused field.

Notes

The current database information may be written on File.db or a named file. If File.db already exists, a backup file (File.dbb) will also be written whenever a new File.db is written.

This command is valid in any processor. Issuing this command at any point will exit the program.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>File>Exit

EXOPTION, *Ldtype*, *Option*, *VALUE*

Specifies the EXPROFILE (p. 719) options for the Mechanical APDL to Ansys CFX or Ansys Fluent profile file transfer.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ldtype

Load type:

SURF

Surface load

VOLU

Volume load

Option

Surface options:

Precision

Number of significant digits for the fractional part of real data

Connectivity

Key to include face connectivity in the exported profile file

Volume options:

Precision

Number of significant digits after the decimal for real data

VALUE

Specify the value for either Precision or Connectivity.

For Precision, specify the number of significant digits. Can be any value between 1 to 20, default 8. When 0 or an invalid value is specified, the program will use the default value of 8 and issue a warning message.

For Connectivity, specify the key to include the element face connectivity data for surface loads (does not support volume loads):

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

Do not include the connectivity data in the exported file (default)

ON

Include the connectivity data in the exported file

Menu Paths

This command cannot be accessed from a menu.

EXP,*IR*,*IA*,--,--,*Name*,--,--,*FACTA*,*FACTB*

Forms the exponential of a variable.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to NV (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA

Reference number of the variable to be operated on.

--,--

Unused fields.

Name

Thirty-two character name for identifying the variable on the printout and displays. Embedded blanks are compressed upon output.

--,--

Unused fields.

FACTA

Scaling factor applied to variable *IA* (defaults to 1.0).

FACTB

Scaling factor (positive or negative) applied to the operation (defaults to 1.0).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Forms the exponential of a variable according to the operation:

IR = *FACTB**EXP(*FACTA* x *IA*)

Main Menu>TimeHist Postpro>Math Operations>Exponentiate

EXPAND,*Nrepeat*,MODAL,*HIndex*,*Icsys*,*SctAng*,*--*,*Phase*

Displays the results of a modal cyclic symmetry analysis.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Nrepeat

Number of sector repetitions for expansion. The default is 0 (no expansion).

MODAL

Specifies that the expansion is for a modal cyclic symmetry analysis.

HIndex

The harmonic index ID for the results to expand.

Icsys

The coordinate system number used in the modal cyclic symmetry solution. The default is the global cylindrical coordinate system (specified via the **CSYS (p. 441)** command where *KCN* = 1).

SctAng

The sector angle in degrees, equal to 360 divided by the number of cyclic sectors.

--

This field is reserved for future use.

Phase

The phase angle in degrees to use for the expansion. The default is 0. Typically, the value is the peak displacement (or stress/strain) phase angle obtained via the **CYCPHASE (p. 472)** command.

Notes

Issue this command to display the results of a modal cyclic symmetry analysis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When you issue the **EXPAND (p. 711)**,*Nrepeat* command, subsequent **SET (p. 1724)** commands read data from the results file and expand them to *Nrepeat* sectors. As long as no entities have been modified, this expansion can be negated (that is, reverted to single sector) by issuing **EXPAND (p. 711)** with no arguments. If you modify entities and wish to return to the partial model, use the Session Editor (see Restoring Database Contents in the *Operations Guide*).

EXPAND (p. 711) displays the results and allows you to print them, as if for a full model. The harmonic index (automatically retrieved from the results file) appears in the legend column.

When plotting or printing element strain energy (SENE), the **EXPAND (p. 711)** command works with brick or tet models only. Element kinetic energy (KENE) plotting or printing is not supported.

EXPAND (p. 711) is a specification command valid only in POST1. It is significantly different from the **/CYCEXPAND (p. 454)** command in several respects, (although you can use either command to display the results of a modal cyclic symmetry analysis):

- **EXPAND (p. 711)** has none of the limitations of the **/CYCEXPAND (p. 454)** command.
- **EXPAND (p. 711)** changes the database by modifying the geometry, the nodal displacements, and element stresses as they are read from the results file, whereas the **/CYCEXPAND (p. 454)** command does not change the database.

Caution:

The **EXPAND (p. 711)** command creates new nodes and elements; therefore, saving (or issuing the **/EXIT (p. 708)**, ALL command) after issuing the **EXPAND (p. 711)** command can result in large databases.

Menu Paths

Main Menu>General Postproc>Cyc Expansion

/**EXPAND**,*Nrepeat1*,*Type1*,*Method1*,*DX1*,*DY1*,*DZ1*,*Nrepeat2*,*Type2*,*Method2*,*DX2*,*DY2*,*DZ2*,*Nrepeat3*,*Type3*,*Method3*,*DX3*,*DY3*,*DZ3*

Allows the creation of a larger graphic display than represented by the actual finite element analysis model.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Nrepeat1, Nrepeat2, Nrepeat3

The number of repetitions required for the element pattern. The default is 0 (no expansion).

Type1, Type2, Type3

The type of expansion requested.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RECT

Causes a Cartesian transformation of DX, DY, and DZ for each pattern (default).

POLAR

Causes a polar transformation of DR, D-Theta and DZ for each pattern.

AXIS

Causes 2D axisymmetric expansion (that is, rotates a 2D model created in the X-Y plane about the Y axis to create a 3D model).

LRECT

Causes a Cartesian transformation of DX, DY, and DZ for each pattern about the current local coordinate system (specified via the **CSYS (p. 441)** command).

LPOLAR

Causes a polar transformation of DR, D-Theta, and DZ for each pattern about the local coordinate system (specified via the **CSYS (p. 441)** command).

Method1*, *Method2*, *Method3

The method by which the pattern is repeated.

FULL

Causes a normal repeat of the pattern (default).

HALF

Uses a symmetry transformation for alternate repeats (to produce an image of a complete circular gear from the image of half a tooth, for example).

DX1*, *DY1*, *DZ1*, *DX2*, *DY2*, *DZ2*, *DX3*, *DY3*, *DZ3

The Cartesian or polar increments between the repeated patterns. Also determines the reflection plane. Reflection is about the plane defined by the normal vector (DX, DY, DZ). If you want no translation, specify a small nonzero value. For a half-image expansion, the increment DX, DY, or DZ is doubled so that POLAR,HALF, ,45 produces full images on 90° centers, and RECT,HALF, ,1 produces full images on 2-meter centers.

Notes

You can use the **/EXPAND (p. 712)** command to perform up to three symmetry expansions at once (that is, X, Y, and Z which is equal to going from a 1/8 model to a full model). Polar expansions allow you to expand a wheel section into a half wheel, then into the half section, and then into the whole.

The command displays elements/results when you issue the **EPLOT (p. 648)** command or postprocessing commands.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The command works on all element and result displays, except as noted below. As the graphic display is created, the elements (and results) are repeated as many times as necessary, expanding the geometry and, if necessary, the displacements and stresses.

Derived results are not supported.

The **/EXPAND (p. 712)** command has the following limitations:

- It does not support solid model entities.
- POLAR, FULL or HALF operations are meaningful only in global cylindrical systems and are unaffected by the **RSYS (p. 1639)** or **DSYS (p. 582)** commands. Cartesian symmetry or unsymmetric operations also occur about the global Cartesian system.
- It does not average nodal results across sector boundaries, even for averaged plots (such as those obtained via the **PLNSOL (p. 1425)** command).
- Axisymmetric harmonic element results are not supported for *Type* = AXIS.

The **/EXPAND (p. 712)** command differs significantly from the **EXPAND (p. 711)** command in several respects:

- The uses of **/EXPAND (p. 712)** are of a more general nature, whereas the **EXPAND (p. 711)** command is intended *primarily* to expand modal cyclic symmetry results.
- **/EXPAND (p. 712)** does not change the database as does the **EXPAND (p. 711)** command.
- You cannot print results displayed via **/EXPAND (p. 712)**.

Menu Paths

Utility Menu>PlotCtrls>Style>Symmetry Expansion>

Utility Menu>PlotCtrls>Style>Symmetry Expansion>Periodic/Cyclic Symmetry Expansion

---

EXPASS,*Key*,--,--,*KeyStat*

Specifies an expansion pass of an analysis.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Expansion pass key:

OFF

No expansion pass will be performed (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON

An expansion pass will be performed.

- - , - -

Unused fields.

KeyStat

Static correction vectors key:

ON

Include static correction vectors in the expanded displacements (default).

OFF

Do not include static correction vectors in the expanded displacements.

Notes

Specifies that an expansion pass of a modal, substructure, buckling, transient, or harmonic analysis is to be performed.

Note:

This separate solution pass requires an explicit **FINISH (p. 758)** from the preceding analysis and reentry into SOLUTION.

The *KeyStat* argument is applicable to the expansion pass of a substructure analysis, and to the expansion pass of a component mode synthesis (CMS) analysis when the CMS method is fixed-interface or free-interface. For a substructure analysis, the static correction vectors are the first terms of Equation 15.134 in the *Mechanical APDL Theory Reference*. For a CMS analysis, the static correction vectors are the third terms of Equation 15.158.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>ExpansionPass

Main Menu>Solution>Analysis Type>ExpansionPass

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*EXPORT,*Matrix*,*Format*,*Fname*,*Val1*,*Val2*,*Val3*

Exports a matrix to a file in the specified format.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Matrix

Name of the matrix to export (must be a matrix previously created with ***DMAT (p. 551)** or ***SMAT (p. 1801)**, or a vector previously created with ***VEC (p. 2085)**).

Format

Format of the output file:

MMF --

Export the matrix in the Matrix Market Format.

SUB --

Export the matrix in the SUB file format.

HBMAT --

Export the matrix in the Harwell-Boeing file format.

MAT --

Export the matrix in a native format, to be re-imported using the ***DMAT (p. 551)** or ***SMAT (p. 1801)** command.

EMAT --

Export the matrix to an existing EMAT file.

APDL --

Export the matrix to an APDL array parameter.

PS --

Export the matrix profile to a Postscript file.

DMIG --

Export the matrix in the DMIG file format.

CSV --

Export the matrix to an ASCII CSV (comma-separated values) file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Fname

Name of the file (case-sensitive, 32-character maximum), or name of the array parameter if *Format* = APDL (no default).

Val1, *Val2*, *Val3*

Additional input. The meaning of *Val1* through *Val3* will vary depending on the specified *Format*. See table below for details.

Additional input for *Format* = SUB, HBMAT, EMAT, APDL, PS, DMIG, and CSV				
Format	***Val1***	***Val2***	***Val3***	**Description**
SUB	Matrix type: STIFF - Stiffness (or conductivity) matrix MASS - Mass (or specific heat) matrix DAMP - Damping matrix RHS - Load vector	Matrix containing the row information (see Notes (p. 718)). Not needed if the matrix was imported from an existing SUB or DMIG file.	WAIT DONE	Identify matrix type to write and specify when to perform the export (see Notes (p. 718)).
HBMAT	File format: ASCII BINARY	Matrix type (optional; see Notes (p. 718)): STIFF - Stiffness matrix MASS - Mass matrix DAMP - Damping matrix	(not used)	Identify the output format and matrix type to write (see Notes (p. 718)).
EMAT	Matrix type: STIFF - Stiffness (or conductivity) matrix MASS - Mass (or specific heat) matrix DAMP - Damping matrix	Element number	(not used)	Identify the matrix type and the element number.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	STRESS - Stress-stiffness matrix			
APDL	First column	Last column	(not used)	Block of columns to export.
PS	Color key: BW - black and white (default) COLOR - color	(not used)	(not used)	Identify the output format.
DMIG	Matrix containing the row information (see Notes (p. 718)). Not needed if the matrix was imported from an existing SUB or DMIG file.	File format: FREE - Free field format LARGE - Large field format (default)	(not used)	The row information vector specifies the mapping between row number, node, and DOF number.
CSV	Number of decimal places (default = 10)	Delimiter character (default=','). Use 'S' for space, 'T' for tab delimiter.	(not used)	Identify the accuracy and formatting.

Notes

Only sparse matrices can be exported to Postscript files. This option plots the matrix profile as a series of dots.

If you want to create a `.sub` file from several matrices, you need to set *Val3* = WAIT for all matrices but the last, and *Val3* = DONE for the last one. The export will be effective at the last ***EXPORT (p. 716)** command.

To create a `.sub` file or `.dmig` file from scratch, you must supply the row information array. (Specify this array in the *Val2* field for `.sub` or in the *Val1* field for `.dmig`.) This must be an *m* x 2 array, where *m* is the size of the matrix. The first column is the node number and the second column is the DOF number corresponding to each row of the matrix.

When exporting an HBMAT file in ASCII format, you can include the matrix type in the header of the file by specifying the matrix type in the *Val2* field. The matrix type is not included in the header if *Val2* is empty. If *Val1* = BINARY, *Val2* is not used.

The ***EXPORT (p. 716)** command is not applicable to sparse matrices initialized from `.full` files by means of the NOD2SOLV option on the ***SMAT (p. 1801)** command (that is, ***SMAT (p. 1801)**,,,IMPORT,FULL,,NOD2SOLV).

The `.csv` file format does not support sparse matrices.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

EXPROFILE, *Ldtype*, *Load*, *VALUE*, *Pname*, *Fname*, *Fext*, *Fdir*

Exports Mechanical APDL interface data on selected nodes to an Ansys CFX or Ansys Fluent Profile file.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ldtype

Load type:

SURF

Surface load.

VOLU

Volumetric load.

Load

Surface loads:

DISP

Displacement (in a static analysis) or mode shape and global parameters (in a modal analysis).

MODE

Normalized mode shape and global parameters (in a modal analysis only).

TEMP

Temperature.

HFLU

Heat flux.

Volumetric loads:

DISP

Displacement.

FORC

Force.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HGEN

Heat generation.

VALUE

If a positive integer, specifies the number of the surface or volume interface. If zero (default), the selected nodes or Named Selection are used.

Pname

Field name in CFX Profile file (32-character maximum). Defaults to `jobname_bcploadnumber` for a surface load and `jobname_subdloadnumber` for volumetric load.

Fname

The CFX Profile filename (248-character maximum). Defaults to `jobname_bcploadnumber` for a surface load and `jobname_subdloadnumber` for a volumetric load.

Fext

The Profile file extension (8-character maximum). Defaults to `.csv`.

Fdir

The Profile file directory (248-character maximum). Defaults to current directory.

Notes

By default, the **EXPROFILE (p. 719)** command assumes the data it writes to the Profile file are in SI units. For models not described in SI units, issue the **EXUNIT (p. 725)** command as needed to write the correct unit labels on the Profile file.

For a modal analysis, if *Load* = DISP or MODE, global parameters including mass, frequency, and maximum displacement are also written to the Ansys CFX Profile file. You should therefore issue the **EXUNIT (p. 725)** command for DISP, TIME, and MASS.

Verify that the coordinate system is set to the global Cartesian (**RSYS (p. 1639)**,0) before using this command.

To transfer multiple loads across an interface, specify a unique file name and extension for each load.

Force (FORC) and heat generation (HGEN) are per-unit volume.

For modal analysis, this command will write global parameters including mass, frequency, and maximum displacement to the profile file. If using cyclic symmetry analysis, this command will also write harmonic indices to the profile file.

For modal analysis, this command does not support the following mode-extraction methods (**MODOPT (p. 1140)**): unsymmetric matrix (UNSYM), the damped system (DAMP), or the QR-damped system (QRDAMP).

To write the normalized (instead of non-normalized) mode shapes from a modal analysis to the file:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Use *Load* = MODE.
- Verify that the mode shapes are normalized to the mass matrix (**MODOPT (p. 1140)**,,,,,,OFF), the default behavior.
- Verify that the scale factor is set to 1.0 (**SET (p. 1724)**,,,1.0), the default value.

The nodes and underlying elements must be selected in order to be exported. See The Unidirectional Load-Transfer Method: Mechanical APDL to CFX for details.

For loads not specified directly via commands (such as **SF (p. 1733)** and **BF (p. 221)**), loads must first be read into the database (**SET (p. 1724)** or **LCASE (p. 1019)**).

Menu Paths

This command cannot be accessed from a menu.

EXPSOL, *LSTEP*, *SBSTEP*, *TIMFRQ*, *Elcalc*

Specifies the solution to be expanded for mode-superposition analyses or substructure analyses.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LSTEP, SBSTEP

Expand the solution identified as load step *LSTEP* and substep *SBSTEP*.

TIMFRQ

As an alternative to *LSTEP* and *SBSTEP*, expand the solution at, or nearest to, the time value *TIMFRQ* (for **ANTYPE (p. 162)**,TRANS or **ANTYPE (p. 162)**,SUBSTR) or frequency value *TIMFRQ* (for **ANTYPE (p. 162)**,HARMIC). *LSTEP* and *SBSTEP* should be blank.

Elcalc

Element calculation key:

YES

Calculate element results, nodal loads, and reaction loads.

NO

Do not calculate these items.

Notes

Specifies the solution to be expanded from analyses that use the mode-superposition method (**ANTYPE (p. 162)**,HARMIC or TRANS) or substructuring (**ANTYPE (p. 162)**,SUBSTR). Use the **NUMEXP (p. 1293)** command to expand a group of solutions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The resulting results file will maintain the same load step, substep, and time (or frequency) values as the requested solution to be expanded.

This command is also valid in PREP7.

---

EXTOPT, *Lab*, *Val1*, *Val2*, *Val3*, *Val4*

Controls options relating to the generation of volume elements from area elements.

PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Label identifying the control option. The meanings of *Val1*, *Val2*, and *Val3* will vary depending on *Lab*.

ON

Sets carryover of the material attributes, real constant attributes, and element coordinate system attributes of the pattern area elements to the generated volume elements. Sets the pattern area mesh to clear when volume generations are done. *Val1*, *Val2*, and *Val3* are ignored.

OFF

Removes all settings associated with this command. *Val1*, *Val2*, and *Val3* are ignored.

STAT

Shows all settings associated with this command. *Val1*, *Val2*, *Val3*, and *Val4* are ignored.

ATTR

Sets carryover of particular pattern area attributes (materials, real constants, and element coordinate systems) of the pattern area elements to the generated volume elements. (See 2.) *Val1* can be:

0

Sets volume elements to use current **MAT (p. 1111)** command settings.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Sets volume elements to use material attributes of the pattern area elements.

Val2 can be:

0

Sets volume elements to use current **REAL (p. 1579)** command settings.

1

Sets volume elements to use real constant attributes of the pattern area elements.

Val3 can be:

0

Sets volume elements to use current **ESYS (p. 685)** command settings.

1

Sets volume elements to use element coordinate system attributes of the pattern area elements.

Val4 can be:

0

Sets volume elements to use current **SECNUM (p. 1685)** command settings.

1

Sets volume elements to use section attributes of the pattern area elements.

ESIZE

Val1 sets the number of element divisions in the direction of volume generation or volume sweep. For **VDRAG (p. 2084)** and **VSWEEP (p. 2168)**, *Val1* is overridden by the **LESIZE (p. 1041)** command *NDIV* setting. *Val2* sets the spacing ratio (bias) in the direction of volume generation or volume sweep. If positive, *Val2* is the nominal ratio of last division size to first division size (if > 1.0, sizes increase, if < 1.0, sizes decrease). If negative, *Val2* is the nominal ratio of center division(s) size to end divisions size. Ratio defaults to 1.0 (uniform spacing). *Val3* and *Val4* are ignored.

ACLEAR

Sets clearing of pattern area mesh. (See 3.) *Val1* can be:

0

Sets pattern area to remain meshed when volume generation is done.

1

Sets pattern area mesh to clear when volume generation is done. *Val2*, *Val3* , and *Val4* are ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VSWE

Indicates that volume sweeping options will be set using *Val1* and *Val2*. Settings specified with **EXTOPT (p. 722)**,VSWE will be used the next time the **VSWEEP (p. 2168)** command is invoked. If *Lab* = VSWE, *Val1* becomes a label. *Val1* can be:

AUTO

Indicates whether you will be prompted for the source and target used by **VSWEEP (p. 2168)** or if VSWE should automatically determine the source and target. If *Val1* = AUTO, *Val2* is ON by default. VSWE will automatically determine the source and target for **VSWEEP (p. 2168)**. You will be allowed to pick more than one volume for sweeping. When *Val2* = OFF, the application prompts you for the source and target for **VSWEEP (p. 2168)**. You will only be allowed to pick one volume for sweeping.

TETS

Indicates whether **VSWEEP (p. 2168)** will tet mesh non-sweepable volumes or leave them unmeshed. If *Val1* = TETS, *Val2* is OFF by default. Non-sweepable volumes will be left unmeshed. When *Val2* = ON, the non-sweepable volumes will be tet meshed if the assigned element type supports tet shaped elements.

Val3 is ignored for *Lab* = VSWE.

Val1*, *Val2*, *Val3*, *Val4

Additional input values as described under each option for *Lab*.

Notes

1. **EXTOPT (p. 722)** controls options relating to the generation of volume elements from pattern area elements using the **VEXT (p. 2091)**, **VROTAT (p. 2155)**, **VOFFST (p. 2140)**, **VDRAG (p. 2084)**, and **VSWEEP (p. 2168)** commands. (When using **VSWEEP (p. 2168)**, the pattern area is referred to as the source area.)

2. Enables carryover of the attributes of the pattern area elements to the generated volume elements when you are using **VEXT (p. 2091)**, **VROTAT (p. 2155)**, **VOFFST (p. 2140)**, or **VDRAG (p. 2084)**. (When using **VSWEEP (p. 2168)**, since the volume already exists, use the **VATT (p. 2075)** command to assign attributes before sweeping.)

3. When you are using **VEXT (p. 2091)**, **VROTAT (p. 2155)**, **VOFFST (p. 2140)**, or **VDRAG (p. 2084)**, enables clearing of the pattern area mesh when volume generations are done. (When you are using **VSWEEP (p. 2168)**, if selected, the area meshes on the pattern (source), target, and/or side areas clear when volume sweeping is done.)

4. Neither **EXTOPT (p. 722)**,VSWE,AUTO nor **EXTOPT (p. 722)**,VSWE,TETS will be affected by **EXTOPT (p. 722)**,ON or **EXTOPT (p. 722)**, OFF.

EXTREM, *NVAR1*, *NVAR2*, *NINC*

Lists the extreme values for variables.

POST26 (p. 58): Listing (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR1, NVAR2, NINC

List extremes for variables *NVAR1* through *NVAR2* in steps of *NINC*. Variable range defaults to its maximum. *NINC* defaults to 1.

Notes

Lists the extreme values (and the corresponding times) for stored and calculated variables. Extremes for stored variables are automatically listed as they are stored. Only the real part of a complex number is used. Extreme values may also be assigned to parameters (***GET (p. 797)**).

Menu Paths

Main Menu>TimeHist Postpro>List Extremes

EXUNIT, *Ldtype*, *Load*, *Untype*, *Name*

Specifies the interface data unit labels to be written to the profile file from Mechanical APDL to Ansys CFX transfer.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ldtype

Load type:

SURF

Surface load.

VOLU

Volumetric load.

Load

Surface loads:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DISP

Displacement in a static analysis. Mode shape in a modal analysis.

TIME

Time. The unit for frequency is the inverse of the unit for time.

MASS

Mass.

TEMP

Temperature.

HFLU

Heat flux.

Volumetric loads:

DISP

Displacement.

FORC

Force

HGEN

Heat generation

Untype

Unit type:

COMM

Predefined unit

USER

User-specified unit

Name

Commonly used predefined unit name or user-specified unit name.

SI

International System of units (meter-kilogram-second) (default)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FT

English System of units (feet-pound-second)

In the SI system, surface loads are in units of m for DISP, degrees K for TEMP, and W/m^2 for HFLU; volumetric loads are in units of m for DISP, N/m^3 for FORC, and W/m^3 for HGEN.

In the English system, surface loads are in units of ft for DISP, degrees F for TEMP, and $BTU/sec\text{-}ft^2$ for HFLU; volumetric loads are in units of ft for DISP, pdl/ft^3 for FORC, and $BTU/sec\text{-}ft^3$ for HGEN. A pdl is a poundal, and 32.174 pdl = 1 lbf.

Notes

This command only specifies which unit labels are to be written to the file when the **EXPROFILE (p. 719)** is issued. It does not perform unit conversions.

Menu Paths

This command cannot be accessed from a menu.

F Commands

F, *Node*, *Lab*, *VALUE*, *VALUE2*, *NEND*, *NINC*, –, –, *MESHFLAG*

Defines force loads at nodes.

SOLUTION (p. 38): FE Forces (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Node

Node at which force is to be specified. If ALL, *NEND* and *NINC* are ignored and forces are applied to all selected nodes (**NSEL (p. 1266)**). If *Node* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *Node*.

Lab

Valid force labels are:

Structural labels: FX, FY, or FZ (forces); MX, MY, or MZ (moments).

Thermal labels: HEAT, HBOT, HE2, HE3, . . ., HTOP (heat flow).

Fluid label: FLOW (fluid flow).

Electric labels: AMPS (current flow), CHRG (electric charge).

Magnetic labels: FLUX (magnetic flux); CSGZ (magnetic current segment).

Diffusion label: RATE (diffusion flow rate).

Viscous-thermal acoustics labels: FX, FY, FZ (volumetric force density).

For structural analyses, DVOL (fluid mass flow rate) is also a valid label. See Notes (p. 730) for more information.

VALUE

Force value or table name reference for specifying tabular boundary conditions. To specify a table, enclose the table name in percent signs (%), for example, **F (p. 729)**, *Node*,HEAT,%*tabname*%). To define a table, issue ***DIM (p. 530)**.

VALUE2

Second force value (if any). If the analysis type and the force allow a complex input, *VALUE* (above) is the real component and *VALUE2* is the imaginary component.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NEND, NINC

Specifies the same values of force at the nodes ranging from *Node* to *NEND* (defaults to *Node*), in steps of *NINC* (defaults to 1).

–

Reserved.

–

Reserved.

MESHFLAG

Specifies how to apply nodal force on the mesh. Valid in a nonlinear adaptivity analysis when *Lab* = FX / FY / FZ and *Node* is not a component name. Not valid when *Lab* = ALL.

0 – Nodal-force loading occurs on the current mesh (default).

1 – Nodal-force loading occurs on the initial mesh for nonlinear adaptivity. (*NEND* and *NINC* are not valid.)

Notes

The available force loads per node correspond to the degrees of freedom listed under **Degrees of Freedom** in the input table for each element type in the *Element Reference*. If both a force and a constrained degree of freedom (**D (p. 483)**) are specified at the same node, the constraint takes precedence. Forces are defined in the nodal coordinate system. The positive directions of structural forces and moments are along and about the positive nodal axis directions. The node and the degree-of-freedom label corresponding to the force must be selected (**NSEL (p. 1266)**, **DOFSEL (p. 569)**).

Fluid flow (FLOW) is positive when flow is out of the nodes, and negative when flow is into the nodes.

For hydrostatic fluid elements (HSFLD241 and HSFLD242), DVOL is used to specify fluid mass flow rate (with units of mass/time) at the pressure node. This allows fluid to be added or taken out of the fluid elements sharing the pressure node. A fluid density must also be specified (**MP (p. 1160)** or **TB (p. 1899)**) to apply a volume change corresponding to the prescribed fluid mass flow rate.

Tabular boundary conditions (*VALUE* = %*tabname*%) are available only for the following labels: Fluid (FLOW), Electric (AMPS), Structural force (FX, FY, FZ, MX, MY, MZ), Thermal (HEAT, HBOT, HE2, HE3, . . ., HTOP), Diffusion (RATE). Tabular boundary conditions are valid only in static (**ANTYPE (p. 162)**,STATIC), full transient (**ANTYPE (p. 162)**,TRANS), full harmonic (**ANTYPE (p. 162)**, HARMIC), modal superposition harmonic and modal superposition transient analyses.

This command is also valid in PREP7.

---

/FACET, *Lab*

Specifies the facet representation used to form solid model displays.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid labels:

FINE

Use finer tessellation to increase the number of facets for the display. Provides the best representation (but decreases speed of operation).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NORML

Use the basic number of facets for the display (default).

COAR

Use a limited number of facets for the display. This option will increase the speed of the operations, but may produce poor representations for some imported models.

WIRE

Display model with a wireframe representation (fast, but surfaces will not be shown).

Command Default

Basic number of facets.

Notes

Specifies the facet (or polygon) representation used to form solid model displays. Used only with the **APLOT (p. 169)**, **ASUM (p. 203)**, **VPLOT (p. 2147)**, and **VSUM (p. 2167)** commands.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Solid Model Facets

FC, *MAT*, *Lab1*, *Lab2*, *DATA1*, *DATA2*, *DATA3*, *DATA4*, *DATA5*, *DATA6*

Provides failure criteria information and activates a data table to input temperature-dependent stress and strain limits.

PREP7 (p. 22): Materials (p. 24)
POST1 (p. 51): Failure Criteria (p. 58)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT

Material reference number. You can define failure criteria for up to 250 different materials.

Lab1

Type of data.

TEMP

Temperatures. Each of the materials you define can have a different set of temperatures to define the failure criteria.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EPEL

Strains.

S

Stresses.

Lab2

Specific criteria. Not used if *Lab1* = TEMP.

XTEN

Allowable tensile stress or strain in the x-direction. (Must be positive.)

XCMP

Allowable compressive stress or strain in the x-direction. (Defaults to negative of XTEN.)

YTEN

Allowable tensile stress or strain in the y-direction. (Must be positive.)

YCMP

Allowable compressive stress or strain in the y-direction. (Defaults to negative of YTEN.)

ZTEN

Allowable tensile stress or strain in the z-direction. (Must be positive.)

ZCMP

Allowable compressive stress or strain in the z-direction. (Defaults to negative of ZTEN.)

XY

Allowable XY stress or shear strain. (Must be positive.)

YZ

Allowable YZ stress or shear strain. (Must be positive.)

XZ

Allowable XZ stress or shear strain. (Must be positive.)

XYCP

XY coupling coefficient (Used only if *Lab1* = S). Defaults to -1.0. [1]

YZCP

YZ coupling coefficient (Used only if *Lab1* = S). Defaults to -1.0. [1]

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

XZCP

XZ coupling coefficient (Used only if *Lab1* = S). Defaults to -1.0. [1]

XZIT

XZ tensile inclination parameter for Puck failure index (default = 0.0)

XZIC

XZ compressive inclination parameter for Puck failure index (default = 0.0)

YZIT

YZ tensile inclination parameter for Puck failure index (default = 0.0)

YZIC

YZ compressive inclination parameter for Puck failure index (default = 0.0)

G1G2

Fracture toughness ratio between GI (mode I) and GII (mode II)

ETAL

Longitudinal friction coefficient

ETAT

Transverse friction coefficient

APL0

Fracture angle under pure transverse compression (default to 53) [2]

1. Entering a blank or a zero for XYCP, YZCP, or XZCP triggers the default value of -1.0. To specify an effective zero, use a small, nonzero value (such as 1E-14) instead. For more information, see Command and Argument Defaults (p. 7).

2. Entering a blank or a zero ALP0 triggers the default value of 53. To specify an effective zero, use a small, nonzero value (such as 1E-14) instead. For more information, see Command and Argument Defaults (p. 7).

DATA1*, *DATA2*, *DATA3*, . . . , *DATA6

Description of *DATA1* through *DATA6*.

T1, T2, T3, T4, T5, T6

Temperature at which limit data is input. Used only when *Lab1* = TEMP.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

V1, V2, V3, V4, V5, V6

Value of limit stress or strain at temperature T1 through T6. Used only when *Lab1* = S or EPEL.

Notes

The data table can be input in either PREP7 or POST1. This table is used only in POST1. When you postprocess failure criteria results defined via the **FC (p. 732)** command (**PLESOL (p. 1401)**, **PRESOL (p. 1481)**, **PLNSOL (p. 1425)**, **PRNSOL (p. 1505)**, **PRRSOL (p. 1518)**, etc.), the active coordinate system must be the coordinate system of the material being analyzed. You do this using **RSYS (p. 1639)**, SOLU. For layered applications, you also use the **LAYER (p. 1015)** command. See the specific element documentation in the *Element Reference* for information about defining your coordinate system for layers.

Some plotting and printing functions will not support Failure Criteria for your PowerGraphics displays. This could result in minor changes to other data when Failure Criteria are applied. See the appropriate plot or print command documentation for more information.

Menu Paths

---

FCCHECK

Checks both the strain and stress input criteria for all materials.

PREP7 (p. 22): Materials (p. 24)
POST1 (p. 51): Failure Criteria (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Issue the **FCCHECK (p. 735)** command to check the completeness of the input during the input phase.

Menu Paths

Main Menu>General Postproc>Failure Criteria>Criteria Check

Main Menu>Preprocessor>Material Props>Failure Criteria>Criteria Check

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FCDELE, *MAT*

Deletes previously defined failure criterion data for the given material.

PREP7 (p. 22): Materials (p. 24)
POST1 (p. 51): Failure Criteria (p. 58)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT

Material number. Deletes all **FC (p. 732)** command input for *this* material.

A value of ALL deletes all **FC (p. 732)** command input for *all* materials.

Notes

This command is also valid in POST1.

Menu Paths

Main Menu>General Postproc>Failure Criteria>Delete

Main Menu>Preprocessor>Material Props>Failure Criteria>Delete

/FCLEAN

Deletes all local files in all processors in a distributed parallel processing run.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Deletes all local files (`.rst`, `.esav`, `.emat`, `.mode`, `.mlv`, `.seld`, `.dsub`, `.ist`, `.full`, `.rdsp`, `.rfrq`, `.rnnn`, `.resf`, `.stat`, `.modesym`, `.osave`, `.erot`, `.log`) in all processors in a distributed parallel processing run.

Notes

Issue **/FCLEAN (p. 736)** to delete all local files having the current *Jobname* (**/FILNAME (p. 757)**) and save disk space in a distributed parallel processing run. Like other file deletion commands, deletion happens immediately upon issuing this command. Different than other file deletion commands, it enables the convenience of deleting all *Jobname*`.*` local files without having to issue separate commands specifying each file type.

All `.log` files except the master (*Jobname*`0.log`) are deleted.

Caution:

Because **/FCLEAN (p. 736)** deletes all local files, it should only be issued if you are sure that none of those files are needed in any downstream analyses. Deleting files that are necessary

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

for subsequent substeps, load steps, commands, or analyses will prevent continuation of the run. For example, since the local files are combined into global files when you issue **FINISH (p. 758)** in the solution processor, issuing **/FCLEAN (p. 736)** before **FINISH (p. 758)** in **/SOLU (p. 1821)** will result in a program crash.

Menu Paths

This command cannot be accessed from a menu.

FCLIST, *MAT*, - -, *TEMP*

To list what the failure criteria is that you have input.

PREP7 (p. 22): Materials (p. 24)
POST1 (p. 51): Failure Criteria (p. 58)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT

Material number (defaults to ALL for all materials).

- -

Unused field.

TEMP

Temperature to be evaluated at (defaults to TUNIF).

Notes

This command allows you to see what you have already input for failure criteria using the FC commands.

Menu Paths

Main Menu>General Postproc>Failure Criteria>List

Main Menu>Preprocessor>Material Props>Failure Criteria>List

/FCOMP, *Ident*, *LEVEL*

Specifies file-compression options.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ident

Mechanical APDL file identifier. There is no default. Valid labels are:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RST

Results file.

DB

Database file.

RNNN

Restart file.

OSAV

File created during a nonlinear analysis that contains a copy of ESAV file from the last converged substep.

LEVEL

Compression level:

SPARSE

Use a sparsification scheme for file compression (default).

0

No file compression occurs.

n

A zlib-based file compression occurs using level number *n*, which ranges from 1 to 5.

Command Default

Files listed under `Ident` are compressed by default using the sparsification scheme.

Notes

Specifies file compression options for results files (`.rst`, `.rstp`, `.rth`, and `.rmg` files), database files (`.db` and `.rdb`), certain restart files (`.Rnnn`), and the `.osav` file created during a nonlinear analysis. (See Program-Generated Files in the *Basic Analysis Guide* for file descriptions.) Records are compressed as they are written and uncompressed as they are read (for example, by the **SET (p. 1724)** command or the **RESUME (p. 1601)** command).

For results files compressed using the sparsification scheme (*LEVEL* = SPARSE, which is the default), use the ***XPL (p. 2196)** command to uncompress the file. For third party tools that need to read the results file, use the method described in Accessing Mechanical APDL Binary Files, which automatically decodes any SPARSE compressed records in the results file.

See File Compression in the *Basic Analysis Guide* for more details.

This command is valid only at the Begin Level.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

FCUM,*Oper*,*RFACT*,*IFACT*

Specifies that force loads are to be accumulated.

SOLUTION (p. 38): FE Forces (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Oper

Accumulation key:

REPL

Subsequent values replace the previous values (default).

ADD

Subsequent values are added to the previous values.

IGNO

Subsequent values are ignored.

RFACT

Scale factor for the real component. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor.

IFACT

Scale factor for the imaginary component. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor.

Command Default

Replace previous values.

Notes

Allows repeated force load (force, heat flow, etc.) values to be replaced, added, or ignored. Operations apply to the selected nodes [NSEL]. and the force labels corresponding to the selected force labels (**DOFSEL (p. 569)**). The operations occur when the next force specifications are defined. For example, issuing the command **F (p. 729)**,1,FX,250 after a previous **F (p. 729)**,1,FX,200 causes the current value of the force on node 1 in the x-direction to be 450 with the add operation, 250 with the replace operation, or 200 with the ignore operation. Scale factors are also available to multiply the next value before the add or replace operation. A scale factor of 2.0 with the previous "add" example results in a force of 700. Scale factors are applied even if no previous values exist. Issue **FCUM (p. 739)**,STAT to show the current

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

label, operation, and scale factors. Solid model boundary conditions are not affected by this command, but boundary conditions on the FE model are affected.

Note:

FE boundary conditions may still be overwritten by existing solid model boundary conditions if a subsequent boundary condition transfer occurs.

FCUM (p. 739) does not work for tabular boundary conditions.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Settings>Replace vs Add>Forces

Main Menu>Solution>Define Loads>Settings>Replace vs Add>Forces

---

FCTYP, *Oper*, *Lab*

Activates or removes failure-criteria types for postprocessing.

POST1 (p. 51): Failure Criteria (p. 58)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Oper

Operation key:

ADD

Activate failure-criteria types. This option is the default behavior.

DELE

Remove failure-criteria types.

Lab

Valid failure-criteria labels. If ALL, select all available (including user-defined) failure criteria.

EMAX

Maximum strain criterion (default)

SMAX

Maximum stress criterion (default)

TWSI

Tsai-Wu strength index (default)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TWSR

Inverse of Tsai-Wu strength ratio index (default)

HFIB

Hashin fiber failure criterion

HMAT

Hashin matrix failure criterion

PFIB

Puck fiber failure criterion

PMAT

Puck inter-fiber (matrix) failure criterion

L3FB

LaRc03 fiber failure criterion

L3MT

LaRc03 matrix failure criterion

L4FB

LaRc04 fiber failure criterion

L4MT

LaRc04 matrix failure criterion

USR1 through USR9

User-defined failure criteria

Command Default

FCTYP (p. 740), ADD, EMAX, SMAX, TWSI, TWSR

Notes

The **FCTYP (p. 740)** command modifies the list of active failure criteria.

By default, active failure criteria include EMAX, SMAX, TWSI, and TWSR.

The command affects any subsequent postprocessing listing and plotting commands (such as **PRESOL (p. 1481)**, **PRNSOL (p. 1505)**, **PLESOL (p. 1401)**, **PLNSOL (p. 1425)**, and **ETABLE (p. 687)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A single **FCTYP (p. 740)** command allows up to six failure-criteria labels. If needed, reissue the command to activate or remove additional failure-criteria types.

Menu Paths

This command cannot be accessed from a menu.

FDELE, *NODE*, *Lab*, *NEND*, *NINC*, *Lkey*

Deletes force loads on nodes.

SOLUTION (p. 38): FE Forces (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Node for which force is to be deleted. If ALL, *NEND* and *NINC* are ignored and forces are deleted on all selected nodes (**NSEL (p. 1266)**). If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE*.

Lab

If ALL, use all appropriate labels. Valid force labels are:

Structural labels: FX, FY, or FZ (forces); MX, MY, or MZ (moments).

Thermal labels: HEAT, HBOT, HE2, HE3, . . ., HTOP (heat flow).

Fluid label: FLOW (fluid flow).

Electric labels: AMPS (current flow), CHRG (electric charge).

Magnetic labels: FLUX (magnetic flux); CSGZ (magnetic current segment).

Diffusion label: RATE (diffusion flow rate).

NEND, NINC

Delete forces from *NODE* to *NEND* (defaults to *NODE*) in steps of *NINC* (defaults to 1).

Lkey

Lock key:

(blank)

The DOF is not locked (default).

FIXED

Displacement on the specified degrees of freedom (*Lab*) is locked. The program prescribes the degree of freedom to the "current" relative displacement value in addition to deleting the force. If a displacement constraint (for example, **D (p. 483)** command) is applied in conjunction with this option, the actual applied displacement will be ramped during the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

next load step. The displacement is ramped from the current value to the newly defined value. This option is only valid for the following labels: FX, FY, FZ, MX, MY, MZ. This option is intended primarily for use in the Ansys Workbench interface to apply an increment length adjustment (bolt pretension loading).

Notes

The node and the degree of freedom label corresponding to the force must be selected (**NSEL (p. 1266)**, **DOFSEL (p. 569)**).

This command is also valid in PREP7.

---

/FDELE, *Ident*, *Stat*

Deletes a binary file after it is used.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ident

Mechanical APDL file name identifier. Valid identifiers are: EMAT, ESAV, FULL, SUB, MODE, DSUB, USUB, OSAV, and SELD. See the *Basic Analysis Guide* for file descriptions.

Stat

Keep or delete key:

KEEP

Keep this file.

DELE

Delete (or do not write, if not necessary) this file.

Command Default

Keep all files.

Notes

Deletes as soon as possible (or prevents writing) a binary file created by Mechanical APDL to save space.

Caution:

Deleting files that are necessary for the next substep, load step, or analysis will prevent continuation of the run.

This command is valid only at the Begin level.

Menu Paths

Utility Menu>File>File Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FEBODY

Specifies "Body loads on elements" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Body Loads

FECONS

Specifies "Constraints on nodes" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>DOF Constraints

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FEFOR

Specifies "Forces on nodes" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Forces

FESURF

Specifies "Surface loads on elements" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>Surface Loads

*FFT, *Type*, *InputData*, *OutputData*, *DIM1*, *DIM2*, *ResultFormat*

Computes the fast Fourier transformation of a specified matrix or vector.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Type

Type of FFT transformation:

FORW --

Forward FFT computation (default).

BACK --

Backward FFT computation.

InputData

Name of matrix or vector for which the FFT will be computed. This can be a dense matrix (created by the ***DMAT (p. 551)** command) or a vector (created by the ***VEC (p. 2085)** command). Data can be real or complex values. There is no default value for this argument.

OutputData

Name of matrix or vector where the FFT results will be stored. The type of this argument must be consistent with *InputData* (see table below). There is no default value for this argument.

FFT Domain	Forward		Backward	
	Input Data	**Output Data**	**Input Data**	**Output Data**
Real	Real	Complex	Complex	Real
Complex	Complex	Complex	Complex	Complex

DIM1

The number of terms to consider for a vector, or the number of rows for a matrix. Defaults to the whole input vector or all the rows of the matrix.

DIM2

The number of columns to consider for a matrix. Defaults to all the columns of the matrix. (Valid only for matrices.)

ResultFormat

Specifies the result format:

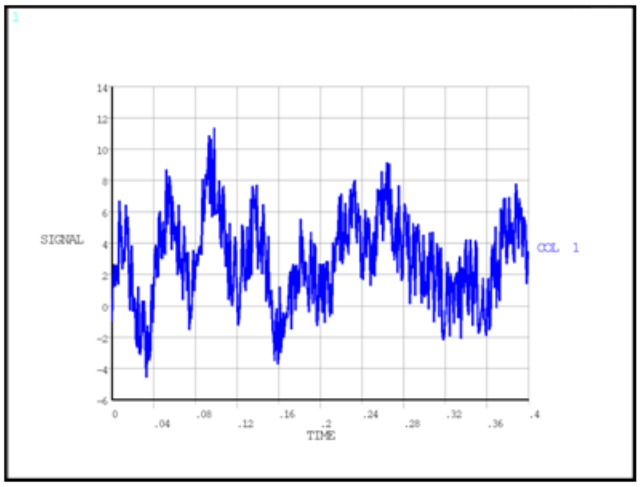
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FULL --

Returns the full result. That is, the result matches the dimension specified on this command (*DIM1*, *DIM2*).

PART --

Returns partial results. For real input data, there is a symmetry in the results of the Fourier transform as some coefficients are conjugated. The partial format uses this symmetry to optimize the storage of the results. (Valid only for real data.)



Notes

In the example that follows, the fast Fourier transformation is used to filter frequencies from a noisy input signal.

Example Usage

The fast Fourier transformation can be used to create a filter to remove noise from a noisy input signal.

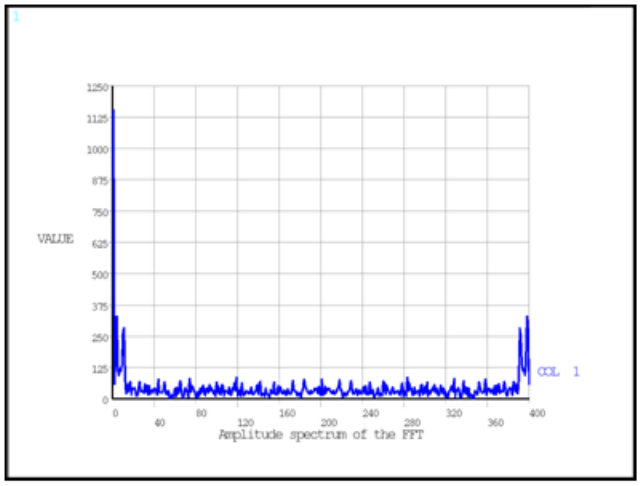


Figure 4: Input Signal

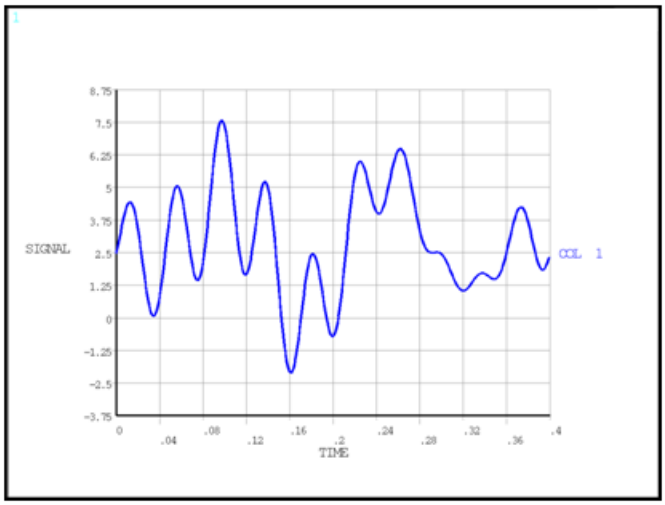
The input signal is decomposed in the Fourier space using the ***FFT (p. 747)**,*FORW* command so that the frequencies that compose the signal can be observed.



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 5: Amplitude Spectrum of the FFT

The filter applies a threshold on the Fourier coefficients. Fourier coefficients of small amplitude are the result of the noise in the input signal. Only coefficients of a large amplitude are significant. The inversion of the ***FFT (p. 747)** command (***FFT (p. 747)**,*BACK* command) rebuilds the signal from the remaining coefficients.

Figure 6: Signal Obtained with the Filter

Example input demonstrating ***FFT (p. 747)** usage is provided below:

```

Menu Paths

This command cannot be accessed from a menu.

FILE,*Fname*,*Ext*,--

Specifies the data file where results are to be found.

POST1 (p. 51): Set Up (p. 51)
POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

If *Fname* is blank, the extension defaults to RST (for structural, fluid, or coupled-field analyses), to RTH (for thermal or electrical analyses), or to RMG (for magnetic analyses). For postprocessing contact results corresponding to the initial contact state in POST1, use the RCN extension. For postprocessing modal coordinates results in POST1, use the RDSP or RFRQ extension.

--

Unused field.

Command Default

Use the result file with the Jobname as *Fname* and with the extension corresponding to the analysis type.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Specifies the Mechanical APDL data file where the results are to be found for postprocessing.

Issuing the **FILE (p. 752)** command with *Ext* = RSDP or in POST1 specifies the `.rsdp` or `.rfrq` file used by the **PRMC (p. 1499)** and **PLMC (p. 1421)** commands. (See POST1 example (p. 753) below.)

Example Usage

POST1

```
/POST1
FILE,,rdsp   !Choose file Jobname.rdsp from a previous MSUP transient solution
PRMC,2,1     !Plot Modal coordinates from rdsp file (loadstep and substep specified as arguments)
FILE,,rst    !Choose file Jobname.rst
SET,1,1      !Load results from chosen .rst file into database
PRNSOL,u,x   !Plot Nodal displacements (loadstep and substep specified using the SET command)
FINISH       !Exit POST1
```

POST26

Example: Mode-Superposition Transient Dynamic Analysis

Utility Menu>File>List>Binary Files

Utility Menu>List>Files>Binary Files

FILEAUX2, *Fname*, *Ident*, --

Specifies the binary file to be dumped.

AUX2 (p. 61): Binary File Dump (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to the current `Jobname` if *Ident* is specified.

Ident

File name identifier. See the *Basic Analysis Guide* for file descriptions and identifiers. If not an identifier, the program uses *Ident* as the file name extension.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

--

Unused field.

Notes

Specifies the binary file to be dumped with the **DUMP (p. 583)** command.

Menu Paths

Utility Menu>List>Files>Binary Files

FILEAUX3, *Fname*, *Ext*, - -

Specifies the results file to be edited.

AUX3 (p. 61): Results Files (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to the current Jobname if *Ext* is specified.

Ext

Filename extension (eight-character maximum).

--

Unused field.

Notes

Specifies the results file to be edited.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FILL,*NODE1*,*NODE2*,*NFILL*,*NSTRT*,*NINC*,*ITIME*,*INC*,*SPACE*

Generates a line of nodes between two existing nodes.

PREP7 (p. 22): Nodes (p. 31)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE1*, *NODE2

Beginning and ending nodes for fill-in. *NODE1* defaults to next to last node specified, *NODE2* defaults to last node specified. If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NFILL

Fill *NFILL* nodes between *NODE1* and *NODE2* (defaults to |*NODE2*-*NODE1*|-1). *NFILL* must be positive.

NSTRT

Node number assigned to first filled-in node (defaults to *NODE1* + *NINC*).

NINC

Add this increment to each of the remaining filled-in node numbers (may be positive or negative). Defaults to the integer result of (*NODE2*-*NODE1*)/(*NFILL* + 1), that is, linear interpolation. If the default evaluates to zero, or if zero is input, *NINC* is set to 1.

ITIME*, *INC

Do fill-in operation a total of *ITIMEs*, incrementing *NODE1*, *NODE2* and *NSTRT* by *INC* each time after the first. *ITIME* and *INC* both default to 1.

SPACE

Spacing ratio. Ratio of last division size to first division size. If > 1.0, divisions increase. If < 1.0, divisions decrease. Ratio defaults to 1.0 (uniform spacing).

Notes

Generates a line of nodes (in the active coordinate system) between two existing nodes. The two nodes may have been defined in any coordinate system. Nodal locations and rotation angles are determined by interpolation. Any number of nodes may be filled-in and any node number sequence may be assigned. See the **CSCIR (p. 436)** command when filling across the 180° singularity line in a non-Cartesian system.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Nodes>Fill between Nds

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FILLDATA, *IR*, *LSTRT*, *LSTOP*, *LINC*, *VALUE*, *DVAL*

Fills a variable by a ramp function.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Define data table as variable *IR* (2 to *NV* (**NUMVAR (p. 1302)**)).

LSTRT

Start at location *LSTRT* (defaults to 1).

LSTOP

Stop at location *LSTOP* (defaults to maximum location as determined from data previously stored.

LINC

Fill every *LINC* location between *LSTRT* and *LSTOP* (defaults to 1).

VALUE

Value assigned to location *LSTRT*.

DVAL

Increment value of previous filled location by *DVAL* and assign sum to next location to be filled (may be positive or negative.)

Notes

Locations may be filled continuously or at regular intervals (*LINC*). Previously defined data at a location will be overwritten.

Menu Paths

Main Menu>TimeHist Postpro>Table Operations>Fill Data

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/FILNAME, *Fname*, *Key*

Changes the Jobname for the analysis.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

Name (32 characters maximum) to be used as the Jobname. Defaults to the initial Jobname as specified on the Mechanical APDL execution command, or to file if none specified.

Key

Specify whether to use the existing log, error, lock, page, and output files (.log, .err, .lock, .page and .out) or start new files.

0, OFF

Continue using current log, error, lock, page, and output files.

1, ON

Start new log, error, lock, page, and output files (old log and error files are closed and saved, but old lock, page, and output files are deleted). Existing log and error files are appended.

Notes

All subsequently created files will be named with this Jobname if *Key* = 0. Use *Key* = 1 to start new log, error, lock, page, and output files. The previous Jobname is typically defined on the Mechanical APDL program execution line. (See the *Operations Guide*.

This command is useful when different groups of files created throughout the run are to have different names. For example, the command may be used before each substructure pass to avoid overwriting files or having to rename each file individually.

This command is valid only at the Begin level.

Menu Paths

Utility Menu>File>Change Jobname

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FINISH

Exits normally from a processor.

SESSION (p. 11): Processor Entry (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This command exits any of the Mechanical APDL processors.

When exiting the Mechanical APDL processors, data remains intact in the database, but the database is not automatically written to a file. (Issue **SAVE (p. 1645)** to write the database to a file.)

If exiting POST1 or POST26:

- POST1: Data in the database remains intact (including the POST1 element table data, the path table data, the fatigue table data, and the load case pointers).
- POST26: Data in the database remains intact, except that POST26 variables are erased and specification commands (such as **FILE (p. 752)**, **PRTIME (p. 1522)**, and **NPRINT (p. 1255)**) are reset. Issue **/QUIT (p. 1563)** to exit the processor and bypass these exceptions.

See **/QUIT (p. 1563)** for an alternate processor exit command.

This command is valid in any processor. This command is not valid at the Begin level.

Menu Paths

Main Menu>Finish

FITEM, *NFIELD*, *ITEM*, *ITEMY*, *ITEMZ*

Identifies items chosen by a picking operation (GUI).

DATABASE (p. 13): Picking (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFIELD

Field number on the command which uses the picking data. (Count the command name as a field, so that a 2 indicates the first command argument, 3 the second command argument, etc.) The corresponding field on the command will have a P51X label.

ITEM

Entity number of the entity picked. Negative entity numbers are used to indicate a range of entities. If the item picked is a coordinate location, then this field represents the X-coordinate. See also the **FLST (p. 766)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ITEMY*, *ITEMZ

Y and Z coordinates of a picked coordinate location. *ITEM* represents the X coordinate. See also the **FLST (p. 766)** command.

Notes

This is a command generated by the GUI and will appear in the log file (`Jobname.log`) if graphical picking is used. This command is *not* intended to be typed in directly in a session (although it can be included in an input file for batch input or for use with the **/INPUT (p. 948)** command).

On the log file, a set of **FITEM (p. 758)** commands is preceded by one **FLST (p. 766)** command which defines the picking specifications for that pick operation. The data listed in the **FITEM (p. 758)** commands are used by the first subsequent command containing a P51X label in one of its fields.

Caution:

For a given entity type, a list containing an *ITEM* that is larger than the maximum defined entity, could deplete the system memory and produce unpredictable results.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

FJ, *ELEM*, *LABEL*, *VALUE*

Specify forces or moments on the components of the relative motion of a joint element.

SOLUTION (p. 38): FE Forces (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element number or ALL to specify all joint elements.

LABEL

Valid labels:

FX

Force in local x direction.

FY

Force in local y direction.

FZ

Force in local z direction.

MX

Moment about local x axis.

MY

Moment about local y axis.

MZ

Moment about local z axis.

VALUE

Value of the label.

Notes

Valid for MPC184 (joint options in KEYOPT(1)).

In a mode-superposition harmonic or transient analysis, you must apply the load in the modal portion of the analysis. Mechanical APDL calculates a load vector and writes it to the MODE file, which you can apply via the **LVSCALE (p. 1094)** command.

See **FJDELE (p. 760)** for information on deleting forces and moments.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Structural>Force/Moment>On Joint Elems

Main Menu>Solution>Define Loads>Apply>Structural>Force/Moment>On Joint Elems

---

FJDELE, *ELEM*, *LAB*

Deletes forces (or moments) on the components of the relative motion of a joint element.

SOLUTION (p. 38): FE Forces (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ELEM

Element number, or ALL. (leaving this blank defaults to ALL)

LAB

Valid labels are:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FX

Force in local x direction.

FY

Force in local y direction.

FZ

Force in local z direction.

MX

Moment about local x axis.

MY

Moment about local y axis.

MZ

Moment about local z axis.

ALL, or (blank)

Delete all valid forces or moments.

Notes

Valid for MPC184 (joint options in KEYOPT(1)).

See **FJ (p. 759)** for information on specifying forces (or moments).

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Delete>All Load Data>All Forces>On Joint Elems

Main Menu>Preprocessor>Loads>Define Loads>Delete>Structural>Force/Moment>On Joint Elems

Main Menu>Solution>Define Loads>Delete>All Load Data>All Forces>On Joint Elems

Main Menu>Solution>Define Loads>Delete>Structural>Force/Moment>On Joint Elems

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FJLIST, *Elem*

Lists forces and moments applied on joint elements.

SOLUTION (p. 38): FE Forces (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Elem

Element number or ALL (or blank). Lists joint element forces and moments on the specified element(s).

Notes

Valid for MPC184 joint elements. See **FJ (p. 759)** for information on specifying forces and moments.

Menu Paths

Utility Menu>List>Loads>Joint Element Forces>On Picked Element

FK, *KPOI*, *Lab*, *VALUE*, *VALUE2*

Defines force loads at keypoints.

SOLUTION (p. 38): Solid Forces (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KPOI

Keypoint at which force is to be specified. If ALL, apply to all selected keypoints (**KSEL (p. 995)**). If *KPOI* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *KPOI*.

Lab

Valid force labels are:

Structural labels: FX, FY, or FZ (forces); MX, MY, or MZ (moments).

Thermal labels: HEAT, HBOT, HE2, HE3, . . ., HTOP (heat flow).

Fluid label: FLOW (fluid flow).

Electric labels: AMPS (current flow), CHRG (electric charge).

Magnetic labels: FLUX (magnetic flux); CSGZ (magnetic current segment).

Diffusion label: RATE (diffusion flow rate).

VALUE

Force value or table name reference for specifying tabular boundary conditions. To specify a table, enclose the table name in percent signs (%), for example, **FK (p. 762)**, *KPOI*, HEAT,%*tabname*%). Use the ***DIM (p. 530)** command to define a table.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VALUE2

Second force value (if any). If the analysis type and the force allow a complex input, *VALUE* (above) is the real component and *VALUE2* is the imaginary component.

Notes

Forces may be transferred from keypoints to nodes with the **FTRAN (p. 783)** or **SBCTRAN (p. 1647)** commands. See the **F (p. 729)** command for a description of force loads.

Tabular boundary conditions (*VALUE* = %*tabname*%) are available only for the following labels: Fluid (FLOW), Electric (AMPS), Structural force (FX, FY, FZ, MX, MY, MZ), and Thermal (HEAT, HBOT, HE2, HE3, . . ., HTOP).

This command is also valid in PREP7.

Menu Paths

FKDELE, *KPOI*, *Lab*

Deletes force loads at a keypoint.

SOLUTION (p. 38): Solid Forces (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KPOI

Keypoint at which force is to be deleted. If ALL, delete forces at all selected keypoints (**KSEL (p. 995)**). If *KPOI* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *KPOI*.

Lab

Valid force label. If ALL, use all appropriate labels. See the **FDELE (p. 742)** command for labels.

Notes

Deletes force loads (and all corresponding finite element loads) at a keypoint. See the **FDELE (p. 742)** command for details.

This command is also valid in PREP7.

Menu Paths

---

FKLIST, *KPOI*, *Lab*

Lists the forces at keypoints.

SOLUTION (p. 38): Solid Forces (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KPOI

List forces at this keypoint. If ALL (default), list for all selected keypoints (**KSEL (p. 995)**). If *KPOI* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *KPOI*.

Lab

Force label to be listed (defaults to ALL). See the **DOFSEL (p. 569)** command for labels.

Notes

Listing applies to the selected keypoints (**KSEL (p. 995)**) and the selected force labels (**DOFSEL (p. 569)**).

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Forces>On All Keypoints
Utility Menu>List>Loads>Forces>On Picked KPs

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FLIST,*NODE1*,*NODE2*,*NINC*

Lists force loads on the nodes.

SOLUTION (p. 38): FE Forces (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE1*, *NODE2*, *NINC

List forces for nodes *NODE1* to *NODE2* (defaults to *NODE1*) in steps of *NINC* (defaults to 1). If ALL, list for all selected nodes (**NSEL (p. 1266)**) and *NODE2* and *NINC* are ignored (default). If *NODE1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE1*.

Notes

Listing applies to the selected nodes (**NSEL (p. 1266)**) and the selected force labels (**DOFSEL (p. 569)**).

Caution:

A list containing a node number that is larger than the maximum defined node (*NODE2*), could deplete the system memory and produce unpredictable results.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Loads>Forces>On All Nodes

Utility Menu>List>Loads>Forces>On Picked Nodes

FLST,*NFIELD*,*NARG*,*TYPE*,*Otype*,*LENG*

Specifies data required for a picking operation (GUI).

DATABASE (p. 13): Picking (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NFIELD

Field number on the command which uses the picking data. (Count the command name as a field, so that a 2 indicates the first command argument, 3 for the second command argument, etc.) The corresponding field on the command will have a P51X label.

NARG

Number of items in the picked list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TYPE

Type of items picked:

1

Node numbers

2

Element numbers

3

Keypoint numbers

4

Line numbers

5

Area numbers

6

Volume numbers

7

Trace points

8

Coordinate locations (in Global Cartesian coordinates)

9

Screen picks (in X, Y screen coordinates (-1 to 1))

Otype

Data order:

NOOR

Data is not ordered (default).

ORDER

Data is in an ordered list (such as for the **E (p. 591)**,P51X and **A (p. 81)**,P51X commands, in which the order of the data items is significant for the picking operation).

LENG

Length of number of items describing the list (should equal *NARG* if *Otype* = NOOR; default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Specifies data required for the **FITEM (p. 758)** command during a picking operation. This is a command generated by the GUI and will appear in the log file (`Jobname.log`) if graphical picking is used. This command is *not* intended to be typed in directly in a session (although it can be included in an input file for batch input or for use with **/INPUT (p. 948)**).

On the log file, **FLST (p. 766)** is always followed by one or more **FITEM (p. 758)** commands which, in turn, are followed by the Mechanical APDL command containing a P51X label in one of its fields. Do not edit this set of commands.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

FLUXV

Calculates the flux passing through a closed contour.

POST1 (p. 51): Magnetics Calculations (p. 55)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

FLUXV (p. 768) invokes a Mechanical APDL macro which calculates the flux passing through a closed contour (path) predefined by **PATH (p. 1354)**.

The calculated flux is stored in the parameter FLUX.

In a 2D analysis, at least two nodes must be defined on the path. In 3D, a path of nodes describing a closed contour must be specified (that is, the first and last node in the path specification must be the same).

A counterclockwise ordering of nodes on the **PPATH (p. 1463)** command gives the correct sign on flux.

Path operations are used for the calculations, and all path items are cleared upon completion.

This macro is available for vector potential formulations only.

Menu Paths

Main Menu>General Postproc>Elec&Mag Calc>Path Based>Path Flux

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FLUREAD, --, *Fname*, *Ext*, *KDIM*, *KOUT*, *LIMIT*, *ListOpt*

Reads one-way Fluent-to-Mechanical APDL coupling data via a .cgns file with one-side fast Fourier transformation complex pressure peak value.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

--

Reserved.

Fname

File name and directory path of a one-way Fluent-to-Mechanical APDL coupling data file (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name. Defaults to jobname.

Ext

File name extension of the one-way Fluent-to-Mechanical APDL coupling data file. Defaults to .cgns).

KDIM

Interpolation data for mapping. A value of 0 (default) or 2 applies 2D interpolation (where interpolation occurs on a surface).

KOUT

Outside region results for mapping:

0

Use the value(s) of the nearest region point for points outside of the region. This behavior is the default.

1

Set results extrapolated outside of the region to zero.

LIMIT

Number of nearby nodes considered for mapping interpolation. Minimum = 5. Default = 20.

Lower values reduce processing time; however, some distorted or irregular meshes require a higher value in cases where three nodes are encountered for triangulation.

ListOpt

Type of items picked:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(blank)

No listing (default).

SOURCE

List the node coordinates and complex pressure values on the Fluent source side during the solution.

TARGET

List the node coordinates and complex pressure values on the mapped Mechanical APDL target side during the solution.

BOTH

List the node coordinates and complex pressure values on both the Fluent source side and the mapped Mechanical APDL target side during the solution.

Notes

The **FLUREAD (p. 769)** command reads one-way Fluent-to-Mechanical APDL coupling data from a `.cgns` file. The Fluent one-side fast Fourier transformation (FFT) peak complex pressure values are mapped to the Mechanical APDL structure model during the acoustic-structural solution at each FFT frequency.

The command can be used only for the model with the acoustic elements.

To apply complex pressure to the structure model, define the SURF154 surface element, then define the one-way coupling interface (**SF (p. 1733)**,,FSIN) on the element.

You can define the solving frequency range via the HARFRQ (p. 885) command. The solver selects the FFT frequencies between the beginning and ending frequencies. The number of substeps is determined by the number of FFT frequencies over the frequency range. The number of substeps defined via the **NSUBST (p. 1287)** command is overwritten.

For better mapping performance, consider the following:

- Calculations for out-of-bound points require much more processing time than do points that are within bounds.
- For each point in the structural destination mesh, the command searches all possible triangles in the Fluent source mesh to find the best triangle containing each point, then performs a linear interpolation inside this triangle. For faster and more accurate results, consider your interpolation method and search criteria carefully. (See *LIMIT*.)

It is possible to apply one-way coupling excitation to multiple frequencies. The one-side FFT peak complex pressure values are necessary to do so.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/FOCUS, *WN*, *XF*, *YF*, *ZF*, *KTRANS*

Specifies the focus point (center of the window).

GRAPHICS (p. 16): Views (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

XF, YF, ZF

Location of the object to be at the focus point (center of the window) in the global Cartesian coordinate system. If *XF* = AUTO, allow automatic location calculation. If *XF* = USER, use focus location of last display (useful when last display had auto focus).

KTRANS

Translate key:

0

Interpret numerical *XF*, *YF*, *ZF* values as described above.

1

Interpret *XF*, *YF*, *ZF* values as multiples of half-screens to translate from the current position in the screen coordinate system. Example: *XF* of 2.4 translates the display approximately 2.4 half-screens to the left in the screen X (horizontal) direction.

2

Interpret *XF*, *YF*, *ZF* values as multiples of half-screens to translate from the current position in the global Cartesian coordinate system. Example: *XF* of 1.5 translates the display approximately 1.5 half-screens in the global Cartesian X direction of the model.

Command Default

Focus location is automatically calculated to be at the geometric center of the object (modified for centering within the window, depending upon the view).

Notes

Specifies the location on (or off) the model which is to be located at the focus point (center of the window). For section and capped displays, the cutting plane is also assumed to pass through this location (unless the working plane is used via **/CPLANE (p. 426)**). See also **/AUTO (p. 207)** and **/USER (p. 2061)** commands.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>PlotCtrls>Pan, Zoom, Rotate

Utility Menu>PlotCtrls>View Settings>Focus Point

FORCE, *Lab*

Selects the element nodal force type for output.

POST1 (p. 51): Controls (p. 51)
POST26 (p. 58): Controls (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Type of force to be associated with the force items:

TOTAL

Total forces (static, damping, and inertia).

STATIC

Static forces.

DAMP

Damping forces.

INERT

Inertia forces.

Command Default

Use the total forces.

Notes

FORCE (p. 772) selects the element nodal force type for output with the POST1 **PRESOL (p. 1481)**, **PLESOL (p. 1401)**, **PRRFOR (p. 1517)**, **NFORCE (p. 1216)**, **FSUM (p. 780)**, etc. commands, the POST26 **ESOL (p. 672)** command, and reaction force plotting (**/PBC (p. 1356)**). For example, **FORCE (p. 772)**,STATIC causes item F of the **PRESOL (p. 1481)** command to be the static forces for the elements processed. Element member forces (such as those available for beams and shells and processed by Item and Sequence number) are not affected by this command. The SMISC records extract the static force.

In a non-spectrum analysis that includes either contact or pretension elements in the model, the **PRRSOL (p. 1518)** command is valid with the **FORCE (p. 772)** command. Otherwise, the **PRRSOL (p. 1518)** command is not valid with **FORCE (p. 772)**. Use the **PRRFOR (p. 1517)** command, which provides the same functionality as **PRRSOL (p. 1518)**, instead.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Use the **FORCE (p. 772)** command prior to any load case operations (**LCOPER (p. 1026)**) to insure the correct element nodal force combinations.

In POST26, the **ESOL (p. 672)** data stored is based on the active **FORCE (p. 772)** specification at the time the data is stored. To store data at various specifications (for example, static and inertia forces), issue a **STORE (p. 1867)** command before each new specification.

The **FORCE (p. 772)** command cannot be used to extract static, damping, and inertial forces for MPC184 joint elements.

To retrieve the different force types, use the ***GET (p. 797)** command with *Entity*=ELEM and *Item1*=EFOR.

The **FORCE (p. 772)** command is not supported in a spectrum analysis. You can specify the force type directly on the combination method commands (*ForceType* on the **PSDCOM (p. 1527)**, **SRSS (p. 1845)**, **CQC (p. 433)**, etc. commands).

The **FORCE (p. 772)** command is not supported in a modal analysis.

Menu Paths

Main Menu>General Postproc>Options for Outp

Main Menu>TimeHist Postpro>Define Variables

Main Menu>TimeHist Postpro>Elec&Mag>Circuit>Define Variables

Utility Menu>List>Results>Options

FORM, *Lab*

Specifies the format of the file dump.

AUX2 (p. 61): Binary File Dump (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Format:

RECO

Basic record description only (minimum output) (default).

TEN

Same as RECO plus the first ten words of each record.

LONG

Same as RECO plus all words of each record.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Basic record description (RECO).

Notes

Specifies the format of the file dump (from the **DUMP (p. 583)** command).

Menu Paths

Utility Menu>File>List>Binary Files

Utility Menu>List>Files>Binary Files

/FORMAT,*NDIGIT*,*Ftype*,*NWIDTH*,*DSIGNF*,*LINE*,*CHAR*,*EXPTYPE*

Specifies format controls for tables.

POST1 (p. 51): Listing (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NDIGIT

Number of digits (3 to 32) in first table column (usually the node or element number). Initially defaults to 7.

Ftype

FORTRAN format type:

G --

G*xx*.*yy* (default)

F --

F*xx*.*yy*

E --

E*xx*.*yy*

where *xx* and *yy* are described below.

NWIDTH

Total width (9 to 32) of the field (*xx* in *Ftype*). Default = 13.

DSIGNF

Number of digits after the decimal point (*yy* in F or E format) or number of significant digits in G format. Range is 2 to *xx*-7 for *Ftype* = G or E; and 0 to *xx*-4 for *Ftype* = F. Default = 5.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LINE

Number of lines (11 minimum) per page. Default = *ILINE* or *BLINE* (**/PAGE (p. 1348)**).

CHAR

Number of characters (41 to 240, system-dependent) per line before wraparound. Default = *ICHAR* or *BCHAR* (**/PAGE (p. 1348)**).

EXPTYPE

Number of digits for the exponent (*Ftype* = G):

3 --

Three digits (default).

2 --

Two digits.

Command Default

The program determines the data format.

Notes

Specifies various format controls for tables printed with the POST1 **PRNSOL (p. 1505)**, **PRESOL (p. 1481)**, **PRETAB (p. 1490)**, **PRRSOL (p. 1518)**, **PRPATH (p. 1517)**, and **CYCCALC (p. 453)** commands. A blank (or out-of-range) field on the command retains the current setting. Issue **/FORMAT (p. 774)**,STAT to display the current settings. Issue **/FORMAT (p. 774)**,DEFA to reestablish the initial default specifications.

For the POST26 **PRVAR (p. 1523)** command, the *Ftype*, *NWIDTH*, and *DSIGNF* fields control the time output format.

When viewing integer output quantities, the floating point format may lead to incorrect output values for large integers. You should verify large integer output values via the ***GET (p. 797)** command whenever possible.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*FREE, *Name*, *VAL1*

Deletes a matrix or a solver object and frees its memory allocation.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Name

Name of the matrix or solver object to delete. Use *Name* = ALL to delete all APDL Math matrices and solver objects. Use *Name* = WRK to delete all APDL Math matrices and solver objects that belong to a given workspace.

VAL1

If *Name* = WRK, *Val1* is the memory workspace number.

Notes

A **/CLEAR (p. 350)** command will automatically delete all the current APDL Math objects.

Menu Paths

This command cannot be accessed from a menu.

FREQ, *FREQ1*, *FREQ2*, *FREQ3*, *FREQ4*, *FREQ5*, *FREQ6*, *FREQ7*, *FREQ8*, *FREQ9*

Defines the frequency points for the SV (p. 1886) vs. FREQ (p. 776) tables.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FREQ1, FREQ2, FREQ3, . . . , FREQ9

Frequency points for SV vs. FREQ tables. Values must be in ascending order. *FREQ1* should be greater than zero. Units are cycles/time.

Command Default

No frequency table.

Notes

Repeat the **FREQ (p. 776)** command for additional frequency points (100 maximum). Values are added after the last nonzero frequency. If all fields (*FREQ1* -- *FREQ9*) are blank, erase SV vs. FREQ tables.

Frequencies must be in ascending order.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Spectral values are input with the **SV (p. 1886)** command and interpreted according to the **SVTYP (p. 1887)** command. Applies only to the SPRS (single-point) option of the **SPOPT (p. 1837)** command. See the **SPFREQ (p. 1828)** command for frequency input in MPRS (multi-point) analysis.

Use the **STAT (p. 1861)** command to list current frequency points.

This command is also valid in PREP7.

Menu Paths

Main Menu>Solution>Load Step Opts>Spectrum>SinglePt>Freq Table

---

FRQSCL, *Scaling*

Turns on automatic scaling of the entire mass matrix and frequency range for modal analyses.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Scaling

Off

Do not use automatic scaling of the mass matrix and frequency range.

On

Use automatic scaling of the mass matrix and frequency range.

Command Default

Mechanical APDL uses automatic scaling if appropriate.

Notes

This command is available only for modal analyses using the Block Lanczos, PCG Lanczos, Supernode, Subspace, or Unsymmetric mode extraction method (**MODOPT (p. 1140)**,LANB, LANPCG, SNODE, SUBPS, or UNSYM).

Use this command to deactivate or force activation of automatic scaling of the entire mass matrix and frequency range for modal analyses where the entire mass matrix is significantly different (that is, orders of magnitude different) than the entire stiffness matrix (for example, due to the particular unit system being used). Where the mass matrix is significantly smaller compared to the stiffness matrix, the eigenvalues will tend to approach very large numbers (>10e12), making the selected mode-extraction method less efficient and more likely to miss modes.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can force the entire mass matrix and frequency range to be scaled via **FRQSCL (p. 777)**,ON. Doing so brings the stiffness and mass matrices closer together in terms of orders of magnitude, improving efficiency and reducing the likelihood of missed modes. The resulting eigenvalues are then automatically scaled back to the original system. If you are using micro MKS units, where the density is typically very small compared to the stiffness, you may want to force scaling on.

If the stiffness and mass are on the same scale, **FRQSCL (p. 777)**,ON has no effect.

This command is not valid and has no effect when used with **MSAVE (p. 1183)**,ON in a modal analysis with the PCG Lanczos mode extraction method.

Menu Paths

This command cannot be accessed from a menu.

FSCALE, *RFACT*, *IFACT*

Scales force load values in the database.

SOLUTION (p. 38): FE Forces (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RFACT

Scale factor for the real component. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor.

IFACT

Scale factor for the imaginary component. Zero (or blank) defaults to 1.0. Use a small number for a zero scale factor.

Notes

Scales force load (force, heat flow, etc.) values in the database. Scaling applies to the previously defined values for the selected nodes (**NSEL (p. 1266)**) and the selected force labels (**DOFSEL (p. 569)**). Issue **FLIST (p. 766)** command to review results. Solid model boundary conditions are not scaled by this command, but boundary conditions on the FE model are scaled.

Note:

Such scaled FE boundary conditions may still be overwritten by unscaled solid model boundary conditions if a subsequent boundary condition transfer occurs.

FSCALE (p. 778) does not work for tabular boundary conditions.

This command is also valid in PREP7.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Operate>Scale FE Loads>Forces

Main Menu>Solution>Define Loads>Operate>Scale FE Loads>Forces

---

FSSECT, *RHO*, *NEV*, *NLOD*, *KBR*

Calculates and stores total linearized stress components.

POST1 (p. 51): Path Operations (p. 54)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

RHO

In-plane (X-Y) average radius of curvature of the inside and outside surfaces of an axisymmetric section. If zero (or blank), a plane or 3D structure is assumed. If nonzero, an axisymmetric structure is assumed. Use a suitably large number (see the *Mechanical APDL Theory Reference*) or use -1 for an axisymmetric straight section.

NEV

Event number to be associated with these stresses (defaults to 1).

NLOD

Loading number to be associated with these stresses (defaults to 1).

KBR

For an axisymmetric analysis (*RHO* $\neq$ 0):

0

Include the thickness-direction bending stresses

1

Ignore the thickness-direction bending stresses

2

Include the thickness-direction bending stress using the same formula as the Y (axial direction) bending stress. Also use the same formula for the shear stress.

Notes

Calculates and stores the total linearized stress components at the ends of a section path (**PATH (p. 1354)**) (as defined by the first two nodes with the **PPATH (p. 1463)** command). The path must be entirely within the selected elements (that is, there must not be any element gaps along the path). Stresses are stored according to the fatigue event number and loading number specified. Locations (one for each node) are associated with those previously defined for these nodes (FL) or else they are automatically defined. Stresses are separated into six total components (SX through SXZ) and six membrane-plus-bending (SX

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

through SXZ) components. The temperature at each end point and the current time are also stored along with the total stress components. Calculations are made from the stresses currently in the database (last **SET (p. 1724)** or **LCASE (p. 1019)** command). Stresses are stored as section coordinate components if axisymmetric or as global Cartesian coordinate components otherwise, regardless of the active results coordinate system (**RSYS (p. 1639)**). The FSLIST command may be used to list stresses. The FS command can be used to modify stored stresses. See also the **PRSECT (p. 1520)** and **PLSECT (p. 1440)** commands for similar calculations.

---

FSSPARM, *PORT1*, *PORT2*

Calculates reflection and transmission properties of a frequency selective surface.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | Premium | Enterprise | **PrepPost** | Solver | AS add-on

PORT1

Port number of input port. Defaults to 1.

PORT2

Port number of output port. Defaults to 1.

Notes

FSSPARM (p. 780) calculates reflection and transmission coefficients, power reflection and transmission coefficients, and return and insertion losses of a frequency selective surface.

Menu Paths

Main Menu>General Postproc>Elec&Mag Calc>Port>FSS Parameters

FSUM, *LAB*, *ITEM*

Sums the nodal force and moment contributions of elements.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LAB

Coordinate system in which to perform summation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(blank)

Sum all nodal forces in global Cartesian coordinate system (default).

RSYS

Sum all nodal forces in the currently active RSYS coordinate system.

ITEM

Selected set of nodes.

(blank)

Sum all nodal forces for all selected nodes (default), excluding contact elements.

CONT

Sum all nodal forces for contact nodes only.

BOTH

Sum all nodal forces for all selected nodes, including contact elements.

Notes

Sums and prints, in each component direction for the total selected node set, the nodal force and moment contributions of the selected elements attached to the node set. Selecting a subset of nodes (**NSEL (p. 1266)**) and then issuing this command will give the total force acting on that set of nodes (default), excluding surface-to-surface, node-to-surface, line-to-line, and line-to-surface contact elements (TARGE169, TARGE170, CONTA172, CONTA174, CONTA175, and CONTA177).

Setting *ITEM* = CONT sums the nodal forces and moment contributions of the selected contact elements (CONTA172, CONTA174, CONTA175, and CONTA177). Setting *ITEM* = BOTH sums the nodal forces for all selected nodes, including contact elements.

Nodal forces associated with surface loads are not included. The effects of nodal coupling and constraint equations are ignored. Moment summations are about the global origin unless another point is specified with the **SPOINT (p. 1836)** command. This vector sum is printed in the global Cartesian system unless it is transformed (**RSYS (p. 1639)**) and a point is specified with the **SPOINT (p. 1836)** command. By default, the sum is done in global Cartesian, and the resulting vector is transformed to the requested system.

The *LAB* = RSYS option transforms each of the nodal forces into the active coordinate system before summing and printing. The **FORCE (p. 772)** command can be used to specify which component (static, damping, inertia, or total) of the nodal load is to be used. This command output is included in the **NFORCE (p. 1216)** command.

The command should not be used with axisymmetric elements because it might calculate a moment where none exists. Consider, for example, the axial load on a pipe modeled with an axisymmetric shell element. The reaction force on the end of the pipe is the total force (for the full 360 degrees) at that location. The net moment about the centerline of the pipe would be zero, but the program would incorrectly calculate a moment at the end of the element as the force multiplied by the radius.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The command is not valid for elements that operate solely within the nodal coordinate system with 1D option activated and rotated nodes (**NROTAT (p. 1264)**).

Using FSUM (p. 780) with the NLGEOM (p. 1231) Command

If you have activated large deflection (**NLGEOM (p. 1231)**,ON), the **FSUM (p. 780)** command generates the following message:

```
Summations based on final geometry and
   will not agree with solution reactions.
```

The message warns that the moment summations may not equal the real moment reactions. When calculating moment summations, the **FSUM (p. 780)** command assumes that the summation of rotations applies; however, it does not apply for large rotations, which require pseudovector representation to sum the rotations.

In contrast, the results for force reactions will be correct because they depend upon linear displacement vectors (which can be added).

Using FSUM (p. 780) in a Spectrum or PSD Analysis (ANTYPE (p. 162), SPECTR)

When using **FSUM (p. 780)** in a spectrum analysis (after the combination file has been input through **/INPUT (p. 948)**,,MCOM and when **SPOPT (p. 1837)** has not been issued with *Elcalc* = YES during the spectrum analysis), or in a PSD analysis when postprocessing 1-sigma results (loadstep 3, 4, or 5), the following message will display in the printout header:

```
(Spectrum analysis summation is used)
```

This message means that the summation of the element nodal forces is performed prior to the combination of those forces. In this case, **RSYS (p. 1639)** does not apply. The forces are in the nodal coordinate systems, and the vector sum is always printed in the global coordinate system.

The spectrum analysis summation is available when the element results are written to the mode file, Jobname.mode (*MSUPkey* = Yes on the **MXPAND (p. 1203)** command).

Because modal displacements cannot be used to calculate contact element nodal forces, *ITEM* does not apply to spectrum and PSD analyses.

Menu Paths

Main Menu>General Postproc>Nodal Calcs>Total Force Sum

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FTRAN

Transfers solid model forces to the finite element model.

SOLUTION (p. 38): Solid Forces (p. 44)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Forces are transferred only from selected keypoints to selected nodes. The **FTRAN (p. 783)** operation is also done if the **SBCTRAN (p. 1647)** command is issued or automatically done upon initiation of the solution calculations (**SOLVE (p. 1822)**).

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Operate>Transfer to FE>Forces

Main Menu>Solution>Define Loads>Operate>Transfer to FE>Forces

FTYPE,*FileType*,*PresType*

Specifies the file type and pressure type for the subsequent import of source points and pressures.

/MAP (p. 63): Pressure Mapping (p. 63)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FileType

Type of file from which the pressure data will be retrieved (no default):

CFXTBR

File from a CFX Transient Blade Row (TBR) analysis export.

CFDPOST

File from a CFD-Post BC Profile export.

FORMATTED

Formatted file.

CSV

Comma-Separated Values file.

PresType

Type of pressure data contained in the file:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Only real-valued pressures are on the file.

1

Real-valued and imaginary-valued pressures are on the file (default).

Notes

CFX Transient Blade Row files (*FileType* = CFXTBR) are obtained from the **Export Results** Tab in CFX-Pre, with **[Export Surface Name]: Option** set to `Harmonic Forced Response`.

CFD-Post files (*FileType* = CFDPOST) are obtained from the **Export** action in CFD-Post with **Type** set to `BC Profile`.

Formatted files (*FileType* = FORMATTED) contain the coordinates and pressure data in fixed-format columns in the order `x, y, z, pressure`. You may have other columns of data in the file which can be skipped over in the *Format* specifier on the **READ (p. 1578)** command, but the data must be in that order.

Comma-separated values files (*FileType* = CSV) contain the coordinates and pressure data in comma-separated fields. The data can be in any order, and other fields of data may also be present.

Menu Paths

This command cannot be accessed from a menu.

FVMESH, *KEEP*

Generates nodes and tetrahedral volume elements from detached exterior area elements (facets).

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEEP

Specifies whether to keep the area elements after the tetrahedral meshing operation is complete.

0

Delete area elements (default).

1

Keep area elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **FVMESH (p. 784)** command generates a tetrahedral volume mesh from a selected set of detached exterior area elements (facets). (Detached elements have no solid model associativity.) The area elements can be triangular-shaped, quadrilateral-shaped, or a mixture of the two.

The **FVMESH (p. 784)** command is in contrast to the **VMESH (p. 2140)** command, which requires a volume to be input.

The main tetrahedra mesher (**MOPT (p. 1151)**,VMESH,MAIN) is the only tetrahedra mesher that supports the **FVMESH (p. 784)** command. The alternate tetrahedra mesher (**MOPT (p. 1151)**,VMESH,ALTERNATE) does not support **FVMESH (p. 784)**. MESH200 elements do not support **FVMESH (p. 784)**.

Tetrahedral mesh expansion (**MOPT (p. 1151)**,TETEXPND,*Value*) is supported for both the **FVMESH (p. 784)** and **VMESH (p. 2140)** commands. Tet-mesh expansion is the only mesh control supported by **FVMESH (p. 784)**.

Triangle- or quadrilateral-shaped elements may be used as input to the **FVMESH (p. 784)** command. Where quadrilaterals are used, the default behavior is for the pyramid-shaped elements to be formed at the boundary when the appropriate element type is specified. See the **MOPT (p. 1151)**,PYRA command for details.

The **FVMESH (p. 784)** command does not support multiple "volumes." If you have multiple volumes in your model, select the surface elements for one "volume," while making sure that the surface elements for the other volumes are deselected. Then use **FVMESH (p. 784)** to generate a mesh for the first volume. Continue this procedure by selecting one volume at a time and meshing it, until all of the volumes in the model have been meshed.

If an error occurs during the meshing operation, the area elements are kept even if *KEEP* = 0.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh>Tet Mesh From>Area Elements

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information
of ANSYS, Inc. and its subsidiaries and affiliates.

G Commands

GAUGE, *Opt*, *FREQ*

Gauges the problem domain for a magnetic edge-element formulation.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Opt

Type of gauging to be performed:

ON

Perform tree gauging of the edge values (default).

OFF

Gauging is off. (You must specify custom gauging via APDL specifications.)

STAT

Gauging status (returns the current *Opt* and *FREQ* values)

FREQ

The following options are valid when *Opt* = ON:

0

Generate tree-gauging information once, at the first load step. Gauging data is retained for subsequent load steps. (This behavior is the default.)

1

Repeat gauging for each load step. Rewrites the gauging information at each load step to accommodate changing boundary conditions on the AZ degree of freedom (for example, adding or deleting AZ constraints via the **D (p. 483)** or **CE (p. 297)** commands).

Notes

The **GAUGE (p. 787)** command controls the tree-gauging procedure required for electromagnetic analyses using an edge-based magnetic formulation (elements SOLID226, SOLID227, SOLID236 and SOLID237).

Gauging occurs at the solver level for each solution (**SOLVE (p. 1822)**). It sets additional zero constraints on the edge-flux degrees of freedom AZ to produce a unique solution; the additional constraints are removed after solution.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Use the *FREQ* option to specify how the command generates gauging information for multiple load steps.

Access the gauging information via the _TGAUGE component of gauged nodes. The program creates and uses this component internally to remove and reapply the AZ constraints required by gauging. If *FREQ* = 0, the _TGAUGE component is created at the first load step and is used to reapply the tree gauge constraints at subsequent load steps. If *FREQ* = 1, the tree-gauging information and the _TGAUGE component are generated at every load step

If gauging is turned off (**GAUGE (p. 787)**,OFF), you must specify your own gauging at the APDL level.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Magnetics>Options Only>Gauging

Main Menu>Solution>Load Step Opts>Magnetics>Options Only>Gauging

---

GCDEF,*Option*,*SECT1*,*SECT2*,*MATID*,*REALID*,*SECT1END*,*SECT2END*

Defines interface interactions between general contact surfaces.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Option to be performed.

(blank)

Retain the previous *Option* setting between *SECT1* and *SECT2*.

AUTO

Define auto asymmetric contact between surfaces *SECT1* and *SECT2*.

SYMM

Define symmetric contact between surfaces *SECT1* and *SECT2*.

ASYM

Define asymmetric contact with *SECT1* as the source (contact) surface and *SECT2* as the target surface.

EXCL

Exclude contact between surfaces *SECT1* and *SECT2*. *MATID*, *REALID*, *SECT1END*, and *SECT2END* are ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DELETE

Remove the given definition from the **GCDEF (p. 788)** table. *MATID*, *REALID*, *SECT1END*, and *SECT2END* are ignored.

Note that **GCDEF (p. 788)**,DELETE,ALL,ALL does not remove the entire **GCDEF (p. 788)** table; it merely removes any existing **GCDEF (p. 788)**,,ALL,ALL definitions, while leaving intact any existing **GCDEF (p. 788)** definitions that are more specific.

To remove the entire **GCDEF (p. 788)** table, issue **GCDEF (p. 788)**,DELETE,TOTAL.

It is good practice to list all definitions using **GCDEF (p. 788)**,LIST before and after a **GCDEF (p. 788)**,DELETE command.

LIST

List stored **GCDEF (p. 788)** data entries. *MATID* and *REALID* are ignored.

GCDEF (p. 788),LIST lists all defined interactions. **GCDEF (p. 788)**,LIST,*SECT1*,*SECT2* lists the entry for the specific *SECT1*/*SECT2* interaction. **GCDEF (p. 788)**,LIST,ALL,ALL lists only the ALL,ALL entry (if any).

TABLE

List interpreted general contact definitions in tabular format. *MATID* and *REALID* are ignored.

By default, rows/columns of the table that match neighboring rows/columns are compressed to simplify the table. Issue **GCDEF (p. 788)**,TABLE,TOTAL to list the entire **GCDEF (p. 788)** table without removal of duplicate rows and columns.

TABLESOL

List a table showing actual interactions considered during solution. This option is only available after the **SOLVE (p. 1822)** command. *MATID* and *REALID* are ignored.

The table shows MAT and REAL entries considered during the solution (actual contact may or may not have occurred). This is in contrast to **GCDEF (p. 788)**,TABLE, which shows the user specifications. For auto asymmetric contact, TABLESOL indicates which of the possible contact versus target surface combinations was considered.

SECT1, SECT2

Section numbers representing *contact* (*SECT1*) and *target* (*SECT2*) general contact surfaces (no defaults). (In most cases, the actual determination of contact versus target surfaces takes place during **SOLVE (p. 1822)**.)

A node component name is also valid input for *SECT1* and *SECT2*. The component name is not stored. Instead, the program loops through all valid section IDs found in the component and creates **GCDEF (p. 788)** entries for all possible SECT1/SECT2 combinations that result. These entries are reflected in the *Option* = LIST and TABLE output. Section IDs can be further controlled by adding an extension (_EDGE, _FACE, _VERT, _TOP, or _BOT) to the end of the component name. See Specifying General Contact Interactions Between Nodal Components in the *Contact Technology Guide* for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The following labels are also valid input:

SELF

Self contact.

ALL

All general contact sections IDs.

ALL_EDGE

Section IDs of all CONTA177 general contact line elements (which may be on the edges of 3D solid and shell base elements, or on beam base elements).

ALL_FACE

Section IDs of all general contact elements on faces of solid or shell base elements (both top and bottom faces of shell elements).

ALL_VERT

Section IDs of all CONTA175 general contact vertex elements (which may be on convex corners of solid and shell base elements, and on endpoints of beam base elements).

ALL_TOP

Section IDs of all general contact elements on top faces of shell base elements, and faces of solid base elements.

ALL_BOT

Section IDs of general contact elements on bottom faces of shell base elements, and faces of solid base elements.

The ALL_ labels apply to all defined general contact element section IDs in the model without regard to the select status of the elements or attached nodes.

See *SECT1*/*SECT2* Interactions (p. 791) for a description of how the various inputs for *SECT1* and *SECT2* are interpreted.

MATID

Material ID number for general contact interaction properties at the *SECT1*/*SECT2* interface. If zero or blank, the previous setting of *MATID* for *SECT1*/*SECT2* (if any) is retained.

As an example, you could specify "always bonded" contact behavior at the interface by setting *MATID* to 2 and issuing the command **TB (p. 1899)**,INTER,2,,,ABOND.

The coefficient of friction MU is also defined by *MATID*. Since the default is *MATID* = 0, frictionless contact (MU = 0) is assumed by default.

REALID

Real constant ID number for general contact interaction properties at the *SECT1*/*SECT2* interface. If zero or blank, the previous setting of *REALID* for *SECT1*/*SECT2* (if any) is retained.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

As an example, you could specify contact stiffness (FKN) = 10 at the interface by setting *REALID* to 14 and issuing the command **R (p. 1565)**,14,,,10.

SECT1END*, *SECT2END

Last section number in the range. For *Option*= LIST, TABLE, or TABLESOL, data entries are processed for *contact* section numbers in the range from *SECT1* to *SECT1END*, and *target* section numbers in the range from *SECT2* to *SECT2END*. *SECT1END* and *SECT2END* are ignored for all other *Option* labels.

Notes

GCDEF (p. 788) defines the interface interaction between general contact surfaces identified by *SECT1* and *SECT2*. **GCDEF (p. 788)** commands are order independent in most cases.

GCDEF (p. 788) definitions should be issued after **GCGEN (p. 792)**. They are saved in the database and are written to and read from `.cdb` files.

See General Contact in the *Contact Technology Guide* for more information on the overall procedure to create general contact.

***SECT1*/*SECT2* Interactions**

The most specific types of general contact definitions are those described below:

SECT1 = any valid general surface section ID and *SECT2* = any different valid general surface section ID: *Option*, *MATID*, and *REALID* apply to general surface interactions between *SECT1* and *SECT2*. This is one of the most specific types of general contact definitions and is never overridden.

SECT1 = any valid general surface section ID and *SECT2* = *SECT1*: *Option*, *MATID*, and *REALID* apply to general surface self contact interactions involving *SECT1*. This is one of the most specific types of general contact definitions and is never overridden.

The remaining general contact definition types can be overridden by the above two general contact definition types:

SECT1 = ALL and *SECT2* = ALL: *Option*, *MATID*, and *REALID* apply to all general surface interactions, except where overridden by a more specific **GCDEF (p. 788)** command.

SECT1 = ALL and *SECT2* = SELF or *SECT1* = SELF and *SECT2* = ALL: *Option*, *MATID*, and *REALID* apply to all general surface self contact interactions, except where overridden by a more specific **GCDEF (p. 788)** command.

SECT1 = ALL and *SECT2* = any valid general surface section ID: *Option*, *MATID*, and *REALID* apply to all general surface interactions that include *SECT2*, except where overridden by a more specific **GCDEF (p. 788)** command.

SECT1 = any valid general surface section ID and *SECT2* = ALL: *Option*, *MATID*, and *REALID* apply to all general surface interactions that include *SECT1*, except where overridden by a more specific **GCDEF (p. 788)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

GCGEN, *Option*, *FeatureANGLE*, *EdgeKEY*, *SplitKey*, *SelOpt*

Creates contact elements for general contact.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Option to be performed.

NEW

Create a new general contact definition. This option removes all existing general contact elements and generates new elements with new section IDs. Any existing **GCDEF (p. 788)** specifications, general contact **SECTYPE (p. 1697)**/**SECDATA (p. 1655)** data, and general contact element types are also removed. If no general contact elements or data exist, this option behaves the same as *Option* = UPDATE.

UPDATE

Generate general contact elements on newly added (or selected) base elements. Newly generated contact elements are assigned new Section IDs. Existing general contact elements remain with their previously assigned section IDs and element attributes. Existing **GCDEF (p. 788)** and **SECTYPE (p. 1697)**/**SECDATA (p. 1655)** general contact data are respected. (This is the default option.)

DELETE

Remove all existing general contact elements. Existing **GCDEF (p. 788)** specifications, general contact **SECTYPE (p. 1697)**/**SECDATA (p. 1655)** data, and general contact element types are also removed.

SELECT

Select all existing general contact elements.

FeatureANGLE

Angle tolerance for determining feature edges (*EdgeKEY*) and general surfaces (*SplitKey*). Default = 42 degrees.

EdgeKEY

Key that controls creation of general contact line and vertex elements (CONTA177, CONTA175) on base elements. Line elements are overlaid on feature edges of 3D deformable bodies and on perimeter edges of 3D shell structures; vertex elements are overlaid on convex corners of deformable

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

bodies and shell structures (2D or 3D), and on endpoints of 3D beam structures. See Understanding *FeatureANGLE* (p. 794) for an explanation of the feature edge criteria.

0

Exclude all edges and vertices (default).

1

Include CONTA177 elements on feature edges only.

2

Include CONTA177 elements on shell perimeter edges only.

3

Include CONTA177 elements on feature edges and shell perimeter edges.

4

Include CONTA177 elements on feature edges and shell perimeter edges, and CONTA175 elements on vertices.

5

Include CONTA175 elements on vertices only.

EdgeKey > 0 is intended to add extra contact constraint between an edge or vertex of one surface and other 3D surfaces. Both edge and vertex contact always use the penalty method and only include structural degrees of freedom (UX, UY, UZ).

GCGEN (p. 792) always creates CONTA177 elements on base beam elements, regardless of the *EdgeKEY* setting.

SplitKey

Key that controls how section IDs and contact element type IDs are assigned to surfaces.

SPLIT

Assign a different section ID and contact element type ID for every general surface of the selected base elements (default). See Understanding *FeatureANGLE* (p. 794) for an explanation of the split criteria. Different section IDs are assigned to the top and bottom surfaces of 2D shell and 3D shell bodies. This allows different **GCDEF (p. 788)** specifications for different portions of the assembly.

PART

Assign a different section ID and contact element type ID for every general surface which covers a physical part. Compared to the SPLIT option, this option produces fewer unique section IDs, which can make it easier to specify interactions via **GCDEF (p. 788)**. However, it may also result in a less accurate and/or less efficient solution.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SelOpt

Key that controls which base elements are considered for general contact.

ATTACH

Use a recursive adjacency selection to obtain complete physical parts (default). This selection starts from the selected base elements, progressively adding elements adjacent to the faces of selected elements until the edge of a part is reached. Then general contact elements are generated.

SELECT

Use only the initially selected base elements to generate general contact elements.

Notes

GCGEN (p. 792) creates general contact elements on the exterior faces of selected base elements. The base elements can be 2D or 3D solids, 3D beams, 2D shells (top and bottom), or 3D shells (top and bottom). The contact element types can be CONTA172, CONTA174, CONTA175, and/or CONTA177, depending upon the types of base elements in the model and the specified **GCGEN (p. 792)** options. General contact elements are identified by a real constant ID equal to zero.

You can control contact interactions between specific general contact surfaces that could potentially be in contact by using the **GCDEF (p. 788)** command. See General Contact in the *Contact Technology Guide* for more information on the overall procedure to create general contact.

Understanding *FeatureANGLE*

The exterior facets of the selected base solid and shell elements are divided into subsets based on the angle between the normals of neighboring faces. On a flat or smooth surface, adjacent exterior element faces have normals that are parallel or nearly parallel; that is, the angle between the adjacent normals is near zero degrees.

When the angle between the normals of two adjacent faces is greater than *FeatureANGLE*, the two faces are considered to be on two separate surfaces (*SplitKey* = SPLIT). The edge between the faces may be convex or concave. A convex (or outside) edge is considered to be a feature edge and may be affected by the *EdgeKEY* setting. For more information, see Feature Angle (*FeatureANGLE*) in the *Contact Technology Guide*.

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which this command applies (defaults to 1)

Lab1, Lab2, Lab3, . . . , Lab12

Command labels (for example, **PLNSOL (p. 1425)**,S,X)

Notes

This command controls the type of element or graph display that appears when you issue the **GPLOT (p. 866)** command when the **/GTYPE (p. 883)**,,(ELEM or GRPH) entity type is active. If you have multiple plotting windows enabled, you can also use **/GCMD (p. 795)** to select one window when you wish to edit its contents.

For related information, see the descriptions of the **GPLOT (p. 866)** and **/GTYPE (p. 883)** commands in this manual.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Multi-Plot Contrls

/GCOLUMN, *CURVE*, *STRING*

Allows the user to apply a label to a specified curve.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

CURVE

Curve number on which label will be applied (integer value between 1 and 10).

STRING

Name or designation that will be applied to the curve (8 characters max).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command is used for an array parameter plot (a plot created by the ***VPLOT (p. 2146)** command). Normally the label for curve 1 is "COL 1", the label for curve 2 is "COL 2" and so on; the column number is the field containing the dependent variables for that particular curve. Issuing **/GCOLUMN (p. 795)**,*CURVE*, with no string value specified resets the label to the original value.

Menu Paths

Utility Menu>PlotCtrls>Style>Graphs>Modify Curve

GENOPT

Specifies "General options" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Solution>General Options

GEOM, *K2D*, *NDIV*

Defines the geometry specifications for the radiation matrix calculation.

AUX12 (p. 62): Radiation Matrix Method (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

K2D

Dimensionality key:

0

3D geometry (default)

1

2D geometry (plane or axisymmetric)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NDIV

Number of divisions in an axisymmetric model. Used only with *K2D* = 1. Defaults to 0 (2D plane). The 2D model is internally expanded to a 3D model based on the number of divisions specified (6 ≤ *NDIV* ≤ 90). For example, *NDIV* of 6 is internally represented by six 60° sections.

Menu Paths

Main Menu>Radiation Opt>Matrix Method>Other Settings

GEOMETRY

Specifies "Geometry" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Status>Preprocessor>Solid Model

***GET**,*Par*,*Entity*,*ENTNUM*,*Item1*,*IT1NUM*,*Item2*,*IT2NUM*

Retrieves a value and stores it as a scalar parameter or part of an array parameter.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Par

The name of the resulting parameter. See ***SET (p. 1720)** for name restrictions.

Entity

Entity keyword. Valid keywords are NODE, ELEM, KP, LINE, AREA, VOLU, etc., as shown for *Entity* = in the tables below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ENTNUM

The number or label for the entity (as shown for *ENTNUM* = in the tables below). In some cases, a zero (or blank) *ENTNUM* represents all entities of the set.

Item1

The name of a particular item for the given entity. Valid items are as shown in the *Item1* columns of the tables below.

IT1NUM

The number (or label) for the specified *Item1* (if any). Valid *IT1NUM* values are as shown in the *IT1NUM* columns of the tables below. Some *Item1* labels do not require an *IT1NUM* value.

Item2,IT2NUM

A second set of item labels and numbers to further qualify the item for which data are to be retrieved. Most items do not require this level of information.

Notes

***GET (p. 797)** retrieves a value for a specified item and stores the value as a scalar parameter, or as a value in a user-named array parameter. An item is identified by various keyword, label, and number combinations. Usage is similar to the ***SET (p. 1720)** command except that the parameter values are retrieved from previously input or calculated results.

Example 8: *GET (p. 797) Usage

***GET (p. 797)**,A,ELEM,5,CENT,X returns the centroid x location of element 5 and stores the result as parameter A.

***GET (p. 797)** command operations, and corresponding get functions, return values in the active coordinate system (**CSYS (p. 441)** for input data or **RSYS (p. 1639)** for results data) unless stated otherwise.

A *get function* is an alternative in-line function that can be used instead of the ***GET (p. 797)** command to retrieve a value. For more information, see Using In-line Get Functions in the *Ansys Parametric Design Language Guide*.

Both ***GET (p. 797)** and ***VGET (p. 2118)** retrieve information from the active data stored in memory. The database is often the source, and sometimes the information is retrieved from common memory blocks that the program uses to manipulate information. Although POST1 and POST26 operations use a `*.rst` file, ***GET (p. 797)** data is accessed from the database or from the common blocks. Get operations do not access the `*.rst` file directly. For repeated gets of sequential items, such as from a series of elements, see the ***VGET (p. 2118)** command.

Most items are stored in the database after they are calculated and are available anytime thereafter. Items are grouped according to where they are usually first defined or calculated. Preprocessing data will often not reflect the calculated values generated from section data. Do not use ***GET (p. 797)** to obtain data from elements that use calculated section data, such as beams or shells.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When the value retrieved by ***GET (p. 797)** is a component name, the resulting character parameter is limited to 32 characters. If the component name is longer than 32 characters, the remaining characters are ignored.

Most of the *general* items listed below are available from all modules. Each of the sections for accessing ***GET (p. 797)** parameters are shown in the following order:

- *GET General Entity Items (p. 799)
- *GET Preprocessing Entity Items (p. 803)
- *GET Solution Entity Items (p. 829)
- *GET Postprocessing Entity Items (p. 832)

The ***GET (p. 797)** command is valid in any processor.

General Items

*GET General Entity Items

- Table 115: *GET General Items, Entity = ACTIVE (p. 799)
- Table 116: *GET General Items, Entity = CMD (p. 800)
- Table 117: *GET General Items, Entity = COMP (p. 800)
- Table 118: *GET General Items, Entity = GRAPH (p. 801)
- Table 119: *GET General Items, Entity = PARM (p. 802)
- Table 120: *GET General Items, Entity = ***TBTYPE*** (p. 803)

Table 115: *GET General Items, Entity = ACTIVE

Entity **= ACTIVE,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797), Par, ACTIVE, 0,** ***Item1**,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
INT		Current interactive key: 0=off, 2=on.
IMME		Current immediate key: 0=off, 1=on.
MENU		Current menu key: 0=off, 1=on.
PRKEY		Printout suppression status: 0=**/NOPR (p. 1251)**, 1=**/GOPR (p. 865)** or **/GO (p. 865)**
UNITS		Units specified by **/UNITS (p. 2054)** command: 0 = USER, 1 = SI, 2 = CGS, 3 = BFT, 4 = BIN, 5 = MKS, 6 = MPA, 7 = uMKS.
ROUT		Current routine: 0 = Begin level, 17 = PREP7, 21 = SOLUTION, 31 = POST1, 36 = POST26, 52 = AUX2, 53 = AUX3, 62 = AUX12, 65 = AUX15.
TIME	WALL,CPU	Current wall clock or CPU time. Current wall clock will continue to accumulate during a run and is *not* reset to zero at midnight.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = ACTIVE, *ENTNUM* = 0 (or blank)		
GET (p. 797), Par, ACTIVE, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
DBASE	LDATE	Date of first modification of any database quantity required for POST1 operation. The parameter returned is *Par* = YEAR*10000 + MONTH*100 + DAY.
DBASE	LTIME	Time of last modification of any database quantity required for POST1 operation. The parameter returned is *Par* = HOURS*10000 + MINUTES*100 + SECONDS.
REV		Minor release revision number (5.6, 5.7, 6.0 etc.). Letter notation (for example, 5.0A) is not included.
TITLE	0,1,2,3,4	**Item2:** START **IT2NUM:** *N* Current title string of the main title (*IT1NUM*=0 or blank) or subtitle 1, 2, 3, or 4 (*IT1NUM*=1,2,3, or 4). A character parameter of up to 8 characters, starting at position *N*, is returned.
JOBNAM		**Item2:** START **IT2NUM:***N* Current Jobname. A character parameter of up to 8 characters, starting at position *N*, is returned. Use ***DIM (p. 530)** and ***DO (p. 567)** to get all 32 characters.
PLATFORM		The current platform.
NPROC	CURR, MAX, MAXP	The number of processors being used for the current session, or the maximum total number of processors (physical and virtual) available on the machine, or the maximum number of physical processors available on the machine. This only applies to shared-memory parallelism.
NUMCPU		Number of distributed processes being used (distributed-memory parallel solution).

Table 116: *GET General Items, Entity = CMD

Entity = CMD, *ENTNUM* = 0 (or blank) **The following items are valid for all commands except star (*) commands and non-graphics slash (/) commands.**		
GET (p. 797), *Par*, CMD, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
STAT		Status of previous command: 0=found, 1=not found (unknown).
NARGS		Field number of last nonblank field on the previous command.
FIELD	2,3...*N*	Numerical value of the *N*th field on the previous command. Field 1 is the command name (not available)

Table 117: *GET General Items, Entity = COMP

Entity = COMP, *ENTNUM* = 0 (or blank)		
GET (p. 797), *Par*, COMP, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
NCOMP		Total number of components and assemblies currently defined.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= COMP,** ***ENTNUM*** **=** ***n*** **(*n*th component)**		
GET (p. 797)**, **Par*, COMP, *n*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
NAME		Name of the *N*th item (component or assembly) in the list of components and assemblies. A character parameter is returned.
Entity **= COMP,** ***ENTNUM*** **=** ***Cname*** **(component or assembly name)**		
GET (p. 797)**, **Par*, COMP, *Cname*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
TYPE		Type of component *Cname:* 1=Nodes, 2=Elements, 6=Keypoints, 7=Lines, 8=Areas, 9=Volumes, 11-15=Subcomponents (11=subcomponent at level 1, 12=subcomponent at level 2, etc.).
NSCOMP		Number of subcomponents (for assemblies).
SNAME	*N*	Name of *N*th subcomponent of assembly *Cname*. A character parameter is returned.

Table 118: *GET General Items, Entity = GRAPH

Entity **=GRAPH,** ***ENTNUM*** **= N (window number)**		
GET (p. 797)**, **Par*, GRAPH, N, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
ACTIVE		**/WINDOW (p. 2177)** status: 0=off, 1=on.
ANGLE		**/ANGLE (p. 140)** *THETA* angle.
CONTOUR	*Name*	**/CONTOUR (p. 415)** value for *Name*, where *Name* = VMIN, VINC, or NCONT.
DIST		**/DIST (p. 536)** *DVAL* value.
DSCALE	DMULT	**/DSCALE (p. 575)** *DMULT* value.
EDGE		**/EDGE (p. 594)** *KEY* value.
FOCUS	X, Y, Z	**/FOCUS (p. 771)** *CIN*, *YF*, or *ZF* value.
GLINE		**/GLINE (p. 860)** *STYLE* value.
MODE		**/USER (p. 2061)** or **/AUTO (p. 207)** setting: 0=user, 1=auto.
NORMAL		**/NORMAL (p. 1253)** *KEY* value.
RANGE	XMIN, XMAX, YMIN, YMAX	**/WINDOW (p. 2177)** *XMIN*, *XMAX*, *YMIN* , or *YMAX* screen coordinates.
RATIO	X, Y	**/RATIO (p. 1572)** *RATOX* or *RATOY*value.
SSCALE	SMULT	**/SSCALE (p. 1847)** *SMULT* value.
TYPE		**/TYPE (p. 2034)** *Type* value.
VCONE	ANGLE	**/VCONE (p. 2078)** *PHI* angle.
VIEW	X, Y, Z	**/VIEW (p. 2131)** *XV*, *YV*, or *ZV* value.
VSCALE	VRATIO	**/VSCALE (p. 2160)** *VRATIO* value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **=GRAPH, *ENTNUM* = 0 (or blank)**		
GET (p. 797), *Par*, GRAPH, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
DISPLAY		**/SHOW (p. 1785)** *VECT* setting: 0=raster, 1=vector.
ERASE		**/ERASE (p. 653)** or **/NOERASE (p. 1249)** setting: 0=no erase, 1=erase.
NDIST		Largest nodal range for current model (DX, DY, or DZ of the model).
NUMBER		**/NUMBER (p. 1290)** *NKEY* value.
PLOPTS	*Name*	**/PLOPTS (p. 1435)** setting of *Name*, where *Name*=LEG1, LEG2, LEG3, INFO, FRAM, TITL, MINM, or VERS.
SEG		Segment capability of graphics driver: 0=no segments available, 1=erasable segments available, 2=non-erasable segments available.
SHRINK		**/SHRINK (p. 1794)** *RATIO* value.

Table 119: *GET General Items, Entity = PARM

Entity **= PARM, *ENTNUM* = 0 (or blank)**		
GET (p. 797), *Par*, PARM, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
MAX		Total number of parameters currently defined.
BASIC		Number of scalar parameters (excluding parameters beginning with an underscore _, array parameters, and character parameters).
LOC	*Num*	Name of the parameter at the *Num* location in the parameter table. A character parameter is returned.
Entity **= PARM, *ENTNUM* = Name (parameter name)**		
GET (p. 797), *Par*, PARM, *Name*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
TYPE		Parameter type: 0 = scalar, 1 = array, 2 = table, 3 = character scalar, 4 = character array, -1 = undefined
DIM	X(1), Y(2), Z(3), (4), (5)	Row (X or 1), Column (Y or 2), Plane (Z or 3), Book (4), or Shelf (5) dimension of array parameter.
CSYS		Local coordinate system number
VAR	1, 2, 3, 4, 5	Name of primary variables 1-5. Primary variable names are character strings.
If Item1 = DIM and ITNUM refers to a dimension that does not exist, the program assigns a value of -1 to *Par*. If Item1 = CSYS and no local coordinate system number was assigned to the array parameter (*Name*), the program assigns a value of ZERO to *Par*.		

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= PARM,** ***ENTNUM*** **= Name (parameter name)**		
GET (p. 797)**, **Par**, PARM, **Name**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
If Item1 = VAR and if IT1NUM refers to a primary variable that does not exist, the program assigns a blank value to *Par*.		

Table 120: *GET General Items, Entity = *TBTYPE*

Entity **=** ***TBTYPE*** **,** ***ENTNUM*** **=** ***MatID*** **(where TBTYPE is the material table type as defined via the TB (p. 1899) command, such (ELASTIC, CTE, etc.), and** ***MatID*** **is the material ID) Evaluates a material property coefficient for a given set of input field variables.**		
***GET (p. 797)**, **Par**, **TBTYPE**, **MatID**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM**, **Fld1**, **Fld2**,...*		
Item1	**IT1NUM**	**Description**
TBEV: Material table evaluation for query at a given field variable	*SINDEX* = Subtable index (1 - max number of subtables)	**Item2**: *CINDEX* = Coefficient index
		IT2NUM: *N* = Number of field variables input
		Fld1, *Fld2*, . . . , : *Val* = Value of the field variable(s), entered in the same order specified via the **TBFIELD (p. 1966)** command(s)

Preprocessing Items

GET (p. 797)**, **Par**, ACTIVE, 0, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
SEG		Segment capability of graphics driver: 0=no segments available, 1=erasable segments available, 2=non-erasable segments available.
CSYS		Active coordinate system.
DSYS		Active display coordinate system.
MAT		Active material.
TYPE		Active element type.
REAL		Active real constant set.
ESYS		Active element coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***Entity* = ACTIVE, *ENTNUM* = 0 (or blank)**		
GET (p. 797)*, *Par*, ACTIVE, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
SECT		Active section.
CP		Maximum coupled node set number in the model (includes merged and deleted sets until compressed out).
CE		Maximum constraint equation set number in the model (includes merged and deleted sets until compressed out).

Table 122: *GET Preprocessing items, Entity = AREA

***Entity* = AREA, *ENTNUM* = *N* (area number)**		
GET (p. 797)*, *Par*, AREA, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
ATTR	*Name*	Number assigned to the attribute, *Name*, where *Name*=MAT, TYPE, REAL, ESYS, KB,KE,SECN, NNOD, NELM, or ESIZ. (NNOD=number of nodes, NELM=number of elements, ESIZ=element size.)
ASEL		Select status of area *N*: -1=unselected, 0=undefined, 1=selected. Alternative get function: ASEL(*N*).
NXTH		Next higher area number above *N* in selected set (or zero if none found).
NXTL		Next lower area number below *N* in selected set (or zero if none found).
AREA		Area of area *N*. (**ASUM (p. 203)** or **GSUM (p. 881)** must have been performed sometime previously with at least this area *N* selected).
LOOP	1,2,...,*I*	*Item2*: LINE, *IT2NUM*: 1,2,...,*p* Line number of position *p* of loop *I*
***Entity* = AREA, *ENTNUM* = 0 (or blank)**		
GET (p. 797)*, *Par*, AREA, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
NUM	MAX, MIN	Highest or lowest area number in the selected set.
NUM	MAXD, MIND	Highest or lowest area number defined.
COUNT		Number of areas in the selected set.
AREA		Combined areas (from last **ASUM (p. 203)** or **GSUM (p. 881)**).
VOLU		Combined volume of areas (from last **ASUM (p. 203)** or **GSUM (p. 881)**. For 3D area elements, thickness is determined from area attributes (**AATT (p. 85)**). For 2D elements, area attributes are ignored and unit thickness is assumed.
CENT	X, Y, Z	Centroid X, Y, or Z location of areas (from last **ASUM (p. 203)** or **GSUM (p. 881)**).
IOR	X, Y, Z, XY, YZ, ZX	Moments of inertia about origin (from last **ASUM (p. 203)** or **GSUM (p. 881)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= AREA,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**, **Par**, AREA, 0, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
IMC	X, Y, Z, XY, YZ, ZX	Moments of inertia about mass centroid (from last **ASUM (p. 203)** or **GSUM (p. 881)**).
IPR	X, Y, Z	Principal moments of inertia (from last **ASUM (p. 203)** or **GSUM (p. 881)**).
IXV	X, Y, Z	Principal orientation X vector components (from last **ASUM (p. 203)** or **GSUM (p. 881)**).
IYV	X, Y, Z	Principal orientation Y vector components (from last **ASUM (p. 203)** or **GSUM (p. 881)**).
IZV	X, Y, Z	Principal orientation Z vector components (from last **ASUM (p. 203)** or **GSUM (p. 881)**).

Table 123: *GET Preprocessing Items, Entity = AXIS

Entity **= AXIS,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**, **Par**, AXIS, 0, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
COUNT	--	Number of defined sections.
NUM	MAX	Largest section number defined.
Entity **= AXIS,** ***ENTNUM*** **=** ***ID*** **(axis section identifier)**		
GET (p. 797)**, **Par**, AXIS, **ID**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
TYPE	--	Section type, for *ID* -- **SECTYPE (p. 1697)** command (always AXIS for axis sections).
NAME	--	Name defined for the given section ID number.
DATA	*nnn*	Where *nnn* is the location in the **SECDATA (p. 1655)** command for the given section ID number.

Table 124: *GET Preprocessing Items, Entity = CDSY

Entity **= CDSY,** ***ENTNUM*** **=** ***N*** **(coordinate system number)**		
GET (p. 797)**, **Par**, CDSY, **N**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
LOC	X, Y, Z	X, Y, or Z origin location in global Cartesian system.
ANG	XY, YZ, ZX	THXY, THYZ, or THZX rotation angle (in degrees) relative to the global Cartesian coordinate system.
ATTR	*Name*	Number assigned to *Name*, where *Name*=KCS, KTHET, KPHI, PAR1, or PAR2. The value -1.0 is returned for KCS if the coordinate system is undefined.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = CDSY, *ENTNUM* = *N* (coordinate system number)		
***GET (p. 797)**, *Par*, CDSY, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
NUM	MAX	The maximum coordinate system number

Table 125: *GET Preprocessing Items, Entity = CE

Entity = CE, *ENTNUM* = *N* (constraint equation set)		
***GET (p. 797)**, *Par*, CE, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
If N = 0, then		
MAX		Maximum constraint equation number
NUM		Number of constraint equations
If N > 0, then		
NTERM		Number of terms in this constraint equation
CONST		Constant term for this constraint equation
TERM	number	Item2 = NODE: Gives the node for this position in the constraint equation. Item2 = DOF: Gives the DOF number for this position in the constraint equation. (1–UX, 2–UY, 3–UZ, 4–ROTX, etc.) Item2 = COEF: Gives the coefficient for this position in the constraint equation.

Table 126: *GET Preprocessing Items, Entity = CMPB

Entity = CMPB, *ENTNUM* = *N* (composite beam section identification number)		
***GET (p. 797)**, *Par*, CMPB, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
COUNT		Number of defined sections. If Item1 = COUNT, then N is blank.
NUM	MAX	Largest section number defined. If IT1NUM = MAX, then N is blank.
EXIS		Returns a 1 if the section exists and if it is a CMPB section.
NAME		The 8-character section name defined via the **SECTYPE (p. 1697)** command.
One of the following: CBMX CBTE CBMD		Item2 = NTEM (the number of temperatures for **CBMX (p. 288)**, **CBTE (p. 289)**, or **CBMD (p. 287)** data).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= CMPB,** ***ENTNUM*** **=** ***N*** **(composite beam section identification number)**		
****GET (p. 797)*****,** ***Par*****, CMPB,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
One of the following: CBMX CBTE CBMD		Item2 = TVAL; IT2NUM = *nnn* where *nnn* is the temperature value (< = NTEM).
One of the following: CBMX CBTE CBMD	*nnn*	Item2 = TEMP; IT2NUM = *tval* Where *nnn* is the location in the **CBMX (p. 288)**, **CBTE (p. 289)**, or **CBMD (p. 287)** command for the given coefficient number, and *tval* is the temperature value.

Table 127: *GET Preprocessing Items, Entity = CP

Entity **= CP,** ***ENTNUM*** **=** ***N*** **(coupled node set)**		
****GET (p. 797)*****,** ***Par*****, CP,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
If N = 0, then		
MAX		Maximum coupled set number
NUM		Number of coupled sets
If N > 0, then		
DOF		The degree of freedom for this set (1–UX, 2–UY, 3–UZ, 4–ROTX, etc.)
NTERM		Number of nodes in this set.
TERM	number	Item2 = NODE: Gives the node for this position number in the coupled set.

Table 128: *GET Preprocessing Items, Entity = CSEC

Entity **= CSEC,** ***ENTNUM*** **= 0 (or blank)**		
****GET (p. 797)*****,** ***Par*****, CSEC, 0,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
COUNT	--	Number of defined sections.
NUM	MAX	Largest section number defined.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= CSEC,** ***ENTNUM*** **=** ***ID*** **(contact section identifier)**		
GET (p. 797),** ***Par**, CSEC,** ***ID*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
TYPE	--	Section type, for *ID* -- **SECTYPE (p. 1697)** command (always CONT for contact sections).
NAME	--	Name defined for the given section ID number.
DATA	*nnn*	Where *nnn* is the location in the **SECDATA (p. 1655)** command for the given section ID number.

Table 129: *GET Preprocessing Items, Entity = ELEM

Entity **= ELEM,** ***ENTNUM*** **=** ***N*** **(element number)**		
GET (p. 797),** ***Par**, ELEM,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
NODE	1, 2, ... 20	Node number at position 1,2,... or 20 of element*N*. Alternative get function: NELEM(*n, npos*), where *npos* is 1,2,...20.
CENT	X, Y, Z	Centroid X, Y, or Z location (based on shape function) in the active coordinate system. The original locations is used even if large deflections are active. Alternative get functions: CENTRX(*N*), CENTRY(*N*), and CENTRZ(*N*) always retrieve the element centroid in global Cartesian coordinates, and are determined from the selected nodes on the elements.
ADJ	1, 2, ... 6	Element number adjacent to face 1,2,...6. Alternative get function: ELADJ(*N*,*face*). Only elements (of the same dimensionality) adjacent to lateral faces are considered.
ATTR	*Name*	Number assigned to the attribute *Name*, where *Name* = MAT, TYPE, REAL, ESYS, PSTAT, LIVE, or SECN. Returns a zero if the element is unselected. If *Name* = LIVE, returns a 1 if the element is selected and active, and a -1 if it is selected and inactive. *Name* = SECN returns the section number of the selected beam element. *Name* = ISOLID returns the underlying element number of the selected contact or target element. A **CNCHECK (p. 382)** command is needed before the ***GET (p. 797)** command.
LENG		Length of line element (straight line between ends).
LPROJ	X, Y, Z	Projected line element length (in the active coordinate system). X is x-projection onto y-z plane, Y is y projection onto z-x plane, and Z is z-projection onto x-y plane.
AREA		Area of area element.
APROJ	X, Y, Z	Projected area of area element area (in the active coordinate system). X is x-projection onto y-z plane, Y is y projection onto z-x plane, and Z is z-projection onto x-y plane.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= ELEM,** ***ENTNUM*** **=** ***N*** **(element number)**		
GET (p. 797)**, **Par**, ELEM, **N**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
VOLU		Element volume. Based on unit thickness for 2D plane elements (unless the thickness option is used) and on the full 360 degrees for 2D axisymmetric elements. For general axisymmetric elements SOLID272 and SOLID273, only the area of the element on the master plane is reported before solving, not the volume. After solving, the volume is reported. **Note:** If results data are in the database, the volume returned is the volume calculated during solution.
ESEL		Select status of element *N*: -1 = unselected, 0 = undefined, 1 = selected. Alternative get function: ESEL(*N*).
NXTH		Next higher element number above *N* in selected set (or zero if none found). Alternative get function: ELNEXT(*N*)
NXTL		Next lower element number below *N* in selected set (or zero if none found).
HGEN		Heat generation on selected element *N*.
DGEN		Diffusing substance generation on selected node *N* (returns 0.0 if node is unselected, or if the DOF is inactive).
HCOE	face	Heat coefficient for selected element *N* on specified face. Returns the value at the first node that forms the face.
TBULK	face	Bulk temperature for selected element *N* on specified face. Returns the value at the first node that forms the face.
PRES	face	Pressure on selected element, *N* on specified face. Returns the value at the first node that forms the face.
SHPAR	*Test*	Element shape test result for selected element *N*, where *Test* = ANGD, ASPE (aspect ratio), JACR (Jacobian ratio), MAXA (maximum corner angle), PARA (deviation from parallelism of opposite edges), or WARP (warping factor).
MEMBER	COUNT	Number of reinforcing members (individual reinforcings) in the element *N*.
EGID	COUNT	Number of non-duplicate global identifiers in the element *N*.
	MIN, MAX	Lowest or highest global identifier in the element *N*.
Entity **= ELEM,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**, **Par**, ELEM, 0, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
NUM	MAX,MIN	Highest or lowest element number in the selected set.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= ELEM,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**, **Par**, ELEM, 0, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
NUM	MAXD, MIND	Highest or lowest element number defined.
COUNT		Number of elements in the selected set.
MATM		Highest material number that is referenced by an element.
TYPM		Highest element type number that is referenced by an element.
RELM		Highest real constant number that is referenced by an element.
ESYM		Highest element coordinate system number that is referenced by an element.
SECM		Highest section ID number that is referenced by an element.
PRTM		Highest part number that is referenced by an element.
MEMBER	COUNT	Number of reinforcing members (individual reinforcings) in the selected set of reinforcing elements.
EGID	COUNT	Number of non-duplicate global identifiers in the selected set of reinforcing elements.
	MIN, MAX	Lowest or highest global identifier in the selected set of reinforcing elements.
	MIND, MAXD	Lowest or highest global identifier defined.

Table 130: *GET Preprocessing Items, Entity = ETYP

Entity **= ETYP,** ***ENTNUM*** **=** ***N*** **(element type number)**		
GET (p. 797)**, **Par**, ETYP, **N**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
ATTR	*Name*	Number assigned to the attribute *Name*, where *Name*=ENAM, KOP1, KOP2, ..., KOP9, KO10, KO11, etc.
Entity **= ETYP,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**,**Par**,ETYP, 0, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
NUM	MAX	Maximum element type.

Table 131: *GET Preprocessing Items, Entity = GCN

Entity **= GCN,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**, **Par**, GCN, 0, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
MAT	*Sect1*	*Item2* = 0 or blank; *IT2NUM* = *Sect2*. Material ID to be used for general contact between *Sect1* and *Sect2*. Alternative get function: SECTOMAT(*Sect1*,*Sect2*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***Entity* = GCN, *ENTNUM* = 0 (or blank)**		
GET (p. 797)*, *Par*, GCN, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
REAL	*Sect1*	*Item2* = 0 or blank; *IT2NUM* = *Sect2*. Real constant ID to be used for general contact between *Sect1* and *Sect2*. Alternative get function: SECTOREAL(*Sect1*,*Sect2*).
DEF	*Sect1*	*Item2* = 0 or blank; *IT2NUM* = *Sect2*. Number indicating the type of contact for the general contact definition between *Sect1* and *Sect2*: = 0 - Excluded general contact between *Sect1* / *Sect2* = 1 - Asymmetric general contact between *Sect1* (contact) / *Sect2* (target) = 2 - Asymmetric general contact between *Sect1* (target) / *Sect2* (contact) = 3 - Symmetric general contact between *Sect1* / *Sect2*
Sect1 and *Sect2* are section numbers associated with general contact surfaces.		

Table 132: *GET Preprocessing Items, Entity = GENB

Item1	**IT1NUM**	**Description**
COUNT		Number of materials.
NUM	MAX	Largest material number for which at least one property is defined.

Table 138: *GET Preprocessing Items, Entity = MPLAB

Entity **= MPlab,** ***ENTNUM*** **=** ***N*** **(** ***MPlab*** **= material property label from MP (p. 1160) command;** ***N*** **= material number.)**		
****GET (p. 797)*****,** ***Par*****, MPlab,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
TEMP	val	Material property value at temperature of *val*. For temperature dependent materials, the program interpolates the property at temperature input for *val*.

Table 139: *GET Preprocessing Items, Entity = NODE

Entity **= NODE,** ***ENTNUM*** **=** ***N*** **(node number)**		
****GET (p. 797)*****,** ***Par*****, NODE,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
LOC	X, Y, Z	X, Y, Z location in the active coordinate system. Alternative get functions: NX(*N*), NY(*N*), NZ(*N*). Inverse get function. NODE(*x, y, z*) returns the number of the selected node nearest the *x, y, z* location (in the active coordinate system, lowest number for coincident nodes).
ANG	XY, YZ, ZX	THXY, THYZ, THZX rotation angle.
NSEL		Select status of node *N*: -1=unselected, 0=undefined, 1=selected. Alternative get function: NSEL(*N*).
NXTH		Next higher node number above *N* in selected set (or zero if none found). Alternative get function: NDNEXT(*N*).
NXTL		Next lower node number below *N* in selected set (or zero if none found).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= NODE,** ***ENTNUM*** **=** ***N*** **(node number)**		
GET (p. 797),** ***Par**, NODE,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
F	FX, MX, ...	Applied force at selected node *N* in direction *IT1NUM* (returns 0.0 if no force is defined, if node is unselected, or if the DOF is inactive). If *ITEM2* is IMAG, return the imaginary part. If the applied force is defined as a constant for this load step, regardless of the KBC setting, the result will be the force at the end time of a load step.
D	UX, ROTX, ...	Applied constraint force at selected node *N* in direction *IT1NUM* (returns a large number, such as 2e100, if no constraint is specified, if the node is unselected, or if the DOF is inactive). If *ITEM2* is IMAG, return the imaginary part. If the applied constraint force is defined as a constant for this load step, regardless of the KBC setting, the result will be the force at the end time of a load step.
HGEN		Heat generation on selected node *N* (returns 0.0 if node is unselected, or if the DOF is inactive).
NTEMP		Temperature on selected node N (returns 0.0 if node is unselected)
CPS	Lab	Couple set number with direction Lab = any active DOF, which contains the node *N*.
DGEN		Diffusing substance generation on selected node *N* (returns 0.0 if node is unselected, or if the DOF is inactive).
Entity **= NODE,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797),** ***Par**, NODE, 0,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
NUM	MAX, MIN	Highest or lowest node number in the selected set.
NUM	MAXD, MIND	Highest or lowest node number defined.
COUNT		Number of nodes in the selected set.
MXLOC	X, Y, Z	Maximum X, Y, or Z node coordinate in the selected set (in the active coordinate system).
MNLOC	X, Y, Z	Minimum X, Y, or Z node coordinate in the selected set (in the active coordinate system).
Note: If the application creates internal nodes during solution, the internal nodes will not be included. You can include them by using *KINTERNAL*. The command syntax is: ***GET (p. 797)**, *Par*, NODE, 0, Item1, IT1NUM, Item2, IT2NUM, KINTERNAL		

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= NODE,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**, **Par**, NODE, 0, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
The options for the *KINTERNAL* key are *(blank)*, which counts all nodes except internal nodes, and *INTERNAL*, which counts all nodes including internal nodes.		

Table 140: *GET Preprocessing Items, Entity = OCEAN

Entity **= OCEAN,** ***ENTNUM*** **=** ***Type*** **(where** ***Type*** **is a valid label on the** ***DataType*** **field of the OCTYPE (p. 1320) command)**		
GET (p. 797)**, **Par**, OCEAN, **Type**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
NAME		Name defined for a given *Type*
DATA	1	Depth when *Type* = BASI
	2	Material ID when *Type* = BASI
	8	*KFLOOD* when *Type* = BASI
	9	*Cay* when *Type* = BASI
	10	*Cb* when *Type* = BASI
	11	*Zmsl* when *Type* = BASI
	13	*Caz* when *Type* = BASI
	14	*Ktable* when *Type* = BASI
	1	*KWAVE* when *Type* = WAVE
	2	*THETA* when *Type* = WAVE
	3	*WAVELOC* when *Type* = WAVE
	4	*KCRC* when *Type* = WAVE
	5	*KMF* when *Type* = WAVE
	6	*PRKEY* when *Type* = WAVE
PROP	NROW	Number of rows defined by **OCTABLE (p. 1316)** command
TABL	*i*	Data in table defined by **OCTABLE (p. 1316)** command *i* = row number; Item2 = column number

Entity **= OCEAN,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**, **Par**, OCEAN, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
COUNT		Number of defined global ocean entities (BASIC/CURRENT/WAVE)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= OCEAN,** ***ENTNUM*** **= 0 (or blank)**
****GET*** **(p. 797),** ***Par*****, OCEAN,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***
It may be necessary to determine *Cay*, *Caz*, *CMy*, or *CMz* during the solution process. In such cases, a negative value (-1.0) is returned to *Par* if the item is not specified in the database.

Table 141: *GET Preprocessing Items, Entity = OCZONE

Entity **= OCZONE,** ***ENTNUM*** **=** ***Name*** **(where** ***Name*** **is a valid label on the** ***ZoneName*** **field of the OCZONE (p. 1322) command)**		
****GET*** **(p. 797),** ***Par*****, OCZONE,** ***Name*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
DATA	8	*KFLOOD* for a given *ENTNUM* = *Name*
	9	*Cay* for a given *ENTNUM* = *Name*
	10	*Cb* for a given *ENTNUM* = *Name*
	13	*Caz* for a given *ENTNUM* = *Name*
PROP	NROW	Number of rows defined by **OCTABLE (p. 1316)** command
TABL	*i*	Data in table defined by **OCTABLE (p. 1316)** command *i* = row number; Item2 = column number
TYPE		Ocean zone type (returns 1, 2 or 3 for ZLOC-, COMP-, or PIP-type zones, respectively)
COMP		Component name when the given ocean zone type is COMP, or internal component name when the given ocean zone type is PIP
COMP2		External component name when the type of given ocean zone is PIP

Entity **= OCZONE,** ***ENTNUM*** **=** ***N***		
****GET*** **(p. 797),** ***Par*****, OCZONE,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
NAME		Name defined for a given zone ID (*ENTNUM*)

Entity **= OCZONE,** ***ENTNUM*** **= 0 (or blank)**		
****GET*** **(p. 797),** ***Par*****, OCZONE, 0,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
COUNT		Number of defined zones
If a requested item is not specified in the database, a negative value (-1.0) is returned to *Par*.		

Table 142: *GET Preprocessing Items, Entity = PIPE

Entity **= PIPE,** ***ENTNUM*** **= 0 (or blank)**		
****GET*** **(p. 797),** ***Par*****, PIPE,** ***NUM*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
COUNT		Number of defined sections
NUM	MAX	Largest section number defined

Entity **= PIPE,** ***ENTNUM*** **=** ***id*** **(pipe section identification number)**		
GET (p. 797),** ***Par**, PIPE,** ***id*****, Item1, IT1NUM, Item2, IT2NUM**		
Item1	**IT1NUM**	**Description**
TYPE		Section type, for id - **SECTYPE (p. 1697)** command (always PIPE for pipe sections)
SUBTYPE		Section type for id - **SECTYPE (p. 1697)** command
NAME		Name defined for the given section id number
DATA	*nnn*	Where *nnn* is the location in the **SECDATA (p. 1655)** command for the given section id number
SFLEX	*nnn*	Where *nnn* is the location in the **SFLEX (p. 1779)** command for the given section ID number
PROP	AREA	Area value
	IYY, IYZ, IZZ	Moments of inertia
	TORS	Torsion constant
	SCYY, SCYZ, SCZZ	Shear correction factors
	OFFY	Section offset in the Y direction.
	OFFZ	Section offset in the Z direction.
	ADDMAS	Added mass per unit length

Table 143: *GET Preprocessing Items, Entity = PART

Entity **= PART,** ***ENTNUM*** **=** ***N*** **(PART number)**		
GET (p. 797),** ***Par**, PART,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
TYPE		Element type number assigned to PART *N*.
MAT		Material number assigned to PART *N*.
REAL		Real constant number assigned to PART *N*.
Entity **= PART,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797),** ***Par**, PART, 0, Item1, IT1NUM, Item2, IT2NUM**		
NUMP		Total number of parts in the model.

Table 144: *GET Preprocessing Items, Entity = RCON

Entity **= RCON (p. 1574),** ***ENTNUM*** **=** ***N*** **(real constant set number)**		
GET (p. 797),** ***Par**, RCON,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
CONST	1, 2, ..., *m*	Value of real constant number *m* in set *N*.
***GET (p. 797),** *Par*, RCON, *0*, Item1, IT1NUM, Item2, IT2NUM		

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = RCON (p. 1574), *ENTNUM* = *N* (real constant set number)		
*GET (p. 797), *Par*, RCON, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
NUM	MAX	The maximum real constant set number defined

Table 145: *GET Preprocessing Items, Entity = REIN

Entity = REIN, *ENTNUM* = *N* (reinforcing section identification number)		
*GET (p. 797), *Par*, REIN, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
TYPE		Section type, for ID -- **SECTYPE (p. 1697)** command (always REIN for reinforcing sections).
SUBTYPE		Section subtype for ID -- **SECTYPE (p. 1697)** command.
NAME		Name defined for a given ID number.
NREIN		Number of reinforcing fibers. For reinforcing sections generated (**EREINF (p. 656)**) via the standard method, the number of fibers defined via **SECDATA (p. 1655)**. For reinforcing sections generated (**EREINF (p. 656)**) via the mesh-independent method, the total number of fibers in the section.
TABL	*ReinfNum*, *I*	Reinforcing fiber data, as defined via **SECDATA (p. 1655)**. This item is not allowed for reinforcing sections generated (**EREINF (p. 656)**) via the mesh-independent method.

Table 146: *GET Preprocessing Items, Entity = SCTN

Entity = SCTN, *ENTNUM* = *N* (pretension section ID number)		
*GET (p. 797), *Par*, SCTN, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
1		Section ID number.
2		Section type (always 5 for pretension section).
3		Pretension node number.
4	Coordinate system number.	Section normal NX.
5	Coordinate system number.	Section normal NY.
6	Coordinate system number.	Section normal NZ.
7 or 8		Eight character section name.
9		Initial action key. Returns 0 or 1 for lock, 2 for "free-to-slide," or 3 for tiny.
10		Force displacement key. Returns 0 or 1 for force, or 2 for displacement.
11		First preload value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= SCTN,** ***ENTNUM*** **=** ***N*** **(pretension section ID number)**		
GET (p. 797)**, **Par**, SCTN, **N**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
12		Load step in which first preload value is to be applied.
13		Load step in which first preload value is to be locked.
14...		14 through 17 is a repeat of 10 through 13, but for the second preload value; 18 through 21 is for the third preload value; and so forth.

Table 147: *GET Preprocessing Items, Entity = SECP

Entity **= SECP,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**, **Par**, SECP, **NUM**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
COUNT		Number of defined sections
NUM	MAX	Largest section number defined
Entity **= SECP,** ***ENTNUM*** **=** ***id*** **(beam section identification number)**		
***GET (p. 797)**, **Par**, SECP, **id**, Item1, IT1NUM, Item2, IT2NUM*		
Item1	**IT1NUM**	**Description**
TYPE		Section type, for id - **SECTYPE (p. 1697)** command (always BEAM for beam sections)
SUBTYPE		Section type for id - **SECTYPE (p. 1697)** command
NAME		Name defined for the given section id number
DATA	*nnn*	Where *nnn* is the location in the **SECDATA (p. 1655)** command for the given section id number
PROP	AREA	Area value
	IYY, IYZ, IZZ	Moments of inertia
	WARP	Warping constant
	TORS	Torsion constant
	CGY, CGZ	Y or Z coordinate center of gravity
	SHCY, SHCZ	Y or Z coordinate shear center
	SCYY, SCYZ, SCZZ	Shear correction factors
	OFFSET	Offset location: 1 = Centroid 2 = Shear Center 3 = Origin 0 = User Defined
	OFFY	Section offset in the Y direction.
	OFFZ	Section offset in the Z direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = SECP, *ENTNUM* = *id* (beam section identification number)		
*GET (p. 797), *Par*, SECP, *id*, Item1, IT1NUM, Item2, IT2NUM		
Item1	**IT1NUM**	**Description**
	TXY	User transverse shear stiffness XY
	TXZ	User transverse shear stiffness XZ
	ADDMAS	Added mass per unit length

Table 148: *GET Preprocessing Items, Entity = SHEL

Entity = SHEL, ENTNUM = *N* (shell section identification number)		
*GET (p. 797), *Par*, SHEL, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
TYPE		Section type, for id -- **SECTYPE (p. 1697)** command. (always SHEL for shell sections)
NAME		Name defined for a given id number.
PROP	TTHK	Total thickness.
	NLAY	Number of layers.
	NSP	Number of section integration points.
	POS	Node position (as defined by **SECOFFSET (p. 1685)**).
		0 = User Defined.
		1 = Middle.
		2 = Top.
		3 = Bottom.
	OFFZ	User-defined section offset (POS = 0).
	TS11	Transverse shear stiffness factors.
	TS22	Transverse shear stiffness factors.
	TS12	Transverse shear stiffness factors.
	HORC	Homogeneous or complete section flag.
		0 = Homogeneous.
		1 = Composite.
	FUNC	Tabular function name for total thickness.
	UT11	User transverse shear stiffness 11.
	UT22	User transverse shear stiffness 22.
	UT12	User transverse shear stiffness 12.
	AMAS	Added mass.
	MSCF	Hourglass control membrane scale factor.
	BSCF	Hourglass control bending scale factor.
	DSTF	Drill stiffness scale factor.
	LDEN	Laminate density.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= SHEL, ENTNUM = *N* (shell section identification number)**		
GET (p. 797)*, *Par*, SHEL, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
	FKCN	*KCN* field value from the **SECFUNCTION (p. 1678)** command, in which the array or table is interpreted.
	ABD	Section membrane and bending stiffness matrix. Valid ITEM2 = 1,6 and IT2NUM = 1,6.
	E	Section transverse shear stiffness matrix. Valid ITEM2 = 1,2 and IT2NUM = 1,2.
LAYD	LayerNumber,THIC	Layer thickness.
	LayerNumber,MAT	Layer material.
	LayerNumber,ANGL	Layer orientation angle.
	LayerNumber,NINT	Number of layer integration points.

Table 149: *GET Preprocessing Items, Entity = TBFT

Entity **= TBFT, *ENTNUM* = *blank***		
GET (p. 797)*, *Par*, TBFT, , *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
nmat		Number of defined material models.
matnum	*index*	Material number in array (index varies for 1 to num materials).
Entity = TBFT, *ENTNUM* = *matid* (For getting names of constitutive function, matid = the material ID number)		
GET (p. 797)*, *Par*, TBFT, *matid*, *nfun*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	IT1NUM	Description
nfun		Number of constitutive functions for this material.
Entity = TBFT, *ENTNUM* = *matid* (To query constitutive function data, matid = the material ID number)		
GET (p. 797)*, *Par*, TBFT, *matid*, *func*, *fname*, *Item2*, *IT2NUM		
Item1	IT1NUM	Description
func	index	If Item2 = fname, the name of the constitutive function is returned.
func	function name	If Item2 = ncon, the number of constants is returned for the function specified in IT1NUM by the constitutive function name.
"	"	If Item2 = cons, set Item2num to index to return the value of the constant.
"	"	If Item2 = fixe, set Item2num to index to return the fix flag status.
"	"	If Item2 = RESI, returns the residual error while fitting the data.
"	"	If Item2 = type, returns the category of the constitutive model (moon, poly, etc.)
"	"	If Item2 = sord, returns the shear order of the prony visco model.
"	"	If Item2 = bord, returns the bulk order of the prony visco model.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity* = TBFT, *ENTNUM* = *blank		
GET (p. 797)**, *Par*, TBFT, , *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
"	"	If Item2 = shif, returns the shift function name of the prony visco model.
Entity = TBFT, *ENTNUM* = *matid* (For getting names of experimental data, matid = the material ID number)		
GET (p. 797)**, *Par*, TBFT, *matid*, *nexp*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	IT1NUM	Description
nexp		Number of experiments for this material.
Entity = TBFT, *ENTNUM* = *matid* (To query experimental data, *matid* = the material ID number)		
GET (p. 797)**, *Par*, TBFT, *matid*, *func*, *fname*, *Item2*, *IT2NUM		
Item1	IT1NUM	Description
"	expindex	If Item2 = type, returns experiments type string.
"	"	If Item2 = numrow, returns number of rows in the data.
"	"	If Item2 = numcol, returns the number of cols in a row (set Intem2num = Row index)
"	"	If Item2 = data, returns the value of the data in *row, col* of exp expindex (set item2Num = row index and item3 = column index. All indices vary from 1 to the maximum value.
"	"	If Item2 = natt, returns the number of attributes.
"	"	If Item2 = attname, returns the attribute name (set Item2Num = Attr index).
"	"	If Item2 = attvald, returns double value of attribute (set Item2Num = Attr index).
"	"	If Item2 = attvali, returns integer valud of attribute (set Item2Num = Attr index).
"	"	If Item2 = attvals, returns the string value of the attribute (set Item2Num = Attr index).

Table 150: *GET Preprocessing Items, Entity = TBLAB

***Entity* = TBLAB, *ENTNUM* = *N*..(*TBlab* = data table label from the TB (p. 1899) command; *N* = material number.)**		
GET (p. 797)**, *Par*, *TBlab*, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*, *TBOPT		
Item1	**IT1NUM**	**Description**
TEMP	*T*	**Item2**: CONST **IT2NUM**: *Num* Value of constant number Num in the data table at temperature *T*. For constants, input an X,Y point;

Entity **= TBLAB,** ***ENTNUM*** **=** ***N*****..(*****TBlab*** **= data table label from the TB (p. 1899) command;** ***N*** **= material number.)**		
GET (p. 797),** ***Par**,** ***TBlab*****,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM*****,** ***TBOPT***		
Item1	**IT1NUM**	**Description**
		the constant numbers are consecutive with the X constants being the odd numbers, beginning with one.

Important:

To get all necessary output for materials defined via the **TB (p. 1899)** command, you must specify the final argument *TBOPT* as indicated in the syntax description above.

Table 151: *GET Preprocessing Items, Entity = VOLU

Entity **= VOLU,** ***ENTNUM*** **=** ***N*** **(volume number)**		
GET (p. 797),** ***Par**, VOLU,** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
ATTR	*Name*	Number assigned to the attribute *Name*, where *Name*=MAT, TYPE, REAL, ESYS, NNOD, or NELM. (NNOD=number of nodes, NELM=number of elements.)
VSEL		Select status of volume *N*: -1=unselected, 0=undefined, 1=selected. Alternative get function: VSEL(*N*).
NXTH		Next higher volume number above *N* in selected set (or zero if none found). Alternative get function: VLNEXT(*N*).
NXTL		Next lower volume number below *N* in selected set (or zero if none found).
VOLU		Volume of volume *N*. (**VSUM (p. 2167)** or **GSUM (p. 881)** must have been performed sometime previously with at least this volume *N* selected).
SHELL	1, 2, ..., *m*	**Item2**: AREA **IT2NUM**: 1,2,...,*p* Line number of position *p* of shell *m*
Entity = VOLU, *ENTNUM* = 0 (or blank)		
***GET (p. 797),** *Par*, VOLU, 0, Item1, IT1NUM, Item2, IT2NUM		
NUM	MAX, MIN	Highest or lowest volume number in the selected set.
NUM	MAXD, MIND	Highest or lowest volume number defined.
COUNT		Number of volumes in the selected set.
VOLU		Combined volumes (from last **VSUM (p. 2167)** or **GSUM (p. 881)**).
CENT	X, Y, Z	Centroid X, Y, or Z location of volumes (from last **VSUM (p. 2167)** or **GSUM (p. 881)**).
IOR	X, Y, Z, XY, YZ, ZX	Moments of inertia about origin (from last **VSUM (p. 2167)** or **GSUM (p. 881)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IMC	X, Y, Z, XY, YZ, ZX	Moments of inertia about mass centroid (from last **VSUM (p. 2167)** or **GSUM (p. 881)**).
IPR	X, Y, Z	Principal moments of inertia (from last **VSUM (p. 2167)** or **GSUM (p. 881)**).
IXV	X, Y, Z	Principal orientation X vector components (from last **VSUM (p. 2167)** or **GSUM (p. 881)**).
IYV	X, Y, Z	Principal orientation Y vector components (from last **VSUM (p. 2167)** or **GSUM (p. 881)**).
IZV	X, Y, Z	Principal orientation Z vector components (from last **VSUM (p. 2167)** or **GSUM (p. 881)**).

Solution Items

*GET Solution Entity Items

- Table 153: *GET Solution Items, Entity = ELEM (p. 830)
- Table 154: *GET Solution Items, Entity = MODE (p. 831)
- Table 155: *GET Solution Items, Entity = DDAM (p. 832)

Table 152: *GET Solution Items, Entity = ACTIVE

Entity **= ACTIVE, *ENTNUM* = 0 (or blank)**		
GET (p. 797), *Par*, ACTIVE, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
ANTY		Current analysis type.
SOLU	DTIME	Time step size.
	NCMLS	Cumulative number of load steps.
	NCMSS	Number of substeps. NOTE: Used only for static, transient, and harmonic balance method (HBM) analyses.
	EQIT	Number of equilibrium iterations.
	NCMIT	Cumulative number of iterations.
	CNVG	Convergence indicator: 0=not converged, 1=converged.
	MXDVL	Maximum degree of freedom value.
	RESFRQ	Response frequency for 2nd order systems.
	RESEIG	Response eigenvalue for 1st order systems.
	DSPRM	Descent parameter.
	FOCV	Force convergence value.
	MOCV	Moment convergence value.
	HFCV	Heat flow convergence value.
	MFCV	Magnetic flux convergence value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = ACTIVE, *ENTNUM* = 0 (or blank)		
***GET (p. 797)**, *Par*, ACTIVE, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
	CSCV	Current segment convergence value.
	CUCV	Current convergence value.
	FFCV	Fluid flow convergence value.
	DICV	Displacement convergence value.
	ROCV	Rotation convergence value.
	TECV	Temperature convergence value.
	VMCV	Vector magnetic potential convergence value.
	SMCV	Scalar magnetic potential convergence value.
	VOCV	Voltage convergence value.
	PRCV	Pressure convergence value.
	VECV	Velocity convergence value.
	CRPRAT	Maximum creep ratio.
	PSINC	Maximum plastic strain increment.
	CGITER	Number of iterations in the PCG and symmetric JCG (non-complex version) solvers.

Table 153: *GET Solution Items, Entity = ELEM

Entity = ELEM, *ENTNUM* = 0 (or blank)		
***GET (p. 797)**, *Par*, ELEM, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
MTOT	X, Y, Z	Total mass components.
MC	X, Y, Z	Center of mass components.
IOR	X, Y, Z, XY, YZ, ZX	Moment of inertia about origin.
IMC	X, Y, Z, XY, YZ, ZX	Moment of inertia about the center of mass.
IPRIN	X, Y, Z	Principal moments of inertia.
IANG	XY, YZ, ZX	Angles of the moments of inertia principal axes.
FMC	X, Y, Z	Force components at mass centroid (1 (p. 830)).
MMOR	X, Y, Z	Moment components at origin (1 (p. 830)).
MMMC	X, Y, Z	Moment components at mass centroid (1 (p. 830)).

Note:

Items (1 (p. 830)) are available only after inertia relief solution (**IRLF (p. 960)**,1) or pre-calculation of masses (**IRLF (p. 960)**,-1).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Item values are consistent with the mass summary printed in the output file. They are based on unscaled mass properties (see **MASCALE (p. 1110)** command).

Table 154: *GET Solution Items, Entity = MODE

***Entity* = MODE, *ENTNUM* = *N* (mode number)**		
GET (p. 797)**, *Par*, MODE, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
FREQ		Frequency of mode *N*. Returned values are valid for modal analyses which calculate real eigensolutions.
STAB		Stability value of mode *N*. Returned values are valid for modal analyses which calculate complex eigensolutions. The stability value is the real part of the complex eigenvalue. It contains information on the mode damping in a damped modal analysis.
DFRQ		Damped frequency of mode *N*. Returned values are valid for modal analyses which calculate complex eigensolutions. The damped frequency is the imaginary part of the complex eigenvalue.
PFACT		Participation factor of mode *N*. • If retrieved after a modal analysis, the real part of the participation factor is returned unless *IT1NUM* = IMAG. The direction is specified using *Item2* = DIREC and *IT2NUM* = X, Y, Z, ROTX, ROTY, or ROTZ • If retrieved after a spectrum analysis, the spectrum number M is specified using *Item2* = SPECT and *IT2NUM* = M. For a PSD analysis with spatial correlation or wave excitation, the retrieved participation factors will correspond to the first degree of freedom that is excited.
EFFM		Effective mass of mode *N*. Returned values are valid only after a modal analysis with effective mass calculation has been solved. The direction is specified using *Item2* = DIREC and *IT2NUM* = X, Y, Z, ROTX, ROTY, or ROTZ.
GENM		Generalized mass (also called modal mass) of mode *N*. Returned values are valid only after a modal analysis with generalized mass calculation has been solved.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = MODE, *ENTNUM* = *N* (mode number)		
***GET (p. 797)**, *Par*, MODE, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
MCOEF		Mode coefficient of mode *N*. Returned values are valid only after a spectrum analysis has been solved. The spectrum number M is specified using *Item2* = SPECT and *IT2NUM* = M. In a SPRS analysis, the values returned are based on the curve with the lowest damping. After a PSD analysis, the diagonal of the dynamic modal covariance matrix is retrieved for the displacement solution.
DAMP		Damping ratio of mode *N*. If retrieved after a modal analysis that creates complex solutions (DAMP, QRDAMP, or UNSYM eigensolvers) returned value is calculated from the complex frequencies. If retrieved after a spectrum analysis, returned value is the effective damping ratio. Not a function of direction. Also retrievable following a harmonic analysis or transient analysis with mode-superposition.

For all items except PFACT and MCOEF (as noted above), only the first 10000 values corresponding to significant modes will be returned.

The MODE file must be available to retrieve items PFACT and MCOEF with specified *Item2*. If *Item2* is not specified, the last calculated value will be returned.

All values retrieved correspond to the first load step values. For a Campbell diagram analysis (multistep modal), ***GET (p. 797)** with *Entity* = CAMP must be used.

Table 155: *GET Solution Items, Entity = DDAM

Entity = DDAM, *ENTNUM* = *N* (mode number)		
***GET (p. 797)**,*Par*,DDAM,*N*, *Item1*, *IT1NUM*		
Item1	**IT1NUM**	**Description**
DSHOCK		Shock design value of mode *N*.

If multiple DDAM analyses are performed, the last calculated value will be returned.

Postprocessing Items

Item1	**IT1NUM**	**Description**
		If Item2 = LAST, IT2NUM = Loadstep, get set number of last substep of loadstep
RSYS		Active results coordinate system.

Table 157: *GET Postprocessing Items, Entity = ACUS

Entity = ACUS, *ENTNUM* = 0 (or blank)		
*GET (p. 797), *Par*, ACUS, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
PWL		Radiated sound power level
PRES		Far-field pressure at a given point
PHASE		Far-field pressure phase at a given point
SPL		Far-field sound pressure level at a given point
SPLA		Far-field a-weighted sound pressure level at a given point
DG		Far-field directivity at a given point
PS		Far-field scattered pressure at a given point
TS		Far-field target strength at a given point
DFIN		Diffuse sound field incident power
SIMP		Magnitude of specific acoustic impedance on the selected surface
AIMP		Magnitude of acoustic impedance on the selected surface
MIMP		Magnitude of mechanical impedance on the selected surface
APRES		Magnitude of average pressure on the selected surface
FORC		Magnitude of average force on the selected surface
POWER		Acoustic power through the selected surface
BSPL		SPL over frequency band
BSPA		A-weighted SPL over frequency band
PWRF		Reference sound power
TL		Transmission loss
RL		Return loss
Item1 = PWL, PRES, SPL, SPLA, PHASE, DG, PS, and TS are available after issuing the **PRFAR (p. 1490)** or **PLFAR (p. 1412)** command. The maximum values are obtained from the current command. Item1 = SIMP, AIMP, MIMP, APRES, FORC, POWER, TL, and RL are available after issuing the corresponding **PRAS (p. 1464)** command at the current frequency. The values are obtained at the current frequency, or at the last frequency for multiple load step and substep cases.		

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = ACUS, *ENTNUM* = 0 (or blank)		
*GET (p. 797), *Par*, ACUS, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
Item1 = DFIN is available after the diffuse sound field solution.		

Table 158: *GET Postprocessing Items, Entity = CAMP

Note:

Available after PLCAMP (p. 1392) or PRCAMP (p. 1469) command is issued.

Entity = CAMP, *ENTNUM* = *N* (mode number)		
*GET (p. 797), *Par*, CAMP, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
NBMO		Number of modes in the Campbell diagram (*ENTNUM* not required). This value is the maximum value for *N*.
NBST		Number of steps in the Campbell diagram: modal load steps with rotational velocity (*ENTNUM* not required). This value is the maximum value for *M* (see Item1 = FREQ).
WHRL	*M*	Whirl of mode *N* at step *M*: -1 is backward whirl, 1 is forward whirl, and 0 is undetermined. For default *IT1NUM*, it corresponds to the whirl at the maximum rotational velocity.
VCRI		Critical speed for mode *N*. This value is available if an excitation is defined via the **PLCAMP (p. 1392)** or **PRCAMP (p. 1469)** command's *SLOPE* argument. (The unit of speed depends upon the *UNIT* value specified in those commands.) **Note:** N does not correspond to the mode number if *FREQB* (**PRCAMP (p. 1469)** or **PLCAMP (p. 1392)** command) is used. Instead, it represents the Nth mode number listed in the output of **PRCAMP (p. 1469)** or **PLCAMP (p. 1392)**.
FREQ	*M*	Natural frequency of mode (Hz) *N* at step *M*. It represents the complex part of the eigenvalue.
STAB	*M*	Stability value (Hz) of mode *N* at step *M*. It represents the real part of the eigenvalue.
UKEY	*M*	Instability key for mode *N* at step *M*: 0 is stable and 1 is unstable. For default *IT1NUM*, it corresponds to the stability over the whole rotational velocity range.
VSTA		Stability limit for mode N. This value is available when *SLOPE* is zero on the **PLCAMP (p. 1392)** or **PRCAMP (p. 1469)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Available after PLCAMP (p. 1392) or PRCAMP (p. 1469) command is issued.

Entity **= CAMP,** ***ENTNUM*** **=** ***N*** **(mode number)**		
GET (p. 797)**,**Par**, CAMP,* ***N**,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
		(The unit of speed depends upon the *UNIT* value specified in those commands.) **Note:** N does not correspond to the mode number if *FREQB* (**PRCAMP (p. 1469)** or **PLCAMP (p. 1392)** command) is used. Instead, it represents the Nth mode number listed in the output of **PRCAMP (p. 1469)** or **PLCAMP (p. 1392)**.

Note:

If the sorting is activated (Option=*ON* on the **PRCAMP (p. 1469)** and **PLCAMP (p. 1392)** commands), all the parameters retrieved are in the sorted order.

Table 159: *GET Postprocessing Items, Entity = CINT

Entity **= CINT,** ***ENTNUM*** **=** ***CrackId*** **(required Crack ID number)**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = CINT, *ENTNUM* = *CrackId* (required Crack ID number)		
*GET (p. 797),*Par*, CINT, *CrackId*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
NODE	ipos	IT1NUM = Position along the crack front (from 1 to NNOD). Default = 1. Returns node number at the given position along the crack front. (For XFEM, an internal node number is returned.)

Table 160: *GET Postprocessing Items, Entity = CYCCALC

Entity = CYCCALC, *ENTNUM* = CYCSPEC (p. 475) specification number Generate date for cyclic results using CYCCALC (p. 453) before retrieving those items.				
*GET (p. 797),*Par*,CYCCALC,*spec*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*				
Item1	**IT1NUM**	**Item2**	**IT2NUM**	**Description**
FREQ	frequency point	SECTOR	sector	**CYCSPEC (p. 475)** result at the IT1NUM frequency and IT2NUM sector
		SECMAX	-	**CYCSPEC (p. 475)** maximum result at the IT1NUM frequency
		SECNUM	-	**CYCSPEC (p. 475)** sector with the maximum result at the IT1NUM frequency
		SECNODE	-	**CYCSPEC (p. 475)** node in the sector with the maximum result at the IT1NUM frequency
The frequency point refers to the harmonic solution data set number (NSET on the **SET (p. 1724)** command)				

Table 161: *GET Postprocessing Items, Entity = ELEM

Entity = ELEM (p. 618), *ENTNUM* = *N* (element number)		
*GET (p. 797),*Par*, ELEM, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
SERR[a]		Structural error energy.
SDSG[a]		Absolute value of the maximum variation of any nodal stress component.
TERR[a]		Thermal error energy.
TDSG[a]		Absolute value of the maximum variation of any nodal thermal gradient component.
SENE		"Stiffness" energy or thermal heat dissipation. Same as TENE.
TENE		Thermal heat dissipation or "stiffness" energy. Same as SENE.
KENE		Kinetic energy.
ASENE		Amplitude “stiffness” energy.
PSENE		Peak “stiffness” energy.
AKENE		Amplitude kinetic energy.
PKENE		Peak kinetic energy.
DENE		Damping energy.
WEXT[b]		Work due to external load.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = **ELEM (p. 618)**, ***ENTNUM*** = ***N*** **(element number)**		
GET (p. 797)**,**Par**, **ELEM**, **N**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
JHEAT		Element Joule heat generation (coupled-field calculation).
JS	X, Y, Z	Source current density (coupled-field calculation) in the global Cartesian coordinate system.
HS	X, Y, Z	Average element magnetic field intensity from current sources.
VOLU		Element volume, as calculated during solution.
ETAB	*Lab*	Value of element table item *Lab* for element *N* (see **ETABLE (p. 687)** command).
EFOR	*Nnum*	Element force at node *Nnum*. The force label is specified using Item2 = FX, FY, FZ, MX, MY, MZ, or HEAT. In a dynamics analysis, the element forces returned are based on the type of force requested. It is specified using the **FORCE (p. 772)** command for all dynamics analyses, except for spectrum analyses where *ForceType* is used on the combination commands (**SRSS (p. 1845)**, **PSDCOM (p. 1527)**, etc.).
SMISC	*Snum*	Value of element summable miscellaneous data at sequence number *Snum* (as used on **ETABLE (p. 687)** command).
NMISC	*Snum*	Value of element non-summable miscellaneous data at sequence number *Snum* (as used on **ETABLE (p. 687)** command).
FSOU		Element fluid flow source loading (poromechanics).

[a] Some element- and material-type limitations apply. For more information, see the documentation for the **PRERR (p. 1480)** command.

[b] WEXT is calculated for element-based loading only (and not for nodal-force loading). WEXT is stored on elements to which loading has been applied; if surface elements are added on top of other elements, for example, and pressure loading is applied to the surface elements, WEXT is available for the surface elements only.

Table 162: *GET Postprocessing Items, Entity = ETAB

Entity = **ETAB**, ***ENTNUM*** = ***N*** **(column number)**

Item1	**IT1NUM**	**Description**
ITEM	*Lab*	Value of item *Lab* from last **FSUM (p. 780)** command. Valid labels are FX, FY, FZ, MX, MY, MZ, FLOW, HEAT, FLUX, etc.

Table 164: *GET Postprocessing Items, Entity = GSRESULT

Entity **= GSRESULT,** ***ENTNUM*** **= 0 (or blank) for generalized plane strain results in fiber direction**		
GET (p. 797)**, **Par**, GSRESULT, 0, **Item1**, **IT1NUM		
Item1	**IT1NUM**	**Description**
LFIBER		Fiber length change at ending point.
ROT	X,Y	Rotation angle of end plane about X or Y axis.
F		Reaction force at ending point.
M	X,Y	Reaction moment on ending plane.

Table 165: *GET Postprocessing Items, Entity = MEMBER

Entity **= MEMBER,** ***ENTNUM*** **=** ***N*** **(GroupID)**		
GET (p. 797)**,**Par**,MEMBER,**N**, **Item1**, **IT1NUM		
Item1	**IT1NUM**	**Description**
TEMP	MIN, MAX	Minimum or maximum temperature of members (individual reinforcings) with GroupID = *N* in the selected set of reinforcing elements.
Entity **= MEMBER,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**,**Par**,MEMBER,0, **Item1**, **IT1NUM		
Item1	**IT1NUM**	**Description**
TEMP	MIN, MAX	Minimum or maximum temperature in the selected set of reinforcing elements.

Table 166: *GET Postprocessing Items, Entity = NODE

Entity **=** ***NODE*****,** ***ENTNUM*** **=** ***N*** **(node number) for nodal degree-of-freedom results:**		
GET (p. 797)**, **Par**, NODE, **N**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
U	X, Y, Z, SUM	X, Y, or Z structural displacement or vector sum. Alternative get functions: UX(*N*), UY(*N*), UZ(*N*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***Entity* = *NODE*, *ENTNUM* = *N* (node number) for nodal degree-of-freedom results:**		
GET (p. 797)*, *Par*, NODE, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
ROT	X, Y, Z, SUM	X, Y, or Z structural rotation or vector sum. Alternative get functions: ROTX(*N*), ROTY(*N*), ROTZ(*N*).
TEMP		Temperature. For SHELL131 and SHELL132 elements with KEYOPT(3) = 0 or 1, use TBOT, TE2, TE3, . . ., TTOP instead of TEMP. Alternative get functions: TEMP(*N*), TBOT(*N*), TE2(*N*), etc.
PRES		Pressure. Alternative get function: PRES(*N*).
GFV1, GFV2, GFV3		Nonlocal field values 1, 2, and 3.
VOLT		Electric potential. Alternative get function: VOLT(*N*).
CONC		Concentration.
MAG		Magnetic scalar potential. Alternative get function: MAG(*N*).
V	X, Y, Z, SUM	X, Y, or Z fluid velocity or vector sum in a fluid analysis. X, Y, or Z nodal velocity or vector sum in a structural transient analysis (analysis with **ANTYPE (p. 162)**,TRANS). Alternative get functions: VX(*N*), VY(*N*), VZ(*N*).
A	X, Y, Z, SUM	X, Y, or Z magnetic vector potential or vector sum in an electromagnetic analysis. X, Y, or Z nodal acceleration or vector sum in a structural transient analysis (analysis with **ANTYPE (p. 162)**,TRANS). Alternative get functions: AX(*N*), AY(*N*), AZ(*N*).
CURR		Current.
EMF		Electromotive force drop.
RF	FX, FY, FZ, MX, MY, MZ, CSGZ, BMOM, RATE, DVOL, FLOW, HEAT, AMPS or CHRG, FLUX, CURT, VLTG	Nodal reaction forces in the nodal coordinate system. The reaction forces returned are the total forces: static, plus damping, plus inertial, as appropriate based on analysis type (see **PRRSOL (p. 1518)** command). The first exception is modal analyses and mode-superposition transient analyses where static forces are returned. The second exception is spectrum analyses where the **PRRFOR (p. 1517)** logic is used internally. In this case, the reaction forces are based on the type of force requested (using *ForceType* with combination commands, such as **SRSS (p. 1845)**, **PSDCOM (p. 1527)**, etc.).
ORBT	A, B, PSI, PHI, YMAX, ZMAX, Whirl	Whirl orbit characteristics: A is the semi-major axis. B is the semi-minor axis. PSI is the angle between the local axis y and the major axis Y. PHI is the angle between initial position (t = 0) and major axis. YMAX is the maximum displacement along local y axis.

***Entity* = *NODE*, *ENTNUM* = *N* (node number) for nodal degree-of-freedom results:**		
GET (p. 797)*, *Par*, NODE, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
		ZMAX is the maximum displacement along local z axis. Whirl is the direction of an orbital motion (-1 is backward whirl, 1 is forward whirl, and 0 is undetermined). Angles PSI and PHI are in degrees and within the range of -180 through +180. Orbits are available only *after* issuing a **PRORB (p. 1515)** command.

Note:

Use this command carefully when N represents an internal node, as the nodal degrees of freedom may have different physical meanings.

***Entity* = *NODE*, *ENTNUM* = *N* (node number) for averaged nodal results based on selected elements:**			
GET (p. 797)*, *Par*, NODE, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM			
Item1	**IT1NUM**	**Description**	**Item2**
S	X, Y, Z, XY, YZ, XZ	Component stress.	*Item2* controls whether nodal-averaged results are used. Valid labels are: AUTO - Use nodal-averaged results, if available. Otherwise use element-based results. ESOL- Use element-based results only. NAR - Use nodal-averaged results only.
	1, 2, 3	Principal stress.	
	INT, EQV	Stress intensity or equivalent stress.	
	MAXF	Maximum stress failure criterion.	
	TWSI	Tsai-Wu strength failure criterion.	
	TWSR	Inverse of Tsai-Wu strength ratio index failure criterion.	
EPTO	X, Y, Z, XY, YZ, XZ,	Component total strain (EPEL + EPPL + EPCR).	
	1, 2, 3	Principal total strain.

***Entity* = *NODE*, *ENTNUM* = *N* (node number) for averaged nodal results based on selected elements:**

GET (p. 797), *Par*, NODE, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM

Item1	IT1NUM	Description	Item2
HS	X, Y, Z	Component magnetic field intensity from current sources (in the global Cartesian coordinate system).	
BFE	TEMP	Body temperatures (calculated from applied temperatures) as used in solution.	
FICT	TEMP	Fictive temperature.	
CAP	C0,X0,K0,ZONE, DPLS,VPLS	Material cap plasticity model only: Cohesion; hydrostatic compaction yielding stress; I1 at the transition point at which the shear and compaction envelopes intersect; zone = 0: elastic state, zone = 1: compaction zone, zone = 2: shear zone, zone = 3: expansion zone; effective deviatoric plastic strain; volume plastic strain.	
FFLX	X, Y, Z	Fluid flow flux in poromechanics.	
FGRA	X, Y, Z	Fluid pore pressure gradient in poromechanics.	
PMSV	VRAT, PPRE, DSAT, RPER	Void volume ratio, pore pressure, degree of saturation, and relative permeability for coupled pore-pressure CPT elements.	
MPDP	TOTA, TENS, COMP, RW	Microplane homogenized total, tension, and compression damages (TOTA, TENS, COMP), and split weight factor (RW).	
EPFR		Free strain in porous media	
DAMAGE	1,2,3,MAX	Damage in directions 1, 2, 3 (1, 2, 3) and the maximum damage (MAX).	
GDMG		Damage	
IDIS		Structural-thermal dissipation rate	
CONT	STAT	Contact status.	
	PENE	Contact penetration.	
	PRES	Contact pressure.	
	SFRIC	Contact friction stress.	
	STOT	Contact total stress (pressure plus friction).	
	SLIDE	Contact sliding distance.

Entity **= *NODE*, *ENTNUM* = *N* (node number) for averaged nodal results based on selected elements:**			
GET (p. 797)*, *Par*, NODE, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM			
Item1	**IT1NUM**	**Description**	**Item2**
	GAP	Contact gap distance.	
	FLUX	Total heat flux at contact surface.	
	CNOS	Total number of contact status changes during substep.	
	FPRS	Actual applied fluid penetration pressure.	
SRES	SVAR*n*	Selected result *n*th state variable.	
	FLDUF0*n*	The *n*th user-defined field variable.	
Element nodal results are the average nodal value of the selected elements.			

Table 167: *GET Postprocessing Items, Entity = PATH

Entity = PATH, *ENTNUM* = 0 (or blank)		
GET (p. 797)*, *Par*, PATH, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
MAX	*Lab*	Maximum value of path item *Lab* from last path operation. Valid labels are the user-defined labels on the **PDEF (p. 1372)** or **PCALC (p. 1362)** command.
MAXPATH		Returns the maximum path number defined.
MIN	*Lab*	Minimum value of path item *Lab* from last path operation. Valid labels are the user-defined labels on the **PDEF (p. 1372)** or **PCALC (p. 1362)** command.
LAST	*Lab*	Last value of path item *Lab* from last path operation. Valid labels are the user-defined labels on the **PDEF (p. 1372)** or **PCALC (p. 1362)** command.
NODE		Value providing the number of nodes defining the path referenced in the last path operation.
ITEM	*Lab*	***Item2*** = PATHPT, ***IT2NUM*** = *n* The value of *Lab* at the *n*th data point from the last path operation.
POINT	*n*	***Item2*** = *X,Y,Z*, or *CSYS*. Returns information about the nth point on the current path.
NVAL		The number of path data points (the length of the data table) from the last path operation.
SET	*n*	***Item2*** = NAME. Returns the name of the *n*th data set on the current path.
NUMPATH		Returns the number of paths defined.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity = PATH, *ENTNUM* = n (path number)		
Item1	**IT1NUM**	**Description**
NAME		Returns the name of the *n*th path.

Table 168: *GET Postprocessing Items, Entity = PLNSOL

Entity = PLNSOL (p. 1425)[a], *ENTNUM* = 0 (or blank)		
*GET (p. 797), *Par*, PLNSOL, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM*		
Item1	**IT1NUM**	**Description**
MAX		Maximum value of item in last contour display (**PLNSOL (p. 1425)**, **PLESOL (p. 1401)**).
MIN		Minimum value of item in last contour display (**PLNSOL (p. 1425)**, **PLESOL (p. 1401)**).
BMAX		Maximum bound value of item in last contour display (**PLNSOL (p. 1425)**, **PLESOL (p. 1401)**).
BMIN		Minimum bound value of item in last contour display (**PLNSOL (p. 1425)**, **PLESOL (p. 1401)**).

[a] You must issue the **/SHOW (p. 1785)** command before commands that produce a graphical output when running in batch mode to produce/export graphic files. For more details, see External Graphics Options in the *Basic Analysis Guide*.

Table 169: *GET Postprocessing Items, Entity = PRENERGY

Note:

Available after the PRENERGY (p. 1478) command is issued.

Entity = PRENERGY, *ENTNUM* = *N* (component number)		
*GET (p. 797), *Par*, PRENERGY, *N*, *Item1*, *IT1NUM*		
Item1	**IT1NUM**	**Description**
NCMP		Number of components (*ENTNUM* not required). This value is the maximum value for *N*.
NENE		Number of energy types (*ENTNUM* not required). This value is the maximum value for *M*.
TOTE	*M*	Total energy of type *M* of the model (*ENTNUM* not required). Energy value is non-zero when *Cname1* is blank on prior **PRENERGY (p. 1478)** command.
ENG	*M*	Energy of type *M* of component *N*. Energy value is non-zero when *Cname1* is specified on prior **PRENERGY (p. 1478)** command.
PENG	*M*	Percentage of energy of type *M* of component *N*. Percentage of energy value is non-zero when *Cname1* is specified on prior **PRENERGY (p. 1478)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Available after the PRENERGY (p. 1478) command is issued.

Entity **= PRENERGY,** ***ENTNUM*** **= *N* (component number)**		
GET (p. 797)**, ***Par**, PRENERGY,** ***N*****,** ***Item1*****,** ***IT1NUM***		
Item1	**IT1NUM**	**Description**
Ordering of *N* and *M* corresponds to **PRENERGY (p. 1478)** output.		

Table 170: *GET Postprocessing Items, Entity = PRERR

Entity **= PRERR,** ***ENTNUM*** **= 0 (or blank)**		
GET (p. 797)**, ***Par**, PRERR, 0,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
SEPC[1]		Structural percent error in energy norm (**PRERR (p. 1480)**).
TEPC[1]		Thermal percent error in energy norm (**PRERR (p. 1480)**).
SERSM[1]		Structural error energy summation (**PRERR (p. 1480)**).
TERSM[1]		Thermal error energy summation (**PRERR (p. 1480)**).
SENSM[1]		Structural energy summation (**PRERR (p. 1480)**).
TENSM[1]		Thermal energy summation (**PRERR (p. 1480)**).

1. Some element- and material-type limitations apply. For more information, see the documentation for the **PRERR (p. 1480)** command.

Table 171: *GET Postprocessing Items, Entity = RAD

Entity **= RAD, ENTNUM = 0 (or blank)**		
GET (p. 797)**, ***Par**, RAD, 0,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
VFAVG		Value of the average view factor computed from the previous VFQUERY command.
Entity **= RAD, ENTNUM = n (enclosure number)**		
GET (p. 797)**, ***Par**, RAD,** ***n*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***		
Item1	**IT1NUM**	**Description**
NETHF		Value of the net heat flux lost by an enclosure. • For a perfect enclosure, it should be zero (due to numerical roundoff, it may be a small number close to zero).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= RAD, ENTNUM = n (enclosure number)**		
GET (p. 797)**, **Par**, RAD, **n**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
		• For an imperfect enclosure, it is the net heat escaping from the enclosure to the space node.

Table 172: *GET Postprocessing Items, Entity = RSTMAC

Note:

Available after RSTMAC (p. 1627) command is issued.

Entity **= RSTMAC (p. 1627), *ENTNUM*= *N* (solution number on *File1*)**

GET (p. 797)**, **Par**, RSTMAC, 0 or **N**, **Item1**, **IT1NUM**, **Item2**, **IT2NUM		
Item1	**IT1NUM**	**Description**
NS1		Total number of solutions (modes for example) read on *File1*. See *Sbstep1* on the **RSTMAC (p. 1627)** command. This value is the maximum value for *N*.
NS2		Total number of solutions (modes for example) read on *File2*. See *Sbstep2* on the **RSTMAC (p. 1627)** command. This value is the maximum value for *M*
MAC	M	Modal assurance criterion value (MAC) between the solution *N* read on *File1* and the solution *M* read on *File2*. **Note:** *N* and *M* do not correspond to the substep (or mode) numbers if NS1 and NS2 are different from the total number of substeps (or modes).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Available after RSTMAC (p. 1627) command is issued.

Entity **= RSTMAC (p. 1627),** ***ENTNUM*** **=** ***N*** **(solution number on** ***File1*****)**

GET (p. 797),** ***Par**, RSTMAC, 0 or** ***N*****,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***

Item1	IT1NUM	Description
MACCYC	M	Modal assurance criterion value (MAC) from compressed table for **CYCLIC (p. 462)** between the solution *N* read on *File1* and the solution *M* read on *File2*. **Note:** *N* and *M* do not correspond to the substep (or mode) numbers if NS1 and NS2 are different from the total number of substeps (or modes).

Table 173: *GET Postprocessing Items, Entity = SECR

Entity **= SECR,** ***ENTNUM*** **=** ***n*** **(element number)**

For beam and pipe (including elbow) section results, return values for *all* elements

if the element number (*n*) is blank or ALL.

GET (p. 797),** ***Par**, SECR, n,** ***Item1*****,** ***IT1NUM*****,** ***Item2*****,** ***IT2NUM***

Item1	IT1NUM	Description	Item2	IT2NUM
S	X, Y, Z, XY, YZ, XZ	Component total stress	MAX – Returns maximum MIN – Returns minimum MAXY – Returns section Y location of maximum MAXZ – Returns section Z location of maximum MINY – Returns section Y location of minimum	These values apply only when Item2 = IVAL, JVAL, or KVAL. --- *For beam and pipe elements:* This value is the RST section-node number when KEYOPT(15) = 0. This value is the integration-point number when KEYOPT(15) = 1.
	1, 2, 3	Principal stress value		
	INT	Stress intensity value		
	EQV	Equivalent stress value		
EPTO	X, Y, Z, XY, YZ, XZ	Component total strain		
	1, 2, 3	Principal total strain value

GET (p. 797), *Par*, SECTION, *component*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM			
Item1	**IT1NUM**	**Item2**	**Description**
		1, 2, 3	Principal stress at midpoint of path.
		INT, EQV	Stress intensity or equivalent stress at midpoint of path.
OUTSIDE	S	X, Y, Z, XY, YZ, XZ	Stress component at end of path.
		1, 2, 3	Principal stress at end of path.
		INT, EQV	Stress intensity or equivalent stress at end of path.

Table 175: *GET Postprocessing Items, Entity = SORT

Entity **= SORT, *ENTNUM* = 0 (or blank)**		
GET (p. 797), *Par*, SORT, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
MAX		Maximum value of last sorted item (**NSORT (p. 1283)** or **ESORT (p. 680)** command).
MIN		Minimum value of last sorted item (**NSORT (p. 1283)** or **ESORT (p. 680)** command).
IMAX		Node/Element number where maximum value occurs.
IMIN		Node/Element number where minimum value occurs.

Table 176: *GET Postprocessing Items, Entity = SSUM

Entity **= SSUM, *ENTNUM* = 0 (or blank)**		
GET (p. 797), *Par*, SSUM, 0, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
ITEM	*Lab*	Value of item *Lab* from last **SSUM (p. 1858)** command. Valid labels are the user-defined labels on the **ETABLE (p. 687)** command.

Table 177: *GET Postprocessing Items, Entity = VARI

Entity **= VARI, *ENTNUM* = *N* (variable number after POST26 data storage) (for complex values, only the real part is returned with Item1 = EXTREM)**		
GET (p. 797),*Par*, *VARI*, *N*, *Item1*, *IT1NUM*, *Item2*, *IT2NUM		
Item1	**IT1NUM**	**Description**
EXTREM	VMAX	Maximum extreme value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Entity **= VARI,** ***ENTNUM*** **= *N* (variable number after POST26 data storage) (for complex values, only the real part is returned with Item1 = EXTREM)**		
***GET (p. 797),Par,VARI,N,Item1,IT1NUM,Item2,IT2NUM**		
Item1	**IT1NUM**	**Description**
	TMAX	Time or frequency corresponding to VMAX.
	VMIN	Minimum extreme value.
	TMIN	Time or frequency corresponding to VMIN.
	VLAST	Last value.
	TLAST	Time or frequency corresponding to VLAST.
	CVAR	Covariance
REAL	f	Real part of variable *N* at time or frequency f.
IMAG	f	Imaginary part of variable *N* at frequency f.
AMPL	f	Amplitude value of variable *N* at frequency f
PHASE	f	Phase angle value of variable *N* at frequency f
RSET	*Snum*	Real part of variable *N* at location *Snum*.
ISET	*Snum*	Imaginary part of variable *N* at location *Snum*.
Entity **= VARI,** ***ENTNUM*** **= 0 (or blank) (after POST26 data storage)**		
***GET (p. 797),Par,VARI,0,Item1,IT1NUM,Item2,IT2NUM**		
Item1	**IT1NUM**	**Description**
NSETS		Number of data sets stored.

Table 178: *GET Postprocessing Items, Entity = XFEM

Entity **= XFEM,** ***ENTNUM*** **= 0 (or blank)**				
***GET (p. 797), Par, XFEM, 0, Item1, IT1NUM**				
Item1	**IT1NUM**	**Item2**	**IT2NUM**	**Description**
STAT	*Element Number*			Status of the element: 0 = uncracked, 1 = cracked
Entity **= XFEM,** ***ENTNUM*** **= NODE**				
***GET (p. 797), Par, XFEM, NODE, Item1, IT1NUM, Item2, IT2NUM**				
Item1	**IT1NUM**	**Item2**	**IT2NUM**	**Description**
ELEM	*Element Number*	POS (or blank)	1-4 (for 2D elements) 1-8 (for SOLID185)	Node number at position *IT2NUM* of cracked element

Entity = XFEM, ***ENTNUM*** = PHI				
GET (p. 797)**, **Par**, XFEM, PHI, **Item1**, **IT1NUM**, **Item2**, **IT2NUM				
Item1	**IT1NUM**	**Item2**	**IT2NUM**	**Description**
ELEM	*Element Number*	NODE	*Node Number*	LSM Phi value for this node number of this element
Entity = XFEM, ***ENTNUM*** = PSI				
GET (p. 797)**, **Par**, XFEM, PSI, **Item1**, **IT1NUM**, **Item2**, **IT2NUM				
Item1	**IT1NUM**	**Item2**	**IT2NUM**	**Description**
ELEM	*Element Number*	NODE	*Node Number*	LSM Psi value for this node number of this element

Menu Paths

Utility Menu>Parameters>Get Scalar Data

/GFILE, *SIZE*

Specifies the pixel resolution on Z-buffered graphics files.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SIZE

Pixel resolution. Defaults to a pixel resolution of 800. Valid values are from 256 to 2400.

Command Default

800 pixels

Notes

Defines the pixel resolution on subsequently written graphics files (for example, JPEG, PNG, TIFF) for software Z-buffered displays (**/TYPE (p. 2034)**). Lowering the pixel resolution produces a "fuzzier" image; increasing the resolution produces a "sharper" image but takes a little longer.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/GFORMAT,*Ftype*,*NWIDTH*,*DSIGNF*

Specifies the format for the graphical display of numbers.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ftype

FORTRAN format types (G is the default if this field is left blank.)

G

G*xx*.*yy*. *xx* and *yy* are described below.

F

F*xx*.*yy*

E

E*xx*.*yy*

NWIDTH

Total width (12 maximum) of the field (the *xx* in *Ftype*). Defaults to 12.

DSIGNF

Number of digits after the decimal point (*yy* in F or E format) or number of significant digits in G format. Range is 1 to *xx*-6 for *Ftype* = G or E; and 0 to *xx*-3 for *Ftype* = F. The default is a function of *Ftype* and *NWIDTH*.

Notes

Enables you to control the format of the graphical display of floating point numbers.

To display the current settings, issue **/GFORMAT (p. 859)**,STAT..

To allow Mechanical APDL to select the format for the graphical display of floating numbers, issue **/GFORMAT (p. 859)**,DEFA.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Floating Point Format

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/GLINE, *WN*, *STYLE*

Specifies the element outline style.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

STYLE

Outline key:

0

Solid element outlines (default)

1

Dashed element outlines

-1

No element outlines

Command Default

Solid element outlines

Notes

Determines the element outline style. Often used when node numbers are displayed to prevent element lines from overwriting node numbers.

Unless you are using an OpenGL or Starbase driver, the dashed element outline option (**/GLINE (p. 860)**,*WN*,1) is not available in the following situations:

- Z-buffered displays (**/TYPE (p. 2034)**,*WN*,6).
- Capped Z-buffered displays (**/TYPE (p. 2034)**,*WN*,7).
- Qslice Z-buffered displays (**/TYPE (p. 2034)**,*WN*,8).

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Edge Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/GMARKER, *CURVE*, *KEY*, *INCR*

Specifies the curve marking style.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

CURVE

Curve number markers will be applied on (integer value between 1 and 10).

KEY

Marker key:

0

No markers will be applied (default).

1

TRIANGLES will be applied.

2

SQUARES will be applied.

3

DIAMONDS will be applied.

4

CROSSES will be applied.

INCR

Determines the curve marking frequency. (a whole number value between 1 and 255). If *INCR* = 1, markers are displayed at every data point on the curve. If *INCR* = 2 then markers are displayed at every second data point. If *INCR* = 3 then they are displayed at every third data point.

Command Default

No markers will be applied.

Notes

The user-specified markers will not be drawn when the area under the curve is color-filled (**/GROPT (p. 870)**, FILL).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>PlotCtrls>Style>Graphs>Modify Curve

GMATRIX, *SYMFAC*, *Condname*, *NUMCOND*, --, *Matrixname*

Performs electric field solutions and calculates the self and mutual conductance between multiple conductors.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SYMFAC

Geometric symmetry factor. Conductance values are scaled by this factor which represents the fraction of the total device modeled. Defaults to 1.

Condname

Alphanumeric prefix identifier used in defining named conductor components.

NUMCOND

Total number of components. If a ground is modeled, it is to be included as a component.

--

Unused field.

Matrixname

Array name for computed conductance matrix. Defaults to GMATRIX.

Notes

To invoke the **GMATRIX (p. 862)** macro, the exterior nodes of each conductor must be grouped into individual components using the **CM (p. 356)** command. Each set of independent components is assigned a component name with a common prefix followed by the conductor number. A conductor system with a ground must also include the ground nodes as a component. The ground component is numbered last in the component name sequence.

A ground conductance matrix relates current to a voltage vector. A ground matrix cannot be applied to a circuit modeler. The lumped conductance matrix is a combination of lumped "arrangements" of voltage differences between conductors. Use the lumped conductance terms in a circuit modeler to represent conductances between conductors.

Enclose all name-strings in single quotes in the **GMATRIX (p. 862)** command line.

GMATRIX (p. 862) works with the following elements:

- SOLID5 (KEYOPT(1) = 9)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- SOLID98 (KEYOPT(1) = 9)
- LINK68
- PLANE230
- SOLID231
- SOLID232

This command is available from the menu path shown below only if existing results are available.

This command does not support multiframe restarts

Distributed-Memory Parallel (DMP) Restriction

This command is not supported in a DMP solution.

Menu Paths

Main Menu>General Postproc>Elec&Mag Calc>Component Based>Self/Mutual conductance

---

GMFACE, *Lab*, *N*

Specifies the facet representation used to form solid models.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid Labels:

FINE

Value that determines how coarse the facets will be.

N

An integer value between one (small) and ten (large) that determines the tolerances that will be applied to the creation of arcs and surfaces. Ten will create many facets, which may in turn cause Mechanical APDL to run very slowly. One will create fewer facets, which may in turn cause larger tolerance errors.

Menu Paths

Utility Menu>PlotCtrls>Style>Solid Model Facets

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***GO**, *Base*

Causes a specified line on the input file to be read next.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Base

"Go to" action:

:*label* --

A user-defined label (beginning with a colon (:), 8 characters maximum). The command reader will skip (and wrap to the beginning of the file, if necessary) to the first line that begins with the matching :*label*.

Caution:

This label option may not be mixed with do-loop or if-then-else constructs.

STOP --

This action will cause an exit from the Mechanical APDL program at this line.

Command Default

Read lines sequentially.

Notes

Causes the next read to be from a specified line on the input file. Lines may be skipped or reread. The ***GO (p. 864)** command will *not* be executed unless it is part of a macro, user file (processed by ***USE (p. 2059)**), an alternate input file (processed by **/INPUT (p. 948)**), or unless it is used in a batch-mode input stream. Jumping into, out of, or within a do-loop or an if-then-else construct to a :*label* line is not allowed.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/GO

Reactivates suppressed printout.

SESSION (p. 11): List Controls (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Reactivates printout suppressed with the **/NOPR (p. 1251)** command without producing any output. The **/GOPR (p. 865)** command has the same function except that it also produces a command response from the program.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

/GOLIST

Reactivates the suppressed data input listing.

SESSION (p. 11): List Controls (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Reactivates printout of the data input listing suppressed with **/NOLIST (p. 1249)**.

This command is valid in any processor, but only within a batch run (**/BATCH (p. 217)**).

Menu Paths

This command cannot be accessed from a menu.

/GOPR

Reactivates suppressed printout.

SESSION (p. 11): List Controls (p. 13)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Reactivates printout suppressed with the **/NOPR (p. 1251)** command. The **/GO (p. 865)** command has the same function except that it does not produce a command response from the program.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

GPLOT

Controls general plotting.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This command displays all entity types as specified via the **/GTYPE (p. 883)** command. Only selected entities (**NSEL (p. 1266)**, **ESEL (p. 661)**, **KSEL (p. 995)**, **LSEL (p. 1074)**, **ASEL (p. 192)**, **VSEL (p. 2163)**) will be displayed. See the descriptions of the **/GTYPE (p. 883)** and **/GCMD (p. 795)** commands for methods of setting the entity types displayed.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Loads>Dynamic Gap Cond>Define

Main Menu>Solution>Dynamic Gap Cond>Define

Utility Menu>Plot>Multi-Plots

/GRAPHICS, *Key*

Defines the type of graphics display.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Graphics key:

FULL

Display all model geometry and results.

POWER

Activate PowerGraphics (default when GUI is on).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

PowerGraphics ON (*Key* = POWER).

Notes

The **/GRAPHICS (p. 866)** command specifies the type of graphics display. *Key* = POWER activates the PowerGraphics capability. PowerGraphics offers faster plotting than the *Key* = FULL option, and speeds up element, results, area, line, and volume displays.

The default PowerGraphics mode is enabled automatically when accessing the GUI. This action supersedes all prior macros or start-up routines (`start.ans`, `config.ans`, etc.). Full graphics mode is accessed only by issuing **/GRAPHICS (p. 866)**,FULL *after* the GUI is active.

Results values (both printed and plotted) may differ between the *Key* = FULL and *Key* = POWER options because each option specifies a different set of data for averaging and display. For *Key* = FULL, all element and results values (interior and surface) are included. For *Key* = POWER, only element and results values along the model exterior surface are processed. Also, the element display can be different between the *Key* = FULL and *Key* = POWER options. For more information, see **EPLOT (p. 648)**.

When *Key* = FULL, it is possible to deselect an individual node, select all elements (including the element that contains that node), and then perform postprocessing calculations on those elements and have that unselected node not be considered in those calculations. If PowerGraphics is active, however, postprocessing always displays based on selected elements.

If you have specified one facet per element edge for PowerGraphics displays (via the **/EFACET (p. 602)** command or options from the **General Postproc** or **Utility** menu), PowerGraphics *does not plot midside nodes*. (**/EFACET (p. 602)** applies to element type displays only.)

Maximum values shown in plots can differ from printed maximum values. This is due to different averaging schemes used for plotted and printed maximum values.

When using solution coordinate systems for results output (**RSYS (p. 1639)**,SOLU) with PowerGraphics, the deformed or displaced shape in a POST1 contour display can be unexpected (although the contours are displayed in the expected colors). The program *does not* rotate displacement values (Ux,Uy,Uz) to global; instead, the displacements (stored locally) are added directly to the global coordinates (X,Y,Z). For example, if in PREP7 the nodes are rotated 90 degrees about the z axis and the global Uy displacements are relatively large, the Ux values will be large, causing the model to display a large deformation in the global X direction.

PowerGraphics displays do not average at geometric discontinuities. The printouts in PowerGraphics will, however, provide averaging information at geometric discontinuities if the models do not contain shell elements. Carefully inspect the data you obtain at geometric discontinuities.

PowerGraphics does not support the following diffusion analysis results: CONC, CG, DF, EPDI.

Key = FULL is not available for XFEM-based crack-growth analysis.

Excepting a few options, PowerGraphics supports these commands:

/CTYPE (p. 443),**PNUM (p. 1457)**
/EDGE (p. 594),**PSYMB (p. 1552)**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/ESHAPE (p. 665) **/SHELL (p. 1784)**
***GET (p. 797)** ***VGET (p. 2118)**

The following commands are executed via the *Key* = FULL option, regardless of whether PowerGraphics is activated:

/CTYPE (p. 443) **/ESYS (p. 685)** **/PBF (p. 1360)** **PRVECT (p. 1524)** ***VGET (p. 2118)**
DNSOL (p. 564) ***GET (p. 797)** **PLETAB (p. 1417)** **/PSYMB (p. 1552)** ***VPUT (p. 2149)**
/EDGE (p. 594) **SHELL (p. 1784)** **PLLS (p. 1419)** **SALLOW (p. 1644)**
ERNORM (p. 659) **/NORMAL (p. 1253)** **PRSECT (p. 1440)** **/SSCALE (p. 1847)**
ESORT (p. 680) **NSEL (p. 1266)** **PRETAB (p. 1496)** **/SHRINK (p. 1794)**
NSORT (p. 1283) **/PNUM (p. 1457)** **PRSECT (p. 1520)** **/TALLOW (p. 1897)**

Menu Paths

Utility Menu>PlotCtrls>Style>Hidden-Line Options

/GRESUME, *Fname*, *Ext*, - -

Sets graphics settings to the settings on a file.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to `Jobname`.

Ext

Filename extension (eight-character maximum).

The extension defaults to GSAV if *Fname* is blank.

- -

Unused field.

Notes

Causes a file to be read to reset the graphics slash (/) commands as they were at the last **/GSAVE (p. 875)** command.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>PlotCtrls>Restore Plot Ctrls

/GRID, *KEY*

Selects the type of grid on graph displays.

GRAPHICS (p. 16): Graphs (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Grid key:

0 (OFF)

No grid.

1 (ON)

Full grid (X and Y grid lines).

2 (X)

Partial grid (X grid lines only).

3 (Y)

Partial grid (Y grid lines only)

Command Default

No grid.

Notes

Selects the type of grid on graph displays. Graphs with multiple Y-axes can have multiple grids (**/GRTYP (p. 874)**). The grid of the first curve is also used as the background grid (above and behind the curve). Grids for other curves are limited to be under the curves. See also **/GTHK (p. 882)** and **/GROPT (p. 870)** for other grid options.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Graphs>Modify Grid

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/GROPT, *Lab*, *KEY*

Sets various line graph display options.

GRAPHICS (p. 16): Graphs (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Apply display style as selected from the following labels:

AXDV

Axis division (tick) marks (defaults to *KEY* = ON).

AXNM

Axis scale numbers (defaults to *KEY* = ON, which puts numbers at the back plane of the graph). If *KEY* = FRONT, numbers are on the front plane of the graph.

AXNSC

Axis number size scale factor. Input the scale value for *KEY* (defaults to 1.0).

ASCAL

Automatic scaling of additional Y-axes for multi-curve (**/GRTYP (p. 874)**, 2 or 3) graphs (defaults to *KEY* = ON). If *KEY* = OFF, use base Y-axis scaling (see the **/YRANGE (p. 2201)** command).

LOGX

Log X scale (defaults to *KEY* = OFF (linear)).

LOGY

Log Y scale (applies only to the base Y axis) (defaults to *KEY* = OFF (linear)).

FILL

Color fill areas under curves (defaults to *KEY* = OFF).

CGRID

Superimpose background grid (**/GRID (p. 869)**) over areas under filled curves (defaults to *KEY* = OFF).

DIG1

Number of significant digits before decimal point for axis values. Input the value for *KEY* (defaults to 4).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DIG2

Number of significant digits after decimal point for axis values. Input the value for *KEY* (defaults to 3).

VIEW

View key for graph displays (defaults to *KEY* = OFF, in which case the view is (0,0,1) for 2D graph displays or (1,2,3) for 3D graph displays). If *KEY* = ON, the view settings for graph displays are the same as the view settings for the model.

REVX

Plots the values on the X-axis in reverse order.

REVY

Plots the values on the Y-axis in reverse order.

DIVX

Determines the number of divisions (grid markers) that will be plotted on the X axis.

DIVY

Determines the number of divisions (grid markers) that will be plotted on the Y axis.

LTYP

Specifies whether program-generated (*KEY* = 1) or system-derived (*KEY* = 0) fonts are used for the axis labels.

CURL

Determines the position of the curve labels. If (*KEY* = 1), the curve label will be plotted in the legend column, and the label will be displayed in the same color as the curve. If (*KEY* = 0) the curve labels will be plotted near the curve. (default).

XAXO

When you use this label, the subsequent *KEY* value will determine an offset amount from the default (along the bottom) location for the X axis. If *KEY* = 1.0, a full offset occurs (the X axis is moved to the top of the graph). If *KEY* = 0.5, the axis is offset to the midpoint of the graph, and if *KEY* = 0 the axis remains in the original position, along the bottom of the graph. For any offset, a grey copy of the original axis (containing the axis numbering) remains at the original location.

YAXO

When you use this label, the subsequent *KEY* value will determine an offset amount from the default (along the left side of the graph) location for the Y axis. If *KEY* = 1.0, a full offset occurs (the Y axis is moved to the right side of the graph). If *KEY* = 0.5, the axis is offset to the midpoint of the graph, and if *KEY* = 0 the axis remains in the original position, along

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the left side of the graph. For any offset, a gray copy of the original axis (containing the axis numbering) remains at the original location.

KEY

Option values:

OFF (0)

Do not apply selected style.

ON (1)

Apply selected style.

nnnn

If *Lab* is DIG1 or DIG2, input the number of digits.

nn

If *Lab* is AXNSC, input the scale factor.

FRONT

If *Lab* is AXNM, FRONT may also be input.

Ndiv

If *Lab* is DIVX or DIVY, determines the number of divisions (1-99) that will be applied to the axis.

Kfont

If *Lab* is LTYP, *Kfont* is ON (1) or OFF(0). ON uses program-generated fonts for the axis labels, while OFF uses SYSTEM (Windows, X-system, etc.) fonts. Default: *Kfont* = ON (Mechanical APDL fonts).

Notes

Sets various line graph display options. Issue **/GROPT (p. 870)**,STAT to display the current settings.

Issue **/GROPT (p. 870)**,DEFA to reset default specifications.

Unless you issue **/GROPT (p. 870)**,VIEW,ON, the program indicates that graph-view manipulation is inactive.

See **/AXLAB (p. 216)**, **/GRTYP (p. 874)**, **/GRID (p. 869)**, and **/GTHK (p. 882)** for other graph-control options.

Automatic scaling using the **/XRANGE (p. 2199)** and **/YRANGE (p. 2201)** commands often yields inappropriate range values for logarithmic scales (**/GROPT (p. 870)**, LOGX or **/GROPT (p. 870)**, LOGY).

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Specifies the grouping mode combination method.

SOLUTION (p. 38): Spectrum Options (p. 41)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SIGNIF

Combine only those modes whose significance level exceeds the *SIGNIF* threshold. For single-point, multi-point, or DDAM response spectrum (*Spectype* = SPRS, MPRS, or DDAM on **SPOPT (p. 1837)**), the significance level of a mode is defined as the mode coefficient divided by the maximum mode coefficient of all modes. Any mode whose significance level is less than *SIGNIF* is considered insignificant and is not contributed to the mode combinations. The higher the *SIGNIF* threshold, the fewer the number of modes combined. *SIGNIF* defaults to 0.001. If *SIGNIF* is specified as 0.0, it is taken as 0.0. (This mode combination method is not valid for **SPOPT (p. 1837)**,PSD.)

Label

Label identifying the combined mode solution output.

DISP

Displacement solution (default). Displacements, stresses, forces, etc., are available.

VELO

Velocity solution. Velocities, "stress velocities," "force velocities," etc., are available.

ACEL

Acceleration solution. Accelerations, "stress accelerations," "force accelerations," etc., are available.

--

Unused field.

ForceType

Label identifying the forces to be combined:

STATIC

Combine the modal static forces (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TOTAL

Combine the modal static plus inertial forces.

Notes

The *SIGNIF* value set with this command (including the default value of 0.001) overrides the *SIGNIF* value set with the **MXPAND (p. 1203)** command.

This command is also valid for PREP7.

---

/GRTYP, *KAXIS*

Selects single or multiple Y-axes graph displays.

GRAPHICS (p. 16): Graphs (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KAXIS

Axis selection key:

0 or 1

Single Y-axis. Up to 10 curves scaled to a single Y-axis.

2

Additional Y-axes (one for each curve) (3 curves maximum). Allows better scaling of curves with widely differing numbering ranges.

3

Same as 2 but with additional Y-axis and curves projected out of the plane (6 curves maximum). Allows clearer display with an isometric view. The default view when *KAXIS* = 3 is View,1,1,2,3.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

Single Y-axis graph (except as noted for selection key 3).

Notes

The basic line graph has one or more curves plotted against the same Y and X axes. Multiple curve graphs can also be plotted with individual Y axes and the same X axis. The Y axis of the first curve is referred to as the base Y-axis and the Y axes of the other curves as additional Y axes. Curves are numbered sequentially from 1 (the base curve) in the order in which they are displayed. See the **/AXLAB (p. 216)**, **/GROPT (p. 870)**, **/GRID (p. 869)**, and **/GTHK (p. 882)** commands for other display options.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Graphs>Modify Axes

/GSAVE, *Fname*, *Ext*, --

Saves graphics settings to a file for later use.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to GSAV if *Fname* is blank.

--

Unused field.

Notes

This command does not save all graphics settings, but only those that may be reset by the **/RESET (p. 1599)** command. The database remains untouched. Use the **/GRESUME (p. 868)** command to read the file. Repeated use of the **/GSAVE (p. 875)** command overwrites the previous data on the file. The following commands are saved by **/GSAVE (p. 875)**:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

GSBDATA, *LabZ*, *VALUEZ*, *LabX*, *VALUEX*, *LabY*, *VALUEY*

Specifies the constraints or applies the load at the ending point for generalized plane strain option.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LabZ

Constraint or load at the ending point in the fiber Z direction.

F

Apply a force in the fiber direction (default).

LFIBER

Define a length change in the fiber direction.

VALUEZ

Value for *LabZ*. The default is zero.

LabX

Constraint or load on rotation about X.

MX

Supply a moment to cause the rotation of the ending plane about X (default).

ROTX

Define a rotation angle (in radians) of the ending plane about X.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VALUEX

Value for *LabX*. The default is zero.

LabY

Constraint or load on rotation about Y

MY

Supply a moment to cause the rotation of the ending plane about Y (default).

ROTY

Define a rotation angle (in radians) of the ending plane about Y.

VALUEY

Value for *LabY*. The default is zero.

Notes

All inputs are in the global Cartesian coordinate system. For more information about the generalized plane strain feature, see Generalized Plane Strain Option of Current-Technology Solid Elements in the *Element Reference*.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Define Loads>Apply>Structural>Gen Plane Strain

Main Menu>Solution>Define Loads>Apply>Structural>Gen Plane Strain

---

GSGDATA, *LFIBER*, *XREF*, *YREF*, *ROTX0*, *ROTY0*

Specifies the reference point and defines the geometry in the fiber direction for the generalized plane strain element option.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LFIBER

Fiber length from the reference point. Defaults to 1.

XREF

X coordinate of the reference point. Defaults to zero.

YREF

Y coordinate of the reference point. Defaults to zero.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ROTX0

Rotation of the ending plane about X in radians Defaults to zero.

ROTY0

Rotation of the ending plane about Y in radians Defaults to zero.

Notes

The ending point is automatically determined from the starting (reference) point and the geometry inputs. All inputs are in the global Cartesian coordinate system. For more information about the generalized plane strain feature, see Generalized Plane Strain Option of Current-Technology Solid Elements in the *Element Reference*.

Menu Paths

Main Menu>Preprocessor>Modeling>Genl plane strn

GSLIST, *Lab*

When using generalized plane strain, lists the input data or solutions.

SOLUTION (p. 38): FE Constraints (p. 47)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Specify the content to be listed.

GEOMETRY

List the data input using GSGDATA

BC

List the data input using GSBDATA.

REACTIONS

When the command is issued in POST1, list the reaction force at the ending point,

and the moment about X and Y if the corresponding constraints were applied.

RESULTS

When the command is issued in POST1, list the change of fiber length at the ending point during deformation and the rotation of the ending plane about X and Y during deformation.

ALL

List all of the above (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command can be used to list the initial position of the ending plane, the applied load or displacements in the fiber direction, the resulting position of the ending plane after deformation, and the available reaction forces and moments at the ending point.

All inputs and outputs are in the global Cartesian coordinate system. For more information about the generalized plane strain feature, see Generalized Plane Strain Option of Current-Technology Solid Elements in the *Element Reference*.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Other>Genl Plane Strn

GSSOL, *NVAR*, *Item*, *Comp*, *Name*

Specifies which results to store from the results file when using generalized plane strain.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR

Arbitrary reference number or name assigned to this variable. Variable numbers can be 2 to *NV* (**NUMVAR (p. 1302)**) while the name can be an eight byte character string. Overwrites any existing results for this variable.

Item

Label identifying item to be stored.

LENGTH

Change of fiber length at the ending point.

ROT

Rotation of the ending plane during deformation.

F

Reaction force at the ending point in the fiber direction.

M

Reaction moment applied on the ending plane.

Comp

Component of the item, if Item = ROT or M.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X

The rotation angle or reaction moment of the ending plane about X.

Y

The rotation angle or reaction moment of the ending plane about Y.

Name

Thirty-two character name identifying the item on the printout and display. Defaults to the label formed by concatenating the first four characters of the *Item* and *Comp* labels.

Notes

This command stores the results (new position of the ending plane after deformation) for generalized plane strain. All outputs are in the global Cartesian coordinate system. For more information about the generalized plane strain feature, see Generalized Plane Strain Option of Current-Technology Solid Elements in the *Element Reference*.

Menu Paths

/**GST**,*Lab*,*RunTrack*

Enables the Graphical Solution Tracking (GST) feature.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Enables or disables the GST feature:

ON – Enable

OFF – Disable

RunTrack

Enables or disables `.gst` file viewing in the Results Tracker utility:

ON – Enable

OFF – Disable (default)

Command Default

GST is enabled (*Lab* = ON) for interactive sessions and disabled (*Lab* = OFF) for batch runs.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

For interactive sessions using the GUI (**/MENU (p. 1121)**,ON), GST directs solution graphics to the screen.

For interactive sessions not using the GUI (**/MENU (p. 1121)**,OFF), or for batch sessions, GST saves solution graphics to the `Jobname.gst` file. To create a `Jobname.gst` file that is compatible with the Results Tracker utility (available via the Mechanical APDL Product Launcher), issue **/GST (p. 880)**,ON,ON.

You can use the GST feature for these nonlinear analysis types: structural, thermal, electric, magnetic, fluid, and diffusion.

For more information about GST and illustrations of the GST graphics for each analysis type, see the analysis guide for the appropriate discipline.

---

GSUM

Calculates and prints geometry items.

PREP7 (p. 22): Keypoints (p. 25)
PREP7 (p. 22): Lines (p. 26)
PREP7 (p. 22): Areas (p. 27)
PREP7 (p. 22): Volumes (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Calculates and prints geometry items (centroid location, moments of inertia, length, area, volume etc.) associated with the selected keypoints, lines, areas, and volumes. Geometry items are reported in the global Cartesian coordinate system. For volumes, a unit density is assumed unless the volumes have a material association via the **VATT (p. 2075)** command. For areas, a unit density (and thickness) is assumed unless the areas have a material (and real constant) association via the **AATT (p. 85)** command. For lines and keypoints, a unit density is assumed, irrespective of any material associations (**LATT (p. 1014)**, **KATT (p. 969)**, **MAT (p. 1111)**). Items calculated by **GSUM (p. 881)** and later retrieved by a ***GET (p. 797)** or ***VGET (p. 2118)** commands are valid only if the model is not modified after the **GSUM (p. 881)** command is issued. This command combines the functions of the **KSUM (p. 999)**, **LSUM (p. 1086)**, **ASUM (p. 203)**, and **VSUM (p. 2167)** commands.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Calc Geom Items>Of Geometry

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/GTHK, *Label*, *THICK*

Sets line thicknesses for graph lines.

GRAPHICS (p. 16): Graphs (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Apply thicknesses as selected from the following labels:

AXIS

Modify thickness of ordinate and abscissa axes on graph displays.

GRID

Modify thickness of grid lines on graph displays.

CURVE

Modify thickness of curve lines (when no area fill (**/GROPT (p. 870)**)).

THICK

Thickness ratio (whole numbers only, from -1 to 10):

-1

Do not draw the curve, but show only the markers specified by **/GMARKER (p. 861)**.

0 or 1

Thin lines.

2

The default thickness.

3

1.5 times the default thickness.

etc.

(up to 10)

Notes

Sets line thicknesses for graph lines (in raster mode only). Use **/GTHK (p. 882)**,STAT to show settings.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>PlotCtrls>Style>Graphs>Modify Axes
Utility Menu>PlotCtrls>Style>Graphs>Modify Curve
Utility Menu>PlotCtrls>Style>Graphs>Modify Grid

/GTYPE, *WN*, *LABEL*, *KEY*

Controls the entities that the GPLOT (p. 866) command displays.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which this command applies (defaults to 1)

LABEL

This represents the type of entity to display:

NODE

Nodes

ELEM

Elements

KEYP

Keypoints

LINE

Lines

AREA

Areas

VOLU

Volumes

GRPH

Graph displays

KEY

Switch:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Turns the entity type off.

1

Turns the entity type on.

Notes

The **/GTYPE (p. 883)** command controls which entities the **GPLOT (p. 866)** command displays. NODE, ELEM, KEYP, LINE, AREA, and VOLU are on by default. When ELEM is activated, you can control the type of element displayed via the **/GCMD (p. 795)** command (which also controls the type of graph display). When the GRPH entity type is activated, all other entity types are deactivated. Conversely, when any of the NODE, ELEM, KEYP, LINE, AREA, and VOLU entity types are active, the GRPH entity type is deactivated.

The **/GTYPE (p. 883)** command gives you several options for multi-window layout:

- One window
- Two windows (left and right or top and bottom of the screen)
- Three windows (two at the top and one at the bottom of the screen, or one top and two bottom windows
- Four windows (two at the top and two at the bottom)

Once you choose a window layout, you can choose one of the following: multiple plots, replotting, or no redisplay.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Multi-Plot Contrls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

H Commands

HARFRQ, *FREQB*, *FREQE*, --, *LogOpt*, *FREQARR*, *Toler*

Defines the frequency range in a harmonic analysis.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FREQB

Frequency (Hz) at the beginning of the *FREQB* to *FREQE* range (if *FREQE* > *FREQB*). If *FREQE* is blank, the solution is done only at frequency *FREQB* (the central frequency of octave bands, when *LogOpt* = OB1, OB2, OB3, OB6, OB12 or OB24).

FREQE

Frequency at end of this range. For non-logarithm spacing (*LogOpt* is blank), solutions are done at an interval of (*FREQE* - *FREQB*) /*NSBSTP*, ending at *FREQE*, and no solution is done at the beginning of the frequency range, *FREQB*. *NSBSTP* is input via the **NSUBST (p. 1287)** command. See the **EXPSOL (p. 721)** command documentation for expansion pass solutions.

--

Reserved.

LogOpt

Logarithm frequency span. Solutions are done at an interval of (log(*FREQE*) - log(*FREQB*)) / (*NSBSTP*-1), (*NSBSTP*>1). The central frequency or beginning frequency is used for *NSBSTP* = 1. Valid values are:

OB1

Octave band.

OB2

1/2 octave band.

OB3

1/3 octave band.

OB6

1/6 octave band.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OB12

1/12 octave band.

OB24

1/24 octave band.

LOG

General logarithm frequency span.

FREQARR

An array containing frequency values (Hz). Combined with the tolerance argument, *Toler*, these values are merged with values calculated based on the specifications from *FREQB*, *FREQE*, and *LogOpt*, as well *NSBSTP* on the **NSUBST (p. 1287)** command and *Clust* on the **HROUT (p. 918)** command. Enclose the array name in percent (%) signs (for example, **HARFRQ (p. 885)**,,,,,%arrname%). Use ***DIM (p. 530)** to define the array.

Toler

Tolerance to determine if a user input frequency value in *FREQARR* is a duplicate and can be ignored. Two frequency values are considered duplicates if their difference is less than the frequency range multiplied by the tolerance. The default value is 1×10^{-5}.

Notes

Defines the frequency range for loads in the harmonic analysis (**ANTYPE (p. 162)**,HARMIC).

Do not use this command for a harmonic ocean wave analysis (**HROCEAN (p. 917)**).

When frequencies are user-defined, the array *FREQARR* must be one-dimensional and contain positive values. User-defined frequency input is not supported for the frequency-sweep Variational Technology method (**HROPT (p. 912)**,VT) or the harmonic balance method (**HROPT (p. 912)**,HBM).

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>Freq and Substeps

Main Menu>Solution>Load Step Opts>Time/Frequenc>Freq and Substeps

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/HBC, *WN*, *Key*

Determines how boundary condition symbols are displayed in a display window.

GRAPHICS (p. 16): Labeling (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window reference number. This number can be any window numbered 1 to 5, or ALL (for all active windows). Default = 1.

Key

Controls hidden-surface boundary condition display behavior:

ON, YES or 1 = Enable – Your boundary condition symbols are processed by the hidden-surface algorithm (for 2D graphics devices) and use an improved pressure-contour display (for 2D and 3D graphics devices).

OFF, NO or 0 (default) = Disable (default) – Your boundary condition symbols are *not* processed by the hidden-surface algorithm..

Command Default

/HBC (p. 887),*WN*,Off

For 2D graphics devices (such as X11, win32, and PNG), boundary condition symbols are not processed by the hidden-surface algorithm. All symbols are displayed.

For both 2D and 3D graphics devices, no enhanced rendering of pressure contours occurs.

Notes

With **/HBC (p. 887)**,*WN*,ON in effect, Mechanical APDL does *not* display symbols obscured by the model in the current view (that is, symbols inside of or behind the model are not drawn). This behavior lessens display clutter.

Menu Paths

Utility Menu>PlotCtrls>Style>Hidden-Line Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HBMAT,*Fname*,*Ext*,--,*Form*,*Matrx*,*Rhs*,*Mapping*

Writes an assembled global matrix in Harwell-Boeing format.

AUX2 (p. 61): Binary File Manipulation (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Defaults to the current Jobname if left blank.

Ext

Filename extension (eight-character maximum).

Defaults to `.matrix` if left blank.

--

Unused field.

Form

Specifies format of output matrix file:

ASCII

Write output matrix file in ASCII form.

BIN

Write output matrix file in binary form.

Matrx

Specify which matrix to write to the output matrix file:

STIFF

Write stiffness matrix to output matrix file. Valid for all types of analyses that write a `.full` file.

MASS

Write mass matrix to output matrix file. Valid for buckling, substructure, and modal analyses. If `.full` file was generated in a buckling analysis, then this label will write stress stiffening matrix to output matrix file.

DAMP

Write damping matrix to output matrix file. Only valid for damped modal analyses.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Rhs

Specifies whether to write the right-hand side vector to output matrix file:

YES

Write right-hand side vector to output matrix file.

NO

Do not write right-hand side vector to output matrix file.

Mapping

Specifies whether to write the mapping file. This file is always named *Fname*.mapping.

YES

Write the mapping file.

NO

Do not write the mapping file (default).

Command Default

By default, assuming a proper filename and extension have been entered, writes the stiffness matrix and right-hand side vector to Jobname.matrix in the current working directory in ASCII format.

Notes

This command copies a matrix from the assembled global matrix file (.full file) or from the superelement matrix file (.sub file) as specified on the **FILEAUX2 (p. 753)** command and write it in Harwell-Boeing format to a new file named Jobname.matrix. The Harwell-Boeing format is widely used by other applications that deal with matrices.

The assembled global matrix file is created during solution depending on the analysis type, equation solver, and other solution options. By default, the assembled global matrix file is never deleted at the end of solution. For most analysis types, the Sparse direct solver and the ICCG solver will write a .full file. All mode extraction methods used for buckling and modal analyses will write a properly formatted .full file to be used with the **HBMAT (p. 888)** command. However, when using distributed-memory parallel (DMP) processing, a majority of analyses will write a distributed (or local) form of the .full file which is not currently supported by the **HBMAT (p. 888)** command.

When dumping the stiffness matrix for transient and harmonic analyses, be aware that the element mass matrix values (and possibly element damping matrix values) are incorporated into the globally assembled stiffness matrix. Thus, the globally assembled stiffness matrix represents more than the stiffness of the model for these analysis types. Please refer to the *Mechanical APDL Theory Reference* for more details.

When dumping a .full file, the rows and columns corresponding to specified constraints (for example, **D (p. 483)** commands) are eliminated from the system of equations and therefore are not written to the .matrix file. Also, rows and columns corresponding to eliminated (dependent) degrees of freedom

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

from coupling and/or constraint equations (for example, **CE (p. 297)**, **CP (p. 421)** commands) are also eliminated from the system of equations and are not written to the `.matrix` file. The DOFs that are eliminated from any coupling and/or constraint equations are determined internally by the solution code and may not match what you specified via the **CE (p. 297)**/**CP (p. 421)** (or similar) commands.

When dumping a `.sub` file, the full *n*x*n* matrix will be written to the `.matrix` file for either symmetric or unsymmetric matrices, regardless of whether any of the matrix coefficients are zero-valued. When dumping a `.full` file, only the lower triangular part of the matrix will be written to the `.matrix` file if the matrix is symmetric; the full matrix is written if the matrix is unsymmetric. Only matrix coefficients that are greater than zero will be written.

The Harwell-Boeing format is column-oriented. That is, non-zero matrix values are stored with their corresponding row indices in a sequence of columns. However, because the Mechanical APDL matrix files are stored by row and not column, when the **HBMAT (p. 888)** command is used with a non-symmetric matrix, the transpose of the matrix is, in fact, written.

The **WRFULL (p. 2184)** command, used with the **SOLVE (p. 1822)** command, generates the assembled global matrix file and eliminate the equation solution process and results output process.

The mapping file can be used to map the matrix equation numbers found in the `.matrix` file directly to the corresponding node numbers and degrees of freedom.

When dumping a CMS `.sub` file, the last rows/columns of the matrix are non-physical degrees of freedom added internally by the CMS process and cannot be mapped directly to a node number or particular degree of freedom.

Menu Paths

Utility Menu>File>List>Binary Files

Utility Menu>List>Files>Binary Files

HBMOPT, *Option*, *Value1*, *Value2*, *Value3*, *Value4*, *Value5*

Specifies solution options for a harmonic balance method (HBM) analysis.

SOLUTION (p. 38): Nonlinear Options (p. 40)
SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Harmonic balance method analysis option. There is no default. The semantic labels for *Value1*, *Value2*, *Value3*, *Value4*, and *Value5* as well as their descriptions and default/range values depend on the option setting. See the command specifications for each option for details. Possible *Option* settings are:

AFT

Specify alternate frequency-time (AFT) procedure options. This command is optional. See Command Specification for *Option* = AFT (p. 892)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NR

Specify Newton-Raphson controls. This command is optional. See Command Specification for *Option* = NR (p. 892).

TRTOL

Specify trust-region solver tolerances. This command is optional. See Command Specification for*Option* = TRTOL (p. 893).

CONTSET

Required settings for a numerical continuation solution. You must issue this command to properly set up an HBM analysis. See Command Specification for *Option* = CONTSET (p. 893).

CONTTERM

Specify termination criteria when continuation is on. This command is optional. See Command Specification for *Option* = CONTTERM (p. 895).

UINIT

Specify a solution guess at the beginning frequency of the solution. This command is optional. See Command Specification for *Option* = UINIT (p. 895).

LINEAR

Specify if nonlinearities are considered. This command is optional. See Command Specification for *Option* = LINEAR (p. 897).

SCAL

Linearly scale the solution vector to improve the convergence rate. See Command Specification for *Option* = SCAL (p. 898).

CONTLIST

List all continuation parameters. This command is optional. *Value1* .. *Value5* are unused fields.

LIST

List all continuation parameters (except continuation). This command is optional. *Value1* .. *Value5* are unused fields.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specification for *Option* = AFT

HBMOPT (p. 890), AFT, *NP*, *NT*, - -, - -, - -

Table 179: Semantic labels and definitions of *Value1*, ... *Value5* for *Option* = AFT

Value	Label and description	Default Value	Range
Value1	***NP*** **Maximum number of time periods** *NP* must be a positive integer. Note that the effective number of time periods may be smaller than *NP* as the AFT transient is stopped when periodic convergence is reached.	4	$NP > 0$
Value2	***NT*** **Number of time points per period** *NT* cannot be less than 2*NH+1, where NH is the number of harmonics[a]. The value of NT is automatically adjusted if this criterion is not met.	128	$16 \leq NT \leq 16384\ (= 2^{14})$
Value3, ... *Value5*	unused fields		

[a] Specify the number of harmonics NH by issuing **HROPT (p. 912)**,HBM,*NH*.

Command Specification for *Option* = NR

HBMOPT (p. 890), NR, *MAXITER*, *MAXINITITER*, - -, - -, - -

Table 180: Semantic labels and definitions of *Value1*, ... *Value5* for *Option* = NR

Value	Label and description	Default Value	Range
Value1	***MAXITER*** **Maximum number of iterations at a frequency point**	25 in most cases. 100 if continuation is turned off or natural continuation is selected by issuing **HBMOPT (p. 890)**,CONTSET with *CorrMeth* = OFF or NAT.	$MAXITER \geq 0$
Value2	***MAXINITITER*** **Maximum number of iterations at initial solution, irrespective of continuation settings**	500	$MAXINITITER \geq 0$

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Value	Label and description	Default Value	Range
Value3, … *Value5*	unused fields		

Command Specification for *Option* = TRTOL

HBMOPT (p. 890), TRTOL, ***UTOL***, ***RTOL***, ***GTOL***, **- -**, **- -**

Table 181: Semantic labels and definitions of *Value1*, ... *Value5* for *Option* = TRTOL

Value	Label and description	Default Value	Range
Value1	***UTOL*** **Tolerance on the solution step size at any given iteration**	1e-15	*UTOL* > 0
Value2	***RTOL*** **Tolerance on the function residual norm**	1e-6	*RTOL* > 0
Value3	***GTOL*** **Tolerance on the gradient norm**	1e-12	*GTOL* > 0
Value4, *Value5*	unused fields		

Command Specification for *Option* = CONTSET

HBMOPT (p. 890), CONTSET, ***CorrMeth***, ***DS***, ***DSMIN***, ***DSMAX***, **- -**

Table 182: Semantic labels and definitions of *Value1*, ... *Value5* for *Option* = CONTSET

Value	Label and description	
Value1	***CorrMeth*** **Corrector method** Specify the corrector type or alternative continuation method. The solver uses natural continuation for the first step for all continuation methods. (See notes (p. 900) for details.)	Possible *CorrMeth* settings are: **OFF** No continuation. Similar to natural continuation except there is no heuristic step adjustment, and the maximum number of allowed nonconverged steps is 1. **ARC** Arc-length corrector (default) **ORT** Orthogonal corrector

Value	Label and description	
		NAT Natural continuation. No continuation method is used.
Value2	***DS*** **Initial step size** Step size for the first substep. In the continuation process, the step size determines the size of the tangent prediction. Because it fully determines the predicted point, it also influences the correction, depending on the corrector method as listed below. From the predicted point, corrections occur: **OFF** or **NAT** - along the frequency direction **ARC** - along the sphere of radius *DS*. **ORT** - in the plane orthogonal to the tangent direction. Since the step size depends on the solution DOFs, it does not correspond to the size between two consecutive computed frequencies.	No default value **Note:** You must always specify a *DS* value except when *CorrMeth* = OFF. **Range:** $DSMIN \leq DS \leq DSMAX$
Value3	***DSMIN***[a] **Minimum step size** If the step size equals the minimum step size during solution and the nonlinear equation solver fails to converge, the solver will exit.	**Default:** *DS*/50 **Range:** $0 < DSMIN < DSMAX$
Value4	***DSMAX***[a] **Maximum step size**	**Default:** 5**DS* **Range:** $DSMAX > DSMIN$
Value5	unused field	

[a] During solution, if an internal step adjustment causes the step size to go either below *DSMIN* or above *DSMAX*, it is adjusted back to the relevant minimum (*DSMIN*) or maximum (*DSMAX*) allowed step size.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specification for *Option* = CONTTERM

HBMOPT (p. 890), CONTTERM, *MAXSTEPS*, *FREQMIN*, *FREQMAX*, - -, - -

Table 183: Semantic labels and definitions of *Value1*, ... *Value5* for *Option* = CONTTERM

Value	Label and description	Default Value	Range
Value1	***MAXSTEPS*** **Maximum number of successful continuation steps**[a] If exceeded, the solver exits.	10000	*MAXSTEPS* $\geq$ 0
Value2	***FREQMIN*** **Minimum frequency** During continuation, if the frequency is below this value, the solver exits.	MIN(*FREQB*, *FREQE*)[b]	*FREQMIN* $\leq$ MIN(*FREQB*, *FREQE*)[b]
Value3	***FREQMAX*** **Maximum frequency** During continuation, if the frequency exceeds this value, the solver exits.	MAX(*FREQB*, *FREQE*)[b]	*FREQMAX* $\geq$ MAX(*FREQB*, *FREQE*)[b]
Value4, *Value5*	unused fields		

[a] A continuation step is considered successful when the nonlinear equation solver converges and successfully produces solution points in two successive substeps. The number of substeps is equal to the number of successful continuation steps + 1.

[b] Set the beginning and ending frequency using the **HARFRQ (p. 885)** command. Note that the beginning frequency can be larger than the ending frequency if the solution branch needs to be evaluated with decreasing frequency.

Command Specification for *Option* = UINIT

HBMOPT (p. 890), UINIT, *U0Flag*, *U0Name*, *U0dof*, *U0BackName*, - -

Table 184: Semantic labels and definitions of *Value1*, ... *Value5* for *Option* = UINIT

Value	Label and description	
Value1	***U0Flag*** **Initial solution guess**	Possible *U0Flag* settings are: **0 or ZERO (default)** Use zero nodal solution as the initial guess.

Value	Label and description	
		1 or APDL Use a user-defined APDL array as the initial guess.
Value2	***U0name*** **Name of the APDL array for the initial solution guess** Optional. If *U0Flag* = 1 or APDL, this APDL array is used to specify the initial solution guess. It must be a 1D array (***DIM (p. 530)**) containing the multiharmonic solution guess. The array size is (2*NH+1)*N_{DOF} where NH is the number of harmonics specified by **HROPT (p. 912)**,HBM,*NH* and N_{DOF} is the number of degrees of freedom, which depends on *U0dof*.	No default value *U0name* is limited to 32 characters.
Value3	***U0dof*** **Degree of freedom numbering of the initial solution guess** Optional. If *U0Flag* = APDL, this indicates the degree of freedom ordering of the initial guess.	Possible *U0dof* settings are: **INT (default)** Internal Ansys DOFs. Length N_{DOF}= numdof*lenbac (See FULL File Format in the *Programmer's Reference*) **SOLU** HBM solution DOFs. Length N_{DOF} = number of multiharmonic equations/(2NH+1)
Value4	***U0BackName*** **APDL array name for the back nodal mapping vector corresponding to the initial guess** Optional. If *Uodof* = INT, the DOF ordering at the time of solution (see Degree of Freedom Ordering in the *Ansys Parametric Design Language Guide*) may be different from the intended DOF ordering corresponding to the initial solution guess (*U0Name*). To address this, *U0BackName* is used to specify a back nodal mapping vector corresponding to *U0Name*. It	No default value *U0BackName* is limited to 32 characters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Value	Label and description	
	must be a 1D array (***DIM (p. 530)**) with size equal to the number of Ansys internal nodes. *U0BackName* is used to reorder the initial solution guess to match the internal node ordering at the time of solution. If it is not provided and *U0dof* = *INT*, it is assumed that the initial solution guess corresponds to the internal DOF ordering at the time of solution. **Note:** When using **HBMOPT (p. 890)**,UINIT,APDL,*U0Name*,INT to specify the initial solution guess *U0Name* in internal DOFs, it is recommended that you provide a *U0BackName* vector to avoid any inconsistency between the array provided and the internal node ordering. For example usage, see Example 3: Two jointed beams with frictional contact interface.	
Value5	unused field	

Command Specification for *Option* = LINEAR

HBMOPT (p. 890), LINEAR, *AFTkey*, - -, - -, - -, - -

Table 185: Semantic labels and definitions of *Value1*, ... *Value5* for *Option* = LINEAR

Value	Label and description	
Value1	***AFTkey*** **Key to ignore nonlinearities (no AFT)**	Possible *AFTkey* settings are: **0 or OFF (default)** Do not ignore nonlinearities **1 or ON** Ignore nonlinearities (valid only in the first loadstep).
Value2, ... *Value5*	unused fields	

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specification for *Option* = SCAL

HBMOPT (p. 890), SCAL, *Type*, *USCAL*, *FSCAL*, *DOF*, *Back*

Table 186: Semantic labels and definitions of *Value1*, ... *Value5* for *Option* = SCAL

Value	Label and description	
Value1	***Type*** **Scale the solution vector by the selected scaling factor type and specification on *USCAL*.** **Note:** See scaling equations in Equation Solution and example usage of HBMOPT,SCAL in Scaling the solution vector in the *Harmonic Balance Method Analysis Guide*.	Possible *Type* settings are: **0 or NONE (default)** No scaling.[a] **1 or APDL** Scaling factors contained in a user-defined APDL array whose name is specified by *USCAL* are used. **2 or VALU** Scalar value specified for *USCAL* is used.
Value2	***USCAL*** **Name of the user-defined APDL array (if *Type* = 1 or APDL) or scalar value (if *Type* = 2 or VALU) used to scale the solution vector to improve convergence behavior.**	*USCAL* setting depends on *Type* specification as follows: **For *Type* = 1 or APDL** *USCAL* is the name (up to 32 characters) of a previously defined APDL array that contains scaling factors. It must be a 1D array (***DIM (p. 530)**, ***VEC (p. 2085)**, etc.) with size equal to the size of the solution vector. **For *TYPE* = 2 or VALU** *USCAL* is a scalar value.
Value3	***FSCAL*** **Scaling value for the circular frequency (ω).** *FSCAL* is only valid for *Type* = 1 (or APDL) or 2 (or VALU)	**Default:** 1.0 **Range:***FSCAL* > 0.0

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Value	**Label and description**	
Value4	***DoF***	Possible *DoF* settings are:
	Degree of freedom numbering of the user-defined scaling vector (*USCAL*)	**INT (default)**
	Optional. If *Type* = 1 or APDL, this indicates the degree of freedom ordering of the user-defined scaling vector.	Internal Ansys DOFs. Length N_{DOF}= numdof*lenbac (See FULL File Format in the *Programmer's Reference*)
		SOLU
		HBM solution DOFs. Length N_{DOF} = number of multiharmonic equations/(2NH+1)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Value	Label and description	
Value3	***Back*** **APDL array name for the back nodal mapping vector corresponding to the user-defined scaling vector** Optional. *Back* is used to specify a back nodal mapping vector corresponding to the user-defined scaling vector, *UScal*. It must be a 1D array (***DIM (p. 530)**) with size equal to the number of Ansys internal nodes. *Back* is used to reorder the user-defined scaling vector to match the internal node ordering at the time of solution. If it is not provided and *DoF* = *INT*, it is assumed that the user-defined scaling vector corresponds to the internal DOF ordering at the time of solution. **Note:** When using **HBMOPT (p. 890)**,SCAL,APDL,*UScal*,*FSCAL*,INT to specify a user-defined scaling vector *UScal* in internal DOFs, it is recommended that you provide a *Back* vector to avoid any inconsistency between the array provided and the internal node ordering. For example usage, see Scaling the solution vector in the *Harmonic Balance Method Analysis Guide*.	No default value. *Back* is limited to 32 characters.

[a] *UScal* is not used if *Type* = 0 or NONE.

Notes

This command is used to specify solution options for a harmonic balance method analysis (see Harmonic Balance Method Analysis Guide).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

There is no command default (p. 7). For an HBM analysis (*Method* = HBM on **HROPT (p. 912)**), you must issue at least one of the following:

- **HBMOPT (p. 890)**, CONTSET, OFF
- **HBMOPT (p. 890)**, CONTSET, *CorrMeth*, *DS* where *CorrMeth* is blank or any setting except OFF.

No continuation solver options

For **HBMOPT (p. 890)**, CONTSET, OFF:

- **NSUBST (p. 1287)** is used to specify the number of substeps and calculate the fixed frequency step. The first substep is at *FREQB* + (*FREQE* - *FREQB*)/*NSBSTP* as in other harmonic analyses, where *FREQB* and *FREQE* are the beginning and ending frequencies of a solution specified with the **HARFRQ (p. 885)** command.
- *FREQB* $\leq$ *FREQE* is enforced.
- Values prescribed for the minimum and maximum frequency (via **HBMOPT (p. 890)**,CONTTERM,,,,*FREQMIN*,*FREQMAX*) for the continuation simulation are ignored.

Alternating frequency-time options

The alternating frequency-time (AFT) procedure and derivation of relevant Jacobians for a general nonlinearity is described in Alternating Frequency-Time Procedure in the *Harmonic Balance Method Analysis Guide*.

Trust-region solver options

An iterative process is used to solve the HBM nonlinear equations using a trust-region nonlinear equation solver as detailed in Equation Solution in the *Harmonic Balance Method Analysis Guide*. All tolerances (*UTOL*, *RTOL*, and *GTOL* specified by **HBMOPT (p. 890)**,TRTOL) are also stopping criteria. The only required convergence criteria is the tolerance on the functional residual norm (**HBMOPT (p. 890)**,TRTOL,,*RTOL*). The other tolerances on the gradient norm and the step size are additional convergence criteria that indicate stronger convergence if satisfied.

Example Usage

Example 1: 1-DOF Duffing Oscillator in the *Harmonic Balance Method Analysis Guide*

Example 2: Two Cantilever Beams with Frictionless Gap Contact in the *Harmonic Balance Method Analysis Guide*

Example 3: Two jointed beams with frictional contact interface in the *Harmonic Balance Method Analysis Guide*

VM319: Nonlinear Harmonic Analysis of a Cyclic Chain of Oscillators

VM320: Nonlinear Harmonic Analysis of a Frictional Damper

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

/HEADER,*Header*,*Stitle*,*Idstmp*,*Notes*,*Colhed*,*Minmax*

Sets page and table heading print controls.

POST1 (p. 51): Listing (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Header

Mechanical APDL page header (system, date, time, version, copyright, title, etc.):

ON

Turns this item on (default for batch mode; not available for interactive mode).

OFF

Turns this item off.

(blank)

Retains the previous setting.

Stitle

Subtitles (see **/STITLE (p. 1867)** command): ON, OFF, or (blank) (see above).

Idstmp

Load step information (step number, substep number, time value): ON, OFF, or (blank) (see above).

Notes

Information relative to particular table listings: ON, OFF, or (blank) (see above).

Colhed

Column header labels of table listings (currently only for single column tables): ON, OFF, or (blank) (see above).

Minmax

Minimum/maximum information or totals after table listings: ON, OFF, or (blank) (see above).

Command Default

All specifications are on (batch mode); *Header* = OFF, all other specifications are on (interactive mode)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Sets specifications on or off for page and table heading print controls associated with the POST1 **PRNSOL (p. 1505)**, **PRESOL (p. 1481)**, **PRETAB (p. 1490)**, **PRRSOL (p. 1518)**, and **PRPATH (p. 1517)** commands.

Note:

If the printout caused a top-of-form (page eject to top of next page), the top-of-form is also suppressed with the printout. Issue **/HEADER (p. 902)**,STAT to display the current settings. Issue **/HEADER (p. 902)**,DEFA to reset the default specifications.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

HELP, *Name*

Displays help information for Mechanical APDL commands and element types.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Name

Command name or element type. Examples are: **HELP (p. 903)**,MP or **HELP (p. 903)**,SOLID185 (or **HELP (p. 903)**,185). For a list of elements of a particular type, enter **HELP (p. 903)**,BEAM, **HELP (p. 903)**,SOLID, **HELP (p. 903)**,HYPER, etc.

Notes

If *Name* matches a command or element name, the description for that command or element is displayed in the Help window.

For command help, type the complete command name (including the * or /). The help system cannot find partial matches. If * is used at the beginning of the string, it is interpreted as a Mechanical APDL * command.

For help on topics that are not Mechanical APDL commands or element types (for example, help for the word "material"), use the full text-search features of the Mechanical APDL help system.

The **HELP (p. 903)** command is valid only in GUI mode. To obtain help when not in GUI mode, activate the GUI (**/MENU (p. 1121)**,ON) or activate the help system directly (**/UI (p. 2040)**,HELP).

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

HEMIOPT, *HRES*, *TOLERANCE*

Specifies options for Hemicube view factor calculation.

SOLUTION (p. 38): Radiosity (p. 50)
AUX12 (p. 62): Radiosity Solver (p. 62)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

HRES

Hemicube resolution. Increase value to increase the accuracy of the view factor calculation. Defaults to 10.

TOLERANCE

Tolerance value that controls whether or not facets are subdivided in view factor calculations to increase view factor accuracy. *TOLERANCE* is closely related to the spacing between facets. Defaults to 1e-6.

Menu Paths

Main Menu>Preprocessor>Radiation Opts>View Factor

Main Menu>Radiation Opt>Radiosity Meth>View Factor

Main Menu>Solution>Radiation Opts>View Factor

HFANG, *Lab*, *PHI1*, *PHI2*, *THETA1*, *THETA2*

Defines or displays spatial angles of a spherical radiation surface for sound radiation parameter calculations.

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Spatial angle label.

ANGLE

Define spatial angles (default).

STATE

Display spatial angles. *PHI1*, *PHI2*, *THETA1*, and *THETA2* are ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PHI1, PHI2

Starting and ending φ angles (degrees) in the spherical coordinate system. *PHI1* defaults to 0 and *PHI2* defaults to 360.

THETA1, THETA2

Starting and ending θ angles (degrees) in the spherical coordinate system. *THETA1* defaults to 0 and *THETA2* defaults to 180.

Notes

Defines or displays spatial angles of a spherical radiation surface.

Use this command only with **PLFAR (p. 1412)**,*Lab* = PRES, or **PRFAR (p. 1490)**,*Lab* = PRES.

Menu Paths

Main Menu>General Postproc>List Results>Field Extension>Direct Gain

Main Menu>General Postproc>List Results>Field Extension>Efficiency

Main Menu>General Postproc>List Results>Field Extension>Power Gain

Main Menu>General Postproc>List Results>Field Extension>Rad Power

Main Menu>General Postproc>Plot Results>Field Extension>Direct Gain

---

HFSYM,*KCN*,*Xkey*,*Ykey*,*Zkey*

Indicates the presence of symmetry planes for the computation of acoustic fields in the near and far field domains (beyond the finite element region).

POST1 (p. 51): Special Purpose (p. 56)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Coordinate system reference number. *KCN* may be 0 (Cartesian), or any previously defined local Cartesian coordinate system number (>10). Defaults to 0.

Xkey

Key for acoustic field boundary condition, as prescribed for the solution, corresponding to the x = constant plane:

None

No sound soft or sound hard boundary conditions (default).

SSB

Sound soft boundary (pressure = 0).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SHB

Sound hard boundary (normal velocity = 0).

Ykey

Key for acoustic field boundary condition, as prescribed for the solution, corresponding to the y = constant plane:

None

No sound soft or sound hard boundary conditions (default).

SSB

Sound soft boundary (pressure = 0).

SHB

Sound hard boundary (normal velocity = 0).

Zkey

Key for acoustic field boundary condition, as prescribed for the solution, corresponding to the z = constant plane:

None

No sound soft or sound hard boundary conditions (default).

SSB

Sound soft boundary (pressure = 0).

SHB

Sound hard boundary (normal velocity = 0).

Notes

HFSYM (p. 905) uses the image principle to indicate symmetry planes (x, y, or z = constant plane) for acoustic field computations outside the modeled domain. A sound hard boundary condition must be indicated even though it occurs as a natural boundary condition.

No menu paths are available for acoustic applications.

*HPROD, *A*, *B*, *C*

Performs a Hadamard vector product (C = A B).

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

A

Name of vector A. Must have been previously created by a ***VEC (p. 2085)** command.

B

Name of vector B. Must have been previously created by a ***VEC (p. 2085)** command.

C

Name of vector C. Must be specified (no default).

Notes

For two vectors *A* and *B* of the same dimension *n*, the Hadamard product (A B) is a vector of the same dimension as the operands, with elements given by:

$$(A \circ B)_i = A_i * B_i$$

This command is limited to vector operands.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HPTCREATE, *TYPE*, *ENTITY*, *NHP*, *LABEL*, *VAL1*, *VAL2*, *VAL3*

Defines a hard point.

PREP7 (p. 22): Hard Points (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

TYPE

Type of entity on which the hard point will be created.

LINE

Hard point will be created on a line.

AREA

Hard point will be created within an area (not on the boundaries).

ENTITY

Number of the line or area on which the hard point will be created.

NHP

Number assigned to the hard point. Defaults to the lowest available hard point number.

LABEL

If *LABEL* = COORD, *VAL1*, *VAL2*, and *VAL3* are the respective global X, Y, and Z coordinates. If *LABEL* = RATIO, *VAL*1 is the parameter value (this is available only for lines). Valid parameter values are between 0 and 1. *VAL2* and *VAL3* are ignored.

VAL1

If *LABEL* = RATIO, ratio value for line. If *LABEL* = COORD, global X coordinate value.

VAL2

If *LABEL* = COORD, global Y coordinate value.

VAL3

If *LABEL* = COORD, global Z coordinate value.

Notes

The ability to enter a parameter value provides a simple way of positioning hard points on lines. For example, to place a hard point halfway along a line, one can simply specify a *VAL1* value of 0.5.

For models imported through the DEFAULT IGES filter, you can place hard points on models only by specifying coordinates (you can't place a hard point using interactive picking).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If you issue any commands that update the geometry of an entity, such as Boolean or simplification commands, any hard points associated with that entity are deleted. Therefore, you should add any hard points after completing the solid model. If you delete an entity that has associated hard points, those hard points are either

- Deleted along with the entity (if the hard point is not associated with any other entities).
- Detached from the deleted entity (if the hard point is associated with additional entities).

When archiving your model (**CDWRITE (p. 293)**), hardpoint information cannot be written to the IGES file. The `Jobname.cdb` file can be written with the **CDWRITE (p. 293)**,DB option.

Hard points are only applicable for area and volume meshing, not for beams.

---

HPTDELETE, *NP1*, *NP2*, *NINC*

Deletes selected hardpoints.

PREP7 (p. 22): Hard Points (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NP1*, *NP2*, *NINC

Delete the pattern of hard points beginning with *NP1* to *NP2* in steps of *NINC* (defaults to 1). If *NP1* = ALL, *NP2* and *NINC* are ignored and the pattern is all selected hard points (**KSEL (p. 995)**). If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored.

Notes

Deletes all attributes attached to the designated hard points as well as the hard points themselves. If any entity is attached to a designated hard point, the command detaches the hard point from that entity (the program will alert you that this will occur).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Delete>Hard Points

HRCPLX, *LOADSTEP*, *SUBSTEP*, *OMEGAT*, *1STLCASE*, *2NDLCASE*

Computes and stores in the database the time-harmonic solution at a prescribed phase angle.

POST1 (p. 51): Set Up (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LOADSTEP

Load step number of the data set to be read (defaults to 1).

SUBSTEP

Substep number within *LOADSTEP*.

OMEGAT

Angle in degrees (Ω (angle) times T (time)).

- If $\geq$ 360°, the amplitude is supplied.
- All others supply results at that angle. For example, if the angle is set to 0.0°, the real part of the solution is supplied. If the angle is set to -90° the imaginary part of the solution is supplied.

1STLCASE

First load case number (defaults to 1).

2NDLCASE

Second load case number (defaults to 2).

Notes

HRCPLX (p. 910) invokes a macro that combines the real and imaginary parts of the solution. If the angle is specified, it produces the following:

$$\{R\} = \{R_R\}\cos\alpha - \{R_I\}\sin\alpha$$

Where:

R_R and R_I are, respectively, the real and imaginary parts of the results quantity (e.g. the nodal displacements, the reaction forces, ...).

α is the angle (OMEGAT).

1STLCASE and *2NDLCASE* are internally generated load cases. You may want to specify these to avoid overwriting an existing load case number 1 or 2.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Not all results computed by this command are valid. See Summable, Non-Summable and Constant Data in the *Basic Analysis Guide* for more information. When the amplitude of the solution is requested (*OMEGAT* >= 360°), averaged values (such as the nodal component stresses, which are an average of element nodal component stresses) are calculated by averaging the amplitudes. Because the degrees of freedom results have different phases, derived results (such as the equivalent stress SEQV) are not valid. See POST1 and POST26 – Complex Results Postprocessing for more details about post-processing complex results.

For postprocessing amplitudes, the only appropriate coordinate system is the solution coordinate system (**RSYS (p. 1639)** ,SOLU). When displaying the displacement amplitudes, use a contour display (**PLNSOL (p. 1425)** command). Because a deformed shape display (**PLDISP (p. 1400)** command) could lead to a non-physical shape, the displacement scaling is off by default (**/DSCALE (p. 575)**,,OFF).

For postprocessing cylindrical geometry, it is suggested that you rotate the element coordinate systems into the appropriate cylindrical system (*EMODIF,,ESYS*) before running the solution and then view the results in this system (*RSYS,SOLU*) in POST1.

Since **HRCPLX (p. 910)** performs load case combinations, it alters most of the data in the database. In particular, it alters applied loads such as forces and imposed displacements. To restore the original loads in the database for a subsequent analysis, reissue the **SET (p. 1724)** command in POST1 to retrieve the real and imaginary set data.

To animate the solution over one period, use the **ANHARM (p. 141)** command.

OMEGAT is not equal to the phase shift.

This command is not supported after a cyclic symmetry analysis; use **/CYCEXPAND (p. 454)**,,PHASEANG instead.

Menu Paths

This command cannot be accessed from a menu.

HREXP,*ANGLE*

Specifies the phase angle for the harmonic analysis expansion pass.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ANGLE

Phase angle (degrees) for expansion pass. If ALL (default), use both 0.0° (real) and 90.0° (imaginary) phase angles.

Notes

Specifies the phase angle where the expansion pass will be done for a harmonic mode-superposition expansion pass.

For a specific angle, the following real solution is stored in the results (*.rst) file:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$\{u\}=\{u^i_{\max}\cos(\phi^i-\varphi)\}$$

Where:

i is the degree of freedom number.

$u^i_{\max}$ is the amplitude of the i th degree of freedom solution

Φ^i is the phase shift angle of the i th degree of freedom solution

φ is the supplied phase shift angle (*ANGLE*)

If *ANGLE* is ALL, both the real and imaginary parts of the solution are stored in the results file.

For more details about the solution equations, see Harmonic Analyses in the *Mechanical APDL Theory Reference*.

This command is ignored if the **HROPT (p. 912)** command has been issued with *Method* = KRYLOV, VT, or VTPA.

This command is also valid in PREP7.

---

HROPT, *Method*, *Value1*, *Value2*, *Value3*, *Value4*, *Value5*

Specifies harmonic analysis options.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Method

Solution method for the harmonic analysis:

AUTO

Automatically select the most efficient method (default). Either the full method (FULL) or the frequency-sweep method (VT) is selected, depending on the model. For *Method* = AUTO, *Value1*..*Value5* are unused fields.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FULL

Full method. For *Method* = AUTO, *Value1*..*Value5* are unused fields.

MSUP

Mode-superposition method. See Command Specification for *Method* = MSUP (p. 913).

VT

Frequency-sweep (Variational Technology) method (based on the FULL harmonic algorithm). See Command Specification for *Method* = VT or VTPA (p. 914).

VTPA

Frequency-sweep (Variational Technology) perfect absorber method (based on the FULL harmonic algorithm). See Command Specification for *Method* = VT or VTPA (p. 914).

KRYLOV

Frequency-sweep Krylov method. See Command Specification for *Method* = KRYLOV (p. 915).

Note:

The Krylov approximation can be run using macros as customizable templates as described in Frequency-Sweep Harmonic Analysis via the Krylov Method in the *Structural Analysis Guide*. Alternatively, you can perform a Krylov solution without customization as described in Krylov Method Implemented using Mechanical APDL Commands in the *Structural Analysis Guide*.

HBM

Harmonic Balance method. See Command Specification for *Method* = HBM (p. 916).

If the solution method is not specified, the program automatically selects either the Full method or the frequency-sweep method, depending on which method is most efficient for the model. The frequency-sweep method uses the underlying Variational Technology method.

Command Specification for *Method* = MSUP

HROPT (p. 912), MSUP, *MAXMODE*, *MINMODE*, *MCFwrite*, *--*, *MCkey*

For more details related to mode-superposition harmonic analyses, see Notes (p. 916).

Table 187: Semantic labels and definitions of *Value1*, ... *Value5* for *Method* = MSUP

Value	MSUP label and description
Value1	***MAXMODE*** Largest mode number to be used to calculate the response (for *Method* = MSUP only). Defaults to the highest mode calculated in the preceding modal analysis.

Value	MSUP label and description
Value2	***MINMODE*** Smallest mode number to be used (for *Method* = MSUP only). Defaults to 1.
Value3	***MCFwrite*** Modal coordinates output key to the Jobname.mcf file (valid only for the mode-superposition method). To control how Jobname.mcf is written, specify options on the **MCFOPT (p. 1116)** command. **NO** Modal coordinates are not written to Jobname.mcf. **YES** Modal coordinates are written to the text file Jobname.mcf (default). **Note:** *MCFwrite* provides a singular (one-time) output of the modal coordinates. It will not provide the information for **LSWRITE (p. 1087)**/**LSSOLVE (p. 1085)** operations.
Value4	**--** Unused field.
Value5	***MCkey*** Modal coordinates output key to the .rfrq file (valid only for the mode-superposition method): **AUTO** Writing depends on the modal analysis settings of the **MXPAND (p. 1203)** command (default). **YES** Always write the modal coordinates to the file Jobname.rfrq. A subsequent expansion pass (**EXPASS (p. 714)**) is not supported.

Command Specification for *Method* = VT or VTPA

HROPT (p. 912), **VT**, **--**, **--**, **--**, ***Damp***, **--**

or

Table 188: Semantic labels and definitions of *Value1*, ... *Value5* for *Method* = VT or VTPA

Value	VT (or VTPA) label and description
Value1, *Value2*, *Value3*	**- -** Unused fields.
Value4	***Damp*** Damping mode for frequency-dependent material properties (valid only for the frequency-sweep method, *Method* = VT). **Hysteretic** Not proportional to the frequency. **Viscous** Proportional to the frequency (default).
Value5	**- -** Unused field.

Command Specification for *Method* = KRYLOV

HROPT (p. 912), KRYLOV, *FRQKRY*, - -, - -, - -, - -

Table 189: Semantic labels and definitions of *Value1*, ... *Value5* for *Method* = KRYLOV

Value	KRYLOV label and description
Value1	***FRQKRY*** Frequency at which the Krylov subspace is built. Defaults to the middle of the frequency range specified using the **HARFRQ (p. 885)** command. (*FRQKRY* is not supported for a distributed-memory parallel solution that uses frequency domain decomposition, **DDOPTION (p. 508)**,FREQ).
Value2, ... *Value5*	**- -** Unused fields.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specification for *Method* = HBM

HROPT (p. 912), HBM, *NH*, - -, - -, - -, - -

Table 190: Semantic labels and definitions of *Value1*, ... *Value5* for *Method* = HBM

Value	HBM label and description
Value1	***NH*** Number of harmonics used in a harmonic balance method analysis. It must be an integer within the range $1 \leq NH \leq 30$. Defaults to 1.
Value2, ... *Value5*	**- -** Unused fields.

Command Default

If you run a harmonic analysis (*Antype* = HARMIC or 3 on the **ANTYPE (p. 162)** command) and you do not issue **HROPT (p. 912)**, the default value is *Method* = AUTO.

Notes

Specifies the method of solution for a harmonic analysis (**ANTYPE (p. 162)**,HARMIC). For detailed descriptions of the various solution methods, see Overview of Harmonic Analysis Solution Methods in the *Structural Analysis Guide*.

If used in SOLUTION, this command is valid only within the first load step.

This command is also valid in PREP7.

For *Method* = MSUP:

For cyclic symmetry mode-superposition harmonic solutions, *MAXMODE* and *MINMODE* are ignored.

To include residual vectors in your mode-superposition harmonic analysis, specify **RESVEC (p. 1603)**,ON.

MAXMODE and *MINMODE* are ignored after a modal restart analysis where remote modal files usage (**MODDIR (p. 1134)**) and residual vector calculation (**RESVEC (p. 1603)**,ON) have been activated.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>Analysis Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HROCEAN, *Type*, *NPHASE*

Perform the harmonic ocean wave procedure (HOWP).

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Specifies how to include ocean wave information in a harmonic analysis:

HARMONIC

Performs a harmonic analysis using both real and imaginary load vectors calculated via the harmonic ocean wave procedure (HOWP). This behavior is the default. This option performs a harmonic analysis running at a frequency determined by the wave period (specified via **OCTABLE (p. 1316)** command input).

STATIC

Performs a static analysis using both real and imaginary load vectors (calculated via HOWP). This option works by performing a harmonic analysis running at a frequency of 0.0.

OFF

Deactivates a previously activated HOWP and performs a *standard* harmonic analysis.

NPHASE

Positive number specifying the number of phases to calculate forces. This value must be at least 8. The default value is 20.

Command Default

The default **HROCEAN (p. 917)** command (issuing the command with no arguments) is:

HROCEAN (p. 917),HARMONIC,20

The command applies HOWP when ocean wave information is available (that is, when ocean wave information has been specified via the **OCDATA (p. 1307)** and **OCTABLE (p. 1316)** commands). If this command is issued when no ocean wave information is available, the program generates an error message.

Notes

The **HROCEAN (p. 917)** command applies ocean wave information (obtained via the **OCDATA (p. 1307)** and **OCTABLE (p. 1316)** commands) in a harmonic analysis (**ANTYPE (p. 162)**,HARMIC) as real and imaginary forces.

You can apply only one ocean load at a time.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The applied frequency in the harmonic (*Type* = HARMONIC) analysis is based on the wave period input on the **OCTABLE (p. 1316)** command (and not on **HARFRQ (p. 885)** command input, which cannot be used). Phase-shift input on the **OCTABLE (p. 1316)** command is ignored.

HOWP does not generate a damping matrix. If you require a damping matrix, you must add it separately.

The command applies to regular wave types only (Airy with one wave component, Wheeler with one wave component, Stokes, and stream function). Irregular wave types are not supported. For information about wave types, see Hydrodynamic Loads in the *Mechanical APDL Theory Reference*.

The program calculates the forces on each load component of each element at *NPHASE* solutions, spread evenly over one wave cycle. Then, the minimum and maximum, and the phase between them, are calculated. The command uses the resulting information to generate the real and imaginary loads.

HOWP cannot be used with stress stiffening.

HOWP works with the full harmonic analysis method (**HROPT (p. 912)**,FULL) only.

For more information, see Harmonic Ocean Wave Procedure (HOWP) in the *Mechanical APDL Theory Reference*.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>Freq and Substeps

Main Menu>Preprocessor>Loads>Load Step Opts>Time/Frequenc>HOWP and Substeps

Main Menu>Solution>Load Step Opts>Time/Frequenc>Freq and Substeps

Main Menu>Solution>Load Step Opts>Time/Frequenc>HOWP and Substeps

---

HROUT,*Reimky*,*Clust*,*Mcont*,*EngCalc*

Specifies the harmonic analysis output options.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Reimky

Real/Imaginary print key:

ON

Print complex displacements as real and imaginary components (default).

OFF

Print complex displacements as amplitude and phase angle (degrees).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Clust

Cluster option (for **HROPT (p. 912)**,MSUP):

OFF

Uniform spacing of frequency solutions (default).

ON

Cluster frequency solutions about natural frequencies.

Mcont

Mode contributions key (for **HROPT (p. 912)**,MSUP):

OFF

No print of mode contributions at each frequency (default).

ON

Print mode contributions at each frequency.

EngCalc

Additional element energies calculation key:

NO

Do not calculate additional energies (default).

YES

Calculate average, amplitude, and peak values for the following: stiffness and kinetic energies, damping energy, and work done by external loads.

Notes

Specifies the harmonic analysis (**ANTYPE (p. 162)**,HARMIC) output options. If used in SOLUTION, this command is valid only within the first load step. **OUTPR (p. 1332)**,NSOL must be specified to print mode contributions at each frequency.

If the calculation of additional energies is requested (*EngCalc* = YES) in a mode-superposition harmonic analysis (*Method* = MSUP on the **HROPT (p. 912)** command), work done by external loads is not calculated in the expansion pass if *MSUPkey* = YES on the **MXPAND (p. 1203)** command. If *MSUPkey* = NO, work due to element loads is calculated in the expansion pass of the real part, but not work due to nodal loads. The average, amplitude, and peak potential energies for complex results (Potential Energy (or Stiffness Energy) for Complex Results) calculated for a linear perturbation full harmonic analysis with a nonlinear base analysis are approximate solutions and may not be accurate.

Only the *Reimky* argument is supported and applicable for frequency-sweep harmonic analyses using the Krylov or Variational Technology Methods. All other arguments are ignored if the **HROPT (p. 912)** command has been issued with *Method* = KRYLOV, VT, or VTPA.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Analysis Options

Main Menu>Solution>Analysis Type>Analysis Options

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

I Commands

IC, *NODE*, *Lab*, *VALUE*, *VALUE2*, *NEND*, *NINC*, *LSIC*

Specifies initial conditions at nodes.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Node at which initial condition is to be specified. If ALL, apply to all selected nodes (**NSEL (p. 1266)**). If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *NODE*.

Lab

Degree-of-freedom label for which the initial condition is to be specified. If ALL, use all appropriate labels.

Structural labels: UX, UY, or UZ (displacements); ROTX, ROTY, or ROTZ (rotations); HDSP (hydrostatic pressure); PRES (pore pressure)

For structural static and transient analyses, specify translational and rotational velocities as initial conditions using these labels: VELX, VELY, VELZ (translational velocities); OMGX, OMGY, OMGZ (rotational velocities).

For structural transient analysis, specify translational and rotational accelerations as initial conditions using these labels: ACCX, ACCY, ACCZ (translational accelerations); DMGX, DMGY, DMGZ (rotational accelerations).

The velocity and acceleration initial conditions are *not* included with *Lab* = ALL.

Thermal labels: TEMP, TBOT, TE2, TE3, . . ., TTOP (temperature)

Magnetic labels: MAG (scalar magnetic potential); AZ (vector magnetic potential)

Diffusion label: CONC (concentration)

Acoustic label: ENKE (acoustic energy density)

VALUE

Initial value of the degree of freedom. Defaults to the program default for that degree of freedom (0.0 for structural analysis, **TUNIF (p. 2027)** for thermal analysis, etc.). Values are in the nodal coordinate system and in radians for rotational degrees of freedom.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VALUE2

Second-order degree of freedom value, mainly used for non-structural DOF where VELX can't be used. Defaults to the program default for that degree of freedom (0.0 for structural analysis). Values are in the nodal coordinate system and in radians/time for rotational degrees of freedom.

NEND, NINC

Specifies the same initial condition values at the range of nodes from *NODE* to *NEND* (defaults to *NODE*), in steps of *NINC* (defaults to 1).

LSIC

Apply the **IC (p. 921)** command at this load step instead of at the first load step.

Notes

The **IC (p. 921)** command specifies initial conditions, which are the initial values of the specified degrees of freedom. It is valid only for a static analysis and full method transient analysis (**TIMINT (p. 2001)**,ON and **TRNOPT (p. 2017)**,FULL). For the transient, the initial value is specified at the beginning of the first load step, that is, at time = 0.0.

To specify initial conditions at a load step other than the first step, use the *LSIC* field. Specify a load step in the *LSIC* field to apply the **IC (p. 921)** command at that load step. The value of the variable calculated from the solver will be overwritten by the one being specified by the **IC (p. 921)** command at the start time for that load step.

If constraints (**D (p. 483)**, **DSYM (p. 580)**, etc.) and initial conditions are applied at the same node, the constraint specification overrides. Exercise caution when specifying constraints. The degree-of-freedom values start from zero, or the first value given in the table when table name is specified. To match the nonzero initial condition value with the initial value for degree-of-freedom constraint, use a table for the degree-of-freedom constraint.

For thermal analyses, any **TUNIF (p. 2027)** specification should be applied before the **IC (p. 921)** command. Otherwise, the **TUNIF (p. 2027)** specification is ignored. If the **IC (p. 921)** command is input before any **TUNIF (p. 2027)** specification, use the **ICDELE (p. 923)** command and then reissue any **TUNIF (p. 2027)** specification and then follow with the **IC (p. 921)** command.

When issuing the **IC (p. 921)** command for elements SOLID278 Layered Thermal Solid and SOLID279 Layered Thermal Solid with through-the-thickness degrees of freedom (KEYOPT(3) = 2), layers are always interpolated linearly based on the location of the degrees of freedom.

Define consistent initial conditions. For example, if you define an initial velocity at a single degree of freedom, the initial velocity at every other degree of freedom will be 0.0, potentially leading to conflicting initial conditions. In most cases, you should define initial conditions at every unconstrained degree of freedom in your model. If you define an initial condition for any degree of freedom at the pilot node of a rigid body (see Modeling Rigid Bodies in the *Contact Technology Guide* for the definition of rigid body), then the same initial condition must also be defined for the same degree of freedom on all other nodes of the rigid body.

After a solution has been performed, the specified initial conditions are overwritten by the actual solution and are no longer available. You must respecify them if you want to perform a subsequent analysis. You may want to keep a database file saved prior to the first solution for subsequent reuse.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If you use the **CDWRITE (p. 293)** command to archive your model, initial displacements, temperatures, etc. specified via the **IC (p. 921)** command are not written to the archive file. Initial velocities and accelerations *are* written.

This command is also valid in PREP7.

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

FACTOR

Multiplication factor applied to the default line width (defaults to 1). The minimum is 1 and the maximum is 6.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Circuit>Scale Icon

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ICROTATE, *NODE*, *OMEGA*, *X1*, *Y1*, *Z1*, *X2*, *Y2*, *Z2*, *Vx*, *Vy*, *Vz*, *ACCEL*

Specifies initial velocity at nodes as a sum of rotation about an axis and translation.

SOLUTION (p. 38): Misc Loads (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NODE

Node at which the initial velocity is to be specified. If ALL, apply to all selected nodes (**NSEL (p. 1266)**). A component name may be input for *NODE*.

OMEGA

Scalar rotational velocity about the rotational axis.

X1, Y1, Z1

Coordinates (in the global Cartesian coordinate system) of the beginning point of the rotational axis vector.

X2, Y2, Z2

Coordinates (in the global Cartesian coordinate system) of the end point of the rotational axis vector.

Vx

Initial translational velocity in direction x of the nodal coordinate system.

Vy

Initial translational velocity in direction y of the nodal coordinate system.

Vz

Initial translational velocity in direction z of the nodal coordinate system.

ACCEL

Key to initialize acceleration due to centrifugal effects:

(blank)

Do not initialize acceleration (default).

CENT

Initialize acceleration due to centrifugal effects along with the initial velocity.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

The **ICROTATE (p. 925)** command specifies initial velocity for all translational degrees of freedom of the specified nodes. The velocity value is a combination of velocity due to rotation about an axis and translation. The velocity at the node is calculated as:

$$v^N = v^{trans} + \omega \left[\frac{x^2 - x^1}{||x^2 - x^1||} \times (x^N - x^1) \right]$$

where

v^N = velocity of node *N* in the nodal coordinate system

v^{trans} = translational velocity input as [*VX*, *VY*, *VZ*]

ω = scalar angular velocity input as *OMEGA*

x^1 and x^2 denote the coordinates of points prescribing the beginning [*X1*, *Y1*, *Z1*] and end [*X2*, *Y2*, *Z2*] of the rotation axis

x^N denotes the coordinates of node *N*

All coordinates are input in the global Cartesian coordinate system, and the velocity due to rotation is then converted to the nodal coordinate system and added to the prescribed translation.

If *ACCEL* = CENT is specified, acceleration due to centrifugal effects is initialized as well. The acceleration at node a^N is initialized as:

$$a^N = \omega \left[\frac{x^2 - x^1}{||x^2 - x^1||} \right] \times \left(\omega \left[\frac{x^2 - x^1}{||x^2 - x^1||} \right] \times (x^N - x^1) \right)$$

The **ICROTATE (p. 925)** command is valid only for static analysis and full method transient analysis (**TIMINT (p. 2001)**,ON with **TRNOPT (p. 2017)**,FULL). The initial value is specified at the beginning of the first load step; that is, at time = 0.0.

The command calculates the nodal velocities and saves them in the database as if the **IC (p. 921)** command had been used to calculate these velocities. Thus, when the `Jobname.cdb` or `Jobname.db` file is written, the velocities prescribed by the **ICROTATE (p. 925)** command appear as **IC (p. 921)** commands. All assumptions, recommendations, and restrictions for the **IC (p. 921)** command are also true for the **ICROTATE (p. 925)** command.

This command is also valid in PREP7.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/ICSCALE, *WN*, *FACTOR*

Scales the icon size for elements supported in the circuit builder.

GRAPHICS (p. 16): Scaling (p. 17)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

FACTOR

Factor applied to the default icon size (defaults to 1).

Notes

Scaling the icon size can provide better visualization of the circuit components when using the Circuit Builder (an interactive builder available in the Mechanical APDL GUI).

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Circuit>Scale Icon

*IF, *VAL1*, *Oper1*, *VAL2*, *Base1*, *VAL3*, *Oper2*, *VAL4*, *Base2*

Conditionally causes commands to be read.

APDL (p. 19): Process Controls (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

VAL1

First numerical value (or parameter which evaluates to a numerical value) in the conditional comparison operation. *VAL1*, *VAL2*, *VAL3*, and *VAL4* can also be character strings (enclosed in quotes) or parameters for *Oper* = EQ and NE only.

Oper1

Operation label. A tolerance of 1.0E-10 is used for comparisons between real numbers:

EQ --

Equal (for *VAL1* = *VAL2*).

NE --

Not equal (for *VAL1* ≠ *VAL2*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LT --

Less than (for *VAL1* < *VAL2*).

GT --

Greater than (for *VAL1* > *VAL2*).

LE --

Less than or equal (for *VAL1* ≤ *VAL2*).

GE --

Greater than or equal (for *VAL1* ≥ *VAL2*).

ABLT --

Absolute values of *VAL1* and *VAL2* before < operation.

ABGT --

Absolute values of *VAL1* and *VAL2* before > operation.

VAL2

Second numerical value (or parameter which evaluates to a numerical value) in the conditional comparison operation.

Base1

Action based on the logical expression (*Oper1*) being true. If false, continue reading at the next line. This is conditional, except for the IF-THEN-ELSE constructs described below; any of the following constructs (through *Base1* = THEN) cause all subsequent fields to be ignored:

:*label* --

A user-defined label (beginning with a colon (:), 8 characters maximum). The command reader will skip (and wrap to the beginning of the file, if necessary) to the first line that begins with the matching :*label*.

Caution:

This label option may not be mixed with do-loop or if-then-else constructs.

STOP --

This action will cause an exit from the Mechanical APDL program at this line, unless running in interactive mode. In interactive mode, the program will not stop.

EXIT --

Exit the current do-loop (***EXIT (p. 707)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CYCLE --

Skip to the end of the current do-loop (***CYCLE (p. 462)**).

THEN --

Make this ***IF (p. 927)** an if-then-else construct (see below).

The following optional values determine the connection between the two logical clauses *Oper1* and *Oper2*

AND --

True if both clauses (*Oper1* and *Oper2*) are true.

OR --

True if either clause is true.

XOR --

True if either (but not both) clause is true.

VAL3

Third numerical value (or parameter which evaluates to a numerical value).

Oper2

Operation label. This will have the same labels as *Oper1*, except it uses *Val3* and *Val4*. A tolerance of 1.0E-10 is used for comparisons between real numbers.

VAL4

Fourth numerical value (or parameter value which evaluates to a numerical value).

Base2

Action based on the logical expression (*Oper1* and *Oper2*) being true. They will be the same values as *Base1*, except as noted.

Command Default

Read commands sequentially.

Notes

Conditionally causes commands to be read from a specific block or at a specific location. Twenty levels of nested ***IF (p. 927)** blocks are allowed. Jumping to a :*label* line is not allowed with keyboard entry. Jumping into, out of, or within a do-loop or an if-then-else construct to a :*label* line is not allowed. Using ***IF (p. 927)** interactively or from the command line prevents rereading the file to find a *label*. To do so, use batch mode or **/INPUT (p. 948)**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Example 9: IF-THEN-ELSE Construct

***IF (p. 927)**,*VAL1*,*0per*,*VAL2*,THEN

***ELSEIF (p. 620)**,*VAL1*,*0per*,*VAL2*

***ELSEIF (p. 620)**,*VAL1*,*0per*,*VAL2*

***ELSE (p. 620)**

***ENDIF (p. 636)**

where "----" represents a block of any number of commands.

Any number of ***ELSEIF (p. 620)** clauses (or none) may be included (in the location shown). One ***ELSE (p. 620)** clause (at most) may be included (in the location shown).

The ***IF (p. 927)** command is executed by evaluating its logical expression. If it is true, the block of commands following it is executed. The construct is considered to be complete and the command following the ***ENDIF (p. 636)** is executed next.

If the logical expression is false, the next ***ELSEIF (p. 620)** command (if any) following the block is executed. The execution logic is the same as for ***IF (p. 927)**. The effect is that the logical expressions in the ***IF (p. 927)** and the ***ELSEIF (p. 620)** commands are sequentially tested until one is found to be true. Then the block of commands immediately following the expression is executed, which completes the execution of the if-then-else construct.

If all ***IF (p. 927)** and ***ELSEIF (p. 620)** expressions are false, the block following the ***ELSE (p. 620)** command is executed, if there is one. Only one block of commands (at most) is executed within the if-then-else construct.

If a batch input stream encounters an end-of-file during a false ***IF (p. 927)** condition, the Mechanical APDL run ends abnormally. You will need to terminate it externally (via the Linux "kill" function or the Windows task manager).

The ***IF (p. 927)**, ***ELSEIF (p. 620)**, ***ELSE (p. 620)**, and ***ENDIF (p. 636)** commands for each if-then-else construct must all be read from the same file (or keyboard).

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IGESIN, *Fname*, *Ext*, --

Transfers IGES data from a file into Mechanical APDL.

AUX15 (p. 63): IGES (p. 63)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to CAD if *Fname* is blank.

--

Unused field.

Notes

Reads a file containing IGES data and transfers it into the Mechanical APDL database. The file transferred is the IGES Version 5.1, ASCII format file. IGES (Initial Graphics Exchange Specification) is a neutral format developed by the U.S. Dept. of Commerce, National Institute of Standards and Technology. No output transfer file is written because the transferred data is read directly into the Mechanical APDL database.

You can import multiple files into a single database, but you must use the same import option (set with the **IOPTN (p. 957)** command) for each file.

The **IOPTN (p. 957)** command sets the parameters for reading the file. Files read via the SMOOTH method (the only available method) use the standard database.

Menu Paths

Utility Menu>File>Import

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IGESOUT, *Fname*, *Ext*, --, *ATT*

Writes solid model data to a file in IGES Version 5.1 format.

PREP7 (p. 22): Database (p. 22)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to IGES if *Fname* is blank.

--

Unused field.

ATT

Attribute key:

0

Do not write assigned numbers and attributes of the solid model entities to the IGES file (default).

1

Write assigned numbers and attributes of solid model entities (keypoints, lines, areas, volumes) to the IGES file. Attributes include MAT, TYPE, REAL, and ESYS specifications as well as associated solid model loads and meshing (keypoint element size, number of line divisions and spacing ratio) specifications.

Notes

Causes the selected solid model data to be written to a coded file in the IGES Version 5.1 format. Previous data on this file, if any, are overwritten.

Keypoints that are not attached to any line are written to the output file as IGES entity 116 (Point).

Lines that are not attached to any area are written to the output file as either IGES Entity 100 (Circular Arc), 110 (Line), or 126 (Rational B-Spline Curve) depending upon whether the Mechanical APDL entity was defined as an arc, straight line, or spline.

Areas are written to the output file as IGES Entity 144 (Trimmed Parametric Surface).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Volumes are written to the output file as IGES entity 186 (Manifold Solid B-Rep Object).

Solid model entities to be written must have all corresponding lower level entities selected (use **ALLSEL (p. 114)**,BELOW,ALL) before issuing command.

Concatenated lines and areas are not written to the IGES file; however, the entities that comprise the concatenated entities are written.

Caution:

Section properties assigned to areas, lines and other solid model entities are not maintained when the model is exported via **IGESOUT (p. 932)**.

Issuing **IGESOUT (p. 932)** after generating a beam mesh with orientation nodes causes the orientation keypoints specified for the line (**LATT (p. 1014)**) to no longer be associated with the line and are therefore not written out to the IGES file. The line does not recognize that orientation keypoints were ever assigned to it. Therefore, **IGESOUT (p. 932)** does not support (for beam meshing) any line operation relying on solid model associativity. (For example, meshing the areas adjacent to the meshed line, plotting the line that contains the orientation nodes, or clearing the mesh from the line that contains orientation nodes may not work as expected.) For more information about beam meshing, see Meshing Your Solid Model.

Menu Paths

Utility Menu>File>Export

/IMAGE, *Label*, *Fname*, *Ext*, --

Allows graphics data to be captured and saved.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Label

Label specifying the operation to be performed:

CAPTURE

Capture the image from the graphics window to a new window.

RESTORE

Restore the image from a file to a new window.

SAVE

Save the contents of the graphic window to a file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DELETE

Delete the window that contains the file.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Ext

Filename extension (eight-character maximum).

If no extension is specified, `bmp` will be used on Windows systems, and `img` will be used on Linux systems.

--

Unused field.

Menu Paths

This command cannot be accessed from a menu.

IMAGIN, *IR*, *IA*, - -, - -, *Name*, - -, - -, *FACTA*

Forms an imaginary variable from a complex variable.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to *NV* (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA

Reference number of the variable to be operated on.

--,--

Unused fields.

Name

Thirty-two character name for identifying the variable on the printout and displays. Embedded blanks are compressed upon output.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- -, - -

Unused fields.

FACTA

Scaling factor (positive or negative) applied to variable *IA* (defaults to 1.0).

Notes

This command forms a new variable from a complex variable by storing the imaginary part as the real part. The imaginary part can then be used in other operations. Used only with harmonic analyses (**ANTYPE (p. 162)**,HARMIC).

Complex variables are stored in two-column arrays with the real component stored in the first column and the imaginary component stored in the second column. This command extracts the value stored in the second column (that is, imaginary component). However, with harmonic analyses, all variables are stored in two-column arrays as complex variables. If the variable is not complex, then the same value is stored in both columns. This command will extract the variable in the second column of the array, even if this variable is not the imaginary component of a complex variable.

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Imaginary Part

IMESH, *LAKY*, *NSLA*, *NTLA*, *KCN*, *DX*, *DY*, *DZ*, *TOL*

Generates nodes and interface elements along lines or areas.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LAKY

Copies mesh according to the following:

LINE or 1

Copies line mesh (default).

AREA or 2

Copies area mesh.

NSLA

Number that identifies the source line or area. This is the line or area whose mesh will provide the pattern for the interface elements. Mechanical APDL copies the pattern of the line or area elements through the area or volume to create the mesh of area or volume interface elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NTLA

Number that identifies the target line or area. This is the line or area that is opposite the source line or area specified by *NSLA*. Add *NTLA* to obtain the copied mesh from the source line or area.

KCN

Number that identifies the particular Mechanical APDL coordinate system.

DX, DY, DZ

Incremental translation of node coordinates in the active coordinate system (*DR*, *D* , *DZ* for cylindrical, and *DR*, *D* , *D* for spherical or toroidal). The source line or area coordinates + *DX*, *DY*, *DZ* = the target line or area coordinates. If left blank, Mechanical APDL automatically estimates the incremental translation.

TOL

Tolerance for verifying topology and geometry. By default, Mechanical APDL automatically calculates the tolerance based on associated geometries.

Notes

Generates nodes and interface elements along lines or areas. The **IMESH (p. 935)** command requires that the target line or area exactly match the source line or area. Also, both target and source lines or areas must be in the same area or volume. The area or volume containing the source line or area must be meshed before executing **IMESH (p. 935)**, while the area or volume containing the target line or area must be meshed after executing **IMESH (p. 935)**.

For three dimensional problems where *LAKY* = AREA, Mechanical APDL fills the interface layer as follows:

If source mesh consists of:	Mechanical APDL fills the interface layer with:
Quadrilateral elements	Hexahedral elements
Triangle elements	Degenerated wedge elements
Combination quadrilateral and triangle elements	Combination hexahedral and degenerated wedge elements

IMMED, *KEY*

Allows immediate display of a model as it is generated.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Immediate mode key:

0

Display only upon request, that is, no immediate display (default with the GUI *off*).

1

Display immediately as model is generated (default with the GUI *on*).

Notes

The command enables you to control whether or not the model is displayed immediately as it is generated in an interactive session. Available only during an interactive session at a graphics display terminal. A valid graphics device name must first be specified (**/SHOW (p. 1785)**).

By default in the GUI, your model is immediately displayed in the Graphics window as you create new entities (such as areas, keypoints, nodes, elements, local coordinate systems, boundary conditions, etc.), referred to as *immediate mode* graphics.

Symbols (such as boundary conditions, local coordinate system triads, etc.) appear immediately and are present on subsequent displays unless you disable the appropriate symbol (via the GUI plot controls function or the appropriate graphics-specification command).

An immediate image is also scaled automatically to fit within the Graphics window. The new scaling is usually apparent on the automatic replot associated with immediate mode. To suppress automatic replot, issue **/UIS (p. 2045)**,REPLOT,0. (With automatic replot suppressed, the immediate image may not always be scaled correctly.)

An immediate display in progress should *not* be aborted with the usual system "break" feature (or else the Mechanical APDL session itself terminates). When you run Mechanical APDL interactively *without* using the GUI, immediate mode is off by default.

This command is valid only in PREP7.

Menu Paths

Utility Menu>PlotCtrls>Erase Options>Immediate Display

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

INISTATE,*Action*,*Val1*,*Val2*,*Val3*,*Val4*,*Val5*,*Val6*,*Val7*,*Val8*,*Val9*

Defines initial-state data and parameters.

PREP7 (p. 22): Data Tables (p. 24)
SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Action

Specifies action for defining or manipulating initial-state data:

SET

Use *Action* = SET to designate initial-state coordinate system, data type, and material type parameters. See "Command Specification for *Action* = SET" (p. 939).

DEFINE

Use *Action* = DEFINE to specify the actual state values, and the corresponding element, integration point, or layer information. See "Command Specifications for *Action* = DEFINE" (p. 940).

Use *Action* = DEFINE for function-based initial state. See "Command Specifications for *Action* = DEFINE (Function-Based Option)" (p. 942).

WRITE

Use *Action* = WRITE to write the initial-state values to a file when the **SOLVE (p. 1822)** command is issued. See "Command Specifications for *Action* = WRITE" (p. 943).

READ

Use *Action* = READ to read the initial-state values from a file. See "Command Specifications for *Action* = READ" (p. 944).

LIST

Use *Action* = LIST to read out the initial-state data. See "Command Specifications for *Action* = LIST" (p. 945).

DELETE

Use *Action* = DELE to delete initial-state data from a selected set of elements. See "Command Specifications for *Action* = DELETE" (p. 945)

Val1, Val2, ..., Val9

Input values based on the *Action* type.

Notes

INISTATE (p. 938) is available for current-technology elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The command can also be used with MESH200 (via the mesh-independent method for defining reinforcing) to apply an initial state to all generated reinforcing elements automatically. For more information, see Applying an Initial State to Reinforcing Elements in the *Structural Analysis Guide*.

Initial-state support for a given element is indicated in the documentation for the element under **Special Features**.

Initial-strain input (**INISTATE (p. 938)**,SET,DTYPE,EPEL) enables the nonlinear solver option automatically even if no nonlinear materials are involved.

The command does not support kinematic hardening material properties (such as **TB (p. 1899)**,PLASTIC,,,,BKIN) or the shape memory alloy material model (**TB (p. 1899)**,SMA).

INISTATE (p. 938) with elastic strain alone is not supported for gasket materials (**TB (p. 1899)**,GASK) and hyperelastic materials (**TB (p. 1899)**,HYPER, **TB (p. 1899)**,BB, **TB (p. 1899)**,AHYPER, **TB (p. 1899)**,CDM, **TB (p. 1899)**,EXPE).

INISTATE (p. 938) with initial stress alone is not supported for gasket materials (**TB (p. 1899)**,GASK).

INISTATE (p. 938) with plastic strain (which must include initial strain or stress, plastic strain, and accumulated plastic strain) does not support gasket materials (**TB (p. 1899)**,GASK), rate-dependent plasticity (**TB (p. 1899)**,RATE), and viscoelasticity (**TB (p. 1899)**,PRONY, **TB (p. 1899)**,SHIFT).

For more information about using the initial-state capability, see Initial State in the *Advanced Analysis Guide*.

Command Specification for *Action* = SET

INISTATE (p. 938), SET, *Val1*, *Val2*

Val1 **=**	***Val2*** **=**
CSYS	Coordinate system. *Val2* is an integer corresponding to the coordinate system: -2 = Element coordinate system -1 = Material coordinate system 0 = Global Cartesian coordinate system 0 - 10 = Any Mechanical APDL-defined coordinate system ≥11 = Any user-defined coordinate system ID
DTYP	Data type. *Val2* is the type of data that will be set on the subsequent **INISTATE (p. 938)**,DEFINE command: STRE = Stress data (default) EPEL = Strain data EPPL = Plastic strain data BSTR = Initial backstress PLEQ = Accumulated equivalent plastic strain

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Val1 =	*Val2* =
	PLWK = Plastic strain energy density EPCR = Creep strain data PPRE = Pore pressure VOID = Void ratio SVAR = State variables RELD = Relative density uf*nn* = User-defined field *nn* (01 through 09)
MAT	Material type. *Val2* is the material ID. Specifying *Val2* = 0 disables material-based initial state and enables integration-point-based initial-state data.
NODE	Enable node-based initial state. When *Val2* = 1, all subsequent **INISTATE (p. 938)** commands use the node-based format. To disable node-based initial state, specify *Val2* = 0.
DATA	Input method. By default, the data is discrete at either the node- or element-integration point. Function-based initial state can be activated via the FUNC option.
STOE	*Val2* is an integer specifying the initial-stress-to-strain flag: 0 = Disable initial-stress to initial-strain conversion (default). 1 = Enable initial-stress to initial-strain conversion.

Notes

Action = SET specifies and modifies the environment into which you will define the initial-state data (via a subsequent **INISTATE (p. 938)**,DEFINE command). Otherwise, subsequent **INISTATE (p. 938)**,DEFINE data is input as initial stress data in the global Cartesian coordinate system.

Command Specifications for *Action* = DEFINE

INISTATE (p. 938),DEFINE,*ELID, EINT, KLAYER, PARMINT, Cxx, Cyy, Czz, Cxy, Cyz, Cxz*

ELID --

Element ID number when using element-based initial state. Defaults to current element selection.

Node number when using node-based initial state. Defaults to current node selection.

EINT --

Gauss integration point. Default = ALL or -1.

For node-based initial state (*Val2* = NODE), element ID number (if specified). The **INISTATE (p. 938)** command is applied only to the specified element (unlike the default behavior, where the command is applied to *all* selected elements containing the specified node).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Not valid for material-based initial-state data (*Val1* = MAT) or node-based initial state (*Val2* = NODE).

KLAYER **--**

Layer number (for layered solid/shell elements) or cell number for beam/pipe elements. Blank for other supported element types and material-based initial-state data. Default = ALL or -1.

ParmInt **--**

Section integration point within a layer, or cell-integration point for beams (typically four integration points). Default = ALL or -1. Not valid for material-based initial-state data (*Val1* = MAT) or node-based initial state (*Val2* = NODE).

Not valid for material-based initial-state data (*Val1* = MAT).

Not used for node-based initial state with elements that do not have a beam/pipe/shell section defined.

For node-based initial state with beams/pipes, values 1 through 4 can be used to specify the values at corner nodes within a cell.

For node-based initial state with layered sections, values can be specified at TOP, BOT, and MID, or left blank (ALL or -1).

Cxx,Cyy,Czz,Cxy,Cyz,Cxz **--**

Stress (S), strain (EPEL), or plastic strain (EPPL) values.

For initial backstress (BSTR), the bilinear kinematic hardening (**TB (p. 1899)**,PLASTIC,,,,BKIN) and Chaboche nonlinear kinematic hardening (**TB (p. 1899)**,CHABOCHE) material models are supported.

Bilinear kinematic hardening defines all six values (*Cxx*, *Cyy*, *Czz*, *Cxy*, *Cyz*, *Cxz*), similar to initial stress or initial plastic strain.

For the Chaboche model, you can define up to 12 values (*Action* = DEFINE), so you can use this method for two subchains of the model. The input format becomes:

Cxx1,Cyy1,Czz1,Cxy1,Cyz1,Cxz1,Cxx2,Cyy2,Czz2,Cxy2,Cyz2,Cxz2

If more than two subchains of the Chaboche model are required, the initial backstress definition is possible via *Action* = READ only. The `.ist` file supports up to five subchains of the Chaboche model. For five subchains of the Chaboche model, for example, the input format becomes:

Cxx1,Cyy1,Czz1,Cxy1,Cyz1,Cxz1,…,Cxx5,Cyy5,Czz5,Cxy5,Cyz5,Cxz5

For more information, see Applying Initial Backstress in the *Advanced Analysis Guide*. Also see Bilinear Kinematic Hardening and Nonlinear Kinematic Hardening in the Theory Reference

Notes

You can issue the **INISTATE (p. 938)** command repeatedly to define multiple sets of initial-state values. initial-state data can be specified according to elements, layers or integration points.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When the initial-state parameters are being defined based on the material, (**INISTATE (p. 938)**,SET,MAT,*MATID*), *ELID* designates the element ID number and all subsequent values are ignored.

For coupled-field elements, the stresses to input must be Biot's effective stresses.

Command Specifications for *Action* = DEFINE (Function-Based Option)

INISTATE (p. 938),DEFINE,*ELID, EINT, --, --, FuncName, C1, C2, ..., C12*

ELID **--**

Element ID number when using element-based initial state. Defaults to current element selection.

Node number when using node-based initial state. Defaults to current node selection.

EINT **--**

Gauss integration point (defaults to ALL). Not valid for material-based initial-state data (*Val1* = MAT) or node-based initial state (*Val2* = NODE).

(Blank) --

Reserved for future use.

(Blank) --

Reserved for future use.

FuncName **--**

LINX | LINY | LINZ. Apply initial-state data as a linear function of location based on the X axis (LINX), Y axis (LINY), or Z axis (LINZ) in the coordinate system specified via the **INISTATE (p. 938)**,SET,CSYS command. Default coordinate system: CSYS,0 (global Cartesian).

C1, C2, ..., C12 **--**

For *FuncName* with tensors, each component uses two values. SXX = *C1* + X**C2*, SYY = *C3* + X**C4*, and so on. Specify 12 values (for the six tensor components).

For *FuncName* with scalars, only two values *C1* and *C2* (*VALUE* = *C1* + X**C2*) are necessary to apply the initial state.

Notes

You can issue **INISTATE (p. 938)** repeatedly with the function-based option to define multiple sets of initial-state values. Initial-state data can be specified according to elements or integration points.

For coupled-field elements, the stresses to input must be Biot's effective stresses.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Specifications for *Action* = WRITE

INISTATE,WRITE,*FLAG, , , , CSID, Dtype*

FLAG **--**

Set this value to 1 to generate the initial-state file, or 0 to disable initial-state file generation.

CSID **--**

Determines the coordinate system for the initial state:

0 (default)

Write in global Cartesian coordinate system for solid elements.

-1 (or MAT)

Write in material coordinate system

-2 (or ELEM)

Write in element coordinate system for link, beam, and layered elements.

Dtype **--**

Sets the data type to be written in the `.ist` file:

S

Output stresses.

EPEL

Output elastic strain.

EPPL

Output plastic strain.

PLEQ

Output equivalent plastic strain.

PLWK

Output plastic strain energy density.

EPCR

Output creep strain.

PPRE

Initial pore pressure.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VOID

Initial void ratio.

SVAR

State variables.

BSTR

Initial backstress.

Notes

Default is 0 for solid elements and -2 for link, beam, and shell elements.

State variables are always written to the `.ist` file in the material coordinate system.

Only the three in-plane stresses for the top and bottom surfaces are written.

For coupled-field elements, the stresses written out are Biot's effective stress values.

Initial pore pressure and void ratio are available for the coupled pore-pressure elements (CPT*nnn*) only: CPT212, CPT213, CPT215, CPT216, and CPT217.

Command Specifications for *Action* = READ

INISTATE (p. 938), READ, *Fname, Ext, Path, MeshIndMethod*

Reads initial-state data from a standalone initial-state (.ist) file of the specified name (*Fname*) and filename extension (*Ext*), located in the specified path (*Path*). The initial-state file must be in a comma-delimited ASCII file format, consisting of individual rows for each stress/strain item, with each row consisting of columns separated by commas.

Use *Action* = READ to apply complex sets of initial-state data to various elements, cells, layers, sections, and integration points. This option is available for element-integration-point-based initial-state data and node-based initial-state data.

Mapping to nodes may offer better performance when many substeps are involved; however, only location support is available. Mapping to element-integration points supports additional field variables TIME, FREQ and TEMP and generally uses less memory.

For other non-user-defined field variables (such as initial stress or strain), initial state is evaluated only at the first substep in the first load step.

MeshIndMethod **--**

Mesh-Independent method `.ist` read options:

0 or DEFA -- Standard (mesh-dependent) initial state `.ist` file (default).

MAPN -- Map to nodes internally when applying the initial state.

MAPI -- Map to element-integration points.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DOBJ -- Do not use `.ist` data in the finite element solution. (Use this option if converting initial-stress data to a traction load (p. 342).)

Command Specifications for *Action* = LIST

INISTATE, LIST, *ELID*

If using the standard method for applying initial-state data,specify *ELID* = element ID number to list initial-state data for elements. If *ELID* is unspecified, *all* initial-state data for all selected elements are listed.

If using the mesh-independent method, specify *ELID* = MIND to list initial-state data.

Command Specifications for *Action* = DELETE

INISTATE, DELE, *ELID*

If using the standard method, specify *ELID* = element ID number to delete initial-state data for elements. If *ELID* is unspecified, *all* initial-state data for all selected elements are deleted.

If using the mesh-independent method, specify *ELID* = MIND to delete initial-state data.

Menu Paths

This command cannot be accessed from a menu.

---

*INIT, *Name*, *Method*, *Val1*, *Val2*, *Val3*

Initializes a vector or matrix.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Name

Vector or matrix which will be initialized. This can be a vector (created by the ***VEC (p. 2085)** command), a dense matrix (created by the ***DMAT (p. 551)** command), or a sparse matrix (created by the ***SMAT (p. 1801)** command).

Method

Initialization method to use:

ZERO --

Fill the vector/matrix with zeros (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CONST --

Fill the vector/matrix with a constant value.

RAND --

Fill the vector/matrix with random values.

DIAG --

Fill the *n*th diagonal of the matrix with a constant value. Other values are not overwritten. For this option, *Name* must be a dense matrix.

ADIAG --

Fill the *n*th anti-diagonal of the matrix with a constant value. Other values are not overwritten. For this option, *Name* must be a dense matrix.

CONJ --

Take the complex conjugate of the values in the vector/matrix (no change for non-complex values).

FILTER --

Initialize a subset of values of a vector using a filtering vector. For this option, *Name* must be a vector.

Val1*, *Val2*, *Val3

Additional input. The meaning of *Val1* through *Val3* will vary depending on the specified *Method*. See details below.

The following *Valx* fields are used with *Method* = CONST:

Val1

The real part of the constant value to use (default = 0).

Val2

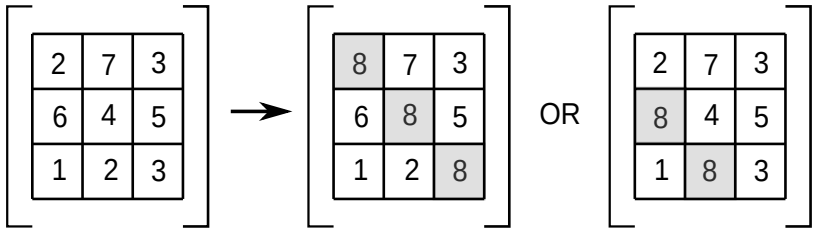
The imaginary part of the constant value to use (default = 0). Required only for a complex vector/matrix.

The following *Valx* fields are used with *Method* = DIAG or *Method* = ADIAG:

Val1

The number of the diagonal to fill. A zero value (which is the default) indicates the main diagonal (or main anti-diagonal). A positive value indicates an upper diagonal; a negative value indicates a lower diagonal.

Val2



The real part of the constant value to use (default = 1).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Val3

The imaginary part of the constant value to use (default = 0). Required only for a complex matrix.

The following example demonstrates *Method* = DIAG:

Original Matrix, M1 *INIT,M1,DIAG,0,8 *INIT,M1,DIAG,-1,8

The following *Valx* fields are used with *Method* = FILTER:

Val1

The name of an existing integer vector (created by ***VEC (p. 2085)**) to be used as the filter vector. The values in this vector indicate the locations in the *Name* vector that are to be initialized to *Val2* (real value) and *Val3* (imaginary value, if applicable). Location values higher than the dimension of the original vector are ignored.

Val2

The real part of the value used for initialization (default = 0).

Val3

The imaginary part of the value used for initialization (default = 0); applicable only if the *Name* vector contains complex values.

Notes

This command initializes a previously defined vector (***VEC (p. 2085)**), dense matrix (***DMAT (p. 551)**), or sparse matrix (***SMAT (p. 1801)**).

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

/INPUT,*Fname*,*Ext*,*Dir*,*LINE*,*LOG*

Switches the input file for the commands that follow.

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to the current Jobname if *Ext* is specified.

Ext

Filename extension (eight-character maximum).

Dir

Directory path (64 characters maximum). Defaults to current directory.

LINE

A value indicating either a line number in the file or a user-defined label in the file from which to begin reading the input file.

(blank), 0, or 1

Begins reading from the top of the file (default).

LINE_NUMBER

Begins reading from the specified line number in the file.

:*label*

Begins reading from the first line beginning with the matching user-defined label :*label* (beginning with a colon (:), 8 characters maximum).

LOG

Indicates whether secondary input from this command should be recorded in the command log (File.log) and the database log:

0

Record only the **/INPUT (p. 948)** command on the log (default).

1

Record commands in the specified secondary file as they are executed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Switches the input file for the next commands. Commands are read from this file until an end-of-file or another file switching directive is read. An end-of-file occurs after the last record of the file or when a **/EOF (p. 645)** command is read. An automatic switch back one level (to the previous file) occurs when an end-of-file is encountered. Twenty levels of nested file switching are allowed. Note that files including ***DO (p. 567)**, ***USE (p. 2059)**, ***ULIB (p. 2051)**, and the "Unknown Command" Macro have less nesting available because each of these operations also uses a level of file switching. For an interactive run, a **/INPUT (p. 948)**,TERM switches to the terminal for the next input. A **/EOF (p. 645)** read from the terminal then switches back to the previous file. A **/INPUT (p. 948)** (with a blank second field) switches back to the primary input file.

Setting *LOG* = 1 on **/INPUT (p. 948)** causes all commands read from the specified file to be recorded in the command log (`File.log`) and the internal database command log (**LGWRITE (p. 1048)**). This option is recommended if the log file will be used later. The *LOG* = 1 option is only valid when the **/INPUT (p. 948)** occurs in the primary input file. Using *LOG* = 1 on a nested **/INPUT (p. 948)** or on a **/INPUT (p. 948)** within a do-loop will have no effect (that is, commands in the secondary input file are not written to the command log).

The *Dir* option is optional as the directory path can be included directly in *Fname*.

This command is valid in any processor.

Menu Paths

Utility Menu>File>Read Input from

---

*INQUIRE,*Obj*,*Property*,*Var1*

Retrieves properties of an existing APDL Math object.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Obj

Name of the vector or matrix of interest.

Property

Object property to get:

DIM1

First dimension of a matrix, or size of a vector.

DIM2

Second dimension of a matrix.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Var1

Name of the resulting parameter that contains the property value.

Notes

The following example demonstrates using ***INQUIRE (p. 949)** to get the number of rows and columns of an existing matrix.

```
*SMAT,K,D,IMPORT,FULL,file.full,STIFF  ! Import the stiffness matrix from an existing FULL file
*INQUIRE,K,DIM1,NROW                  ! Get the first dimension of the stiffness matrix
*INQUIRE,K,DIM2,NCOL                  ! Get the second dimension of the stiffness matrix
/COM, K matrix size: %NROW% x %NCOL%
```

Menu Paths

This command cannot be accessed from a menu.

/INQUIRE,*StrArray*,*FUNC*

Returns system information to a parameter.

APDL (p. 19): Parameters (p. 19)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

StrArray

Name of the "string array" parameter that will hold the returned values. String array parameters are similar to character arrays, but each array element can be as long as 248 characters. If the string parameter does not exist, it will be created.

FUNC

Specifies the type of system information returned:

LOGIN --

Returns the pathname of the login directory on Linux systems or the pathname of the default directory (including drive letter) on Windows systems.

DOCU --

Returns the pathname of the Mechanical APDL docu directory.

APDL --

Returns the pathname of the Mechanical APDL APDL directory.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PROG --

Returns the pathname of the Mechanical APDL executable directory.

AUTH --

Returns the pathname of the directory in which the license file resides.

USER --

Returns the name of the user currently logged-in.

DIRECTORY --

Returns the pathname of the current directory.

JOBNAME --

Returns the current *Jobname*.

RSTDIR --

Returns rst directory (**FILE (p. 752)** command).

RSTFILE --

Returns rst file name (**FILE (p. 752)** command).

RSTEXT --

Returns rst file extension (**FILE (p. 752)** command).

PSEARCH --

Returns path used for "unknown command" macro (**/PSEARCH (p. 1535)** command).

OUTPUT --

Returns the current output file name (**/OUTPUT (p. 1334)** command).

Returning the Value of an Environment Variable to a Parameter

If *FUNC*=ENV, the command format is **/INQUIRE (p. 950)**,*StrArray*,ENV,*ENVNAME*,*Substring*. In this instance, ENV specifies that the command should return the value of an environment variable. The following defines the remaining fields:

ENVNAME

Specifies the name of the environment variable.

Substring

If *Substring* = 1, the first substring (up to the first colon (:)) is returned. If *Substring* = 2, the second substring is returned, etc. For Windows platforms, the separating character is semicolon (;). If this argument is either blank or 0, the entire value of the environment variable is returned.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Returning the Value of a Title to a Parameter

If *FUNC* = TITLE, the command format is **/INQUIRE (p. 950)**,*StrArray*,TITLE,*Title_num*. In this context, the value of *Title_num* can be blank or 1 through 5. If the value is 1 or blank, the title is returned. If the value is 2 through 5, a corresponding subtitle is returned (2 denoting the first subtitle, and so on).

Returning Information About a File to a Parameter

The **/INQUIRE (p. 950)** command can also return information about specified files within the file system. For these capabilities, the format is **/INQUIRE (p. 950)**,*Parameter*,*FUNC*,*Fname*, *Ext*, --. The following defines the fields:

Parameter

Name of the parameter that will hold the returned values.

FUNC

Specifies the type of file information returned:

EXIST --

Returns a 1 if the specified file exists, and 0 if it does not.

DATE --

Returns the date stamp of the specified file in the format *yyyymmdd.hhmmss*.

SIZE --

Returns the size of the specified file in MB.

WRITE --

Returns the status of the write attribute. A 0 denotes no write permission while a 1 denotes write permission.

READ --

Returns the status of the read attribute. A 0 denotes no read permission while a 1 denotes read permission.

EXEC --

Returns the status of the execute attribute (this has meaning only on Linux). A 0 denotes no execute permission while a 1 denotes execute permission.

LINES --

Returns the number of lines in an ASCII file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Ext

Filename extension (eight-character maximum).

--

Unused field.

Notes

The **/INQUIRE (p. 950)** command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

INRES,*Item1*,*Item2*,*Item3*,*Item4*,*Item5*,*Item6*,*Item7*,*Item8*

Identifies the data to be retrieved from the results file.

POST1 (p. 51): Controls (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Item1,Item2,Item3,...,Item8

Data to be read into the database from the results file. May consist of any of the following labels:

ALL

All solution items (default).

BASIC

NSOL, RSOL, NLOAD, STRS, FGRAD, and FFLUX items.

NSOL

Nodal DOF solution.

RSOL

Nodal reaction loads.

ESOL

Element solution items (includes all of the following):

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NLOAD

Element nodal loads.

STRS

Element nodal stresses.

EPEL

Element elastic strains.

EPTH

Element thermal, initial, and swelling strains.

EPPL

Element plastic strains.

EPCR

Element creep strains.

FGRAD

Element nodal gradients.

FFLUX

Element nodal fluxes.

MISC

Element miscellaneous data (SMISC and NMISC).

NAR

Nodal-averaged result items (includes all of the following):

NDST

Nodal-averaged stresses.

NDEL

Nodal-averaged elastic strains.

NDPL

Nodal-averaged plastic strains.

NDCR

Nodal-averaged creep strains.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NDTH

Nodal-averaged thermal and swelling strains.

Notes

Identifies the type of data to be retrieved from the results file for placement into the database through commands such as **SET (p. 1724)**, **SUBSET (p. 1871)**, and **APPEND (p. 173)**. **INRES (p. 953)** is a companion command to the **OUTRES (p. 1336)** command controlling data written to the database and the results file. Since the **INRES (p. 953)** command can only flag data that has already been written to the results file, care should be taken when using the **OUTRES (p. 1336)** command to include all data you wish to retrieve for postprocessing later on.

The *Item* = ALL option includes all NAR items. For more information, see Nodal-Averaged Results in the *Element Reference*.

Menu Paths

Main Menu>General Postproc>Data & File Opts

INRTIA

Specifies "Inertial loads" as the subsequent status topic.

SOLUTION (p. 38): Status (p. 49)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

Utility Menu>List>Loads>Inertia Loads

Utility Menu>List>Status>Solution>Inertia Loads

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

INT1, *IR*, *IY*, *IX*, - - , *Name*, - - , - - , *FACTA*, *FACTB*, *CONST*

Integrates a variable.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to *NV* (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result. Table values represent integrated sum of *IY* to current table position of *IX*.

IY, IX

Integrate variable *IY* with respect to *IX*.

--

Unused field.

Name

Thirty-two character name for identifying the variable on the printout and displays. Embedded blanks are compressed upon output.

--, --

Unused fields.

FACTA, FACTB

Scaling factors (positive or negative) applied to the corresponding variables (default to 1.0).

CONST

Initial value.

Notes

Integrates variables according to the operation:

$$IR = \int (FACTA \times IY)\, d(FACTB \times IX) + CONST$$

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Integrate

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

INVOPT, *Option*

Enables or disables inverse solving for the current load step.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Option

Enables or disables inverse solving for a load step:

ON

Enable.

OFF

Disable and revert to forward solving (default).

Notes

Option = ON is valid only at the first load step of a static analysis. Large-deflection effects must be enabled (**NLGEOM (p. 1231)**,ON). The unsymmetric solver (**NROPT (p. 1261)**,UNSYM) is required and the program selects it automatically.

After issuing **INVOPT (p. 957)**,ON, inverse solving remains in effect until **INVOPT (p. 957)**,OFF is issued. The solution then reverts to traditional forward solving (default).

This command cannot be issued during a restart. *Option* can only be changed between load steps.

For more information, see Nonlinear Static Analysis with Inverse Solving in the *Structural Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

IOPTN, *Lab*, *VAL1*

Controls options relating to importing a model.

AUX15 (p. 63): IGES (p. 63)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Label identifying the import option. The meaning of *VAL1* varies depending on *Lab*.

STAT

List overall status of import facilities, including current option values. *VAL1* is ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DEFA

Set default values for all import options. *VAL1*is ignored.

MERG

Entity merge option. *VAL1* can be:

YES

Automatic merging is performed (default).

NO

No merging of entities.

SOLID

Solid option. *VAL1* can be:

YES

Solid is created automatically (default).

NO

No solid created.

GTOLER

Entity merging tolerance. If IGES = SMOOTH, the GTOLER,*VAL1* can be:

DEFA

Use system defaults (default).

FILE

Use tolerance from the imported file.

n

A user-specified tolerance value.

IGES

IGES import option. *VAL1* can be:

STAT

List status of IGES related options in the output window.

SMOOTH (or RV52)

Use more robust IGES revision 5.2 import function (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SMALL

Small areas option. *VAL1* can be:

YES

Small areas are deleted (default).

NO

Small areas are retained.

VAL1

Additional input value as described under each *Lab* option.

Command Default

Merging is performed during the IGES transfer with no global solid model tolerance (GTOLER) used.

Notes

Controls various options during a model file transfer. A global solid model tolerance (GTOLER) can be specified.

The SMALL,YES option (default) delete small areas and can cause geometrical inconsistencies that could cause the import process to abort. Retaining the small areas increases processor time and memory usage.

The data is stored in the standard Mechanical APDL graphics database.

The IGES,SMOOTH (default) option is capable of reading in any rational B-spline curve entity (type 126), or rational B-spline surface entity (type 128) with a degree less than or equal to 20. Attempts to read in B-spline curve or surface entities of degree higher than 20 may result in error messages.

If you issue the **/CLEAR (p. 350)** command, the **IOPTN (p. 957)** settings return to their defaults.

For MERG,YES, merging of coincident geometry items is performed automatically when the **IGESIN (p. 931)** command is issued (that is, an internal **NUMMRG (p. 1295)**,KP command is issued). The model is merged with the *consideration tolerance* (*TOLER* on **NUMMRG (p. 1295)**) set equal to 0.75 * the shortest distance between the endpoints of any active line. See the **NUMMRG (p. 1295)** command for more information about the tolerances. In most cases, the default merging is appropriate. Use the **IOPTN (p. 957)** command when you want to:

- Disable merging operations.
- Override the default merging and specify a global solid model tolerance value (GTOLER).
- Disable the automatic creation of solids (SOLID).

The **IOPTN (p. 957)** command should be issued *before* the **IGESIN (p. 931)** command. You cannot change these options after your model has been imported or created. If you must change the options:

1. Clear the database (**/CLEAR (p. 350)**) or exit and restart the program.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Set the correct options.

3. Reimport or recreate the model.

This command is valid in any processor.

Menu Paths

Utility Menu>File>Import

IRLF,*KEY*,*PrintFreq*,*RampKey*

Specifies that inertia relief calculations are to be performed.

SOLUTION (p. 38): Inertia (p. 45)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Calculation key:

0

No inertia relief calculations.

1

Counterbalance loads with inertia relief forces.

-1

Precalculate masses for summary printout only (no inertia relief).

PrintFreq

Frequency at which inertia relief information is printed during substeps in a nonlinear static or eigenvalue buckling analysis. This value must be a positive integer, 0, or ALL, as described below.

0

No inertia relief information is printed during the Newton Raphson substeps (default).

n

Prints inertia relief information every *n*th substep of each load step.

ALL

Prints inertia relief information every substep.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RampKey

Key to control ramping of rigid body accelerations. See notes for steps to achieve convergence when turning on the inertia relief option in the second or later load step of a nonlinear analysis (p. 962).

0

(Default) Rigid body acceleration is stepped and ramped together with total external loads following specifications set using the **KBC (p. 970)** command. Normally, the inertia relief option is turned on at the first load step.

1

Ramp the rigid body accelerations alone following specifications set by the **KBC (p. 970)** command. This option is only used for better convergence when the inertia relief load step is nonlinear and the inertia relief option is turned on from a later load step (other than the first). It works with **KBC (p. 970)**,0 specified and no new loads added to the current load step. After the current load step, *RampKey* is automatically set to 0. See Turning On the Inertia Relief Option in the Second or Later Load Step (p. 962).

Command Default

No inertia relief calculations.

Notes

The **IRLF (p. 960)** command specifies that the program is to calculate accelerations to counterbalance the applied loads (inertia relief). Displacement constraints on the structure should be only those necessary to prevent rigid-body motions (3 are needed for a 2D structure and 6 for a 3D structure). If the minimum number of displacement constraints are applied and it is a linear static analysis, the sum of the reaction forces at the constrained points will be zero. However, if it is a nonlinear static analysis (**NLGEOM (p. 1231)**,ON), the sum of reaction forces at the constrained points will be approximately zero due to the error introduced by nonlinear iterations. Accelerations are calculated from the element mass matrices and the applied forces. Data needed to calculate the mass (such as density) must be input. Both translational and rotational accelerations may be calculated.

This option applies to the following analyses: static (linear or nonlinear), linear perturbation static, and buckling (see Including Inertia Relief Calculations in the *Basic Analysis Guide* and Supported Analysis Types for Inertia Relief in the *Theory Reference*). Elements that operate in the nodal coordinate system and axisymmetric or generalized plane strain elements are not allowed. Symmetry models are not valid for inertia relief analysis. Models with both 2D and 3D element types are not recommended.

Loads may be input as usual. Displacements and stresses are calculated as usual.

An automatic inertia relief capability is available for linear static analysis only. See the **AIRL (p. 111)** command for details.

Use **IRLIST (p. 962)** to print inertia relief calculation results. Note that **IRLIST (p. 962)** can only be issued at the end of the analysis, right after the **SOLVE (p. 1822)** command in the nonlinear case. To print information during substeps in a nonlinear static or eigenvalue buckling analysis, set *PrintFreq* as described above. The mass and moment of inertia summary printed before the solution is accurate (because of

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the additional pre-calculations required for inertia relief). See Inertia Relief in the *Mechanical APDL Theory Reference* for calculation details. See also the *Structural Analysis Guide* for procedural details.

Turning On the Inertia Relief Option in the Second or Later Load Step

If the inertia relief option is turned on in the second or later load step in a nonlinear static analysis, follow these precautionary steps for easy nonlinear convergence:

1. At the second or higher load step, where **IRLF (p. 960)**,1 is issued the first time, do not apply new external loads.
2. Set *Rampkey* = 1 at this load step and **KBC (p. 970)**,0 so that the rigid body accelerations are ramped.
3. Use the **NSUBST (p. 1287)** or **DELTIM (p. 515)** command to allow more substeps in this load step.

When a superelement (MATRIX50) is present in the model, any DOF constraints that you need to apply (**D (p. 483)**) on a degree of freedom (DOF) belonging to the superelement must be applied in the use pass of the MATRIX50 element (*not* in the generation pass). The command has no effect in the generation pass of a substructure. In the expansion pass, precalculation of masses for summary printout (**IRLF (p. 960)**,-1) occurs only on elements that are part of the substructure.

This command is also valid in PREP7.

Example Usage

Example command inputs for including inertia relief calculations in a static analysis with geometric nonlinearity, a linear perturbation static analysis, and a linear perturbation buckling analysis are found in Including Inertia Relief Calculations in the *Basic Analysis Guide*.

Menu Paths

---

IRLIST

Prints inertia relief summary table.

POST1 (p. 51): Listing (p. 53)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Prints the inertia relief summary data, including the mass summary table, the total load summary table, and the inertia relief summary table resulting from the inertia relief calculations. These calculations are performed in the solution phase (**SOLVE (p. 1822)**) as specified by the **IRLF (p. 960)** or **AIRL (p. 111)** command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Inertia relief output is stored in the database rather than in the results file (`Jobname.rst`). When you issue **IRLIST (p. 962)** or **AIRL (p. 111)**, Mechanical APDL pulls the information from the database, which contains the inertia relief output from the most recent solution (**SOLVE (p. 1822)**).

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

---

*ITENGINE,*Type*,*EngineName*,*PrecondName*,*Matrix*,*RhsVector*,*SolVector*,*MaxIter*,*Toler*

Performs a solution using an iterative solver.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Argument Descriptions

Type

Specifies the algorithm to be used:

PCG --

Preconditioned conjugate gradient (default).

EngineName

Name used to identify this iterative solver engine. Must be specified.

PrecondName

Linear solver engine name (***LSENGINE (p. 1077)**) identifying the factored matrix to be used as the preconditioner.

Matrix

Name of the matrix to solve.

RhsVector

Matrix (load vector) name.

SolVector

Solution vector name. If non-zero, it will be taken as the initial vector for the iterative process.

MaxIter

Maximum number of iterations allowed. Default is 2 times the number of rows in the matrix.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Toler

Convergence tolerance. Default is 1.0E-8.

Notes

This command solves Ax = b using a preconditioned conjugate gradient algorithm. It uses an existing factored system as the preconditioner. This solution method is useful if an existing matrix has been solved and minor changes have been made to the matrix.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

J Commands

JPEG, *Keyword*, *OPT*

Provides JPEG file export for Mechanical APDL displays.

GRAPHICS (p. 16): Set Up (p. 16)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Keyword

Specifies various JPEG file export options.

QUAL

If *Keyword* = QUAL, then *OPT* is an integer value defining the JPEG quality index on an arbitrary scale ranging from 1 to 100. The default value is 75.

ORIENT

If *Keyword* = ORIENT, then *OPT* will determine the orientation of the entire plot. *OPT* can be either Horizontal (default) or Vertical.

COLOR

If *Keyword* = COLOR, then *OPT* will determine the color depth of the saved file. *OPT* can be 0, 1, or 2, corresponding to Black and White, Grayscale, and Color (default), respectively.

TMOD

If *Keyword* = TMOD, then *OPT* will determine the text method. *OPT* can be either 1 or 0, corresponding to bitmap text (default) or line stroke text, respectively.

DEFAULT

If *Keyword* = DEFAULT, then all of the default values, for all of the Keyword parameters listed above, are active.

OPT

OPT can have the following names or values, depending on the value for *Keyword* (see above).

1 to 100

If *Keyword* = QUAL, a value between 1 and 100 will determine the quality index of the JPEG file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Horizontal, Vertical

If *Keyword* = ORIENT, the terms Horizontal or Vertical determine the orientation of the plot.

0,1,2

If *Keyword* = COLOR, the numbers 0, 1, and 2 correspond to Black and White, Grayscale and Color, respectively.

1,0

If *Keyword* = TMOD, the values 1 and 0 determine whether bitmap (1) or stroke text (0) fonts will be used

Menu Paths

Utility Menu>PlotCtrls>HardCopy>ToFile

JSOL, *NVAR*, *ELEM*, *ITEM*, *COMP*, *Name*

Specifies result items to be stored for the joint element.

POST26 (p. 58): Set Up (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NVAR

Arbitrary reference number or name assigned to this variable. Variable numbers can be 2 to *NV* (**NUMVAR (p. 1302)**) while the name can be an eight-byte character string. Overwrites any existing results for this variable.

ELEM

Element number for which to store results.

Item

Label identifying the item. Valid item labels are shown in Table 191: JSOL - Valid Item and Component Labels (p. 967) below.

Comp

Component of the *Item* (if required). Valid component labels are shown in Table 191: JSOL - Valid Item and Component Labels (p. 967) below.

Name

Thirty-two character name identifying the item on printouts and displays. Defaults to a label formed by concatenating the first four characters of the *Item* and *Comp* labels.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command is valid for the MPC184 joint elements. The values stored are for the free or unconstrained degrees of freedom of a joint element. Relative reaction forces and moments are available only if stiffness, damping, or friction is associated with the joint element.

Table 191: JSOL - Valid Item and Component Labels

Item	Comp	Description
U	X, Y, Z	x, y, or z relative displacement.
ROT	X, Y, Z	x, y, or z relative rotation.
VEL	X, Y, Z	x, y, or z relative linear velocity.
OMG	X, Y, Z	x, y, or z relative angular velocity.
ACC	X, Y, Z	x, y, or z relative linear acceleration.
DMG	X, Y, Z	x, y, or z relative angular acceleration.
RF	X, Y, Z	Relative reaction forces in the local x, y, or z direction.
RM	X, Y, Z	Relative reaction moments in the local x, y, or z direction.

Menu Paths

This command cannot be accessed from a menu.

K Commands

K, *NPT*, *X*, *Y*, *Z*

Defines a keypoint.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NPT

Reference number for keypoint. If zero, the lowest available number is assigned (**NUMSTR (p. 1301)**).

X, Y, Z

Keypoint location in the active coordinate system (may be R, θ, Z or R, θ, Φ). If *X* = P, graphical picking is enabled and all other fields (including *NPT*) are ignored (valid only in the GUI).

Notes

Defines a keypoint in the active coordinate system (**CSYS (p. 441)**) for line, area, and volume descriptions. A previously defined keypoint of the same number will be redefined. Keypoints may be redefined only if it is not yet attached to a line or is not yet meshed. Solid modeling in a toroidal system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Keypoints>In Active CS

Main Menu>Preprocessor>Modeling>Create>Keypoints>On Working Plane

KATT, *MAT*, *REAL*, *TYPE*, *ESYS*

Associates attributes with the selected, unmeshed keypoints.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT, REAL, TYPE, ESYS

Material number, real constant set number, type number, and coordinate system number to be associated with selected, unmeshed keypoints.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Keypoints subsequently generated from the keypoints will also have these attributes. These element attributes will be used when the keypoints are meshed. If a keypoint does not have attributes associated with it (by this command) at the time it is meshed, the attributes are obtained from the then current **MAT (p. 1111)**, **REAL (p. 1579)**,**TYPE (p. 2036)**, and **ESYS (p. 685)** command settings. Reissue the **KATT (p. 969)** command (before keypoints are meshed) to change the attributes. A zero (or blank) argument removes the corresponding association.

If any of the arguments *MAT*, *REAL*, *TYPE*, or *ESYS* are defined as -1, then that value will be left unchanged in the selected set.

In some cases, Mechanical APDL can proceed with a keypoint meshing operation even when no logical element type has been assigned via **KATT (p. 969)**,,,*TYPE* or **TYPE (p. 2036)**. For more information, see the discussion on setting element attributes in Meshing Your Solid Model in the *Modeling and Meshing Guide*.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh Attributes>All Keypoints

Main Menu>Preprocessor>Meshing>Mesh Attributes>Picked KPs

KBC, *KEY*, *OMGSQRDKEY*

Specifies ramped or stepped loading within a load step.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Ramping key:

0

Loads are linearly interpolated (ramped) for each substep from the values of the previous load step to the values of this load step. This is the default value.

1

Loads are step changed (stepped) at the first substep of this load step to the values of this load step (that is, the same values are used for all substeps). Useful for rate-dependent behavior (for example, creep, viscoplasticity, etc.) or transient load steps only.

OMGSQRDKEY

Key for the interpolation of the rotational velocity loading (only supported when *KEY* = 0):

0

Rotational velocities are linearly interpolated. This is the default.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

A quadratic interpolation is used for the rotational velocities (**OMEGA (p. 1324)**, **CMOMEGA (p. 368)**, and **CMROTATE (p. 373)**). All other loads are interpolated linearly.

Command Default

The loading is ramped for:

- static analysis (**ANTYPE (p. 162)**,STATIC)
- transient analysis with transient effects excluded (**ANTYPE (p. 162)**,TRANS and **TIMINT (p. 2001)**,OFF)
- harmonic analysis (**ANTYPE (p. 162)**,HARM)

The loading is step-applied for transient analysis with transient effects included (**ANTYPE (p. 162)**,TRANS and **TIMINT (p. 2001)**,ON; **TIMINT (p. 2001)**,ON is the default for transient analysis).

Notes

Specifies whether loads applied to intermediate substeps within the load step are to be stepped or ramped. Used only if *DTIME* on the **DELTIM (p. 515)** command is less than the time span or, conversely, if *NSBSTP* on the **NSUBST (p. 1287)** command is greater than one. Flags (FSI, MXWF, MVDI, etc.) are always stepped.

Changing the ramping *KEY* (that is, switching between ramped and stepped boundary conditions) between load steps is not recommended.

For ramped loading (**KBC (p. 970)**,0), when a load is applied for the first time, it is interpolated from zero to the value of the current load step, and not from the initial condition or value of the degree of freedom from the previous load step.

Spatially varying tabular loads or boundary conditions do not support direct ramping or stepping options and, instead, apply their full values according to the supplied tabular functions regardless of the **KBC (p. 970)** setting.

Regardless of the **KBC (p. 970)** setting, any tabular load is applied as step change. This is the case, for example, for a static or harmonic cyclic symmetry analysis with a load that varies by sector (**CYCOPT (p. 466)**, LDSECT). Note that when tabular and non-tabular loads are present in the same analysis, the non-tabular loads are ramped or stepped according to the **KBC (p. 970)** setting.

Irrespective of the **KBC (p. 970)** setting, loads are usually step-removed. See Stepping or Ramping Loads in the *Basic Analysis Guide* for more information.

It is sometimes difficult to obtain successful convergence with stepped loading in a nonlinear transient problem. If divergence is encountered, determine if stepped loading was used by default, then determine if it is appropriate for the analysis.

This command is also valid in PREP7.

---

KBETW, *KP1*, *KP2*, *KPNEW*, *Type*, *VALUE*

Creates a keypoint between two existing keypoints.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KP1

First keypoint. If *KP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

KP2

Second keypoint.

KPNEW

Number assigned to the new keypoint. Defaults to the lowest available keypoint number.

Type

Type of input for *VALUE*.

RATIO

Value is the ratio of the distances between keypoints as follows: (*KP1*-*KPNEW*)/(*KP1*-*KP2*).

DIST

Value is the absolute distance between *KP1* and *KPNEW* (valid only if current coordinate system is Cartesian).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VALUE

Location of new keypoint, as defined by *Type* (defaults to 0.5). If *VALUE* is a ratio (*Type* = RATIO) and is less than 0 or greater than 1, the keypoint is created on the extended line. Similarly, if *VALUE* is a distance (*Type* = DIST) and is less than 0 or greater than the distance between *KP1* and *KP2*, the keypoint is created on the extended line.

Notes

Placement of the new keypoint depends on the currently active coordinate system (**CSYS (p. 441)**). If the coordinate system is Cartesian, the keypoint will lie on a straight line between *KP1* and *KP2*. If the system is not Cartesian (for example, cylindrical, spherical, etc.), the keypoint will be located as if on a line (which may not be straight) created in the current coordinate system between *KP1* and *KP2*. Note that solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Keypoints>KP between KPs

---

KCENTER, *Type*, *VAL1*, *VAL2*, *VAL3*, *VAL4*, *KPNEW*

Creates a keypoint at the center of a circular arc defined by three locations.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Type of entity used to define the circular arc. The meaning of *VAL1* through *VAL4* will vary depending on *Type*. If *Type* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

KP

Arc is defined by keypoints.

LINE

Arc is defined by locations on a line.

VAL1, VAL2, VAL3, VAL4

Values used to specify three locations on the arc (see table below).

KPNEW

Number assigned to new keypoint. Defaults to the lowest available keypoint number.

Definitions:

If *Type* = KP, inputs *VAL1* through *VAL4* are defined as follows:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VAL1

First keypoint.

VAL2

Second keypoint.

VAL3

Third keypoint.

VAL4

Arc radius. If *VAL4* = 0 or blank (default), the arc is defined by the three keypoints specified as *VAL1*, *VAL2*, and *VAL3* and arc radius is not used. If *VAL4* is nonzero, *VAL1*, *VAL2*, and *VAL4* are used to calculate the center point, and *VAL3* is used to locate the center point as follows:

***VAL4* > 0**

Center point and *VAL3* are on the same side of the line between the first two keypoints.

***VAL4* < 0**

Center point and *VAL3* are on opposite sides of the line between the first two keypoints.

If *Type* = LINE, inputs *VAL1* through *VAL4* are defined as follows:

VAL1

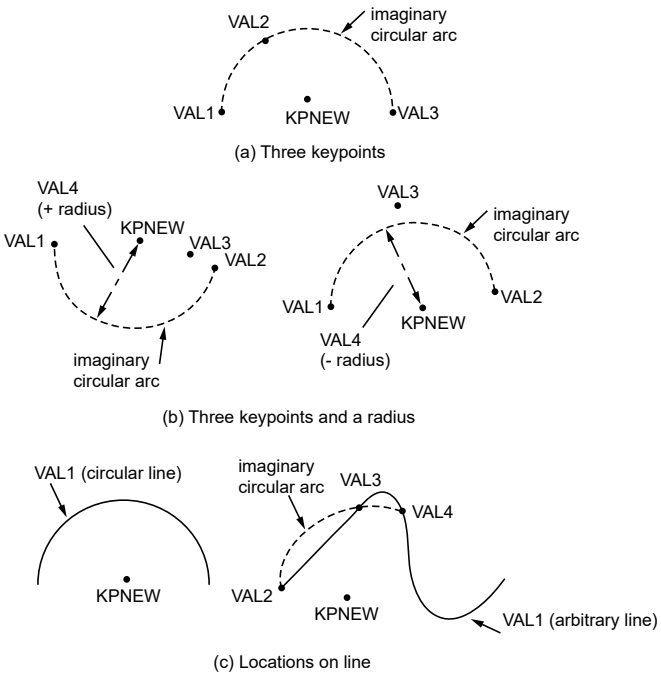
Line number.

VAL2

Line ratio (0 to 1) indicating the first location (defaults to 0).

VAL3

Line ratio (0 to 1) indicating the second location (defaults to 0.5).



VAL4

Line ratio (0 to 1) indicating the third location (defaults to 1).

Notes

KCENTER (p. 973) should be used in the Cartesian coordinate system (**CSYS (p. 441)**,0) only. This command provides three methods to define a keypoint at the center of three locations. As shown below, the center point can be calculated based on a) three keypoints, b) three keypoints and a radius, or c) three locations on a line. Note that for method c, if a circular line is specified by *VAL1*, *VAL2* through *VAL4* are not needed.

---

KCLEAR, *NP1*, *NP2*, *NINC*

Deletes nodes and point elements associated with selected keypoints.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NP1, *NP2*, *NINC*

Delete mesh for keypoints *NP1* to *NP2* (defaults to *NP1*) in steps of *NINC* (defaults to 1). If *NP1* = ALL, *NP2* and *NINC* are ignored and the mesh for all selected keypoints (**KSEL (p. 995)**) is deleted. If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NP1*.

Notes

Deletes *all* nodes and point elements associated with selected keypoints (regardless of whether the nodes or elements are selected). Nodes associated with non-point elements will not be deleted. Attributes assigned as a result of **KATT (p. 969)** are maintained. In the program's response to the command, if a keypoint is tallied as "cleared," it means either its node or element reference was deleted.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Meshing>Clear>Keypoints

KDELE, *NP1*, *NP2*, *NINC*

Deletes unmeshed keypoints.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NP1*, *NP2*, *NINC

Delete keypoints from *NP1* to *NP2* (defaults to *NP1*) in steps of *NINC* (defaults to 1). If *NP1* = ALL, *NP2* and *NINC* are ignored and all selected keypoints (**KSEL (p. 995)**) are deleted. If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NP1* (*NP2* and *NINC* are ignored).

Notes

Deletes selected keypoints. A keypoint attached to a line cannot be deleted unless the line is first deleted.

Menu Paths

Main Menu>Preprocessor>Modeling>Delete>Keypoints

KDIST, *KP1*, *KP2*

Calculates and lists the distance between two keypoints.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KP1

First keypoint in distance calculation. If *KP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

KP2

Second keypoint in distance calculation.

Notes

KDIST (p. 976) lists the distance between keypoints *KP1* and *KP2*, as well as the current coordinate system offsets from *KP1* to *KP2*, where the X, Y, and Z locations of *KP1* are subtracted from the X, Y, and Z locations of *KP2* (respectively) to determine the offsets. **KDIST (p. 976)** is valid in any coordinate system except toroidal (**CSYS (p. 441)**,3).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KDIST (p. 976) returns a variable, called "*_RETURN*," which contains the distance value. You can use this value for various purposes; for example, to set the default number of line divisions to be generated along region boundary lines (**ESIZE (p. 668)**,*_RETURN*). In interactive mode, you can access this command by using the Model Query Picker (**Utility Menu> List> Picked Entities**), where you can also access automatic annotation functions, and display the value on your model.

This command is valid in any processor.

Menu Paths

Main Menu>Preprocessor>Modeling>Check Geom>KP distances

KEEP, *Key*

Stores POST26 definitions and data during active session.

POST26 (p. 58): Display (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

State or value

On or 1

Allows you to exit and reenter **/POST26 (p. 1462)** without losing your current time history variable information. Keeps a cache of the **/POST26 (p. 1462)** variable information including the active file name (**FILE (p. 752)**), variable definitions (**NSOL (p. 1281)**, **ESOL (p. 672)**, **RFORCE (p. 1607)**, and **SOLU (p. 1819)**) and stored variable data in memory for the current Mechanical APDL session.

Off or 0

/POST26 (p. 1462) variable information is deleted when you exit **/POST26 (p. 1462)**.

Command Default

ON - Hold time history information in memory. You can, for example, move back and forth between **/POST1 (p. 1461)** and **/POST26 (p. 1462)** without redefining and storing the time history variables each time you enter **/POST26 (p. 1462)**.

Notes

Your variable information is saved in memory only for the current active Mechanical APDL session. It is deleted when you exit Mechanical APDL. This information is also deleted when you issue **/CLEAR (p. 350)**, **RESUME (p. 1601)**, **SOLVE (p. 1822)**, or **RESET (p. 1598)**.

When you reenter **/POST26 (p. 1462)** all time history variable data is available for use. When you issue **STORE (p. 1867)**,*NEW*, variable definitions created by math operations such as **ADD (p. 95)** or **PROD (p. 1515)** will not be restored. However, variables defined with **NSOL (p. 1281)**, **ESOL (p. 672)**, **RFORCE (p. 1607)**, and **SOLU (p. 1819)** will be restored. Only the last active results file name is kept in memory (**FILE (p. 752)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Commands such as **LAYERP26 (p. 1016)**, **SHELL (p. 1784)**, and **FORCE (p. 772)** that specify the location or a component of data to be stored will retain the setting at the time of exiting **/POST26 (p. 1462)** .

Menu Paths

Main Menu>TimeHist Postpro>Settings>Data

KESIZE, *NPT*, *SIZE*, *FACT1*, *FACT2*

Specifies the edge lengths of the elements nearest a keypoint.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NPT

Number of the keypoint whose lines will be adjusted. If ALL, use all selected keypoints (**KSEL (p. 995)**). If *NPT* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

SIZE

Size of elements along lines nearest keypoint *NPT* (overrides any other specified size). If *SIZE* is zero (or blank), use *FACT1* or *FACT2*.

FACT1

Scale factor applied to a previously defined *SIZE*. Not used if *SIZE* is input.

FACT2

Scale factor applied to the minimum element division at keypoint *NPT* for any attached line. This feature is useful with adaptive mesh refinement. Not used if *SIZE* or *FACT1* is input.

Notes

Affects only the line divisions adjacent to the keypoint on lines not previously assigned divisions by other line commands (**LESIZE (p. 1041)**, etc.). The remaining line divisions are determined from the division nearest the keypoint at the other end of the line (specified by another **KESIZE (p. 978)** command or the **ESIZE (p. 668)** command). Divisions are transferred to the lines during the mesh operation. If smart element sizing is being used (**SMRTSIZE (p. 1811)**), **KESIZE (p. 978)** specifications may be overridden (that is, a smaller element size may be used) to accommodate curvature and small features.

This command is valid in any processor. The command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Size Cntrls>ManualSize>Keypoints>All KPs

Main Menu>Preprocessor>Meshing>Size Cntrls>ManualSize>Keypoints>Clr Size

Main Menu>Preprocessor>Meshing>Size Cntrls>ManualSize>Keypoints>Picked KPs

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KEYOPT, *ITYPE*, *KNUM*, *VALUE*

Sets element key options.

PREP7 (p. 22): Element Type (p. 23)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITYPE

Element type number as defined on the **ET (p. 686)** command.

The following labels are valid input for contact elements:

CONT

Set element key options for all contact element types, CONTA172, CONTA174, CONTA175, and CONTA177.

TARG

Set element key options for all target element types, TARGE169 and TARGE170.

GCN

Set element key options for all contact element types used in a general contact definition (that is, all contact elements having a real constant set number = 0). See Notes (p. 980) for additional information specific to general contact.

JOIN

Set element key options for all joint element types (MPC184 with KEYOPT(1) > 2). Valid for joint elements only. See Notes (p. 980) for additional information specific to joint elements.

KNUM

Number of the KEYOPT to be defined (KEYOPT(*KNUM*)).

VALUE

Value of this KEYOPT.

Notes

The **KEYOPT (p. 979)** command is an alternative method for inputting element key option (KEYOPT) values via the **ET (p. 686)** command. (Issue the **ET (p. 686)** command *first* to define *ITYPE*).

The **KEYOPT (p. 979)** command is required for inputting key options numbered higher than six (that is, > KEYOPT(6)).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Special Usage for Structural Elements

If **ETCONTROL (p. 701)**,SET is enabled, key options that you specify via the **KEYOPT (p. 979)** command might be overridden for many structural elements. For more information, see Automatic Selection of Element Technologies and Formulations in the *Element Reference*.

Special Usage for General Contact

Specify *ITYPE* = GCN to set element key options for all contact element types used in a general contact definition. You can selectively set element key options for multiple contact element types in a general contact definition by setting *ITYPE* to a valid label (ALL_EDGE, ALL_FACE, ALL_VERT, ALL_TOP, or ALL_BOT) or by inputting a node component name with or without a component name extension (_EDGE, _FACE, _VERT, _TOP, or _BOT). For more information, see Defining Non-Default Contact Settings in the *Contact Technology Guide*.

Special Usage for Joint Elements

Specify *ITYPE* = JOIN to set element key options for all joint element types in the model. Use this option to switch between Lagrange Multiplier-based and penalty-based joint element formulations.

Menu Paths

Main Menu>Preprocessor>Element Type>Add/Edit/Delete

KEYPTS

Specifies "Keypoints" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KEYW

Sets a keyword used by the GUI for context filtering (GUI).

SESSION (p. 11): Run Controls (p. 11)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a program-generated command and is not intended for your use. It is included here in the documentation because it might appear in the log file (`Jobname.log`). When using log files, or portions of log files, as input, any included **KEYW (p. 981)** commands may be left as is, or removed, without consequence.

Menu Paths

Main Menu>Preferences

KFILL,*NP1*,*NP2*,*NFILL*,*NSTRT*,*NINC*,*SPACE*

Generates keypoints between two keypoints.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NP1, NP2

Beginning and ending keypoints for fill-in. *NP1* defaults to next to last keypoint specified, *NP2* defaults to last keypoint specified. If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NFILL

Fill *NFILL* keypoints between *NP1* and *NP2* (defaults to |*NP2*-*NP1*|-1). *NFILL* must be positive.

NSTRT

Keypoint number assigned to first filled-in keypoint (defaults to *NP1* + *NINC*).

NINC

Add this increment to each of the remaining filled-in keypoint numbers (may be positive or negative). Defaults to (*NP2*-*NP1*)/(*NFILL* + 1), that is, linear interpolation.

SPACE

Spacing ratio. Ratio of last division size to first division size. If > 1.0, divisions increase. If < 1.0, divisions decrease. Ratio defaults to 1.0 (uniform spacing).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Generates keypoints (in the active coordinate system) between two existing keypoints. The two keypoints may have been defined in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended. Any number of keypoints may be filled in and any keypoint numbering sequence may be assigned.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Keypoints>Fill between KPs

---

KGEN, *ITIME*, *NP1*, *NP2*, *NINC*, *DX*, *DY*, *DZ*, *KINC*, *NOELEM*, *IMOVE*

Generates additional keypoints from a pattern of keypoints.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITIME

Do this generation operation a total of *ITIME* times, incrementing all keypoints in the given pattern automatically (or by *KINC*) each time after the first. *ITIME* must be more than 1 for generation to occur.

NP1*, *NP2*, *NINC

Generate keypoints from the pattern of keypoints beginning with *NP1* to *NP2* (defaults to *NP1*) in steps of *NINC* (defaults to 1). If *NP1* = ALL, *NP2* and *NINC* are ignored and the pattern is all selected keypoints (**KSEL (p. 995)**). If *NP1* is negative, *NP2* and *NINC* are ignored and the last |*NP1*| keypoints (in sequence from the highest keypoint number) are used as the pattern to be repeated. If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NP1* (*NP2* and *NINC* are ignored).

DX*, *DY*, *DZ

Keypoint location increments in the active coordinate system (DR, Dθ, DZ for cylindrical, DR, Dθ, DΦ for spherical).

KINC

Keypoint increment between generated sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies if elements and nodes are also to be generated:

0

Generate nodes and point elements associated with the original keypoints, if they exist.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Do not generate nodes and elements.

IMOVE

Specifies whether keypoints will be moved or newly defined:

0

Generate additional keypoints as requested with the *ITIME* argument.

1

Move original keypoints to new position retaining the same keypoint numbers (*ITIME*, *KINC*, and *NOELEM* are ignored). Valid only if the old keypoints are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Generates additional keypoints (and corresponding mesh) from a given keypoint pattern. The MAT, TYPE, REAL, and ESYS attributes are based upon the keypoints in the pattern and not upon the current settings. Generation is done in the active coordinate system. Keypoints in the pattern may have been defined in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Copy>Keypoints

KL, *NL1*, *RATIO*, *NK1*

Generates a keypoint at a specified location on an existing line.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Number of the line. If negative, the direction of line (as interpreted for *RATIO*) is reversed. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

RATIO

Ratio of line length to locate keypoint. Must be between 0.0 and 1.0. Defaults to 0.5 (divide the line in half).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NK1

Number to be assigned to keypoint generated at division location (defaults to lowest available keypoint number (**NUMSTR (p. 1301)**)).

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Keypoints>On Line

Main Menu>Preprocessor>Modeling>Create>Keypoints>On Line w/Ratio

---

KLIST, *NP1*, *NP2*, *NINC*, *Lab*

Lists the defined keypoints or hard points.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NP1*, *NP2*, *NINC

List keypoints from *NP1* to *NP2* (defaults to *NP1*) in steps of *NINC* (defaults to 1). If *NP1* = ALL (default), *NP2* and *NINC* are ignored and all selected keypoints (**KSEL (p. 995)**) are listed. If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NP1* (*NP2* and *NINC* are ignored).

Lab

Coordinate listing key:

(blank)

List all keypoint information.

COORD

Suppress all but the keypoint coordinates (shown to a higher degree of accuracy than when displayed with all information).

HPT

List only hard point information.

Notes

Lists keypoints in the active display coordinate system (**DSYS (p. 582)**). An attribute (TYPE, MAT, REAL, or ESYS) listed as a zero is unassigned; one listed as a positive value indicates that the attribute was assigned with the **KATT (p. 969)** command (and will not be reset to zero if the mesh is cleared); one listed as a negative value indicates that the attribute was assigned using the attribute pointer (**TYPE (p. 2036)**, **MAT (p. 1111)**, **REAL (p. 1579)**, or **ESYS (p. 685)**) that was active during meshing (and will be reset to zero if the mesh is cleared).

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>List>Keypoints>Coordinates +Attributes

Utility Menu>List>Keypoints>Coordinates only

Utility Menu>List>Keypoints>Hard Points

KMESH, *NP1*, *NP2*, *NINC*

Generates nodes and point elements at keypoints.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NP1*, *NP2*, *NINC

Mesh keypoints from *NP1* to *NP2* (defaults to *NP1*) in steps of *NINC* (defaults to 1). If *NP1* = ALL, *NP2* and *NINC* are ignored and all selected keypoints (**KSEL (p. 995)**) are meshed. If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NP1*.

Notes

Missing nodes required for the generated elements are created and assigned the lowest available numbers.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh>Keypoints

KMODIF, *NPT*, *X*, *Y*, *Z*

Modifies an existing keypoint.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NPT

Modify coordinates of this keypoint. If *NPT* = ALL, modify coordinates of all selected keypoints (**KSEL (p. 995)**). If *NPT* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NPT*.

X*, *Y*, *Z

Replace the previous coordinate values assigned to this keypoint with these corresponding coordinate values. Values are interpreted according to the active coordinate system (R, θ, Z for cylindrical, R, θ,Φ for spherical). If *X* = P, graphical picking is used to locate keypoint and *Y* and *Z* are ignored. A blank retains the previous value. You cannot specify *Y* = P.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Lines, areas, and volumes attached to the modified keypoint (if any) must all be selected and will be redefined using the active coordinate system. However, solid modeling in a toroidal coordinate system is not recommended.

Caution:

Redefined entities may be removed from any defined components and assemblies. Nodes and elements will be automatically cleared from any redefined keypoints, lines, areas, or volumes.

The **KMODIF (p. 985)** command moves keypoints for geometry modification without validating underlying entities. To merge keypoints and update higher order entities, issue the **NUMMRG (p. 1295)** command instead.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Keypoints>Set of KPs

Main Menu>Preprocessor>Modeling>Move / Modify>Keypoints>Single KP

KMOVE, *NPT*, *KC1*, *X1*, *Y1*, *Z1*, *KC2*, *X2*, *Y2*, *Z2*

Calculates and moves a keypoint to an intersection.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NPT

Move this keypoint. If *NPT* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NPT*.

KC1

First coordinate system number. Defaults to 0 (global Cartesian).

X1, Y1, Z1

Input one or two values defining the location of the keypoint in this coordinate system. Input "U" for unknown value(s) to be calculated and input "E" to use an existing coordinate value. Fields are R1, θ1, Z1 for cylindrical, or R1, θ1, φ1 for spherical.

KC2

Second coordinate system number.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X2, Y2, Z2

Input two or one value(s) defining the location of the keypoint in this coordinate system. Input "U" for unknown value(s) to be calculated and input "E" to use an existing coordinate value. Arguments are R2, θ2, Z2 for cylindrical, or R2, θ2, φ2 for spherical.

Notes

Calculates and moves a keypoint to an intersection location. The keypoint must have been previously defined (at an approximate location) or left undefined (in which case it is internally defined at the **SOURCE (p. 1824)** location). The actual location is calculated from the intersection of three surfaces (implied from three coordinate constants in two different coordinate systems). Note that solid modeling in a toroidal coordinate system is not recommended. See the **MOVE (p. 1158)** command for surface and intersection details. The three (of six) constants easiest to define should be used. The program will calculate the remaining three coordinate constants. All arguments, except *KC1*, must be input. Use the repeat command (***REPEAT (p. 1586)**) after the **KMOVE (p. 986)** command to move a series of keypoints, if desired.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Keypoints>To Intersect

---

KNODE, *NPT*, *NODE*

Defines a keypoint at an existing node location.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NPT

Arbitrary reference number for keypoint. If zero, the lowest available number is assigned (**NUMSTR (p. 1301)**).

NODE

Node number defining global X, Y, Z keypoint location. If *NODE* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NODE*.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Keypoints>On Node

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KPLOT, *NP1*, *NP2*, *NINC*, *Lab*

Displays the selected keypoints.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NP1*, *NP2*, *NINC

Display keypoints from *NP1* to *NP2* (defaults to *NP1*) in steps of *NINC* (defaults to 1). If *NP1* = ALL (default), *NP2* and *NINC* are ignored and all selected keypoints (**KSEL (p. 995)**) are displayed.

Lab

Determines what keypoints are plotted (one of the following):

(blank)

Plots all keypoints.

HPT

Plots only those keypoints that are hard points.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>Plot>Keypoints>Hardpoints

Utility Menu>Plot>Keypoints>Keypoints

Utility Menu>Plot>Specified Entities>Keypoints

KPSCALE, *NP1*, *NP2*, *NINC*, *RX*, *RY*, *RZ*, *KINC*, *NOELEM*, *IMOVE*

Generates a scaled set of (meshed) keypoints from a pattern of keypoints.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NP1*, *NP2*, *NINC

Set of keypoints (*NP1* to *NP2* in steps of *NINC*) that defines the pattern to be scaled. *NP2* defaults to *NP1*, *NINC* defaults to 1. If *NP1* = ALL, *NP2* and *NINC* are ignored and the pattern is defined by all selected keypoints. If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NP1* (*NP2* and *NINC* are ignored).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RX, RY, RZ

Scale factors to be applied to the X, Y, Z keypoint coordinates in the active coordinate system (RR, Rθ, RZ for cylindrical; RR, Rθ, RΦ for spherical). The Rθ and RΦ scale factors are interpreted as angular *offsets*. For example, if CSYS = 1, an *RX*, *RY*, *RZ* input of (1.5,10,3) would scale the specified keypoints 1.5 times in the radial and 3 times in the Z direction, while adding an offset of 10 degrees to the keypoints.) Zero, blank, or negative scale factor values are assumed to be 1.0. Zero or blank angular offsets have no effect.

KINC

Increment to be applied to the keypoint numbers for generated set. If zero, the lowest available keypoint numbers will be assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies whether nodes and elements are also to be generated:

0

Nodes and point elements associated with the original keypoints will be generated (scaled) if they exist.

1

Nodes and point elements will *not* be generated.

IMOVE

Specifies whether keypoints will be moved or newly defined:

0

Additional keypoints will be generated.

1

Original keypoints will be *moved* to new position (*KINC* and *NOELEM* are ignored). Use only if the old keypoints are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Generates a scaled set of keypoints (and corresponding mesh) from a pattern of keypoints. The MAT, TYPE, REAL, and ESYS attributes are based on the keypoints in the pattern and not the current settings. Scaling is done in the active coordinate system. Keypoints in the pattern could have been generated in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Scale>Keypoints

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KREFINE, *NP1*, *NP2*, *NINC*, *LEVEL*, *DEPTH*, *POST*, *RETAIN*

Refines the mesh around specified keypoints.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NP1, NP2, NINC

Keypoints (*NP1* to *NP2* in increments of *NINC*) around which the mesh is to be refined. *NP2* defaults to *NP1*, and *NINC* defaults to 1. If *NP1* = ALL, *NP2* and *NINC* are ignored and all selected keypoints are used for refinement. If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NP1* (*NP2* and *NINC* are ignored).

LEVEL

Amount of refinement to be done. Specify the value of *LEVEL* as an integer from 1 to 5, where a value of 1 provides minimal refinement, and a value of 5 provides maximum refinement (defaults to 1).

DEPTH

Depth of mesh refinement in terms of the number of elements outward from the indicated keypoints (defaults to 1).

POST

Type of postprocessing to be done after element splitting, in order to improve element quality:

OFF

No postprocessing will be done.

SMOOTH

Smoothing will be done. Node locations may change.

CLEAN

Smoothing and cleanup will be done. Existing elements may be deleted, and node locations may change (default).

RETAIN

Flag indicating whether quadrilateral elements must be retained in the refinement of an all-quadrilateral mesh. (Mechanical APDL ignores the *RETAIN* argument when you are refining anything other than a quadrilateral mesh.)

ON

The final mesh will be composed entirely of quadrilateral elements, regardless of the element quality (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

The final mesh may include some triangular elements in order to maintain element quality and provide transitioning.

Notes

KREFINE (p. 990) performs local mesh refinement around the specified keypoints. By default, the indicated elements are split to create new elements with 1/2 the edge length of the original elements (*LEVEL* = 1).

KREFINE (p. 990) refines all area elements and tetrahedral volume elements that are adjacent to the specified keypoints. Any volume elements that are adjacent to the specified keypoints, but are not tetrahedra (for example, hexahedra, wedges, and pyramids), are not refined.

You cannot use mesh refinement on a solid model that contains initial conditions at nodes (**IC (p. 921)**), coupled nodes (**CP (p. 421)** family of commands), constraint equations (**CE (p. 297)** family of commands), or boundary conditions or loads applied directly to any of its nodes or elements. This applies to nodes and elements anywhere in the model, not just in the region where you want to request mesh refinement. See Revising Your Model in the *Modeling and Meshing Guide* for additional restrictions on mesh refinement.

This command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Modify Mesh>Refine At>Keypoints

---

*KRON, *M1*, *M2*, *M3*

Computes the Kronecker product of two matrices/vectors, $M_3 = M_1 \otimes M_2$.

APDL (p. 19): Matrix Operations (p. 21)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

M1

Name of matrix (or vector) M_1. Must have been previously specified (***DMAT (p. 551)**, ***SMAT (p. 1801)**, ***VEC (p. 2085)**, etc.)

M2

Name of matrix (or vector) M_2. Must have been previously specified (***DMAT (p. 551)**, ***SMAT (p. 1801)**, ***VEC (p. 2085)**, etc.)

M3

Name (up to 32 characters) of resulting matrix (or vector) M_3. Must be specified (no default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Details of the operation are demonstrated in the example below:

$$\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \otimes \begin{bmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{bmatrix} = \begin{bmatrix} a_{11}\times b_{11} & a_{11}\times b_{12} & a_{12}\times b_{11} & a_{12}\times b_{12} \\ a_{11}\times b_{21} & a_{11}\times b_{22} & a_{12}\times b_{21} & a_{12}\times b_{22} \\ a_{21}\times b_{11} & a_{21}\times b_{12} & a_{22}\times b_{11} & a_{22}\times b_{12} \\ a_{21}\times b_{21} & a_{21}\times b_{22} & a_{22}\times b_{21} & a_{22}\times b_{22} \end{bmatrix}$$

Input matrices (or vectors) can be any of the supported types: integer, double precision real, or complex double precision.

Input matrices can be sparse or dense, and their dimensions do not have to be the same.

Output matrices are always dense, regardless of the input matrices type.

Since the ***KRON (p. 991)** command is manipulating dense matrices, it should only be used on small or medium-size matrices for performances reasons.

Menu Paths

This command cannot be accessed from a menu.

KRYOPT, *MAXDIM*, --, --, *RESTOL*, *OrthTol*

Specifies solution options for a Krylov method harmonic analysis.

SOLUTION (p. 38): Dynamic Options (p. 40)

Valid Products: (p. 2) Pro | Premium | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAXDIM

Maximum dimension of subspace. The default size is automatically determined by the program (ranges around 50).

--, --

Unused fields.

RESTOL

Tolerance used to verify the L-2 norm values of calculated residuals and issue a warning if *RESTOL* is exceeded throughout the entire frequency range. Default = 0.05.

OrthTol

Tolerance that controls the orthonormality check of the Krylov subspace vectors. Valid values range from 0 to 1. The default is 1E-8.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

The default values listed for each argument above are used.

Notes

This command is used to specify solution options for a harmonic analysis solved with the Krylov method (*Method* = KRYLOV on **HROPT (p. 912)**, see also Frequency-Sweep Harmonic Analysis via the Krylov Method in the *Structural Analysis Guide*).

Increasing subspace size (*MAXDIM*) improves solution accuracy with the trade-off of increased computational cost and additional memory requirements.

The *RESTOL* and *OrthTol* options do not affect the accuracy of the solution. They simply control the output of messages displayed regarding the accuracy of the final computed solution or orthonormality of the computed subspace.

The program computes the condition number of a matrix created based on the dot products of the Krylov subspace vectors with each other. When the condition number of this matrix is closer to 1, it means the subspace vectors are orthonormal. When it is closer to 0, that means the subspace vectors are not orthonormal. The *OrthTol* value is used in the following formula to determine the orthonormality of the computed Krylov subspace: $1-\frac{1}{\text{Condition Number}}<\text{OrthTol}$. When this condition is true, the Krylov subspace is determined to be sufficiently orthonormal, and vice versa.

Menu Paths

This command cannot be accessed from a menu.

KSCALE, *KINC*, *NP1*, *NP2*, *NINC*, *RX*, *RY*, *RZ*

Generates a scaled pattern of keypoints from a given keypoint pattern.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KINC

Do this scaling operation one time, incrementing all keypoints in the given pattern by *KINC*. If *KINC* = 0, keypoints will be redefined at the scaled locations.

NP1*, *NP2*, *NINC

Scale keypoints from pattern beginning with *NP1* to *NP2* (defaults to *NP1*) in steps of *NINC* (defaults to 1). If *NP1* = ALL, *NP2* and *NINC* are ignored and pattern is all selected keypoints (**KSEL (p. 995)**). If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NP1* (*NP2* and *NINC* are ignored).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RX, RY, RZ

Scale factor ratios. Scaling is relative to the origin of the active coordinate system (RR, Rθ, RZ for cylindrical, RR, Rθ, RΦ for spherical). If > 1.0, pattern is enlarged. If < 1.0, pattern is reduced. Ratios each default to 1.0.

Notes

Generates a scaled pattern of keypoints from a given keypoint pattern. Scaling is done in the active coordinate system (see analogous node scaling (**NSCALE (p. 1265)**)). Solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

This command cannot be accessed from a menu.

KSCON, *NPT*, *DELR*, *KCTIP*, *NTHET*, *RRAT*

Specifies a keypoint about which an area mesh will be skewed.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NPT

Keypoint number at concentration. If *NPT* = ALL, use all selected keypoints. If remaining fields are blank, remove concentration from this keypoint (if unmeshed). If *NPT* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NPT*.

DELR

Radius of first row of elements about keypoint.

KCTIP

Crack tip singularity key:

0

Do not skew midside nodes, if any, within the element.

1

Skew midside nodes of the first row of elements to the 1/4 point for crack tip singularity.

NTHET

Number of elements in circumferential direction (defaults to approximately one per 45° (or one per 30°, if *KCTIP* = 1)).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RRAT

Ratio of 2nd row element size to *DELR* (defaults to 0.75, or 0.5 if *KCTIP* = 1).

Notes

Defines a concentration keypoint about which an area mesh will be skewed. Useful for modeling stress concentrations and crack tips. During meshing, elements are initially generated circumferentially about, and radially away, from the keypoint. Lines attached to the keypoint are given appropriate divisions and spacing ratios. Only one concentration keypoint per unmeshed area is allowed. Use **KSCON (p. 994)**,STAT to list current status of concentration keypoints. The **KSCON (p. 994)** command does not support 3D modeling.

This command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Size Cntrls>Concentrat KPs>Create

Main Menu>Preprocessor>Meshing>Size Cntrls>Concentrat KPs>List

---

KSEL, *Type*, *Item*, *Comp*, *VMIN*, *VMAX*, *VINC*, *KABS*

Selects a subset of keypoints or hard points.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

ALL

Restore the full set.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NONE

Unselect the full set.

INVE

Invert the current set (selected becomes unselected and vice versa).

STAT

Display the current select status.

The following fields are used only with *Type* = S, R, A, or U:

Item

Label identifying data. Valid item labels are shown in the table below. Some items also require a component label. If *Item* = PICK (or simply "P"), graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). Defaults to KP.

Comp

Component of the item (if required). Valid component labels are shown in the table below.

VMIN

Minimum value of item range. Ranges are keypoint numbers, coordinate values, attribute numbers, etc., as appropriate for the item. A component name (as specified on the **CM (p. 356)** command) may also be substituted for *VMIN* (*VMAX* and *VINC* are ignored). If *Item* = MAT, TYPE, REAL, or ESYS and if *VMIN* is positive, the absolute value of *Item* is compared against the range for selection; if *VMIN* is negative, the signed value of *Item* is compared. See the **KLIST (p. 984)** command for a discussion of signed attributes.

VMAX

Maximum value of item range. *VMAX* defaults to *VMIN*.

VINC

Value increment within range. Used only with integer ranges (such as for keypoint numbers). Defaults to 1. *VINC* cannot be negative.

KABS

Absolute value key:

0

Check sign of value during selection.

1

Use absolute value during selection (sign ignored).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

All keypoints are selected.

Notes

Selects a subset of keypoints or hard points. For example, to select a new set of keypoints based on keypoint numbers 1 through 7, use **KSEL (p. 995)**,S,KP,,1,7. The selected subset is used when the ALL label is entered (or implied) on other commands, such as **KLIST (p. 984)**,ALL. Only data identified by keypoint number are selected. Data are flagged as selected and unselected; no data are actually deleted from the database.

This command is valid in any processor.

For selections based on non-integer numbers (coordinates, results, etc.), items that are within the range *VMIN* -*Toler* and *VMAX* + *Toler* are selected. The default tolerance *Toler* is based on the relative values of *VMIN* and *VMAX* as follows:

- If *VMIN* = *VMAX*, *Toler* = 0.005 x *VMIN*.
- If *VMIN* = *VMAX* = 0.0, *Toler* = 1.0E-6.
- If *VMAX* ≠ *VMIN*, *Toler* = 1.0E-8 x (*VMAX* - *VMIN*).

Use the **SELTOL (p. 1710)** (p. 1710) command to override this default and specify *Toler* explicitly.

Table 192: KSEL - Valid Item and Component Labels

Valid Item and Component Labels KSEL (p. 995), *Type, Item, Comp, VMIN, VMAX, VINC, KABS*

Item	Comp	Description
KP		Keypoint number.
EXT		Keypoint numbers on exterior of selected lines (ignore remaining fields).
HPT		Hard point number.
LOC	X,Y,Z	X, Y, or Z location in the active coordinate system.
MAT		Material number associated with the keypoint.
TYPE		Element type number associated with the keypoint.
REAL		Real constant set number associated with the keypoint.
ESYS		Element coordinate system associated with the keypoint.

Menu Paths

Utility Menu>Select>Entities

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KSLL, *Type*

Selects those keypoints contained in the selected lines.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of keypoint select:

S

Select a new set (default).

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Notes

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

KSLN, *Type*

Selects those keypoints associated with the selected nodes.

DATABASE (p. 13): Selecting (p. 14)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of keypoint select:

S

Select a new set (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

Notes

Valid only if the nodes were generated by a *meshing* operation (**KMESH (p. 985)**, **LMESH (p. 1057)**, **AMESH (p. 121)**, **VMESH (p. 2140)**) on a solid model that contains the associated keypoints.

This command is valid in any processor.

Menu Paths

Utility Menu>Select>Entities

KSUM

Calculates and prints geometry statistics of the selected keypoints.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Calculates and prints geometry statistics (centroid location, moments of inertia, etc.) associated with the selected keypoints. Geometry items are reported in the global Cartesian coordinate system. A unit density is assumed, irrespective of any material associations (**KATT (p. 969)**, **MAT (p. 1111)**). Items calculated by **KSUM (p. 999)** and later retrieved by a ***GET (p. 797)** or ***VGET (p. 2118)** command are valid only if the model is not modified after the **KSUM (p. 999)** command is issued.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Calc Geom Items>Of Keypoints

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KSYMM, *Ncomp*, *NP1*, *NP2*, *NINC*, *KINC*, *NOELEM*, *IMOVE*

Generates a reflected set of keypoints.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Ncomp

Symmetry key:

X

X (or R) symmetry (default).

Y

Y (or θ) symmetry.

Z

Z (or Φ) symmetry.

NP1*, *NP2*, *NINC

Reflect keypoints from pattern beginning with *NP1* to *NP2* (defaults to *NP1*) in steps of *NINC* (defaults to 1). If *NP1* = ALL, *NP2* and *NINC* are ignored and pattern is all selected keypoints (**KSEL (p. 995)**). If *Ncomp* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NP1* (*NP2* and *NINC* are ignored).

KINC

Keypoint increment between sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies whether nodes and elements are also to be generated:

0

Generate nodes and point elements associated with the original keypoints, if they exist.

1

Do not generate nodes and elements.

IMOVE

Specifies whether keypoints will be moved or newly defined:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Generate additional keypoints.

1

Move original keypoints to new position retaining the same keypoint numbers (*KINC* and *NOELEM* are ignored). Valid only if the old keypoints are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Generates a reflected set of keypoints (and corresponding mesh) from a given keypoint pattern by a symmetry reflection (see analogous node symmetry command, **NSYM (p. 1289)**). The MAT, TYPE, REAL, and ESYS attributes are based upon the keypoints in the pattern and not upon the current settings. Reflection is done in the active coordinate system by changing a particular coordinate sign. Keypoints in the pattern may have been generated in any coordinate system. However, solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Reflect>Keypoints

KTRAN, *KCNTO*, *NP1*, *NP2*, *NINC*, *KINC*, *NOELEM*, *IMOVE*

Transfers a pattern of keypoints to another coordinate system.

PREP7 (p. 22): Keypoints (p. 25)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCNTO

Reference number of coordinate system where the pattern is to be transferred. Transfer occurs from the active coordinate system.

NP1*, *NP2*, *NINC

Transfer keypoints from pattern beginning with *NP1* to *NP2* (defaults to *NP1*) in steps of *NINC* (defaults to 1). If *NP1* = ALL, *NP2* and *NINC* are ignored and pattern is all selected keypoints (**KSEL (p. 995)**). If *NP1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NP1* (*NP2* and *NINC* are ignored).

KINC

Keypoint increment between sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NOELEM

Specifies whether nodes and elements are also to be generated:

0

Generate nodes and point elements associated with the original keypoints, if they exist.

1

Do not generate nodes and elements.

IMOVE

Specifies whether keypoints will be moved or newly defined:

0

Generate additional keypoints.

1

Move original keypoints to new position retaining the same keypoint numbers (*KINC* and *NOELEM* are ignored). Valid only if the old keypoints are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Transfers a pattern of keypoints (and corresponding mesh) from one coordinate system to another (see analogous node transfer command, **TRANSFER (p. 2011)**). The MAT, TYPE, REAL, and ESYS attributes are based upon the keypoints in the pattern and not upon the current settings. Coordinate systems may be translated and rotated relative to each other. Initial pattern may be generated in any coordinate system. Coordinate values are interpreted in the active coordinate system and are transferred directly. Solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Transfer Coord>Keypoints

---

KUSE, *KEY*

Specifies whether or not to reuse factorized matrices.

SOLUTION (p. 38): Load Step Options (p. 43)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KEY

Reuse key:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0

Program decides whether or not to reuse the previous factorized matrices.

1

Force the previous factorized matrices to be reused. Used mainly in a restart. Forcing reuse of the matrices is a nonstandard use of the program and should be done with caution. For instance, using this option and changing the number of elements, or the number or type of degrees of freedom, may cause an abort.

-1

All element matrices are reformed and are used to reform new factorized matrices.

Command Default

Program makes decision.

Notes

Overrides the program logic to determine whether or not to reuse the previous factorized matrices for each substep of this load step. Applies only to static or full transient analyses. For more details see Other General Options in the *Basic Analysis Guide*.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Load Step Opts>Other>Reuse Factorized Matrix

Main Menu>Solution>Load Step Opts>Other>Reuse Factorized Matrix

---

KWPAVE, *P1*, *P2*, *P3*, *P4*, *P5*, *P6*, *P7*, *P8*, *P9*

Moves the working plane origin to the average location of keypoints.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

P1, P2, P3, . . . , P9

Keypoints used in calculation of the average. At least one must be defined. If *P1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Notes

Moves the origin of the working plane to the average of the specified keypoints. Averaging is based on the active coordinate system.

This command is valid in any processor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Utility Menu>WorkPlane>Offset WP to>Keypoints

KWPLAN, *WN*, *KORIG*, *KXAX*, *KPLAN*

Defines the working plane using three keypoints.

DATABASE (p. 13): Working Plane (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number whose viewing direction will be modified to be normal to the working plane (defaults to 1). If *WN* is a negative value, the viewing direction will not be modified. If fewer than three points are used, the viewing direction of window *WN* will be used instead to define the normal to the working plane.

KORIG

Keypoint number defining the origin of the working plane coordinate system. If *KORIG* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

KXAX

Keypoint number defining the x-axis orientation (defaults to the x-axis being parallel to the global X-axis; or if the normal to the working plane is parallel to the global X-axis, then defaults to being parallel to the global Y-axis).

KPLAN

Keypoint number defining the working plane (the normal defaults to the present display view (**/VIEW (p. 2131)**) of window *WN*).

Notes

Defines a working plane to assist in picking operations using three keypoints as an alternate to the **WPLANE (p. 2180)** command. The three keypoints also define the working plane coordinate system. A minimum of one keypoint (at the working plane origin) is required. Immediate mode may also be active. See **WPSTYL (p. 2182)** command to set the style of working plane display.

This command is valid in any processor.

Menu Paths

Utility Menu>WorkPlane>Align WP with>Keypoints

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

L Commands

L, *P1*, *P2*, *NDIV*, *SPACE*, *XV1*, *YV1*, *ZV1*, *XV2*, *YV2*, *ZV2*

Defines a line between two keypoints.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

P1

Keypoint at the beginning of line. If *P1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

P2

Keypoint at the end of line.

NDIV

Number of element divisions within this line. Normally this field is not used; specifying divisions with **LESIZE (p. 1041)**, etc. is recommended.

SPACE

Spacing ratio. Normally this field is not used, as specifying spacing ratios with the **LESIZE (p. 1041)** command is recommended. If positive, *SPACE* is the nominal ratio of the last division size (at *P2*) to the first division size (at *P1*). If the ratio is greater than 1, the division sizes increase from *P1* to *P2*, and if less than 1, they decrease. If *SPACE* is negative, then |*SPACE*| is the nominal ratio of the center division size to those at the ends.

The following fields are used only if specified end slopes on the line are desired, otherwise zero curvature end slopes will be automatically calculated to produce a line which is "straight" in the active coordinate system. To specify end slopes, use the following fields to define a "slope vector" (one for each end of the line, if desired) that has its tail at the origin and its head at the point *XV*, *YV*, *ZV* in the active coordinate system (**CSYS (p. 441)**). The corresponding end slope of the line will then be parallel to this "slope vector."

XV1, YV1, ZV1

Location (in the active coordinate system) of the head of the "slope vector" corresponding to the slope at the *P1* end of the line. The tail of the vector is at the origin of the coordinate system.

XV2, YV2, ZV2

Location of the head of the "slope vector" corresponding to the slope at the *P2* end of the line.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Defines a line between two keypoints from *P1* to *P2*. The line shape may be generated as "straight" (in the active coordinate system) or curved. The line shape is invariant with coordinate system after it is generated. Note that solid modeling in a toroidal coordinate system is not recommended. A curved line is limited to 180°. Lines may be redefined only if not yet attached to an area.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Lines>Lines>In Active Coord

---

L2ANG, *NL1*, *NL2*, *ANG1*, *ANG2*, *PHIT1*, *PHIT2*

Generates a line at an angle with two existing lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Number of the first line to be hit (touched by the end of the new line). If negative, assume *P1* (see below) is the second keypoint of the line instead of the first. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NL2

Number of the second line to be hit. If negative, assume *P3* is the second keypoint of the line instead of the first.

ANG1

Angle of intersection (usually zero or 180) of generated line with tangent to first line.

ANG2

Angle of intersection (usually zero or 180) of generated line with tangent to second line.

PHIT1

Number to be assigned to keypoint generated at hit location on first line (defaults to lowest available keypoint number (**NUMSTR (p. 1301)**)).

PHIT2

Number to be assigned to keypoint generated at hit location on second line (defaults to lowest available keypoint number (**NUMSTR (p. 1301)**)).

Notes

Generates a straight line (*PHIT1-PHIT2*) at an angle (*ANG1*) with an existing line *NL1* (*P1-P2*) and which is also at an angle (*ANG2*) with another existing line *NL2* (*P3-P4*). If the angles are zero the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

generated line is tangent to the two lines. The *PHIT1* and *PHIT2* locations on the lines are automatically calculated. Line *P1-P2* becomes *P1-PHIT1*, *P3-P4* becomes *P3-PHIT2*, and new lines *PHIT1-P2*, *PHIT2-P4*, and *PHIT1-PHIT2* are generated. Line divisions are set to zero (use **LESIZE (p. 1041)**, etc. to modify).

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Lines>Lines>Angle to 2 Lines

Main Menu>Preprocessor>Modeling>Create>Lines>Lines>Norm to 2 Lines

---

L2TAN, *NL1*, *NL2*

Generates a line tangent to two lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Number of the first line generated line is tangent to. If negative, assume *P1* (see below) is the second keypoint of the line instead of the first. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NL2

Number of the second line generated line is tangent to. If negative, assume *P3* is the second keypoint of the line instead of the first.

Notes

Generates a line (*P2-P3*) tangent at point *P2* to line *NL1* (*P1-P2*) and tangent at point *P3* to line *NL2* (*P3-P4*).

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Lines>Lines>Tan to 2 Lines

---

LANBOPTION, *StrmCk*, *--*, *AltMeth*, *Memory_Option*

Specifies Block Lanczos eigensolver options.

SOLUTION (p. 38): Analysis Options (p. 38)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

StrmCk

Controls whether the Block Lanczos eigensolver will perform a Sturm sequence check:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

Do not perform the Sturm sequence check (default).

ON

Perform a Sturm sequence check. This requires additional matrix factorization (which can be expensive), but does help ensure that no modes are missed in the specified range.

--

Unused field.

AltMeth

ALT1

Alternative version of the Block Lanczos eigensolver for more difficult modal or buckling problems. This version of Block Lanczos only runs in shared-memory parallel (SMP) mode. If the analysis is run in distributed-memory parallel (DMP) mode, it will switch to SMP mode when this Alternative Block Lanczos solver is invoked, and resume in DMP mode after the eigensolution.

Memory_Option

Memory allocation option:

DEFAULT

Default memory configuration (default). Everything is determined dynamically with respect to current machine resources.

INCORE

Fully in-core memory configuration.

MIX1

First level of mixed in-core / out-of-core configuration.

MIX2

Second level of mixed in-core / out-of-core configuration.

OUTOFCORE

Fully out-of-core memory configuration.

Command Default

The Sturm sequence check is off for the Block Lanczos eigensolver when it is used in a modal analysis, and on when it is used in a buckling analysis.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The default memory allocation strategy is used. Mechanical APDL evaluates the resources of the machine to choose the in-core or out-of-core mode.

Notes

LANBOPTION (p. 1007) specifies options to be used with the Block Lanczos eigensolver during an eigenvalue buckling analysis (**BUCOPT (p. 280)**,LANB) or a modal analysis (**MODOPT (p. 1140)**,LANB).

For more difficult eigenproblems, *AltMeth* = ALT1 could achieve better converged eigensolutions at the cost of more computing time. This ALT1 option is useful for double-checking solution accuracy. It should be used for difficult eigenproblems like those with many duplicated eigenmodes, or eigenbuckling problems with very thin beam/shell structures.

Memory Allocation Option

The Block Lanczos eigensolver algorithm allocates two main pools of memory:

1. Memory for the internal sparse solver iterations.
2. Memory for the specific Lanczos working arrays.

The following table shows how memory is allocated for each option.

Memory_Option	Sparse Solver	Working Arrays
INCORE	In-Core	In-Core
MIX1	In-Core	Out-of-Core
MIX2	Out-of-Core	In-Core
OUTOFCORE	Out-of-Core	Out-of-Core

The MIX1 configuration typically uses more memory than the MIX2 configuration, except when a large number of modes are requested for a small model.

Menu Paths

This command cannot be accessed from a menu.

LANG, *NL1*, *P3*, *ANG*, *PHIT*, *LOCAT*

Generates a straight line at an angle with a line.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Number of the line to be hit (touched by the end of the new line). If negative, assume *P1* (see below) is the second keypoint of the line instead of the first. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

P3

Keypoint at which generated line must end.

ANG

Angle of intersection of generated line *PHIT-P3* with tangent to line *P1-P2* at *PHIT*. If 0 (default), the generated line is tangent to *NL1* toward end P1; if 90, the generated line is perpendicular to *NL1*. If 180, the generated line is tangent to NL1 toward end P2. *ANG* can be any value, but is adjusted to the corresponding acute angle with respect to *LOCAT*. See "Notes" (p. 1010) for a discussion of accuracy.

PHIT

Number to be assigned to keypoint generated at hit location (defaults to lowest available keypoint number (**NUMSTR (p. 1301)**)).

LOCAT

Approximate location of *PHIT* in terms of the ratio of the distance along the line (*NL1*) to the length of the line. *LOCAT* can range from 0 to 1. If *LOCAT* is blank, the point will be located with less speed and accuracy, and an arbitrary location may result.

Notes

Generates a straight line (*PHIT-P3*) at an angle (*ANG*) with a line *NL1* (*P1-P2*). The location of *PHIT* on the line is automatically calculated. Line *P1-P2* becomes *P1-PHIT* and new lines *PHIT-P2* and *PHIT-P3* are generated. Line divisions are set to zero (use **LESIZE (p. 1041)**, etc. to modify).

PHIT is positioned closest to *LOCAT* for the given angle, *ANG*. To ensure better performance, it is recommended that *LOCAT* be input, even if it is 0.

The program uses an iterative procedure to position *PHIT*. The procedure is not exact, with the result that the actual value of *ANG* will sometimes differ slightly from the specified value.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Lines>Lines>At angle to line

Main Menu>Preprocessor>Modeling>Create>Lines>Lines>Normal to Line

---

LARC, *P1*, *P2*, *PC*, *RAD*

Defines a circular arc.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

P1

Keypoint at one end of circular arc line. If *P1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

P2

Keypoint at other end of circular arc line.

PC

Keypoint defining plane of arc and center of curvature side (with positive radius). Must not lie along the straight line from *P1* to *P2*. *PC* need not be at the center of curvature.

RAD

Radius of curvature of the arc. If negative, assume center of curvature side is opposite to that defined by *PC*. If *RAD* is blank, *RAD* will be calculated from a curve fit through *P1*, *PC*, and *P2*.

Notes

Defines a circular arc line from *P1* to *P2*. The line shape is generated as circular, regardless of the active coordinate system. The line shape is invariant with coordinate system after it is generated.

When dealing with a large radius arc (1e3), or if the location of the arc you create is far away from the origin of your coordinate system, anomalies may occur. You can prevent this by creating the arc at a smaller scale, and then scaling the model back to full size (**LSSCALE (p. 1084)**).

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Lines>Arcs>By End KPs & Rad

Main Menu>Preprocessor>Modeling>Create>Lines>Arcs>Through 3 KPs

---

/**LARC**, *XCENTR*, *YCENTR*, *XLRAD*, *ANGLE1*, *ANGLE2*

Creates annotation arcs (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

XCENTR

Arc X center location (-1.0 < X < 1.0).

YCENTR

Arc Y center location (-1.0 < Y < 1.0).

XLRAD

Arc radius length.

ANGLE1

Starting angle of arc.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ANGLE2

Ending angle of arc. The arc is drawn counterclockwise from the starting angle, *ANGLE1*, to the ending angle, *ANGLE2*.

Notes

This command defines annotation arcs to be written directly onto the display at a specified location.

The command is generated by the Graphical User Interface (GUI) and will appear in the log file (`Jobname.log`) if annotation is used. It is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with the **/INPUT (p. 948)** command).

All arcs are shown on subsequent displays unless the annotation is turned off or deleted. Issueu **/LSPEC (p. 1081)** to set the attributes of the arc.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

LAREA, *P1*, *P2*, *NAREA*

Generates the shortest line between two keypoints on an area.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

P1

First keypoint of line to be generated. If *P1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

P2

Second keypoint of line to be generated.

NAREA

Area containing *P1* and *P2*, or area to which generated line is to be parallel.

Notes

Generates the shortest line between two keypoints, *P1* and *P2*, both of which lie on an area. The generated line will also lie on the area. *P1* and *P2* may also be equidistant (in global Cartesian space) from the area (and on the same side of the area), in which case a line parallel to the area is generated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Lines>Lines>Overlaid on Area

---

LARGE, *IR*, *IA*, *IB*, *IC*, *Name*, - -, - -, *FACTA*, *FACTB*, *FACTC*

Finds the largest (the envelope) of three variables.

POST26 (p. 58): Operations (p. 59)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IR

Arbitrary reference number assigned to the resulting variable (2 to *NV* (**NUMVAR (p. 1302)**)). If this number is the same as for a previously defined variable, the previously defined variable will be overwritten with this result.

IA, IB, IC

Reference numbers of the three variables to be operated on. If only two, leave *IC* blank. If only one, leave *IB* blank also.

Name

Thirty-two character name for identifying the variable on the printout and displays. Embedded blanks are compressed upon output.

--, --

Unused fields.

FACTA, FACTB, FACTC

Scaling factors (positive or negative) applied to the corresponding variables (default to 1.0).

Notes

Creates a new variable by finding the largest of up to three variables according to the operation:

IR = Largest of (*FACTA* x *IA*, *FACTB* x *IB*, *FACTC* x *IC*)

The comparison is done at each time location, so that the new variable is the "envelope" of the three existing variables.

Menu Paths

Main Menu>TimeHist Postpro>Math Operations>Find Maximum

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LATT, *MAT*, *REAL*, *TYPE*, *- -*, *KB*, *KE*, *SECNUM*

Associates element attributes with the selected, unmeshed lines.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

MAT, REAL, TYPE

Material number, real constant set number, and type number to be associated with selected, unmeshed lines.

- -

Unused field.

KB, KE

Beginning and ending orientation keypoints to be associated with selected, unmeshed lines. Mechanical APDL uses the location of these keypoints to determine how to orient beam cross sections during beam meshing. Beam elements may be created along a line with a constant orientation by specifying only one orientation keypoint (*KB*), or a pre-twisted beam may be created by selecting different orientation keypoints at each end of the line (*KB* and *KE*). (For a line bounded by two keypoints (*KP1* and *KP2*), the orientation vector at the beginning of the line extends from *KP1* to *KB*, and the orientation vector at the end of the line extends from *KP2* to *KE*. The orientation vectors are used to compute the orientation nodes of the elements.)

SECNUM

Section identifier to be associated with selected, unmeshed lines. For details, see the description of the **SECTYPE (p. 1697)** and **SECNUM (p. 1685)** commands.

Notes

The element attributes specified by the **LATT (p. 1014)** command will be used when the lines are meshed.

Lines subsequently generated from the lines will also have the attributes specified by *MAT*, *REAL*, *TYPE*, and *SECNUM*. If a line does not have these attributes associated with it (by this command) at the time it is meshed, the attributes are obtained from the then current **MAT (p. 1111)**, **REAL (p. 1579)**, **TYPE (p. 2036)**, and **SECNUM (p. 1685)** command settings.

In contrast, the values specified by *KB* and *KE* apply only to the selected lines; that is, lines subsequently generated from these lines will not share these attributes. Similarly, if a line does not have *KB* and *KE* attributes associated with it via the **LATT (p. 1014)** command at the time it is meshed, Mechanical APDL cannot obtain the attributes from elsewhere. See the discussion on beam meshing in Meshing Your Solid Model in the *Modeling and Meshing Guide* for more information.

Reissue the **LATT (p. 1014)** command (before lines are meshed) to change the attributes. A zero (or blank) argument removes the corresponding association. If any of the arguments are defined as -1, then that value will be left unchanged in the selected set.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In some cases, Mechanical APDL can proceed with a line meshing operation even when no logical element type has been assigned via **LATT (p. 1014)**,,,*TYPE* or **TYPE (p. 2036)**. See Meshing Your Solid Model in the *Modeling and Meshing Guide* for more information about setting element attributes.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh Attributes>All Lines

Main Menu>Preprocessor>Meshing>Mesh Attributes>Picked Lines

LAYER, *NUM*

Specifies the element layer for which data are to be processed.

POST1 (p. 51): Controls (p. 51)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NUM

Layer-processing mode:

N

The layer number to process. The default value is 0.

FCMAX

Processes the layer with the largest failure criteria.

Command Default

The default is *N* = 0, meaning that the entire element is considered to be the default "layer." Accordingly, the results data are from the bottom of the bottom layer and the top of the top layer.

Notes

Specifies the element layer for which results data are to be listed, plotted, or otherwise processed.

Applies to stress and strain data for layered elements SHELL181, SHELL281, ELBOW290, SOLID185, SOLID186, SOLSH190, SHELL208, SHELL209, REINF264, and REINF265; heat flux and heat gradient for SHELL131 and SHELL132.

For reinforcing elements, *N* is a given reinforcing member (individual reinforcing). Specifying *N* = 0 (default) or *N* = 1 selects the first reinforcing member.

The **SHELL (p. 1784)** command can then be used (with shell elements) to specify a location (TOP, MID, BOT) within the layer for output. (The **SHELL (p. 1784)** command does not apply to thermal shell elements SHELL131 and SHELL132.) Transverse shear stresses for MID are linearly averaged from TOP and BOT, and do not reflect a parabolic distribution. Setting KEYOPT(8) = 2 for SHELL181, SHELL281, SHELL208, SHELL209, and ELBOW290 writes the mid-surface values directly to the results file and yields more accurate values than linear averaging.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Because energy is a per-element quantity, you cannot use this command for energy output.

When using the **LAYER (p. 1015)** command with SHELL181, SOLID185, SOLID186, SOLSH190, SHELL208, SHELL209, SHELL281, and ELBOW290, KEYOPT(8) must be set to 1 (or 2 for SHELL181, SHELL281, ELBOW290, SHELL208, and SHELL209) in order to store results for all layers.

When *NUM* = FCMAX, you must provide the failure criterion input. If specifying input via the **FC (p. 732)** command, all structural elements are processed. For more information, see the documentation for the **FC (p. 732)** command.

Use this command with **RSYS (p. 1639)**,LSYS to display results in the layer coordinate system for a particular layer.

Menu Paths

Main Menu>General Postproc>Options for Outp

Utility Menu>List>Results>Options

LAYERP26, *NUM*

Specifies the element layer for which data are to be stored.

POST26 (p. 58): Controls (p. 59)

Valid Products: (p. 2) Pro | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NUM

Layer-processing mode:

N

The layer number to process. The default value is 1.

Command Default

The default is *N* = 1, meaning that results data are from the "first" layer. If KEYOPT(8) = 0, "first" layer actually means the bottom of the bottom layer and the top of the top layer.

Notes

Defines the element layer for which results data are to be stored for postprocessing. Applies to stress and strain data for layered elements SHELL181, SOLID185, SOLID186, SOLSH190, SHELL208, SHELL209, SHELL281, REINF265, and ELBOW290.

The **SHELL (p. 1784)** command can be used (for shell elements) to specify a location (TOP, MID, BOT) within the layer for selection on the **ESOL (p. 672)** command. Transverse shear stresses for MID are linearly averaged from TOP and BOT, and do not reflect a parabolic distribution. Setting KEYOPT(8) = 2 for SHELL181, SHELL208, SHELL209, SHELL281, and ELBOW290 writes the mid-surface values directly to the results file and yields more accurate values than linear averaging.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

That this command cannot be used for energy output, as energy is a per-element quantity.

When using the **LAYERP26 (p. 1016)** command with SHELL181, SOLID185, SOLID186, SOLSH190, SHELL208, or SHELL209, KEYOPT(8) must be set to 1 (or 2 for SHELL181, SHELL208, SHELL209, SHELL281, and ELBOW290) in order to store results for all layers.

In POST26, the **ESOL (p. 672)** data stored is based on the active **LAYERP26 (p. 1016)** specification at the time the data is stored. To store data at various specifications (for example, layers 2 and 5), issue a **STORE (p. 1867)** command before each new specification.

Menu Paths

Main Menu>TimeHist Postpro>Define Variables

Main Menu>TimeHist Postpro>Elec&Mag>Circuit>Define Variables

LAYLIST, *IEL*, *LAYR1*, *LAYR2*, *Mplab1*, *Mplab2*

Lists real constants material properties for layered elements.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IEL

Element number to be listed. If ALL, list all selected elements (**ESEL (p. 661)**) of the appropriate type. If blank and the current element type is a layered element type, list data from the current real constant table in the layered format.

LAYR1, LAYR2

Range of layer numbers to be listed. If *LAYR1* is greater than *LAYR2*, a reverse order list is produced. *LAYR1* defaults to 1. *LAYR2* defaults to *LAYR1* if *LAYR1* is input or to the number of layers if *LAYR1* is not input.

Mplab1, Mplab2

Material property labels (for example, EX) to be listed along with the layer real constants.

Notes

Lists real constants and any two material properties for layered shell and solid elements.

If matrix input is selected (KEYOPT(2) = 2 or 3), *LAYR1*, *LAYR2*, *Mplab1*, and *Mplab2* are not used.

This command is valid in any processor.

Menu Paths

Utility Menu>List>Elements>Layered Elements

Utility Menu>List>Properties>Layer Data

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LAYPLOT, *IEL*, *LAYR1*, *LAYR2*

Displays the layer stacking sequence for layered elements.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

IEL

Element number for the display. If blank and the current element type is a layered element type, display data from the current real constant table.

LAYR1, LAYR2

Range of layer numbers to be displayed. If *LAYR1* is greater than *LAYR2*, a reversed order display is produced. Up to 20 layers may be displayed at a time. *LAYR1* defaults to 1. *LAYR2* defaults to *LAYR1* if *LAYR1* is input or to the number of layers (or to 19+*LAYR1*, if smaller) if *LAYR1* is not input.

Notes

Displays the layer-stacking sequence as defined in the real constant table for layered shell and solid elements in a form where the layers are visible (like a sheared deck of cards).

The element x-axis is shown as 0.0 degrees.

Layers are cross-hatched and color-coded for clarity. The hatch lines indicate the layer angle (real constant THETA) and the color coding is for material identification (real constant MAT).

The actual orientation of a specific layer in three-dimensional space can be seen using **/PSYMB (p. 1552)**,LAYR. To use **/PSYMB (p. 1552)**,LAYR with smeared reinforcing elements (REINF265), first set the vector-mode graphics option (**/DEVICE (p. 523)**,VECTOR,1).

Layer thickness can be displayed using the **/ESHAPE (p. 665)** and **EPLOT (p. 648)** commands.

This command is valid in any processor.

Menu Paths

Utility Menu>Plot>Layered Elements

LCABS, *LCN0*, *KABS*

Specifies absolute values for load case operations.

POST1 (p. 51): Load Case Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LCN0

Load case pointer number. If ALL, apply to all selected load cases (**LCSEL (p. 1029)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KABS

Absolute value key:

0

Use algebraic values of load case *LCNO* in operations.

1

Use absolute values of load case *LCNO* in operations.

Command Default

Use algebraic values.

Notes

Causes absolute values to be used in the load case operations (**LCASE (p. 1019)** or **LCOPER (p. 1026)**). Absolute values are taken prior to assigning a load case factor (**LCFACT (p. 1022)**) and are applied only to defined load cases (**LCDEF (p. 1021)**).

When **LCABS (p. 1018)** operates on nodal-averaged results, it may yield different numerical values compared to the same data stored as element results. For more information, see Nodal-Averaged Results in the *Element Reference*.

Menu Paths

Main Menu>General Postproc>Load Case>Calc Options>Absolut Value

---

LCASE, *LCNO*

Reads a load case into the database.

POST1 (p. 51): Load Case Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LCNO

Load case pointer number (**LCDEF (p. 1021)**,STAT). Defaults to 1.

Command Default

Load case 1.

Notes

Reads a load case into the database. Load cases are created as described on the **LCDEF (p. 1021)** or **LCWRITE (p. 1031)** commands. The results portion of the database and the applied forces and displace-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ments are cleared before reading the data in. Absolute values (**LCABS (p. 1018)**) and scale factors (**LCFACT (p. 1022)**) can be applied during the read operation.

For details on using load case combination, see Creating and Combining Load Cases in the *Basic Analysis Guide*.

Menu Paths

Main Menu>General Postproc>Load Case>Read Load Case

LCCALC

Specifies "Load case settings" as the subsequent status topic.

POST1 (p. 51): Status (p. 58)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.log`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

This command is also valid for rezoning.

Menu Paths

Utility Menu>List>Status>General Postproc>Load Case Calcs

LCCAT, *NL1*, *NL2*

Concatenates multiple lines into one line for mapped meshing.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1*, *NL2

Lines to be concatenated. If *NL1* = ALL, *NL2* is ignored and all selected lines (**LSEL (p. 1074)**) are concatenated. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* is ignored).

Notes

Concatenates multiple, adjacent lines (the input lines) into one line (the output line) in preparation for mapped meshing. An area that contains too many lines for mapped meshing can still be mapped

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

meshed if some of the lines in that area are first concatenated (see Meshing Your Solid Model in the *Modeling and Meshing Guide* for details on mapped meshing restrictions).

LCCAT (p. 1020) is meant to be used solely for meshing and cannot be used for any other purposes. Specifically, (a) the output line and any areas that have the output line on their line list (**ALIST (p. 113)**) cannot be used as input to any other solid modeling operation (not even another **LCCAT (p. 1020)** command); and (b) the output line cannot accept solid model boundary conditions (**DL (p. 545)**, **SFL (p. 1774)**).

The output line will take on the element divisions of the input lines and will not accept element divisions that are directly assigned (**LESIZE (p. 1041)**). The output line from the **LCCAT (p. 1020)** operation will be coincident with the input lines and the input lines will be retained. Consider the **LCOMB (p. 1025)** command instead of **LCCAT (p. 1020)** if you wish to delete the input lines and if the lines to be combined have similar slopes at the common keypoint(s). When an **LCCAT (p. 1020)** command is issued, area line lists (**ALIST (p. 113)**) that contain *all* of the input lines will be updated so that the area line lists refer to the output line instead of the input lines. Deletion of the output line (**LDELE (p. 1033)**) effectively reverses the **LCCAT (p. 1020)** operation and restores area line lists to their original condition.

You can use the **LSEL (p. 1074)** command to select lines that were created by concatenation, and then follow it with an **LDELE (p. 1033)**,ALL command to delete them. Also see Meshing Your Solid Model in the *Modeling and Meshing Guide* for a discussion on how to easily select and delete concatenated lines in one step.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh>Areas>Mapped>Concatenate>Lines

---

LCDEF, *LCNO*, *LSTEP*, *SBSTEP*, *KIMG*

Creates a load case from a set of results on a results file.

POST1 (p. 51): Load Case Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LCNO

Arbitrary pointer number (1-99) to be assigned to the load case specified by *LSTEP*, *SBSTEP* and by the **FILE (p. 752)** command. Defaults to 1 + previous value.

LSTEP

Load step number to be defined as the load case. Defaults to one.

SBSTEP

Substep number. Defaults to the last substep of the load step.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KIMG

Used only with results from complex analyses:

0

Use real part of complex solution

1

Use imaginary part.

Notes

Creates a load case by establishing a pointer to a set of results on a results file (written during the analysis solution phase). This pointer (*LCNO*) can then be used on the **LCASE (p. 1019)** or **LCOPER (p. 1026)** commands to read the load case data into the database.

Issue **LCDEF (p. 1021)**,ERASE to delete *all* load case pointers (and *all* load case files, if any). Issue **LCDEF (p. 1021)**,*LCNO*,ERASE to delete only the specific load case pointer *LCNO* (and its file, if any). With the ERASE options, all pointers are deleted; however only files with the default extension (**LCWRITE (p. 1031)**) are deleted. Issue **LCDEF (p. 1021)**,STAT for status of all selected load cases (**LCSEL (p. 1029)**), or **LCDEF (p. 1021)**,STAT,ALL for status of all load cases. The **STAT (p. 1861)** command may be used to list all load cases. See also **LCFILE (p. 1023)** to establish a pointer to a set of results on a load case file (written by **LCWRITE (p. 1031)**). Harmonic element data read from a result file load case is stored at the zero-degree position.

For details on using load case combination, see Creating and Combining Load Cases in the *Basic Analysis Guide*.

Menu Paths

Main Menu>General Postproc>Load Case>Create Load Case

Main Menu>General Postproc>Load Case>Erase Load Case

Main Menu>General Postproc>Load Case>List Load Cases

LCFACT, *LCNO*, *FACT*

Defines scale factors for load case operations.

POST1 (p. 51): Load Case Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LCNO

Load case pointer number. If ALL, apply to all selected load cases (**LCSEL (p. 1029)**).

FACT

Scale factor applied to load case *LCNO*. Blank defaults to 1.0.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

All factors are 1.0.

Notes

Defines scale factors to be used in the load case operations (**LCASE (p. 1019)** or **LCOPER (p. 1026)**). Scale factors are applied after an absolute value operation (**LCABS (p. 1018)**) and are applied only to defined load cases (**LCDEF (p. 1021)**).

For details on using load case combination, see Creating and Combining Load Cases in the *Basic Analysis Guide*.

Menu Paths

Main Menu>General Postproc>Load Case>Calc Options>Scale Factor

---

LCFILE, *LCNO*, *Fname*, *Ext*, --

Creates a load case from an existing load case file.

POST1 (p. 51): Load Case Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LCNO

Arbitrary (1-99) pointer number assigned to this load case.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to the *LCNO* value preceded by an" L" (for values 10–99) or by an" L0" (for values 1–9).

--

Unused field.

Notes

Creates a load case by establishing a pointer to an existing load case file (**LCWRITE (p. 1031)**). This pointer (*LCNO*) can then be used on the **LCASE (p. 1019)** or **LCOPER (p. 1026)** commands to read the load

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

case data into the database. This command is typically used to reestablish load case pointers in a new Mechanical APDL session (pointers are not saved on the database file), or when more than one pointer to a single load case is desired. See the **LCDEF (p. 1021)** command for status and erase operations. See also **LCDEF (p. 1021)** to establish a pointer to a set of results on a results file (written during the analysis solution phase).

For details on using load case combination, see Creating and Combining Load Cases in the *Basic Analysis Guide*.

Menu Paths

Main Menu>General Postproc>Load Case>Create Load Case

LCLEAR, *NL1*, *NL2*, *NINC*

Deletes nodes and line elements associated with selected lines.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1*, *NL2*, *NINC

Delete mesh for lines *NL1* to *NL2* (defaults to *NL1*) in steps of *NINC* (defaults to 1). If *NL1* = ALL, *NL2* and *NINC* are ignored and the mesh for all selected lines (**LSEL (p. 1074)**) is deleted. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* and *NINC* are ignored).

Notes

Deletes *all* nodes and line elements associated with selected lines (regardless of whether the nodes or elements are selected). Nodes shared by adjacent meshed lines and nodes associated with non-line elements will not be deleted. Attributes assigned as a result of **LATT (p. 1014)** are maintained. In the program's response to the command, if a line or keypoint is tallied as "cleared," it means either its node or element reference was deleted.

Menu Paths

Main Menu>Preprocessor>Meshing>Clear>Lines

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LCOMB, *NL1*, *NL2*, *KEEP*

Combines adjacent lines into one line.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Number of the first line to be combined. If *NL1* = ALL, *NL2* is ignored and all selected lines (**LSEL (p. 1074)**) are combined. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* is ignored).

NL2

Number of the second line to be combined.

KEEP

Specifies whether to keep the input entities:

0

Delete lines *NL1* and *NL2* and their common keypoint. Keypoints will not be deleted if they are meshed or if they are attached to other lines. Lines will not be deleted if they are attached to different areas.

1

Keep *NL1*, *NL2*, and their common keypoint. (The common keypoint will *not* be attached to the output line.)

Notes

Combines adjacent lines into one line (the output line). This operation will effectively "undo" the **LDIV (p. 1034)** operation. Line divisions are set to zero (use **LESIZE (p. 1041)**, etc. to modify). Lines attached to the same area(s) can also be combined. See also the **LCCAT (p. 1020)** command for line concatenation capability.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Add>Lines

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LCOPER, *Oper*, *LCASE1*, *Oper2*, *LCASE2*, *SweepANG*

Performs load case operations.

POST1 (p. 51): Load Case Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Oper

Valid operations are:

ZERO

Zero results portion of database (*LCASE1* ignored).

SQUA

Square database values (*LCASE1* ignored).

SQRT

Square root of database (absolute) values (*LCASE1* ignored).

LPRIN

Recalculate line element principal stresses (*LCASE1* ignored). Stresses are as shown for the NMISC items of the **ETABLE (p. 687)** command for the specific line element type.

ADD

Add *LCASE1* to database values.

SUB

Subtract *LCASE1* from database values.

SRSS

Square root of the sum of the squares of database and *LCASE1*.

MIN

Compare and save in database the algebraic minimum of database and *LCASE1*.

MAX

Compare and save in database the algebraic maximum of database and *LCASE1*.

ABMN

Compare and save in database the absolute minimum of database and *LCASE1* (based on magnitudes, then apply the corresponding sign).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ABMX

Compare and save in database the absolute maximum of database and *LCASE1* (based on magnitudes, then apply the corresponding sign).

LCASE1

First load case in the operation (if any). See *LCNO* of the **LCDEF (p. 1021)** command. If ALL, repeat operations using all selected load cases (**LCSEL (p. 1029)**).

Oper2

Valid operations are:

MULT

Multiplication: *LCASE1***LCASE2*

CPXMAX

This option does a phase angle sweep to calculate the maximum of derived stresses, equivalent strain, and principal strains for a complex solution where *LCASE1* is the real part and *LCASE2* is the imaginary part. The *Oper* field is not applicable with this option. Also, the **LCABS (p. 1018)** and **SUMTYPE (p. 1880)** commands have no effect on this option. The value of S3 will be a minimum. Absolute maximum is obtained for component quantity. This option does not apply to derived displacement amplitude (USUM). Load case writing (**LCWRITE (p. 1031)**) is not supported. See POST1 and POST26 – Complex Results Postprocessing in the *Theory Reference* for more information.

LCASE2

Second load case. Used only with *Oper2* operations.

SweepANG

Sweep angle increment in degrees for phase sweep. Used only with *Oper2* = CPXMAX. (Default = 1°)

Notes

LCOPER (p. 1026) operates on the database and one or two load cases according to:

Database = Database *Oper* (*LCASE1 Oper2 LCASE2*)

where operations *Oper* and *Oper2* are as described above.

Absolute values and scale factors may be applied to the load cases before the operations (**LCABS (p. 1018)**, **LCFACT (p. 1022)**). If *LCASE1* is not specified, only operation *Oper* is performed on the current database. If *LCASE2* is specified, operation *Oper2* is performed *before* operation *Oper*. If *LCASE2* is not specified, operation *Oper2* is ignored.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Solution items not contained (**OUTRES (p. 1336)**) in either the database or the applicable load cases will result in a null item during a load case operation. Harmonic element data read from a result file load case are processed at zero degrees.

Load case combinations must be performed on load cases from the same results file. Combining load cases from different results files is not supported.

Load case combinations of element-based solutions are performed in the solution coordinate system, and the data resulting from load case combinations are stored in the solution coordinate system. The resultant data are then transformed to the active results coordinate system (**RSYS (p. 1639)**) when listed or displayed. Except in the cases of *Oper* = LPRIN, ADD, or SUB, you must use **RSYS (p. 1639)**,SOLU to list or display results. In the case of layered elements, the layer (**LAYER (p. 1015)**) must also be specified.

If nodal-averaged results are a part of the load case combination, the resulting nodal-averaged result data are in the global Cartesian coordinate system. Furthermore, the resulting numerical values may differ from the same **LCOPER (p. 1026)** operation performed on the same data stored as element results. The SQUA, SQRT, LPRIN, and SRSS operations are not valid when applied to nodal averaged results. For more information, see Nodal-Averaged Results in the *Element Reference*.

Use the **FORCE (p. 772)** command prior to any combination operation to correctly combine the requested force type.

If Oper2=CPXMAX, the derived stresses and strain calculation do not apply to line elements.

For details on using load case combination, see Creating and Combining Load Cases in the *Basic Analysis Guide*.

For cyclic symmetry (**CYCLIC (p. 462)**), **LCOPER (p. 1026)** operates on the raw base and duplicate sector values. It cannot be used on the expanded values (**/CYCEXPAND (p. 454)**).

Main Menu>General Postproc>Load Case>Subtract

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LCSEL, *Type*, *LCMIN*, *LCMAX*, *LCINC*

Selects a subset of load cases.

POST1 (p. 51): Load Case Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Type

Label identifying the type of select:

S

Select a new set.

R

Reselect a set from the current set.

A

Additionally select a set and extend the current set.

U

Unselect a set from the current set.

ALL

Restore the full set.

NONE

Unselect the full set.

INVE

Invert the current set (selected becomes unselected and vice versa).

STAT

Display the current select status.

LCMIN

Minimum value of load case pointer range.

LCMAX

Maximum value of load case pointer range. *LCMAX* defaults to *LCMIN*.

LCINC

Value increment within range. Defaults to 1. *LCINC* cannot be negative.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Default

All load cases are selected.

Notes

Selects a subset of load cases for other operations. For example, to select a new set of load cases based on load cases 1 through 7, use **LCSEL (p. 1029)**,S,1,7. The subset is used when the ALL label is entered (or implied) on other commands, such as **LCFACT (p. 1022)**, **LCABS (p. 1018)**, **LCOPER (p. 1026)**, etc. Load cases are flagged as selected and unselected; no load case pointers (**LCDEF (p. 1021)**, **LCWRITE (p. 1031)**, **LCFILE (p. 1023)**) are actually deleted from the database.

For details on using load case combination, see Creating and Combining Load Cases in the *Basic Analysis Guide*.

Menu Paths

Main Menu>General Postproc>Load Case>Calc Options>Sele Ld Cases

---

LCSL, *NL1*, *NL2*, *NL3*, *NL4*, *NL5*, *NL6*, *NL7*, *NL8*, *NL9*

Divides intersecting lines at their point(s) of intersection.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1, NL2, NL3, . . . , NL9

Numbers of lines to be intersected. If *NL1* = ALL, *NL2* to *NL9* are ignored and the intersection of all selected lines is found. If *NL1* = P, use graphical picking to specify lines (*NL2* to *NL9* are ignored).

Notes

Divides intersecting (classifies) lines at their point(s) of intersection. The original lines (and their corresponding keypoint(s)) will be deleted by default. See the **BOPTN (p. 269)** command for the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LCSUM, *Lab*

Specifies whether to process non-summable items in load case operations.

POST1 (p. 51): Results (p. 51)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Combination option

(blank)

Only combine summable items [default].

ALL

Combine all items including non summable items.

Notes

Allows non-summable items (e.g. plastic strains) to be included in load combinations. Issue **LCSUM (p. 1031)**,ALL before the first load case operation (**LC*XX*** command). May also be used to include nonsummable items in the appending of a results file (**RAPPND (p. 1570)** command).

For details on using load case combination, see Creating and Combining Load Cases in the *Basic Analysis Guide*.

Menu Paths

This command cannot be accessed from a menu.

LCWRITE, *LCNO*, *Fname*, *Ext*, --

Creates a load case by writing results to a load case file.

POST1 (p. 51): Load Case Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LCNO

Arbitrary pointer number (1-99) to be assigned to this load case.

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ext

Filename extension (eight-character maximum).

The extension defaults to the *LCNO* value preceded by an "L" (for values 10–99) or by an "L0" (for values 1–9).

--

Unused field.

Notes

Creates a load case by writing the results data in the database to a load case file. The database remains unchanged by this operation. A pointer is also established to the written set of results on the load case file. This pointer (*LCNO*) can then be used on the **LCASE (p. 1019)** or **LCOPER (p. 1026)** commands to read the load case data into the database. By default, only summable results data (such as displacements, stresses, elastic strains) and constant results data (such as volume) are written to the load case file unless requested (**LCSUM (p. 1031)** command). Non-summable results data (such as plastic strains, strain energy), boundary conditions, and nodal loads are not written to the load case file. The load case file may be named by default or by a user name. Rewriting to the same file overwrites the previous data. See the **LCDEF (p. 1021)** command for status and erase operations.

For details on using load case combination, see Creating and Combining Load Cases in the *Basic Analysis Guide*.

Menu Paths

Main Menu>General Postproc>Load Case>Write Load Case

LCZERO

Zeroes the results portion of the database.

POST1 (p. 51): Load Case Calculations (p. 55)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

Often used before the **LCOPER (p. 1026)** command. Same as **LCOPER (p. 1026)**,ZERO.

Menu Paths

Main Menu>General Postproc>Load Case>Zero Load Case

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LDELE, *NL1*, *NL2*, *NINC*, *KSWP*

Deletes unmeshed lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1*, *NL2*, *NINC

Delete lines from *NL1* to *NL2* (defaults to *NL1*) in steps of *NINC* (defaults to 1). If *NL1* = ALL, *NL2* and *NINC* are ignored and all selected lines (**LSEL (p. 1074)**) are deleted. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* and *NINC* are ignored).

KSWP

Specifies whether keypoints are also to be deleted:

0

Delete lines only.

1

Delete lines, as well as keypoints attached to lines but not attached to other lines.

Notes

A line attached to an area cannot be deleted unless the area is first deleted.

Menu Paths

Main Menu>Preprocessor>Meshing>Concatenate>Del Concats>Lines

Main Menu>Preprocessor>Meshing>Mesh>Areas>Mapped>Del Concats>Lines

Main Menu>Preprocessor>Modeling>Delete>Line and Below

Main Menu>Preprocessor>Modeling>Delete>Lines Only

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LDIV,*NL1*,*RATIO*,*PDIV*,*NDIV*,*KEEP*

Divides a single line into two or more lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Number of the line to be divided. If negative, assume *P1* (see below) is the second keypoint of the line instead of the first for *RATIO*. If ALL, divide all selected lines (**LSEL (p. 1074)**). If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1*.

RATIO

Ratio of line length *P1-PDIV* to line length *P1-P2*. Must be between 0.0 and 1.0. Input ignored if *NDIV* > 2.

PDIV

Number to be assigned to keypoint generated at division location (defaults to lowest available keypoint number (**NUMSTR (p. 1301)**)). Input ignored if *NL1* = ALL or *NDIV* > 2. If *PDIV* already exists and lies on line *NL1*, divide line at *PDIV* (*RATIO* must also be 0.0). If *PDIV* already exists and does not lie on line *NL1*, *PDIV* is projected and moved to the nearest point on line *NL1* (if possible). *PDIV* cannot be attached to another line, area, or volume.

NDIV

The number of new lines to be generated from old line (defaults to 2).

KEEP

Specifies whether to keep the input entities:

0

Modify old line to use new keypoints and slopes.

1

Do not modify old line. New lines will overlay old line and have unique keypoints.

Notes

Divides a single line *NL1* (defined from keypoint *P1* to keypoint *P2*) into two or more lines. Line *NL1* becomes the new line beginning with keypoint *P1* and new lines are generated ending at keypoint *P2*. If the line is attached to an area, the area will also be updated. Line divisions are set to zero (use **LESIZE (p. 1041)**, etc. to modify).

---

LDRAG, *NK1, NK2, NK3, NK4, NK5, NK6, NL1, NL2, NL3, NL4, NL5, NL6*

Generates lines by sweeping a keypoint pattern along path.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NK1, NK2, NK3, . . . , NK6

List of keypoints in the pattern to be dragged (6 maximum if using keyboard entry). If *NK1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). If *NK1* = ALL, all selected keypoints (except those that define the drag path) will be swept along the path. A component name may also be substituted for *NK1*.

NL1, NL2, NL3, . . . , NL6

List of lines defining the path along which the pattern is to be dragged (6 maximum if using keyboard entry). Must be a continuous set of lines.

Notes

Generates lines (and their corresponding keypoints) by sweeping a given keypoint pattern along a characteristic drag path. If the drag path consists of multiple lines, the drag direction is determined by the sequence in which the path lines are input (*NL1*, *NL2*, etc.). If the drag path is a single line (*NL1*), the drag direction is from the keypoint on the drag line that is closest to the first keypoint of the given pattern to the other end of the drag line.

The magnitude of the vector between the keypoints of the given pattern and the first path keypoint remains constant for all generated keypoint patterns and the path keypoints. The direction of the vector relative to the path slope also remains constant so that patterns may be swept around curves. Keypoint and line numbers are automatically assigned (beginning with the lowest available values (**NUMSTR (p. 1301)**)). For best results, the entities to be dragged should be orthogonal to the start of the drag path. Drag operations that produce an error message may create some of the desired entities prior to terminating.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Extrude>Keypoints>Along Lines

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LDREAD, *Lab*, *LSTEP*, *SBSTEP*, *TIME*, *KIMG*, *Fname*, *Ext*, --

Reads results from the results file and applies them as loads.

SOLUTION (p. 38): FE Constraints (p. 47)
SOLUTION (p. 38): FE Body Loads (p. 48)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Lab

Valid load label:

TEMP

Temperatures from a thermal analysis are applied as body force nodal loads (**BF (p. 221)**) in a structural analysis or other type of analysis.

When used in conjunction with *KIMG* = 1 or *KIMG* = 2, temperatures can be applied to a subsequent thermal analysis as nodal loads (**D (p. 483)**) or initial conditions (**IC (p. 921)**), respectively.

See the "Notes" (p. 1039) section for details on transferring temperatures from layered thermal shell elements (SHELL131, SHELL132) and layered thermal solid elements (SOLID278, SOLID279).

FORC

Forces from an electromagnetic analysis are applied as force loads (**F (p. 729)**) in a structural analysis. **LDREAD (p. 1036)**,FORC reads coupling forces. See the discussion on force computation in the *Low-Frequency Electromagnetic Analysis Guide*.

For a full harmonic magnetic analysis, FORC represents the time-averaged force (use in conjunction with *KIMG* = 2). Values are in the nodal coordinate system for the force loads (**F (p. 729)**).

HGEN

Heat generations from an electromagnetic analysis are applied as body-force loads (**BFE (p. 237)**) in a thermal analysis. For a full harmonic analysis, HGEN represents the time-averaged heat generation load (use in conjunction with *KIMG* = 2).

JS

Source current density from a current-conduction analysis are applied as body-force loads (**BFE (p. 237)**). Values are in the global Cartesian coordinate system.

EF

Electric field element centroid values from an electrostatic analysis are applied as body-force loads (**BFE (p. 237)**) in a magnetic analysis. Values are in the global Cartesian coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

REAC

Reaction loads from any analysis are applied as force loads (**F (p. 729)**) in any analysis. Values are in the nodal coordinate system.

CONC

Concentrations from a diffusion analysis are applied to a subsequent diffusion analysis as nodal loads (**D (p. 483)**) or initial conditions (**IC (p. 921)**) when used in conjunction with *KIMG*=1 or *KIMG*=2, respectively.

VMEN

Mean flow velocities from a static mean flow analysis are applied to a subsequent harmonic or modal solution of the convective wave equation as body-force loads (**BF (p. 221)**).

VOLT

Voltages from an electric, electrostatic, or electromagnetic analysis are applied to a subsequent electric, electrostatic, or electromagnetic analysis as nodal loads (**D (p. 483)**) when *KIMG* = 1 or as initial conditions (**IC (p. 921)**) when *KIMG* = 2.

LSTEP

Load step number of the data set to be read. Defaults to 1. If LAST, ignore *SBSTEP* and *TIME* and read the last data set.

SBSTEP

Substep number (within *LSTEP*). If zero (or blank), *LSTEP* represents the last substep of the load step.

TIME

Time-point identifying the data set to be read. Used only if both *LSTEP* and *SBSTEP* are zero (or blank). If *TIME* is between two solution time points on the results file, a linear interpolation is done between the two data sets. If *TIME* is beyond the last time point on the file, use the last time point.

KIMG

When used with results from harmonic analyses (**ANTYPE (p. 162)**,HARMIC) *KIMG* establishes which set of data to read:

0

Read the real part of the solution. Valid also for *Lab* = EHFLU to read in time-average heat flux.

1

Read the imaginary part of the solution.

2

Calculate and read the time-average part. Meaningful for *Lab* = HGEN or FORC.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When used with the PRES label, *KIMG* represents the shell element face on which to apply the pressure:

1

Apply pressure to face 1

2

Apply pressure to face 2

When used with the TEMP label, *KIMG* indicates how temperatures are to be applied.

0

Apply temperatures as body loads (**BF (p. 221)**)

1

Apply temperatures as nodal loads (**D (p. 483)**)

2

Apply temperatures as initial conditions (**IC (p. 921)**)

When used with the CONC label, *KIMG* indicates how concentrations are to be applied.

1

Apply concentrations as nodal loads (**D (p. 483)**)

2

Apply concentrations as initial conditions (**IC (p. 921)**)

When used with the VOLT label, *KIMG* indicates how voltages are to be applied.

1

Apply voltages as nodal loads (**D (p. 483)**)

2

Apply voltages as initial conditions (**IC (p. 921)**)

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to `Jobname`.

Ext

Filename extension (eight-character maximum).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The extension defaults to RST (or RMF for a static mean flow analysis) if *Fname* is blank.

- -

Unused field.

Notes

The **LDREAD (p. 1036)** command reads results data from the results file and applies them as loads.

The command can also apply results from an analysis defined with one physics environment as loads on a second analysis using a different physics environment. Results values are applied as loads for field-coupling effects (for example, output temperatures from a thermal analysis as input to a structural analysis).

The command works based on the assumption that the meshes have not changed.

Nodal loads are applied only to selected nodes. Element loads are applied only to selected elements. Element surface loads are applied only to selected elements where all face nodes for that surface are selected.

To assure proper distribution of the surface loads, select *only* the nodes on the element face where the surface load is to be applied.

Scaling and accumulation specifications are applied as the loads are read via the following commands:

- **BFCUM (p. 233)** for body-force loads. (Heat-generation loads are not accumulated.)
- **SFCUM (p. 1758)** for surface loads.
- **FCUM (p. 739)** for force loads.

List the results via the appropriate list command:

- **BFLIST (p. 255)** or **BFELIST (p. 244)** for body-force loads.
- **SFELIST (p. 1770)** for surface loads.
- **FLIST (p. 766)** for force loads.

Values may be redefined after being read by issuing **LDREAD (p. 1036)** again with a different load step and substep, or time value.

This command is also valid in PREP7.

Transferring Temperature Output from SHELL131 and SHELL132

If a thermal analysis uses SHELL131 or SHELL132 thermal shell elements, temperatures can be transferred as body force element loads (**BFE (p. 237)**). In most cases, only the top and bottom temperatures from SHELL131 and SHELL132 are used by the structural shell elements; any interior temperatures are ignored. However, *all* temperatures are used by SHELL181 having section input, and SHELL281 having section input; for these elements, therefore, the number of temperature points at a node generated in the thermal model must match the number of temperature points at a node needed by the structural model.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When using SHELL131 or SHELL132 information for the **LDREAD (p. 1036)** operation, all element types should specify the same set of thermal degrees of freedom.

Transferring Temperature Output from SOLID278 and SOLID279

If a thermal analysis uses SOLID278 or SOLID279 thermal solid elements, the temperatures are available either at the nodes (KEYOPT(3) = 0) or at the nodes and layers (KEYOPT(3) = 1 or 2). Under normal circumstances, only the nodal temperatures are transferred to the structural elements.

However, if the structural elements are layered solids (KEYOPT(3) = 1 for SOLSH190, SOLID185, SOLID186) and the thermal elements have KEYOPT(3) = 1 or 2 (layered solid) and KEYOPT(8) = 1 (store data for all layers), then the layer temperatures are transferred to the structural elements. If the number of layers do not match, the algorithm reverts back to nodal temperature transfer.

KIMG = 0 (body loads) is the only valid mode for layered temperature transfer.

Examples

Thermal-Stress Example: Load Transfer Coupled-Field Analysis with One-way Coupling

Induction Heating Example: Load Transfer Coupled-Field Analysis with Two-way Coupling

LESIZE,*NL1*,*SIZE*,*ANGSIZ*,*NDIV*,*SPACE*,*KFORC*,*LAYER1*,*LAYER2*,*KYNDIV*

Specifies the divisions and spacing ratio on unmeshed lines.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Number of the line to be modified. If ALL, modify all selected lines (**LSEL (p. 1074)**). If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1*.

SIZE

If *NDIV* is blank, *SIZE* is the division (element edge) length. The number of divisions is automatically calculated from the line length (rounded upward to next integer). If *SIZE* is zero (or blank), use *ANGSIZ* or *NDIV*.

ANGSIZ

The division arc (in degrees) spanned by the element edge (except for straight lines, which always result in one division). The number of divisions is automatically calculated from the line length (rounded upward to next integer).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

NDIV

If positive, *NDIV* is the number of element divisions per line. If -1 (and *KFORC* = 1), *NDIV* is assumed to be zero element divisions per line. TARGE169 with a rigid specification ignores *NDIV* and will always mesh with one element division.

SPACE

Spacing ratio. If positive, nominal ratio of last division size to first division size (if > 1.0, sizes increase, if < 1.0, sizes decrease). If negative, |*SPACE*| is nominal ratio of center division(s) size to end divisions size. Ratio defaults to 1.0 (uniform spacing). For layer-meshing, a value of 1.0 normally is used. If *SPACE* = FREE, ratio is determined by other considerations

KFORC

KFORC 0-3 are used only with *NL1* = ALL. Specifies which selected lines are to be modified.

0

Modify only selected lines having undefined (zero) divisions.

1

Modify all selected lines.

2

Modify only selected lines having fewer divisions (including zero) than specified with this command.

3

Modify only selected lines having more divisions than specified with this command.

4

Modify only nonzero settings for *SIZE*, *ANGSIZ*, *NDIV*, *SPACE*, *LAYER1*, and *LAYER2*. If *KFORC* = 4, blank or 0 settings remain unchanged.

LAYER1

Layer-meshing control parameter. Distance which defines the thickness of the inner mesh layer, *LAYER1*. Elements in this layer are uniformly-sized with edge lengths equal to the specified element size for the line (either through *SIZE* or line-length/*NDIV*). A positive value for *LAYER1* is interpreted as an absolute length, while a negative value in interpreted as a multiplier on the specified element size for the line. As a general rule, the resulting thickness of the inner mesh layer should be greater than or equal to the specified element size for the line. If *LAYER1* = OFF, layer-meshing control settings are cleared for the selected lines. The default value is 0.0

LAYER2

Layer-meshing control parameter. Distance which defines the thickness of the outer mesh layer, *LAYER2*. Elements in this layer transition in size from those in *LAYER1* to the global element size. A positive value of *LAYER2* is interpreted as an absolute length, while a negative value is interpreted

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

as a mesh transition factor. A value of *LAYER2* = -2 would indicate that elements should approximately double in size as the mesh progresses normal to *LAYER1*. The default value is 0.0.

KYNDIV

0, No, and Off means that SmartSizing cannot override specified divisions and spacing ratios. Mapped mesh fails if divisions do not match. This defines the specification as "hard".

1, Yes, and On means that SmartSizing can override specified divisions and spacing ratios for curvature or proximity. Mapped meshing can override divisions to obtain required matching divisions. This defines the specification as" soft".

Notes

Defines the number of divisions and the spacing ratio on selected lines. Lines with previously specified divisions may also be changed.

This command is also valid for rezoning.

---

LEXTND,*NL1*,*NK1*,*DIST*,*KEEP*

Extends a line at one end by using its slope.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Number of the line to be extended. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NK1

Number of keypoint at the end of line *NL1* to be extended.

DIST

Distance that the line will be extended.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KEEP

Specifies whether to keep the input entities:

0

Modify old line to use new keypoints and slopes.

1

Do not modify old line. New line will overlay old line and have unique keypoints.

Notes

Extends a line at one end by using its slope. Lines may be redefined only if not yet attached to an area. Line divisions are set to zero (use **LESIZE (p. 1041)**, etc. to modify). Note that solid modeling in a toroidal coordinate system is not recommended.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Extend Line

LFILLT, *NL1*, *NL2*, *RAD*, *PCENT*

Generates a fillet line between two intersecting lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1

Number of the first intersecting line. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NL2

Number of the second intersecting line.

RAD

Radius of fillet to be generated. Radius should be less than the lengths of the two lines specified with *NL1* and *NL2*.

PCENT

Number to be assigned to generated keypoint at fillet arc center. If zero (or blank), no keypoint is generated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Generates a fillet line between two intersecting lines *NL1* (*P1-PINT*) and *NL2* (*P2-PINT*). Three keypoints may be generated, two at the fillet tangent points (*PTAN1* and *PTAN2*) and one (optional) at the fillet arc center (*PCENT*). Line *P1-PINT* becomes *P1-PTAN1*, *P2-PINT* becomes *P2-PTAN2*, and new arc line *PTAN1-PTAN2* is generated. Generated keypoint and line numbers are automatically assigned (beginning with the lowest available values (**NUMSTR (p. 1301)**)). Line divisions are set to zero (use **LESIZE (p. 1041)**, etc. to modify).

Menu Paths

Main Menu>Preprocessor>Modeling>Create>Lines>Line Fillet

LFSURF, *SLINE*, *TLINE*

Generates surface elements overlaid on the edge of existing solid elements and assigns the extra node as the closest fluid element node.

PREP7 (p. 22): Elements (p. 32)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

SLINE

Component name for the surface lines of the meshed solid areas. The component name must be 32 characters or less.

TLINE

Component name for the target lines meshed with fluid elements. The component name must be 32 characters or less.

Notes

This command macro is used to generate surface effect elements overlaid on the surface of existing plane elements and, based on proximity, to determine and assign the extra node for each surface element. The underlying areas of the solid region and the fluid lines must be meshed prior to calling this command macro. The active element type must be SURF151 with appropriate settings for KEYOPT(4), KEYOPT(5), KEYOPT(6), and KEYOPT(8).

The surface lines of the solid and the target lines of the fluid are grouped into components and named using the **CM (p. 356)** command. The names must be enclosed in single quotes (for example, '*SLINE*') when the **LFSURF (p. 1045)** command is manually typed in.

When using the GUI method, node and element components are created through the picking dialog boxes associated with this command.

The macro is applicable for the SURF151 and FLUID116 element types.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Main Menu>Preprocessor>Modeling>Create>Elements>Surf / Contact>Surf Effect>Attch to Fluid>Node to Fluid

---

LGEN, *ITIME*, *NL1*, *NL2*, *NINC*, *DX*, *DY*, *DZ*, *KINC*, *NOELEM*, *IMOVE*

Generates additional lines from a pattern of lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

ITIME

Do this generation operation a total of *ITIME*s, incrementing all keypoints in the given pattern automatically (or by *KINC*) each time after the first. *ITIME* must be > 1 for generation to occur.

NL1*, *NL2*, *NINC

Generate lines from pattern beginning with *NL1* to *NL2* (defaults to *NL1*) in steps of *NINC* (defaults to 1). If *NL1* = ALL, *NL2* and *NINC* are ignored and pattern is all selected lines (**LSEL (p. 1074)**). If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* and *NINC* are ignored).

DX*, *DY*, *DZ

Keypoint location increments in the active coordinate system (--, Dθ, DZ for cylindrical, --, Dθ, -- for spherical).

KINC

Keypoint increment between generated sets. If zero, the lowest available keypoint numbers are assigned (**NUMSTR (p. 1301)**).

NOELEM

Specifies if elements and nodes are also to be generated:

0

Generate nodes and elements associated with the original lines, if they exist.

1

Do not generate nodes and elements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IMOVE

Specifies whether to redefine the existing lines:

0

Generate additional lines as requested with the *ITIME* argument.

1

Move original lines to new position retaining the same keypoint numbers (*ITIME*, *KINC*, and *NOELM* are ignored). Valid only if the old lines are no longer needed at their original positions. Corresponding meshed items are also moved if not needed at their original position.

Notes

Generates additional lines (and their corresponding keypoints and mesh) from a given line pattern. The MAT, TYPE, REAL, and ESYS attributes are based upon the lines in the pattern and not upon the current settings. End slopes of the generated lines remain the same (in the active coordinate system) as those of the given pattern. For example, radial slopes remain radial, etc. Generations which produce lines of a size or shape different from the pattern (that is, radial generations in cylindrical systems, radial and phi generations in spherical systems, and theta generations in elliptical systems) are not allowed. Note that solid modeling in a toroidal coordinate system is not recommended. New line numbers are automatically assigned (beginning with the lowest available values (**NUMSTR (p. 1301)**)).

Menu Paths

Main Menu>Preprocessor>Modeling>Copy>Lines

Main Menu>Preprocessor>Modeling>Move / Modify>Lines

LGLUE, *NL1, NL2, NL3, NL4, NL5, NL6, NL7, NL8, NL9*

Generates new lines by "gluing" lines.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1, NL2, NL3, . . . , NL9

Numbers of the lines to be glued. If *NL1* = ALL, all selected lines will be glued (*NL2* to *NL9* will be ignored). If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1*.

Notes

Use of the **LGLUE (p. 1047)** command generates new lines by "gluing" input lines. The glue operation redefines the input lines so that they share keypoints at their common ends. The new lines encompass the same geometry as the original lines. This operation is only valid if the intersections of the input lines are keypoints at the ends of those lines. See the *Modeling and Meshing Guide* for an illustration.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

The **LGLUE (p. 1047)** command results in the merging of keypoints at the common end of the lines. The keypoints of the lower numbered line will be kept. This means one must be aware of line numbering when multiple **LGLUE (p. 1047)** commands are applied to avoid any "ungluing" of geometry.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Glue>Lines

LGWRITE,*Fname*,*Ext*,--,*Kedit*

Writes the database command log to a file.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

The file name defaults to Jobname.

Ext

Filename extension (eight-character maximum).

The extension defaults to LGW if *Fname* and *Ext* are blank.

--

Unused field.

Kedit

Flag to suppress nonessential commands:

NONE

Do not suppress any commands (default).

COMMENT

Write nonessential commands as comments (starting with !).

REMOVE

Do not write nonessential commands or comments.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

Writes the database command log to a named file. The database command log contains all commands that were used to create the current database. These commands are recorded in the database as they are issued, and saved in the database file (`File.db`) whenever the database is saved. The **LGWRITE (p. 1048)** command extracts these commands from the database and writes them to a file. Nonessential commands (for listing, graphics displays, help, etc.) can be excluded from the file by using the *Kedit* field. The file resulting from **LGWRITE (p. 1048)** can be used as command input to the program. This command is most useful if the session log file (`File.log`), which is normally saved during an interactive session, has been lost or corrupted.

This command is valid in any processor.

Menu Paths

Utility Menu>File>Write DB Log File

/LIGHT, *WN*, *NUM*, *INT*, *XV*, *YV*, *ZV*, *REFL*

Specifies the light direction for the display window.

GRAPHICS (p. 16): Style (p. 17)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

WN

Window number (or ALL) to which command applies (defaults to 1).

NUM

Ambient or directional light key:

0

Ambient light (default).

1

Directional light.

INT

Light intensity factor (defaults to 0.3 for ambient, 1.0 for directional). This option is valid only for 3D devices).

XV, YV, ZV

Light direction (valid only for *NUM* = 1). The directional light source is parallel to the line from point *XV*, *YV*, *ZV* to the origin, in the global Cartesian system origin. Defaults to the viewing direction (**/VIEW (p. 2131)**).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

REFL

Light reflectance factor (valid only for *NUM* = 1 and 3D devices).

Command Default

Use ambient light.

Notes

Defines the light direction for the window. Use this command only with 3D graphics devices or 2D devices when Z-buffering is used (**/TYPE (p. 2034)**,,(6 or 7)). The ambient light has no direction, only an intensity. You can position the directional light source by defining a point (in the global Cartesian coordinate system) representing a point along the light directional line. This point, and the global Cartesian coordinate system origin, define the line along which the light is positioned looking toward the origin. You can use any point along the light line; for example, both (1.,1.,1.) and (2.,2.,2.) give the same light effect. For 3D graphics devices only, the directional light source also has intensity and reflectance factors.

By choosing the highest intensity ambient light for 3D graphics devices (via **/LIGHT (p. 1049)**,WN,0,1), you can nullify color shading and other effects of directional lighting.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Style>Light Source

LINA, *NL*, *NA*

Finds the intersection of a line with an area.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL

Number of line to be intersected. If *NL* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NA

Number of area to be intersected.

Notes

Finds the intersection of a line with an area. New lines will be generated where the lines intersect the areas. If the regions of intersection are only points, new keypoints will be generated instead. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Intersect>Line with Area

---

LINE

Specifies "Lines" as the subsequent status topic.

PREP7 (p. 22): Status (p. 35)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This is a status (**STAT (p. 1861)**) topic command. Status topic commands are generated by the GUI and will appear in the log file (`Jobname.LOG`) if status is requested for some items under **Utility Menu> List> Status**. This command will be immediately followed by a **STAT (p. 1861)** command, which will report the status for the specified topic.

If entered directly into the program, the **STAT (p. 1861)** command should immediately follow this command.

Menu Paths

This command cannot be accessed from a menu.

/LINE, *X1*, *Y1*, *X2*, *Y2*

Creates annotation lines (GUI).

GRAPHICS (p. 16): Annotation (p. 18)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

X1

Line X starting location (-1.0 < X < 2.0).

Y1

Line Y starting location (-1.0 < Y < 1.0).

X2

Line X ending location (-1.0 < X < 2.0).

Y2

Line Y ending location (-1.0 < Y < 1.0).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notes

This command defines annotation lines to be written directly onto the display at a specified location.

The command is generated by the Graphical User Interface (GUI) and appears in the log file (`Jobname.log`) if annotation is used. It is *not* intended to be typed in directly in a Mechanical APDL session (although it can be included in an input file for batch input or for use with the **/INPUT (p. 948)** command).

All lines are shown on subsequent displays unless the annotation is turned off or deleted. Issue **/LSPEC (p. 1081)** to set the attributes of the line.

This command is valid in any processor.

Menu Paths

Utility Menu>PlotCtrls>Annotation>Create Annotation

LINES, *N*

Specifies the length of a printed page.

POST26 (p. 58): Listing (p. 60)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

N

Number of lines per page (defaults to 20). (Minimum allowed = 11).

Command Default

20 lines per page.

Notes

Specifies the length of a printed page (for use in reports, etc.).

Menu Paths

Main Menu>TimeHist Postpro>Settings>List

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LINL, *NL1*, *NL2*, *NL3*, *NL4*, *NL5*, *NL6*, *NL7*, *NL8*, *NL9*

Finds the common intersection of lines.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1, NL2, NL3, . . . , NL9

Numbers of lines to be intersected. If *NL1* = ALL, find the intersection of all selected lines and *NL2* to *NL9* are ignored. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1*.

Notes

Finds the common (not pairwise) intersection of lines. The common intersection is defined as the regions shared (in common) by *all* lines listed on this command. New lines will be generated where the original lines intersect. If the regions of intersection are only points, new keypoints will be generated instead. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Intersect>Common>Lines

LINP, *NL1*, *NL2*, *NL3*, *NL4*, *NL5*, *NL6*, *NL7*, *NL8*, *NL9*

Finds the pairwise intersection of lines.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1, NL2, NL3, . . . , NL9

Numbers of lines to be intersected pairwise. If *NL1* = ALL, find the pairwise intersection of all selected lines and *NL2* to *NL9* are ignored. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *NL1*.

Notes

Finds the pairwise intersection of lines. The pairwise intersection is defined as any and all regions shared by at least two lines listed on this command. New lines will be generated where the original lines intersect pairwise. If the regions of pairwise intersection are only points, new keypoints will be generated. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Intersect>Pairwise>Lines

---

LINV, *NL*, *NV*

Finds the intersection of a line with a volume.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL

Number of line to be intersected. If *NL* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI).

NV

Number of volume to be intersected.

Notes

Finds the intersection of a line with a volume. New lines will be generated where the lines intersect the volumes. If the regions of intersection are only points, new keypoints will be generated instead. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Intersect>Line with Volume

---

LIST, *LEVEL*

Lists out the sets in the results file.

AUX3 (p. 61): Results Files (p. 61)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Notes

This command lists the results set number, the load step, substep, and time step for each set. It also shows all sets marked for deletion.

The **LIST (p. 1054)** command is valid only in the results file editing processor (auxiliary processor AUX3).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Menu Paths

This command cannot be accessed from a menu.

---

*LIST, *Fname*, *Ext*, --

Displays the contents of an external, coded file.

SESSION (p. 11): Files (p. 12)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Fname

File name and directory path (248 characters maximum, including the characters needed for the directory path). An unspecified directory path defaults to the working directory; in this case, you can use all 248 characters for the file name.

Ext

Filename extension (eight-character maximum).

--

Unused field.

Notes

Displays the contents of an external, coded file. The file to be listed cannot be in use (open) at the time (except for the error file, `Jobname.err`, which may be displayed with ***LIST (p. 1055)**,ERR).

Use caution when you are listing active Mechanical APDL files via the **List> Files> Other** and **File> List> Other** menu paths. File I/O buffer and system configurations can result in incomplete listings unless the files are closed.

This command is valid in any processor.

Menu Paths

This command cannot be accessed from a menu.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LLIST, *NL1*, *NL2*, *NINC*, *Lab*

Lists the defined lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1*, *NL2*, *NINC

List lines from *NL1* to *NL2* (defaults to *NL1*) in steps of *NINC* (defaults to 1). If *NL1* = ALL (default), *NL2* and *NINC* are ignored and all selected lines (**LSEL (p. 1074)**) are listed. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* and *NINC* are ignored).

Lab

Determines what type of listing is used (one of the following):

(blank)

Prints information about all lines in the specified range.

RADIUS

Prints the radius of certain circular arcs, along with the keypoint numbers of each line. Straight lines, non-circular curves, and circular arcs not internally identified as arcs (which depends upon how each arc is created) will print a radius value of zero.

LAYER

Prints layer-mesh control specifications.

HPT

Prints information about only those lines that contain hard points. HPT is not supported in the GUI.

ORIENT

Prints a list of lines, and identifies any orientation keypoints and any cross section IDs that are associated with the lines. Used for beam meshing with defined orientation nodes and cross sections.

Notes

There are 2 listings for the number of element divisions and the spacing ratio. The first listing shows assignments from **LESIZE (p. 1041)** only, followed by the "hard" key (*KYNDIV*). See **LESIZE (p. 1041)** for more information. The second listing shows *NDIV* and *SPACE* for the existing mesh, if one exists. Whether this existing mesh and the mesh generated by **LESIZE (p. 1041)** match at any given point depends upon meshing options and the sequence of meshing operations.

A "-1" in the "nodes" column indicates that the line has been meshed but that there are no interior nodes.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

An attribute (TYPE, MAT, REAL, or ESYS) listed as a zero is unassigned; one listed as a positive value indicates that the attribute was assigned with the **LATT (p. 1014)** command (and will not be reset to zero if the mesh is cleared); one listed as a negative value indicates that the attribute was assigned using the attribute pointer (**TYPE (p. 2036)**, **MAT (p. 1111)**, **REAL (p. 1579)**, or **ESYS (p. 685)**) that was active during meshing (and will be reset to zero if the mesh is cleared).

This command is valid in any processor.

Menu Paths

Utility Menu>List>Lines

LMESH, *NL1*, *NL2*, *NINC*

Generates nodes and line elements along lines.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1*, *NL2*, *NINC

Mesh lines from *NL1* to *NL2* (defaults to *NL1*) in steps of *NINC* (defaults to 1). If *NL1* = ALL, *NL2* and *NINC* are ignored and all selected lines (**LSEL (p. 1074)**) are meshed. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* and *NINC* are ignored).

Notes

Generates nodes and line elements along lines. Missing nodes required for the generated elements are created and assigned the lowest available numbers.

Menu Paths

Main Menu>Preprocessor>Meshing>Mesh>Lines

LNSRCH, *Key*, *LSTOL*, *LStrun*

Activates a line search to be used with Newton-Raphson.

SOLUTION (p. 38): Nonlinear Options (p. 40)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

Key

Line search key:

OFF

Do not use a line search.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ON

Use a line search. Note, adaptive descent is suppressed when **LNSRCH (p. 1057)** is on unless explicitly requested on the **NROPT (p. 1261)** command. *Having line search on and adaptive descent on at the same time is not recommended.*

AUTO

The program automatically switches line searching ON and OFF between substeps of a load step as needed. This option is recommended.

LSTOL

Line search convergence tolerance (default = 0.5).

LStrun

Truncation key for the line search parameter. Default = OFF, meaning no truncation. To activation truncation, input the number of digits to use after the decimal point for the line search parameter. (See Line Search in the *Theory Reference* for more information.)

Command Default

Line search off, unless contact elements are present.

Notes

Activates a line search to be used with the Newton-Raphson method (**NROPT (p. 1261)**). Line search is an alternative to adaptive descent (see Line Search in the *Theory Reference*).

LNSRCH (p. 1057),AUTO can be very efficient for problems in which **LNSRCH (p. 1057)** is needed at only certain substeps.

You cannot use line search (**LNSRCH (p. 1057)**), automatic time stepping (**AUTOTS (p. 207)**), or the DOF solution predictor (**PRED (p. 1476)**) with the arc-length method (**ARCLEN (p. 175)**, **ARCTRM (p. 177)**). If you activate the arc-length method after you set **LNSRCH (p. 1057)**, **AUTOTS (p. 207)**, or **PRED (p. 1476)**, a warning message appears. If you choose to proceed with the arc-length method, the program disables your line search, automatic time stepping, and DOF predictor settings, and the time step size is controlled by the arc-length method internally.

This command is also valid in PREP7.

Menu Paths

Main Menu>Preprocessor>Loads>Analysis Type>Sol'n Controls>Nonlinear

Main Menu>Preprocessor>Loads>Load Step Opts>Nonlinear>Line Search

Main Menu>Solution>Analysis Type>Sol'n Controls>Nonlinear

Main Menu>Solution>Load Step Opts>Nonlinear>Line Search

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LOCAL, *KCN*, *KCS*, *XC*, *YC*, *ZC*, *THXY*, *THYZ*, *THZX*, *PAR1*, *PAR2*

Defines a local coordinate system by a location and orientation.

DATABASE (p. 13): Coordinate System (p. 15)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

KCN

Arbitrary reference number assigned to this coordinate system. Must be greater than 10. A coordinate system previously defined with this number will be redefined.

KCS

Coordinate system type:

0 or CART

Cartesian

1 or CYLIN

Cylindrical (circular or elliptical)

2 or SPHE

Spherical (or spheroidal)

3 or TORO

Toroidal

XC, YC, ZC

Location (in the global Cartesian coordinate system) of the origin of the new coordinate system.

THXY

First rotation about local Z (positive X toward Y).

THYZ

Second rotation about local X (positive Y toward Z).

THZX

Third rotation about local Y (positive Z toward X).

PAR1

Used for elliptical, spheroidal, or toroidal systems. If *KCS* = 1 or 2, *PAR1* is the ratio of the ellipse Y-axis radius to X-axis radius (defaults to 1.0 (circle)). If *KCS* = 3, *PAR1* is the major radius of the torus.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PAR2

Used for spheroidal systems. If *KCS* = 2, *PAR2* = ratio of ellipse Z-axis radius to X-axis radius (defaults to 1.0 (circle)).

Notes

Defines a local coordinate system by origin location and orientation angles. The local coordinate system is parallel to the global Cartesian system unless rotated. Rotation angles are in degrees and redefine any previous rotation angles. See the **CLOCAL (p. 352)**, **CS (p. 435)**, **CSWPLA (p. 440)**, and **CSKP (p. 438)** commands for alternate definitions. This local system becomes the active coordinate system (**CSYS (p. 441)**). Local coordinate systems may be displayed with the **/PSYMB (p. 1552)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>WorkPlane>Local Coordinate Systems>Create Local CS>At Specified Loc

---

LOVLAP, *NL1, NL2, NL3, NL4, NL5, NL6, NL7, NL8, NL9*

Overlaps lines.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1, NL2, NL3, . . . , NL9

Numbers of lines to be overlapped. If *NL1* = ALL, *NL2* to *NL9* are ignored and all selected lines are overlapped. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1*.

Notes

Overlaps lines. Generates new lines which encompass the geometry of all the input lines. The new lines are defined by the regions of intersection of the input lines, and by the complementary (non-intersecting) regions. See the *Modeling and Meshing Guide* for an illustration. This operation is only valid when the region of intersection is a line. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Overlap>Lines

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LPLOT, *NL1*, *NL2*, *NINC*

Displays the selected lines.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1*, *NL2*, *NINC

Display lines from *NL1* to *NL2* (defaults to *NL1*) in steps of *NINC* (defaults to 1). If *NL1* = ALL (default), *NL2* and *NINC* are ignored and display all selected lines (**LSEL (p. 1074)**).

Notes

Mesh divisions on plotted lines are controlled by the *LDIV* option of the **/PSYMB (p. 1552)** command.

This command is valid in any processor.

Menu Paths

Utility Menu>Plot>Lines

Utility Menu>Plot>Specified Entities>Lines

LPTN, *NL1*, *NL2*, *NL3*, *NL4*, *NL5*, *NL6*, *NL7*, *NL8*, *NL9*

Partitions lines.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1*, *NL2*, *NL3*, . . . , *NL9

Numbers of lines to be operated on. If *NL1* = ALL, *NL2* to *NL9* are ignored all selected lines are used. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may be substituted for *NL1*.

Notes

Partitions lines. Generates new lines which encompass the geometry of all the input lines. The new lines are defined by both the regions of intersection of the input lines and the complementary (non-intersecting) regions. See the *Modeling and Meshing Guide* for an illustration. See the **BOPTN (p. 269)** command for an explanation of the options available to Boolean operations. Element attributes and solid model boundary conditions assigned to the original entities will not be transferred to the new entities generated.

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Booleans>Partition>Lines

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LREFINE, *NL1*, *NL2*, *NINC*, *LEVEL*, *DEPTH*, *POST*, *RETAIN*

Refines the mesh around specified lines.

PREP7 (p. 22): Meshing (p. 29)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL1, NL2, NINC

Lines (*NL1* to *NL2* in increments of *NINC*) around which the mesh is to be refined. *NL2* defaults to *NL1*, and *NINC* defaults to 1. If *NL1* = ALL, *NL2* and *NINC* are ignored and all selected lines are used for refinement. If *NL1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL1* (*NL2* and *NINC* are ignored).

LEVEL

Amount of refinement to be done. Specify the value of *LEVEL* as an integer from 1 to 5, where a value of 1 provides minimal refinement, and a value of 5 provides maximum refinement (defaults to 1).

DEPTH

Depth of mesh refinement in terms of the number of elements outward from the indicated lines (defaults to 1).

POST

Type of postprocessing to be done after element splitting, in order to improve element quality:

OFF

No postprocessing will be done.

SMOOTH

Smoothing will be done. Node locations may change.

CLEAN

Smoothing and cleanup will be done. Existing elements may be deleted, and node locations may change (default).

RETAIN

Flag indicating whether quadrilateral elements must be retained in the refinement of an all-quadrilateral mesh. (Mechanical APDL ignores the *RETAIN* argument when you are refining anything other than a quadrilateral mesh.)

ON

The final mesh will be composed entirely of quadrilateral elements, regardless of the element quality (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OFF

The final mesh may include some triangular elements in order to maintain element quality and provide transitioning.

Notes

LREFINE (p. 1062) performs local mesh refinement around the specified lines. By default, the indicated elements are split to create new elements with 1/2 the edge length of the original elements (*LEVEL* = 1).

LREFINE (p. 1062) refines all area elements and tetrahedral volume elements that are adjacent to the specified lines. Any volume elements that are adjacent to the specified lines, but are not tetrahedra (for example, hexahedra, wedges, and pyramids), are not refined.

You cannot use mesh refinement on a solid model that contains initial conditions at nodes (**IC (p. 921)**), coupled nodes (**CP (p. 421)** family of commands), constraint equations (**CE (p. 297)** family of commands), or boundary conditions or loads applied directly to any of its nodes or elements. This applies to nodes and elements anywhere in the model, not just in the region where you want to request mesh refinement. For additional restrictions on mesh refinement, see Revising Your Model in the *Modeling and Meshing Guide*.

This command is also valid for rezoning.

Menu Paths

Main Menu>Preprocessor>Meshing>Modify Mesh>Refine At>Lines

LREVERSE, *LNUM*, *NOEFLIP*

Reverses the normal of a line, regardless of its connectivity or mesh status.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

LNUM

Line number of the line whose normal direction is to be reversed. If *LNUM* = ALL, the normals of all selected lines will be reversed. If *LNUM* = P, graphical picking is enabled. A component name may also be substituted for *LNUM*.

NOEFLIP

Indicates whether you want to change the normal direction of the existing elements on the reversed line(s) so that they are consistent with each line's new normal direction.

0

Make the normal direction of existing elements on the reversed line(s) consistent with each line's new normal direction (default).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1

Do not change the normal direction of existing elements on the reversed line(s).

Notes

You cannot use the **LREVERSE (p. 1063)** command to change the normal direction of any element that has a body or surface load. We recommend that you apply all of your loads only *after* ensuring that the element normal directions are acceptable.

Real constants (such as nonuniform shell thickness and tapered beam constants) may be invalidated by an element reversal.

For more information, see Revising Your Model in the *Modeling and Meshing Guide*.

Menu Paths

Main Menu>Preprocessor>Modeling>Move / Modify>Reverse Normals>of Lines

---

LROTAT, *NK1, NK2, NK3, NK4, NK5, NK6, PAX1, PAX2, ARC, NSEG*

Generates circular lines by rotating a keypoint pattern about an axis.

PREP7 (p. 22): Lines (p. 26)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NK1, NK2, NK3, . . . , NK6

List of keypoints in the pattern to be rotated (6 maximum if using keyboard entry). If *NK1* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). If *NK1* = ALL, all selected keypoints (except *PAX1* and *PAX2*) will define the pattern to be rotated. A component name may also be substituted for *NK1*.

PAX1, PAX2

Keypoints defining the axis about which the keypoint pattern is to be rotated.

ARC

Arc length (in degrees). Positive follows right-hand rule about *PAX1-PAX2* vector. Defaults to 360.

NSEG

Number of lines (8 maximum) around circumference. Defaults to minimum required for 90° (maximum) arcs, that is, 4 for 360°, 3 for 270°, etc.

Notes

Generates circular lines (and their corresponding keypoints) by rotating a keypoint pattern about an axis. Keypoint patterns are generated at regular angular locations (based on a maximum spacing of

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

90°). Line patterns are generated at the keypoint patterns. Keypoint and line numbers are automatically assigned (beginning with the lowest available values (**NUMSTR (p. 1301)**)).

Menu Paths

Main Menu>Preprocessor>Modeling>Operate>Extrude>Keypoints>About Axis

---

LSBA, *NL*, *NA*, *SEPO*, *KEEPL*, *KEEPA*

Subtracts areas from lines.

PREP7 (p. 22): Booleans (p. 28)

Valid Products: (p. 2) **Pro** | **Premium** | **Enterprise** | **PrepPost** | **Solver** | AS add-on

NL

Line (or lines, if picking is used) to be subtracted from. If ALL, use all selected lines. If *NL* = P, graphical picking is enabled and all remaining command fields are ignored (valid only in the GUI). A component name may also be substituted for *NL*.

NA

Area (or areas, if picking is used) to be subtracted. If ALL, use all selected areas. A component name may also be substituted for *NA*.

SEPO

Behavior if the intersection of the lines and the areas is a keypoint or keypoints:

(blank)

The resulting lines will share keypoint(s) where they touch.

SEPO

The resulting lines will have separate, but coincident keypoint(s) where they touch.

KEEPL

Specifies whether *NL* lines are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete *NL* lines after **LSBA (p. 1065)** operation (override **BOPTN (p. 269)** command settings).

KEEP

Keep *NL* lines after **LSBA (p. 1065)** operation (override **BOPTN (p. 269)** command settings).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

KEEPA

Specifies whether *NA* areas are to be deleted:

(blank)

Use the setting of KEEP on the **BOPTN (p. 269)** command.

DELETE

Delete areas after **LSBA (p. 1065)** operation (override **BOPTN (p. 269)** command settings).
